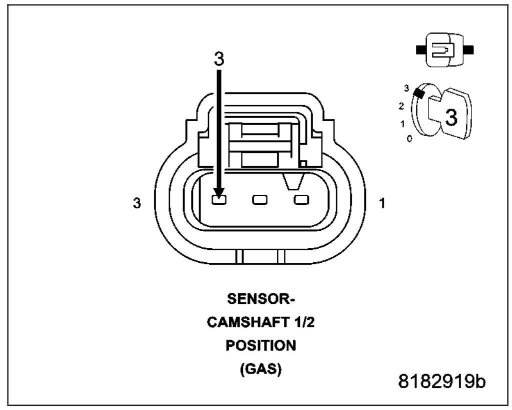
Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CAMSHAFT 1/2 POSITION SENSOR IRREGULAR SIGNAL

Turn the ignition off.



Using a lab scope and the Miller special tool #6801, backprobe the (K441) CMP 1/2 Signal circuit in the Camshaft 1/2 Position Sensor harness connector.

Ignition on, engine not running.

Wiggle the related wire harness and lightly tap on the Camshaft 1/2 Position Sensor while monitoring the lab scope screen.

Start the engine.

Monitor the Camshaft 1/2 Position Sensor signal on the lab scope screen.

Were any Camshaft 1/2 Position Sensor signals irregular or missing?

Yes >> Go to 4

No >> Go to 6

4. CAMSHAFT 1/2, TONE WHEEL OR PULSE RING

Turn the ignition off.

Remove the Camshaft 1/2 Position Sensor.

Inspect the Camshaft 1/2 Position Sensor and mounting area for any condition that would result in an incorrect signal, such as damage, foreign material or excessive movement.

Were any problems found?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. CAMSHAFT 1/2 POSITION SENSOR

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/2 Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Camshaft 1/2 Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

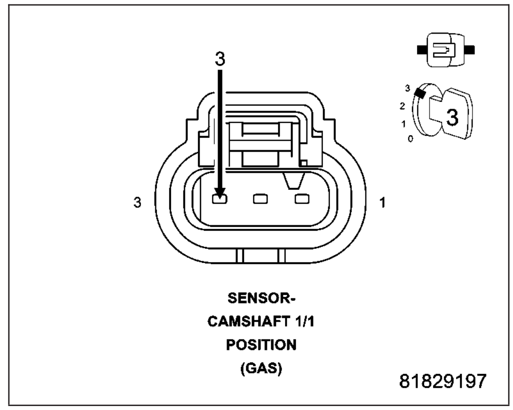
6. CAMSHAFT 1/1 POSITION SENSOR CIRCUIT WIRING OR CONNECTORS

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/1 Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Inspect the Camshaft 1/1 Position Sensor for conditions such as loose mounting screws, damage, or cracks.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

7. CAMSHAFT 1/1 POSITION SENSOR IRREGULAR SIGNAL

Using a lab scope and the Miller special tool #6801, backprobe the (K44) CMP 1/1 Signal circuit in the Camshaft 1/1 Position Sensor harness connector.

Ignition on, engine not running.

Wiggle the related wire harness and lightly tap on the Camshaft 1/1 Position Sensor while monitoring the lab scope screen.

Start the engine.

Monitor the Camshaft 1/1 Position Sensor signal on the lab scope screen.

Were any Camshaft 1/1 Position Sensor signals irregular or missing?

Yes >> Go to 8

No >> Go to 10

8. CAMSHAFT 1/1, TONE WHEEL OR FLEX PLATE

Turn the ignition off.

Remove the Camshaft 1/1 Position Sensor.

Inspect the Camshaft 1/1 Position Sensor and mounting area for any condition that would result in an incorrect signal, such as damage, foreign material, or excessive movement.

Were any problems found?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. CAMSHAFT 1/1 POSITION SENSOR

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/1 Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Camshaft 1/1 Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/2 Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0420-CATALYST 1/1 EFFICIENCY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  After engine warm up, at medium throttle with vehicle speed between 35 and 60 mph.
- **Set Condition:**
  If the switch rate of the downstream O2 sensor is within the calibrated fail threshold during monitoring. Two trip fault. Three good trips to turn off the MIL.

Possible Causes
EXHAUST LEAK
ENGINE MECHANICAL CONDITION
AGING O2 SENSOR
CATALYTIC CONVERTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EXHAUST LEAK

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false O2 Sensor failure

Turn the ignition off.

Inspect the exhaust system for leaks between the engine and the 1/1 Oxygen Sensor.

Inspect the exhaust system for leaks between the engine and within 6 inches downstream of the 1/2 Oxygen Sensor.

Perform a leak test with Miller Tool #8404A Evaporative Emissions Leak Detector (EELD), even if an audible leak is not heard. Pay particular attention to the exhaust manifold to head surface, exhaust pipe to manifold connection, and the O2 sensor boss for leaks.

Connect the SMOKE supply tip (black hose) to the exhaust cone adapter (if equipped) and place it into the tail pipe.

Set the smoke/air control switch to SMOKE.

Press the remote smoke/air start button.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the exhaust system path and look for a leak, indicated by exiting smoke.

If a leak is concealed from view, release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

Were any exhaust leaks found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 2

2. ACTIVE DTC

NOTE: A new downstream O2 Sensor and an aging upstream O2 Sensor may cause the DTC to set. Review the repair history of the vehicle before continuing.

NOTE: If an O2 Sensor DTC is set along with the Catalytic Converter Efficiency DTC, diagnose the O2 Sensor DTC(s) before continuing.

NOTE: Check for contaminants that may have damaged the O2 Sensor and Catalytic Converter: contaminated fuel, unapproved silicone, oil and coolant, repair necessary.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.
Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.
With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. CATALYTIC CONVERTER INSPECTION

NOTE: Thoroughly inspect the top and bottom of the Catalytic Converter.
Inspect the Catalytic Converter for the following:
— Damage including dents, holes, internal damage, or leaks.
— Severe discoloration caused by overheating.

Were any problems found?

Yes >> Replace the Catalytic Converter. If necessary, repair the condition that may have caused the failure.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. ENGINE MECHANICAL CONDITION

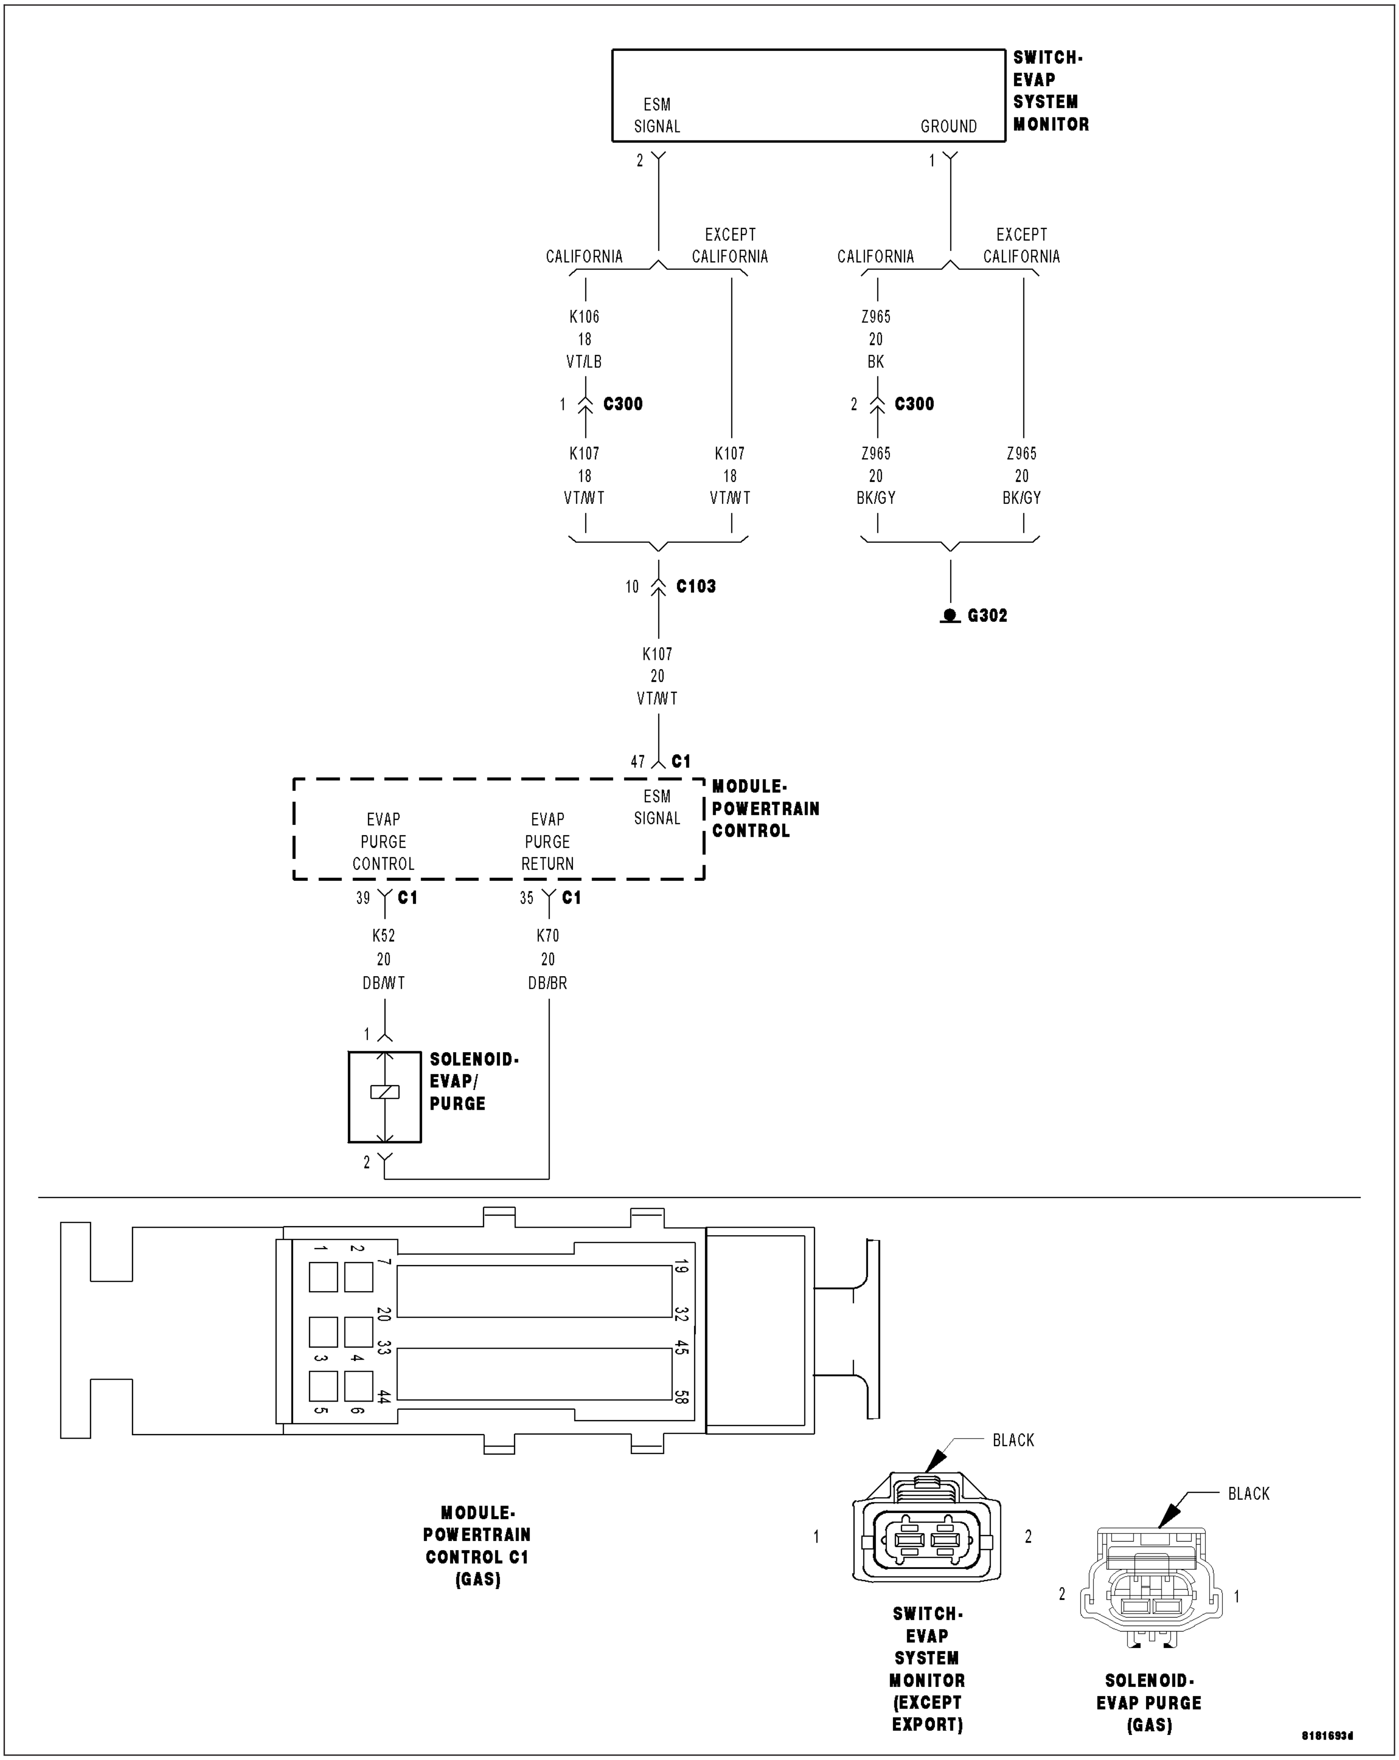
Check the exhaust for excessive smoke caused by an internal problem in the engine.

Is an engine mechanical condition present?

Yes >> Repair the engine mechanical condition as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. UPSTREAM O2 SENSOR



A new downstream O2 Sensor along with an aging upstream O2 Sensor may cause the DTC to set.
Review the vehicle repair history.

Has the downstream O2 Sensor been replaced without replacing the upstream O2 Sensor?

Yes >> Replace the upstream O2 Sensor as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Catalytic Converter.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0440-GENERAL EVAP SYSTEM FAILURE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running after a cold start, with the difference between ECT and AAT is less than 10° C (18 °F), fuel level between 12% and 88%, manifold vacuum greater than a minimum value, ambient temperature between 4° C and 37° C (39° F and 89° F) and altitude less than 8500 feet.
- **Set Condition:**
  When monitor conditions are met, the PCM will ramp in purge flow. If the PCM does not sense an ESM switch closure after a calculated amount of purge flow accumulation, an error is detected. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
INTERMITTENT DTC
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP SYSTEM LEAK
EVAP PURGE HOSE/TUBE OBSTRUCTION
(Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K107) ESM SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
EVAP PURGE SOLENOID
EVAP SYSTEM MONITOR SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EVAP SYSTEM PRETEST

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the Freeze Frame data if any DTCs are present.

Review the vehicle repair history for items related to the current condition.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any related technical service bulletins (TSBs) and, if any apply, follow the recommended procedure.

Select the appropriate response from the list below:

A technical service bulletin (TSB) repaired the condition.
Test complete.

A DTC is present, no TSBs apply, or the TSB did not repair the condition.
Go to 2

2. DTC IS ACTIVE

NOTE: Allow the vehicle to cool to ambient temperature before continuing with this procedure.

NOTE: A loose gas cap may have caused this DTC to set. Make sure gas cap is tight and in good condition. Make sure the gas cap meets OEM specifications.

Start the engine.

Allow the engine to idle.

Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. EVAP SYSTEM INSPECTION

Inspect the EVAP System for any of the following conditions:

- Holes or cracks
- Loose seal points
- Damaged or missing components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Cap
- Damaged or missing Fuel Cap seal
- Improper installation of the Fuel Cap
- Damaged Locking tabs on the Fuel Cap and/or filler tube
- Damaged seal points on the Fuel Cap and/or filler tube

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. INSUFFICIENT VACUUM SUPPLY TO THE EVAP PURGE SOLENOID

Inspect the Evap Purge Solenoid vacuum supply hose for proper routing and installation.

Make sure the vacuum supply hose between the throttle body or intake manifold and the EVAP Purge Solenoid is free from any obstructions or blockage.

Make sure the vacuum port at the throttle body or intake manifold is free from any obstructions or blockage.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. EVAP PURGE SOLENOID

NOTE: After disconnecting the Evap Purge vacuum connections, inspect the lines and solenoid for signs of contamination.

Using a hand vacuum pump, apply 10 in Hg to the ″CAN″ side of the EVAP Purge Solenoid.

NOTE: The solenoid should hold vacuum for a minimum of 15 seconds.

Turn the ignition on.

With the scan tool, actuate the EVAP Purge Solenoid to the ON position.

NOTE: The vacuum should drop when the solenoid is actuated.

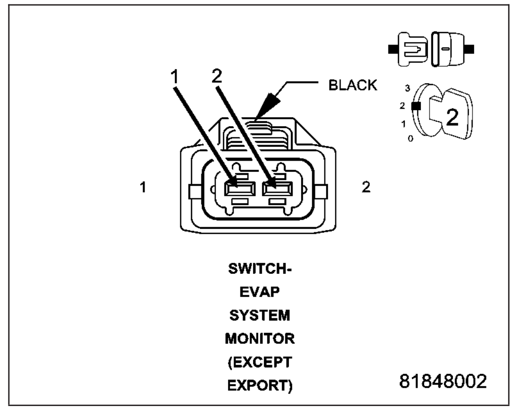
Does the solenoid function as described above?

Yes >> Go to 6

No >> Replace the EVAP Purge Solenoid.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. ESIM SWITCH STATE

Turn the ignition off.



Disconnect the Evap System Monitor Switch harness connector.

Turn the ignition on.

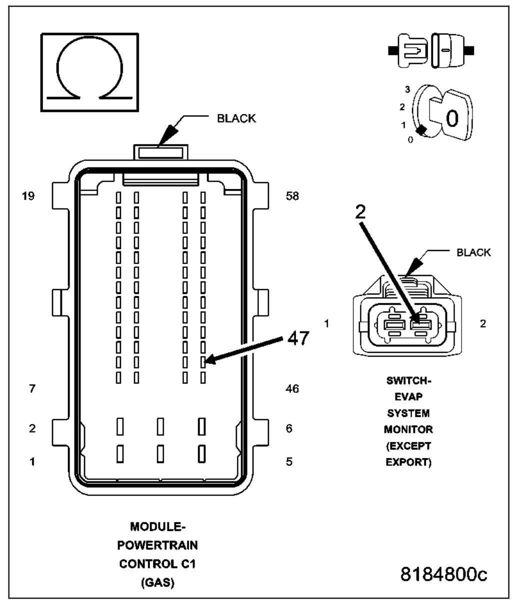
Monitor the ESIM Switch state on the scan tool.

Carefully connect a jumper wire between the (K107) ESM Signal circuit and the (Z965) Ground circuit in the Evap System Monitor Switch harness connector.

Monitor the ESIM Switch state on the scan tool.

Does the Switch change from OPEN to CLOSED with the jumper in place?

Yes >> Go to 9



No >> Go to 7

7. (K107) ESM SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

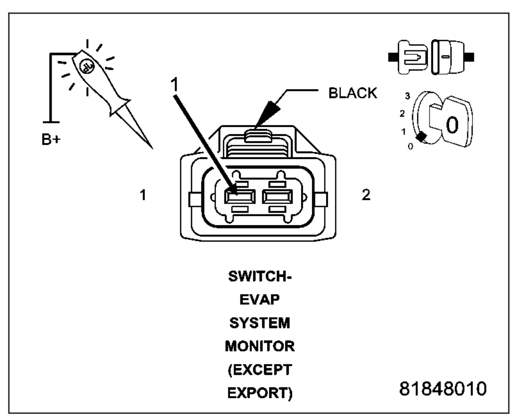
Turn the ignition off.

Disconnect the PCM harness connectors.

Measure the resistance of the (K107) ESM Signal circuit between the Evap System Monitor Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 8



No >> Repair the (K107) ESM Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Using a 12 volt test light connected to 12 volts, check the (Z965) Ground circuit in the Evap System Monitor Switch harness connector.

NOTE: The test light should be illuminate and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 13

No >> Repair the (Z965) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. VERIFY EVAPORATIVE EMISSION LEAK

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

To continue testing you will need Miller Tool #8404 Evaporative Emission Leak Detector (EELD).

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the Evap system.

Connect the red power lead of EELD to the battery positive terminal and the black ground lead to battery negative terminal.

Block the vent hose of the EVAP Canister.

Connect shop air to the EELD.

Set the smoke/air control switch to AIR.

Insert the tester's AIR supply tip (clear hose) into the .040 orifice on the tester's control panel.

Press the remote smoke/air start button.

Position the red flag on the air flow meter so it is aligned with the indicator ball.

When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute.

Install the service port adapter #8404-14 on the vehicle's service port (if equipped) or install the #8404-ADP into the filter line.

Connect the Air supply hose from the EELD to the service port (if equipped) or to the #8404-ADP adapter.

Press the remote button to activate AIR flow.

Compare the flow meter indicator ball reading to the red flag.

ABOVE the red flag indicates that a leak is present.

BELOW the red flag indicates that the system is sealed.

Does the flow meter indicate that a leak is present?

Yes >> Go to 10

No >> Go to 11

10. EVAPORATIVE EMISSION LEAK DETECTION

NOTE: A thorough visual inspection of the Evap system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

Remove the Air supply hose from the service port or the #8404-ADP adapter.

Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the #8404-ADP adapter.

Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move at this point.

Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.

If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultra-violet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that are left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow when viewed with a UV light.

NOTE: The EVAP System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in the specific zones. For further assistance see the Zone Identification Charts below.

- — ZONE 1—

1 Fuel Cap

2 Recirculation Check Valve.

3 Vapor Recirculation Line.

4 Signal Vapor Line for FVM.

5 Flow Management Valve.

6 Fuel Tank to Canister Vapor Line.

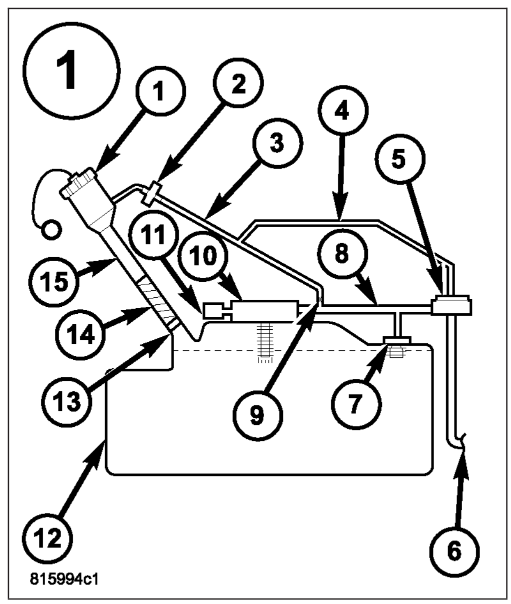
7 Fuel Tank Vent (Check Valve).

8 Vapor Line to Canister.

9 Flow Control Orifice.

10 Control Valve.

11 Liquid Trap.



12 Fuel Tank.

13 Check valve.

14 Fuel Fill Tube to Tank connector.

15 Fuel Fill Tube

Damaged or disconnected components.

- — ZONE 2 —

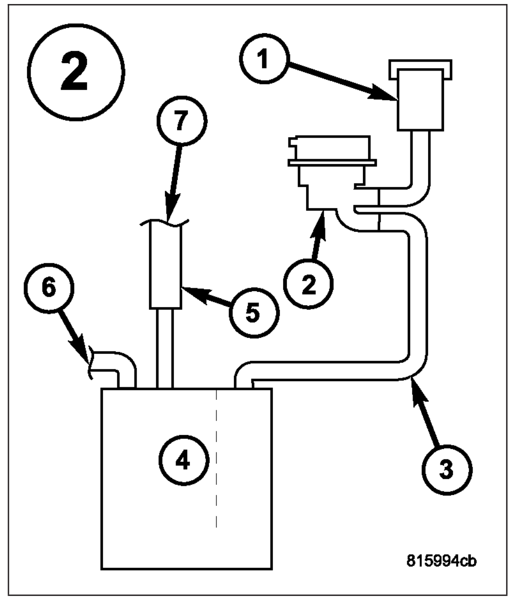
1 Filter.

2 ESM.

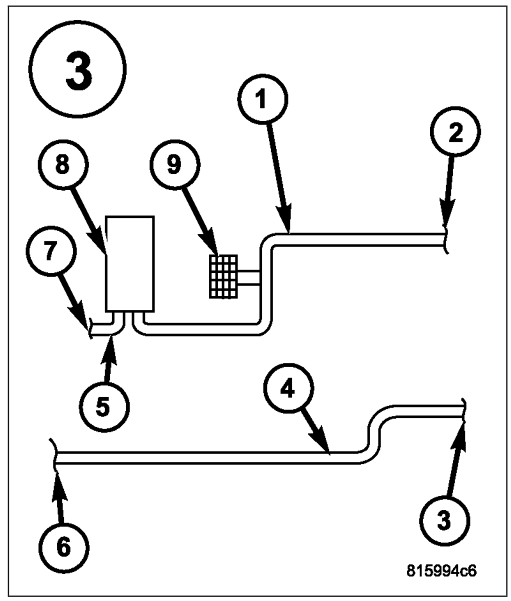
3 Canister Vent Line.

4 Evap Canister.

5 Chassis Purge Valve.



6 Fuel Tank to Canister Vapor Line connection.



7 Evap Purge connection.

- — ZONE 3 —

1 Evap Purge Vacuum Line.

2 Connection to Chassis Line.
3 Connection to Canister.
4 Chassis Purge Line.
5 Evap Purge Vacuum Line.
6 Connection to Evap Purge Harness.
7 Chassis Evap Purge Line connection to Engine Vacuum.
8 Evap Purge Valve.
9 Service Port.

NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke or dye may or may not be visible. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Was a leak found?

Yes >> Repair or replace the leaking component as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 11

11. EVAP PURGE HOSE/TUBE OBSTRUCTION

Inspect the Evap Purge hose/tube for proper routing and installation between the EVAP Purge Solenoid and the Fuel Tank and between the Fuel Tank and the Evap Purge Canister.

Make sure the hose/tube is not damaged or kinked and is free from any obstructions or blockage.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 12

12. EVAP SYSTEM MONITOR SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap System Monitor Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

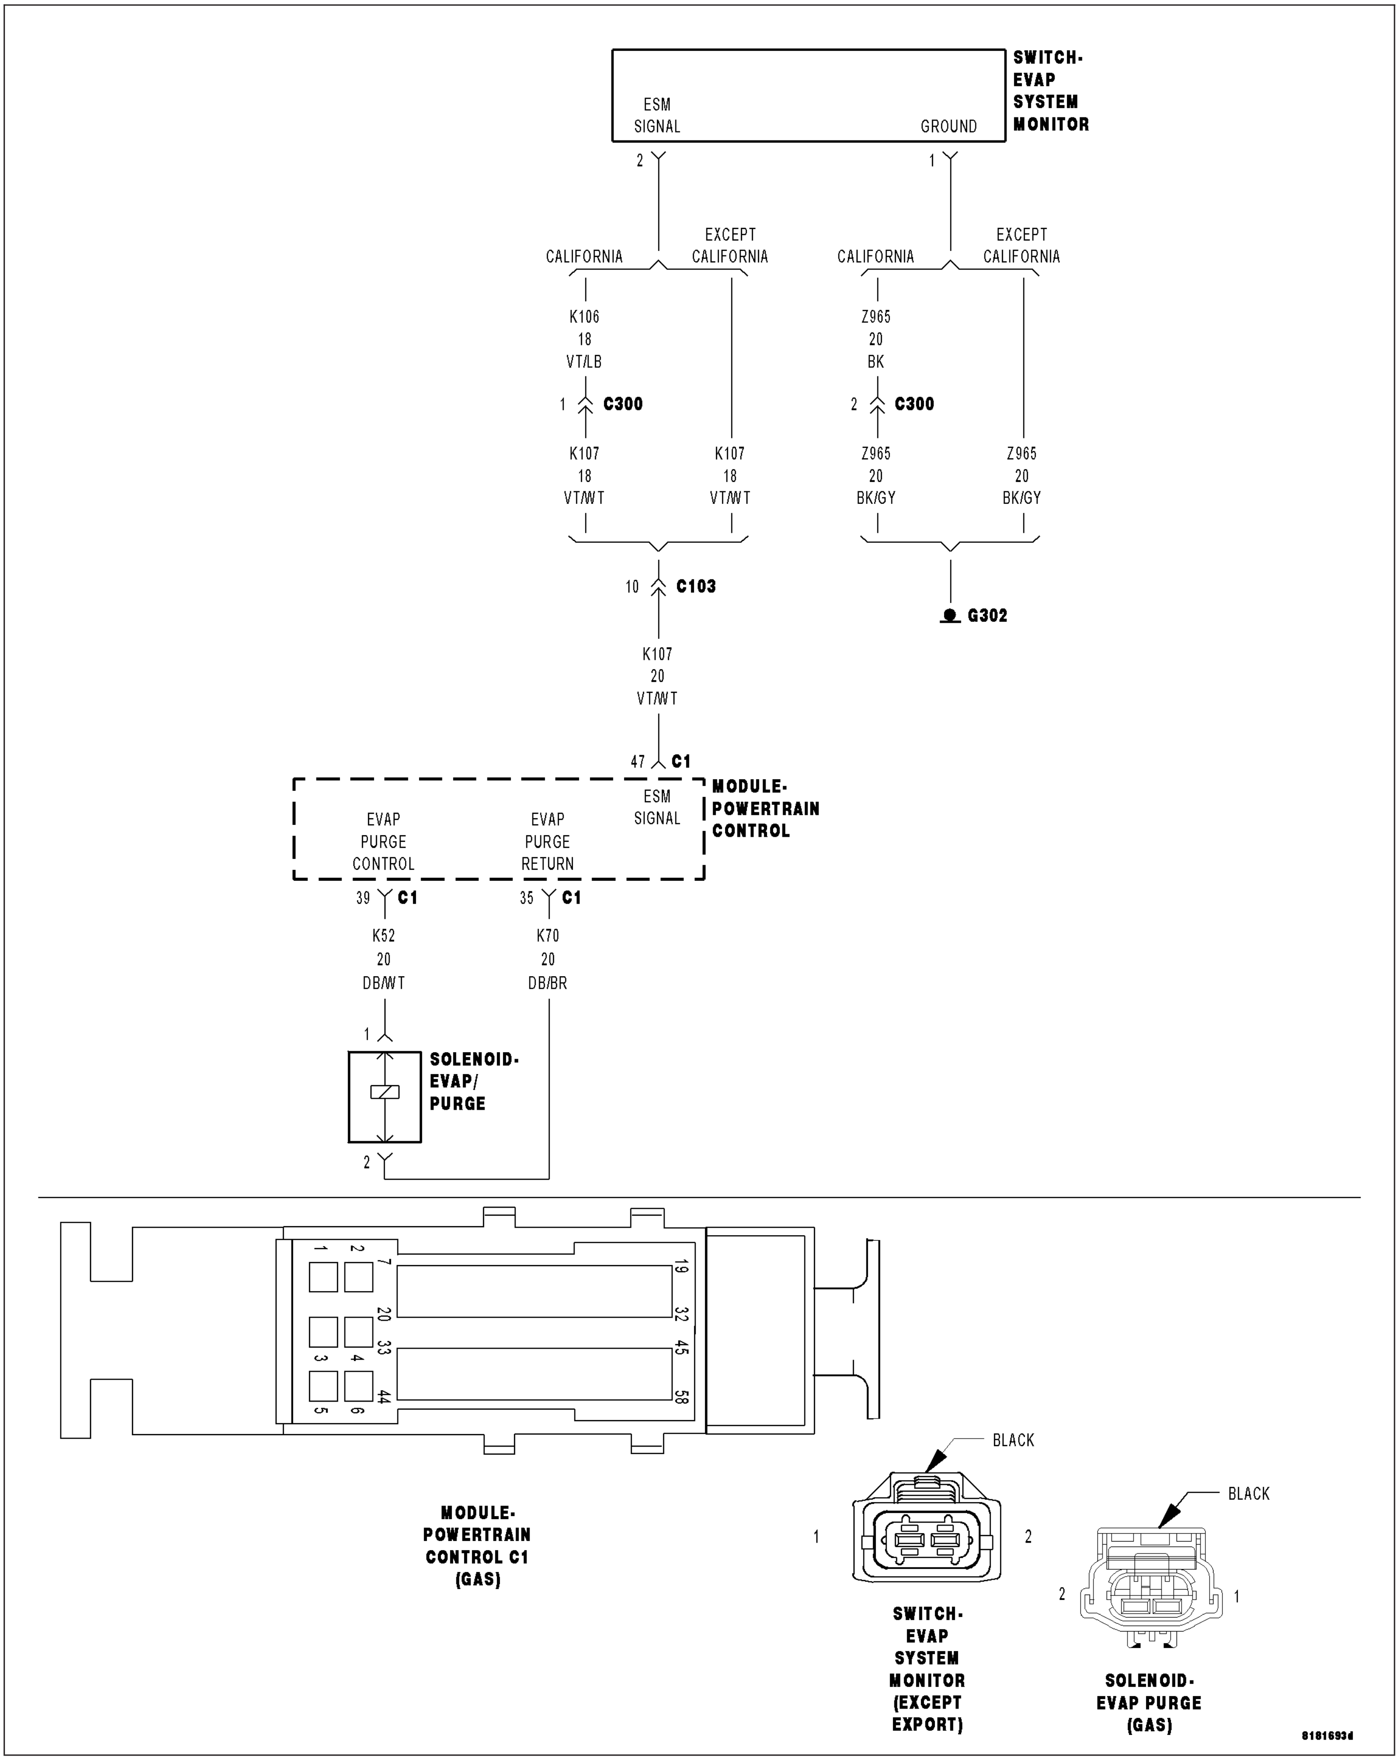
No >> Replace the Evap System Monitor Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap System Monitor Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0441-EVAP PURGE SYSTEM PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The Evap Purge Monitor tests the integrity of the hoses/tube between the throttle body/intake and the fuel tank. The monitor is a two stage test and runs only after the Evap system passes the small leak test. Stage one is non-intrusive. The PCM monitors the purge vapor ratio and the ESM switch closed ratio. If the purge vapor ratio is above a calculated value, the monitor passes. If the ESM switch closed ratio is greater than calculated value when purge flow is greater than a minimum value, the monitor passes. Stage two is an intrusive test and runs only if stage one does not pass. The PCM commands the purge solenoid to flow at a specified rate to force the purge vapor ratio to update. The ratio is compared to a calibrated specification. If it is less than specified, a one trip failure is recorded. This test can detect if the purge hose is off, obstructed, or the purge valve is not operational.

- **When Monitored:**
  With the engine running, after the Evap System small leak test has passed.
- **Set Condition:**
  If the PCM detects that the purge vapor ratio and the ESM switch closed ratio are below a calculated value, the PCM commands the purge solenoid to flow at a specified rate to update the purge vapor ratio. If the ratio remains below a specified value, a one trip failure is recorded. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
INTERMITTENT DTC
EVAP PURGE SOLENOID VACUUM SUPPLY
EVAP PURGE HOSE/TUBE OBSTRUCTION
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EVAP SYSTEM PRETEST

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the Freeze Frame data if any DTCs are present.

Review the vehicle repair history for items related to the current condition.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any related technical service bulletins (TSBs) and, if any apply, follow the recommended procedure.

Select the appropriate response from the list below:

A technical service bulletin (TSB) repaired the condition.
Test complete.

A DTC is present, no TSBs apply, or the TSB did not repair the condition.
Go to 2

2. DTC IS ACTIVE

NOTE: If P0443 is set along with this DTC, perform the diagnostic procedure for P0443 before continuing with this test.

Start the engine.

Allow the engine to idle.

Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.

With a scan tool, select View DTCs.

NOTE: If any other DTC sets, active or pending, perform the diagnostic procedure for that DTC before proceeding with this test.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. EVAP SYSTEM INSPECTION

Inspect the EVAP System for any of the following conditions:

- Holes or cracks
- Loose seal points
- Damaged or missing components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Cap
- Damaged or missing Fuel Cap seal
- Improper installation of the Fuel Cap
- Damaged Locking tabs on the Fuel Cap and/or filler tube
- Damaged seal points on the Fuel Cap and/or filler tube

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. INSUFFICIENT VACUUM SUPPLY TO THE EVAP PURGE SOLENOID

Inspect the Evap Purge Solenoid vacuum supply hose for proper routing and installation.

Make sure the vacuum supply hose between the throttle body or intake manifold and the EVAP Purge Solenoid is free from any obstructions or blockage.

Make sure the vacuum port at the throttle body or intake manifold is free from any obstructions or blockage.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. EVAP PURGE HOSE/TUBE OBSTRUCTION

Inspect the Evap Purge hose/tube for proper routing and installation between the EVAP Purge Solenoid and the Fuel Tank and between the Fuel Tank and the Evap Purge Canister.

Make sure the hose/tube is not damaged or kinked and is free from any obstructions or blockage.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. EVAP PURGE SOLENOID

NOTE: After disconnecting the Evap Purge Solenoid vacuum connections, inspect the lines and solenoid for signs of contamination.

Using a hand vacuum pump, apply 10 in Hg to the ″CAN″ side of the EVAP Purge Solenoid.

NOTE: The solenoid should hold vacuum for a minimum of 15 seconds.

Turn the ignition on.

With the scan tool, actuate the EVAP Purge Solenoid to the ON position.

NOTE: The vacuum should drop when the solenoid is actuated.

Does the solenoid function as described above?

Yes >> Go to 7

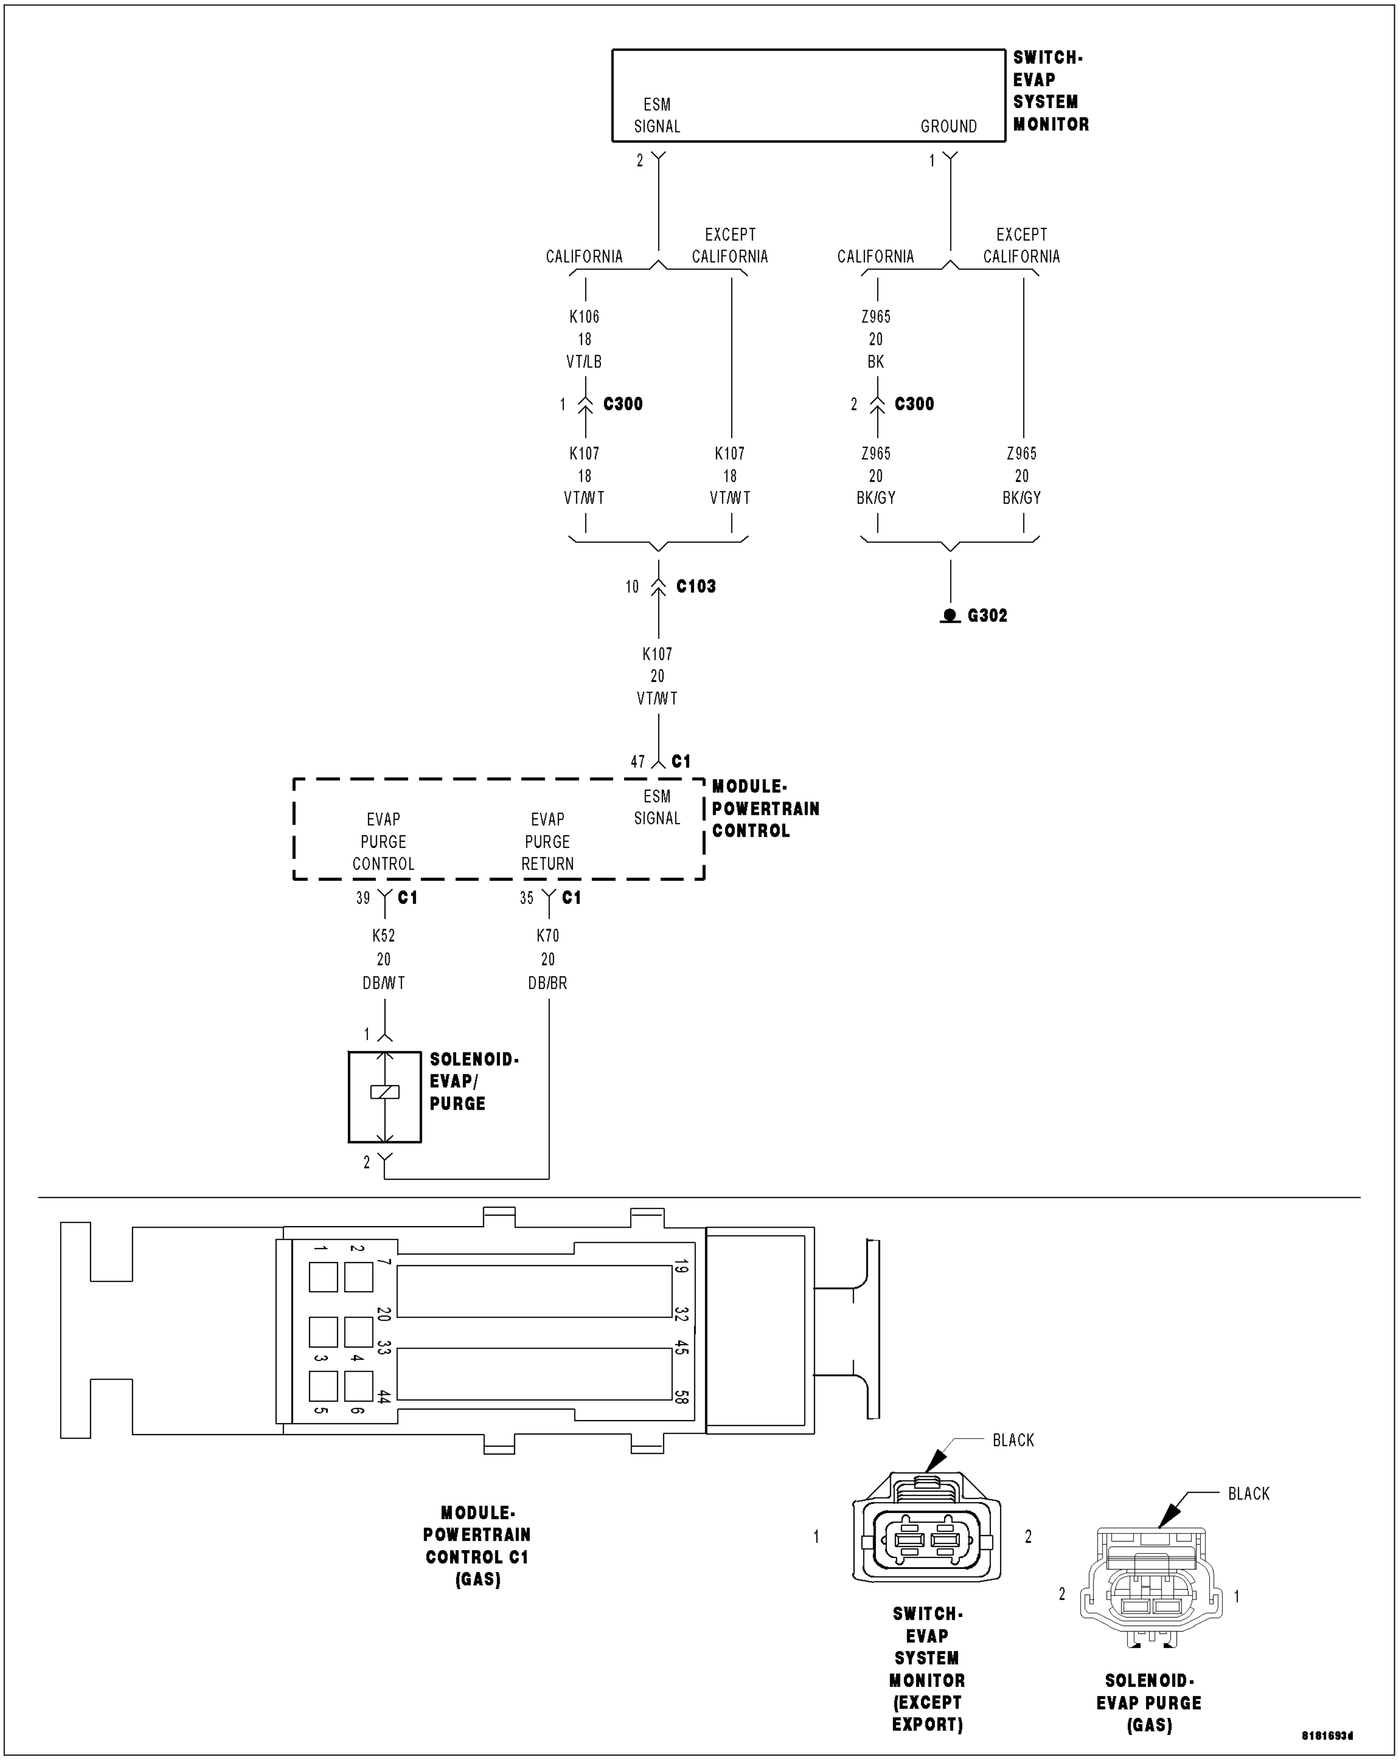
No >> Replace the EVAP Purge Solenoid.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EVAP Purge Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0443-EVAP PURGE SOLENOID CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the actual state of the Evap Purge Solenoid does not match the intended state.

Possible Causes
INTERMITTENT DTC
(K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K70) EVAP PURGE RETURN CIRCUIT SHORTED TO VOLTAGE
(K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND
(K70) EVAP PURGE RETURN CIRCUIT OPEN OR HIGH RESISTANCE
(K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

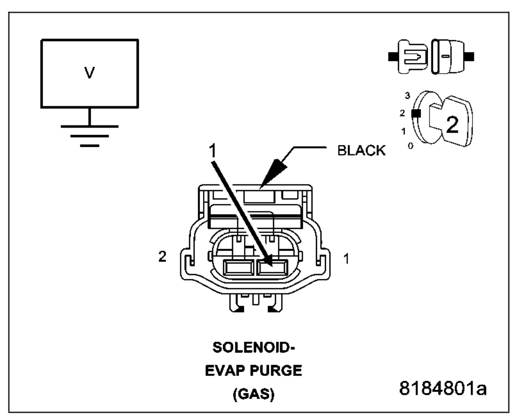
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO VOLTAGE



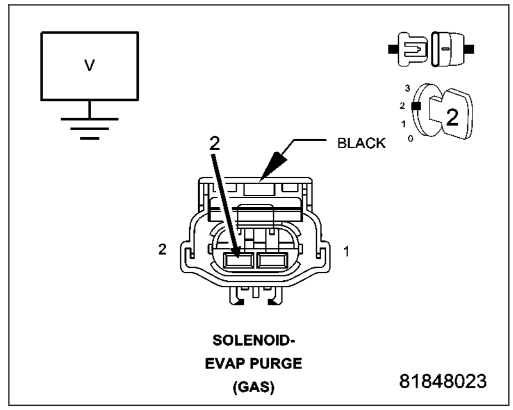
Turn the ignition off.

Disconnect the Evap Purge Solenoid connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.



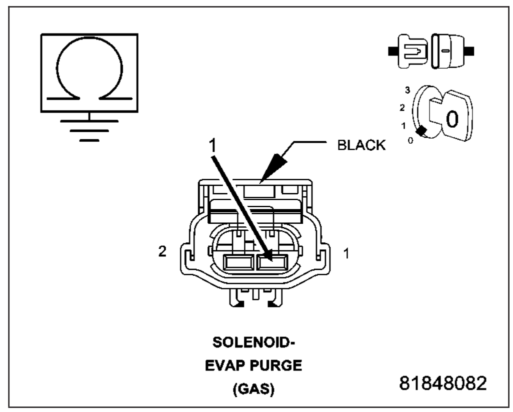
Is there any voltage present?

Yes >> Repair the (K52) Evap Purge Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K70) EVAP PURGE RETURN CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K70) Evap Purge Return circuit in the Evap Purge Solenoid harness connector.



Is there any voltage present?

Yes >> Repair the (K70) Evap Purge Return circuit for a short to voltage.

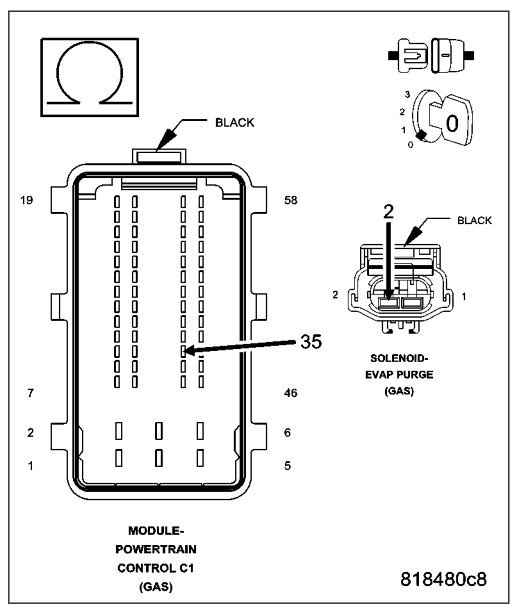
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K52) Evap Purge Control circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

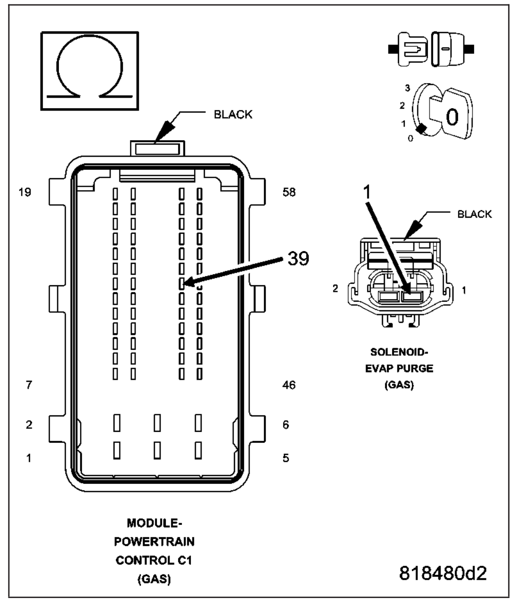
No >> Go to 5

5. (K70) EVAP PURGE RETURN CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to 12 volts, check the (K70) Evap Purge Return circuit in the Evap Purge Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 6

No >> Repair the (K70) Evap Purge Return circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

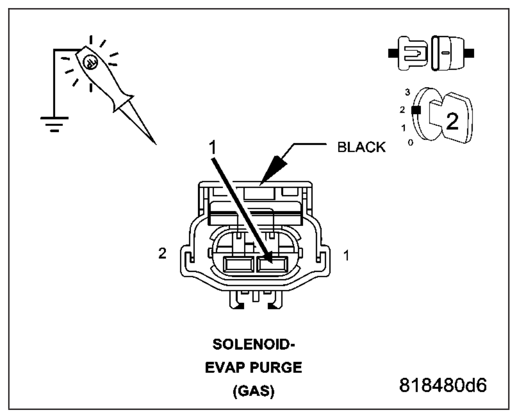
6. (K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K52) Evap Purge Control circuit between the Evap Purge Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (K52) Evap Purge Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. EVAP PURGE SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Evap Purge Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Replace the Evap Purge Solenoid in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

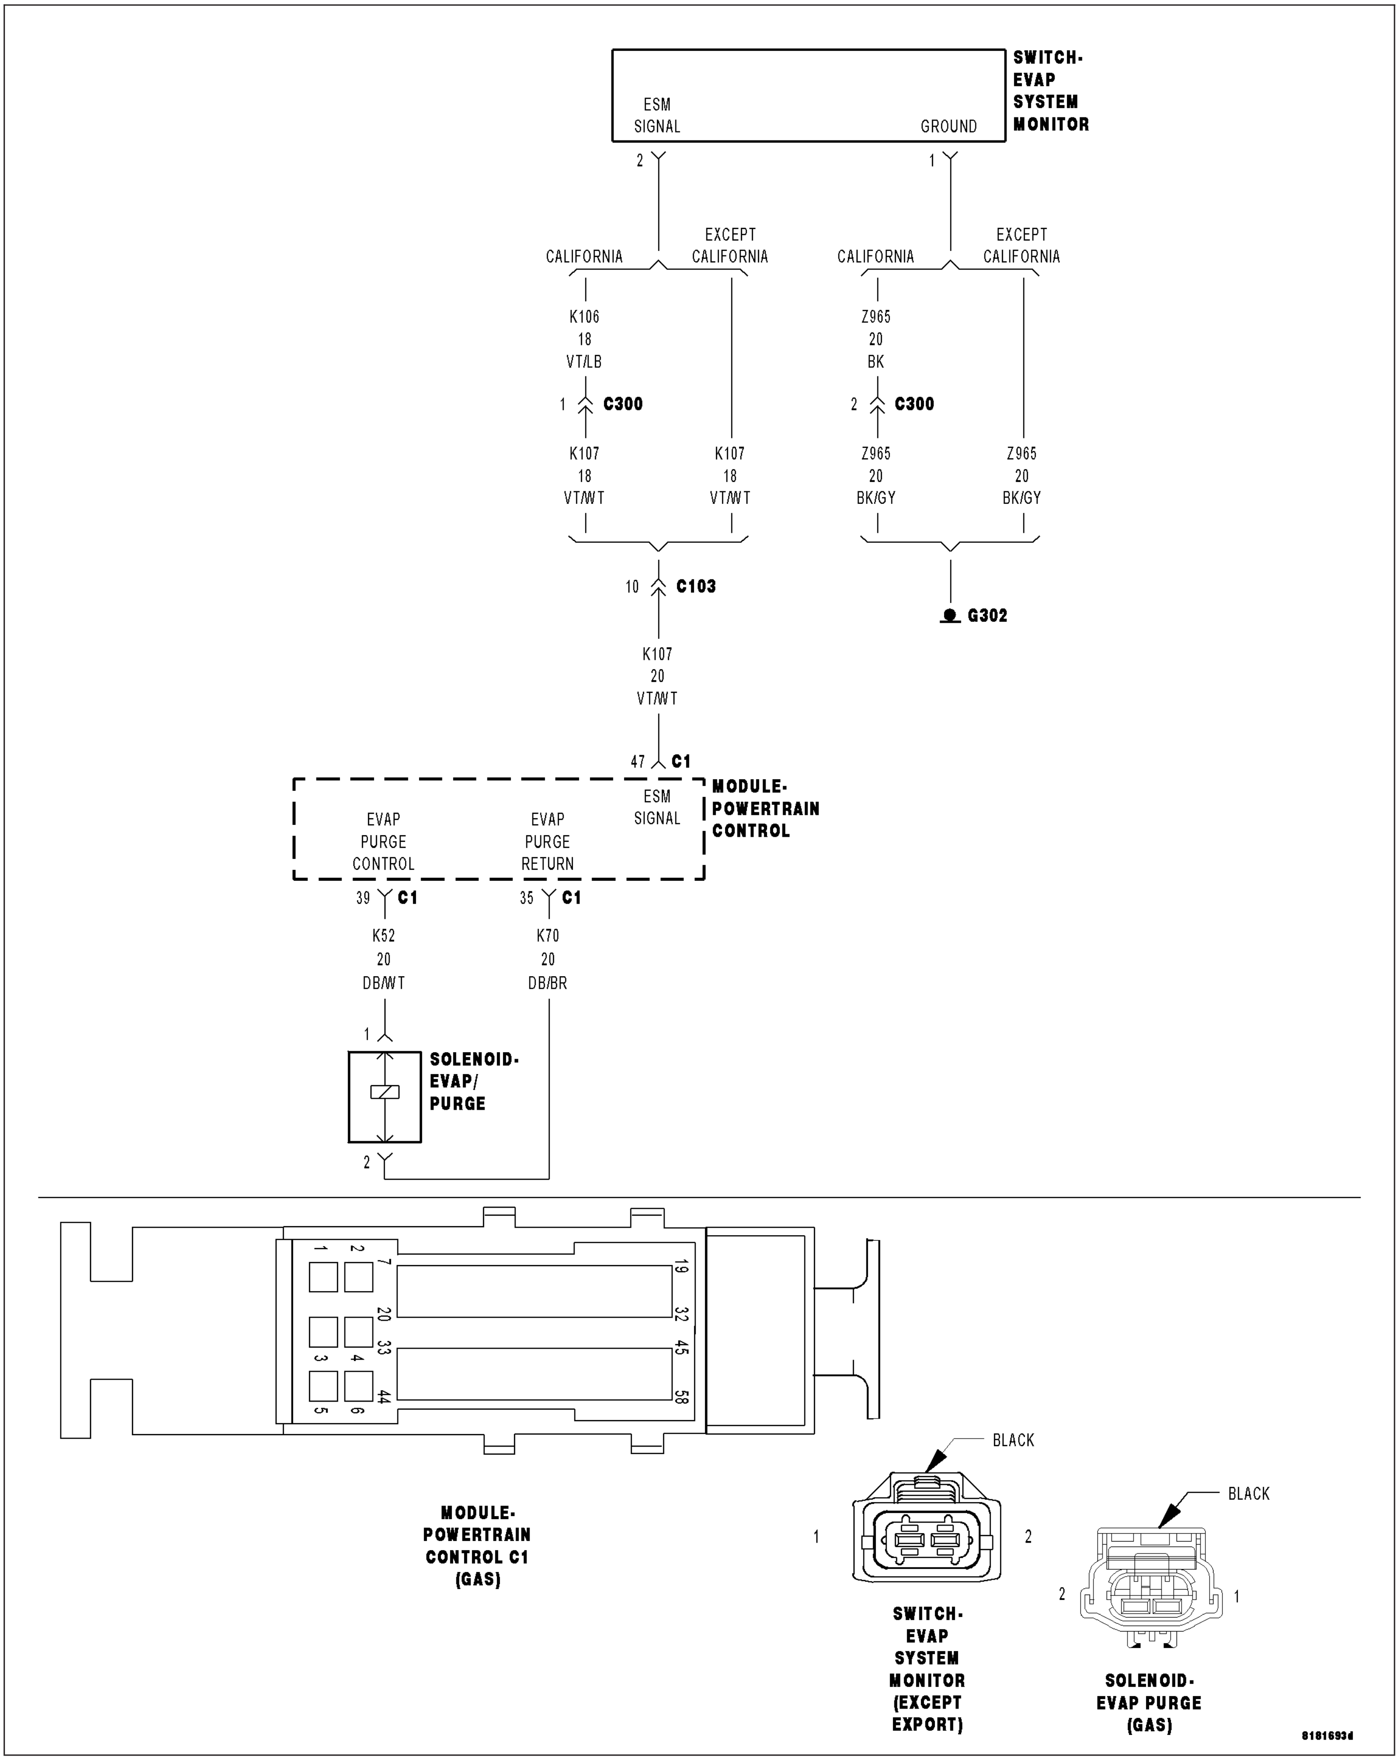
No >> Go to 8

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0444-EVAP PURGE SOLENOID CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the actual state of the Evap Purge Solenoid does not match the intended state.

Possible Causes
INTERMITTENT DTC
(K70) EVAP PURGE RETURN CIRCUIT OPEN OR HIGH RESISTANCE
(K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

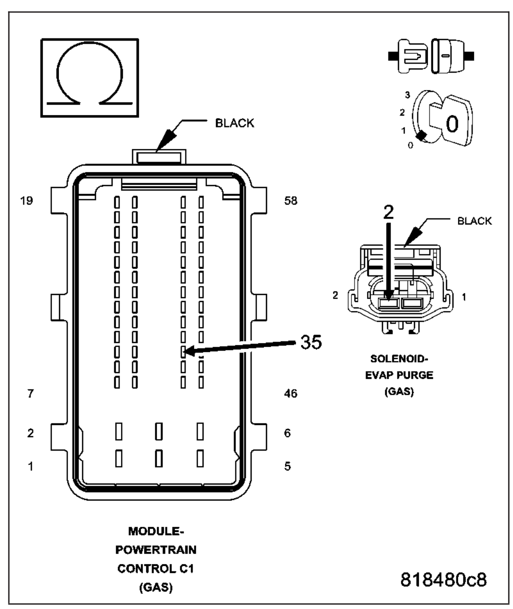
2. (K70) EVAP PURGE RETURN CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Evap Purge Solenoid connector.

Turn the ignition on.

Using a 12 volt test light connected to 12 volts, check the (K70) Evap Purge Return circuit in the Evap Purge Solenoid harness connector.



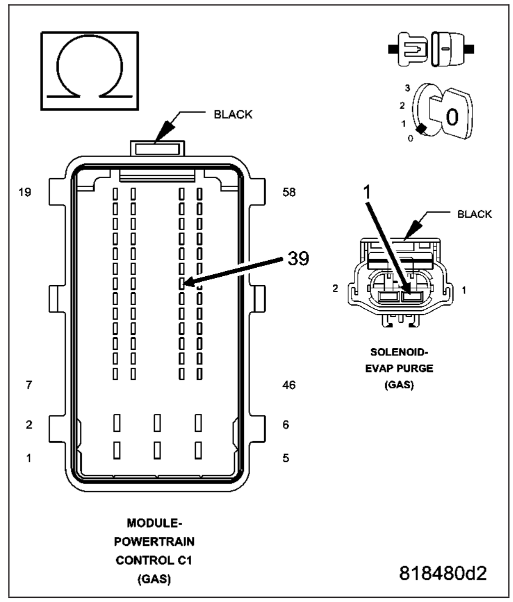
NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (K70) Evap Purge Return circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



3. (K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

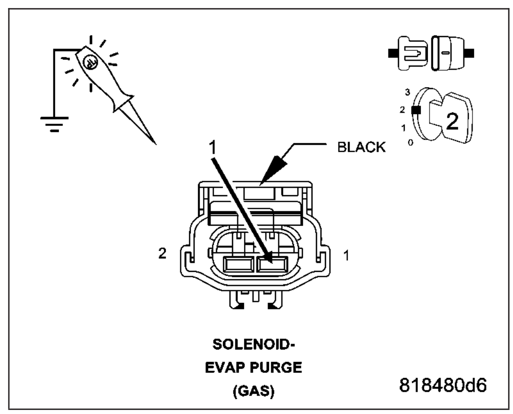
Measure the resistance of the (K52) Evap Purge Control circuit between the Evap Purge Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (K52) Evap Purge Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



4. EVAP PURGE SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Evap Purge Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Replace the Evap Purge Solenoid in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

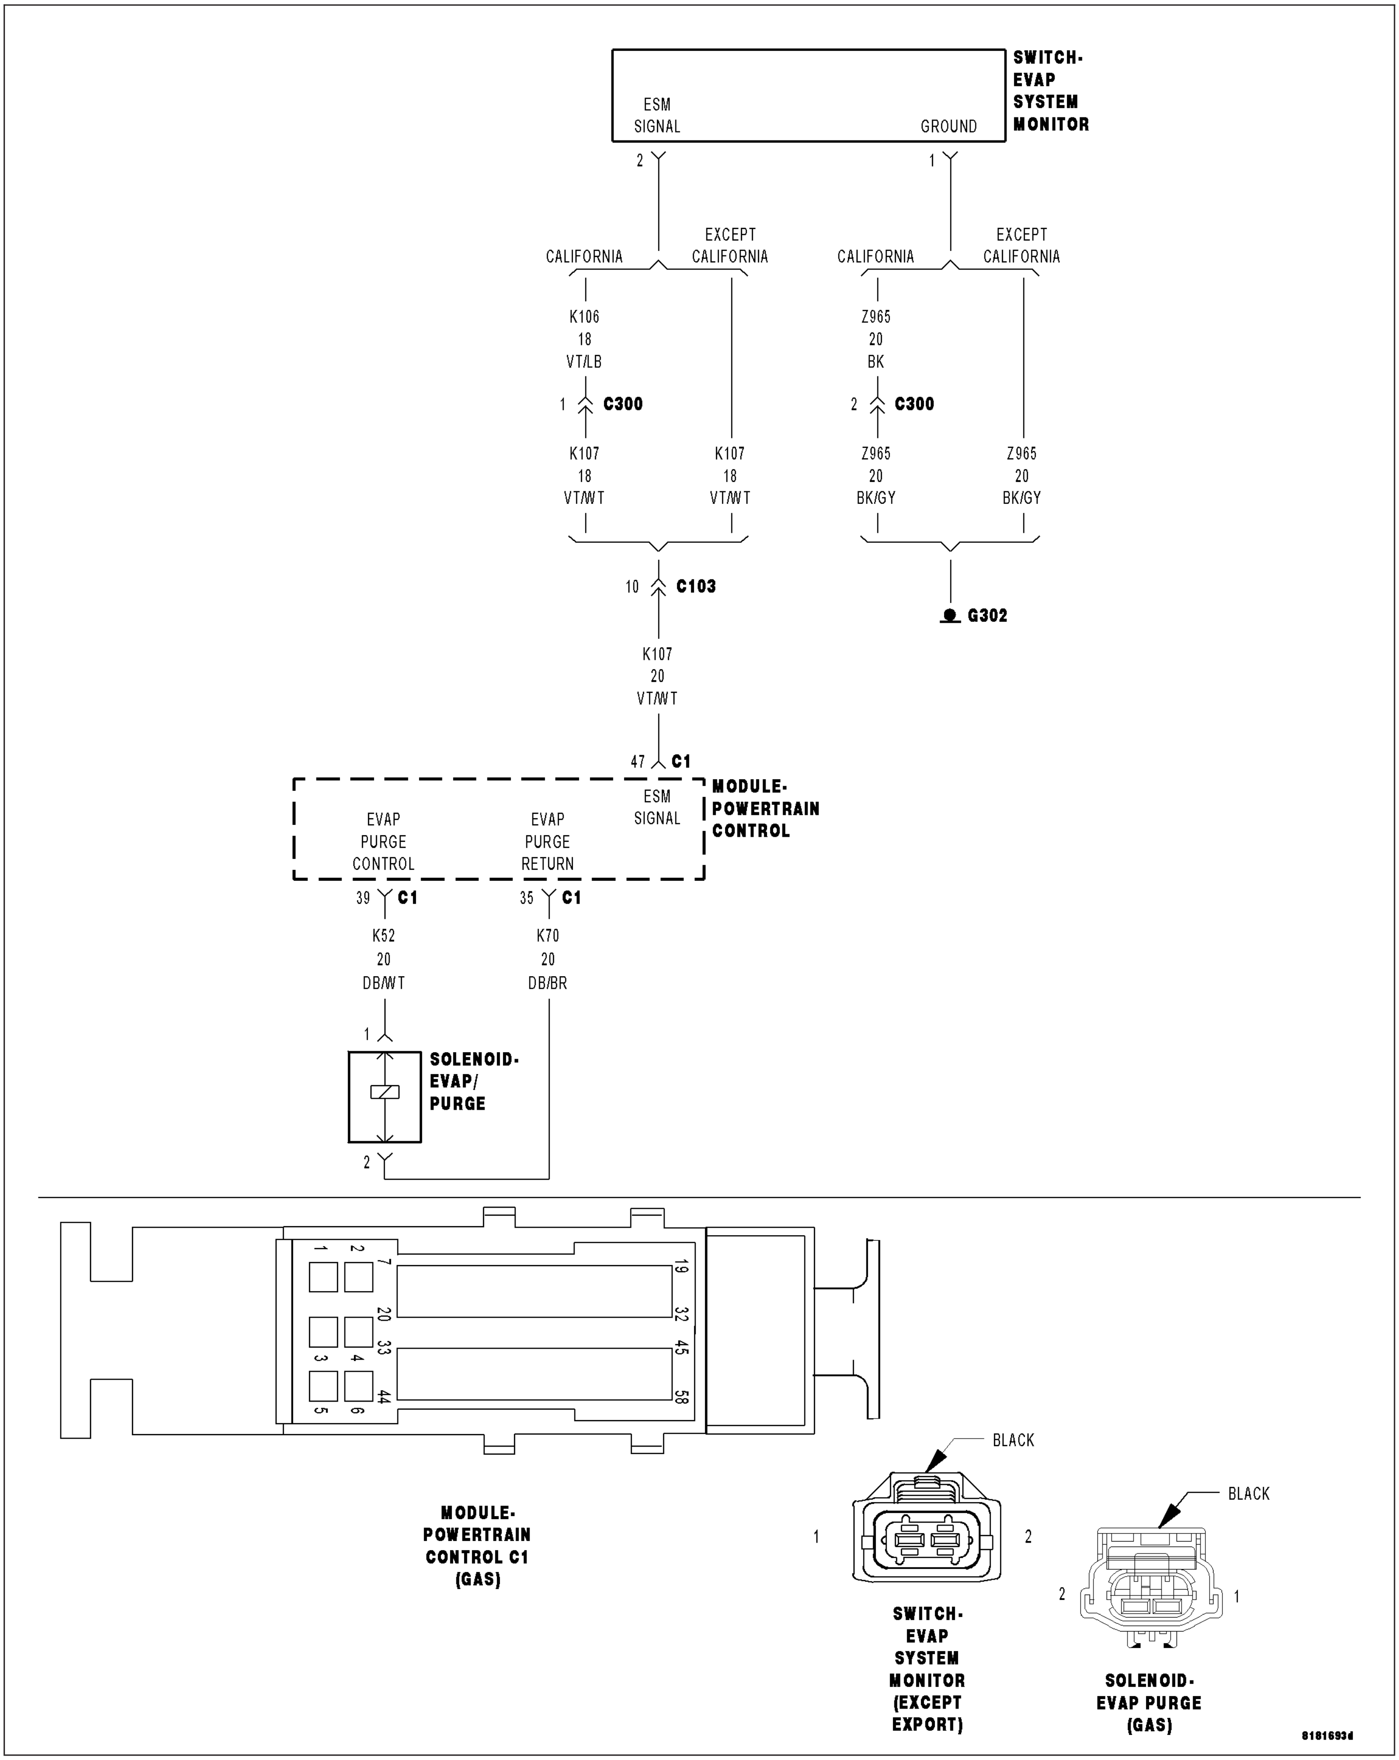
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0452-EVAP PRESSURE SWITCH STUCK CLOSED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Immediately after key off.
- **Set Condition:**
  At key off, the PCM energizes the Purge Solenoid for a calibrated amount of time (30 seconds maximum) and stores the state of the ESIM switch. The state is evaluated again at the next key on. If the PCM does not detect that the ESIM switch is open, an error is detected. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
INTERMITTENT DTC
EVAP PURGE HOSE/TUBE OBSTRUCTION
(K107) ESIM SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
(K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND
ESM SWITCH
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EVAP SYSTEM PRETEST

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the Freeze Frame data if any DTC(s) are present.

Review the vehicle repair history for items related to the current condition.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any related technical service bulletins (TSBs) and, if any apply, follow the recommended procedure.

Select the appropriate response from the list below:

A technical service bulletin (TSB) repaired the condition.
Test complete.

A DTC is present, no TSBs apply, or the TSB did not repair the condition.
Go to 2

2. DTC IS ACTIVE

Ignition on, engine not running.

With a scan tool, select Data Display and view the ESIM Switch state.

Is the ESIM Switch state ’Closed’?

Yes >> Go to 3

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. ESIM SWITCH STATE

With a scan tool, select Data Display and view the ESIM Switch state.

Disconnect the purge hose from the EVAP canister.

Is the ESIM Switch state change from ’Closed’ to ’Open’ when the purge hose was disconnected?

Yes >> Go to 4

No >> Go to 7

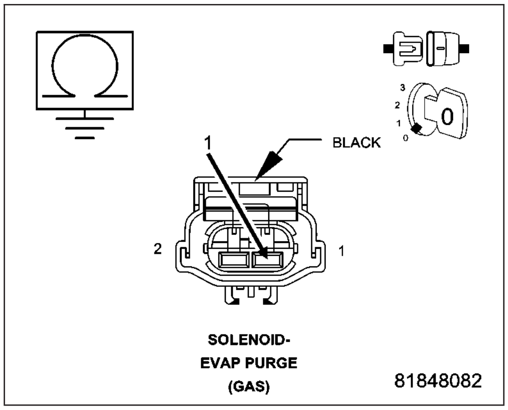
4. EVAP PURGE HOSE/TUBE OBSTRUCTION

Inspect the Evap Purge hose/tube for proper routing and installation between the EVAP Purge Solenoid and the Fuel Tank and between the Fuel Tank and the Evap Purge Canister.

Make sure the hose/tube is not damaged or kinked and is free from any obstructions or blockage.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



No >> Go to 5

5. (K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the PCM harness connector.

Measure the resistance between ground and the (K52) Evap Purge Control circuit in the EVAP Purge Solenoid harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (K52) Evap Purge Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. EVAP PURGE SOLENOID

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Evap Purge Solenoid in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

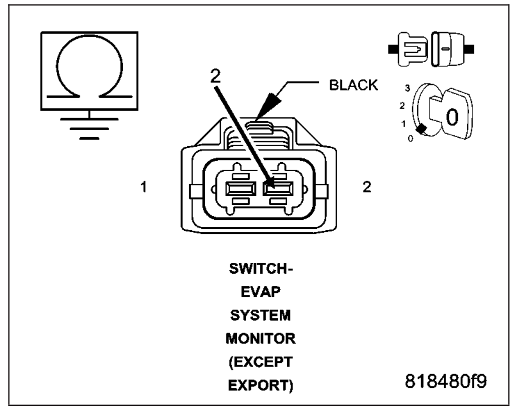
7. ESIM ASSEMBLY

With a scan tool, select Data Display and view the ESIM Switch state.

Disconnect the Evap System Monitor Switch electrical connector.

Does the ESIM Switch state change from CLOSED to OPEN when the switch is disconnected?

Yes >> Replace the ESIM Assembly.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



No >> Go to 8

8. (K107) SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the PCM harness connector.

Measure the resistance between ground and the (K107) ESIM Switch Signal circuit in the ESIM Assembly harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K107) ESIM Switch Signal circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the Powertrain Control Module (PCM) and between the Evap System Monitor Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0455-EVAP SYSTEM LARGE LEAK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running, during a cold start test with the fuel level above 12%, ambient temperature between 4° C and 32° C (39° F and 89° F) and the fuel system in closed loop. The test runs when the small leak test is maturing.
- **Set Condition:**
  The PCM activates the EVAP Purge Solenoid to pull the EVAP system into a vacuum to close the ESM switch. Once the ESM switch is closed, the PCM turns the EVAP Purge solenoid off to seal the EVAP system. If the ESM switch reopens before the calibrated amount of time, a large leak error is detected. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
EVAP SYSTEM LEAK
EVAP PURGE SOLENOID
EVAP SYSTEM MONITOR SWITCH

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EVAP SYSTEM PRETEST

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the Freeze Frame data if any DTC(s) are present.

Review the vehicle repair history for items related to the current condition.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any related technical service bulletins (TSBs) and, if any apply, follow the recommended procedure.

Select the appropriate response from the list below:

A technical service bulletin (TSB) repaired the condition.
Test complete.

A DTC is present, no TSBs apply, or the TSB did not repair the condition.
Go to 2

2. DTC IS ACTIVE

NOTE: Allow the vehicle to cool to ambient temperature before continuing with this procedure.

NOTE: A loose gas cap may have caused this DTC to set. Make sure gas cap is tight and in good condition. Make sure the gas cap meets OEM specifications.

Start the engine.

Allow the engine to idle.

Using the scan tool, perform the ESIM FORCED MONITOR TEST. Allow the test to complete.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. EVAPORATIVE SYSTEM INSPECTION

Check for the follow conditions:

- Holes or cracks
- Loose seal points
- Evidence of damaged components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Filler Cap
- Improper installation of the Fuel Fill Cap
- Damaged Locking tabs on Cap and/or fill tube
- Damaged seal points on Cap and/or fill tube
- Fuel cap gasket seal

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. EVAPORATIVE SYSTEM LEAKING

To continue testing you will need Miller Tool #8404A Evaporative Emission Leak Detector (EELD).

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to follow these instructions can result in personal injury or death.

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the EVAP system.

Connect the red power lead of the EELD to the battery positive terminal and the black ground lead to battery negative terminal.

Block the vent hose of the canister if using the service port.

Connect shop air to the EELD.

Set the smoke/air control switch to AIR.

Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).

Press the remote smoke/air start button.

Position the red flag on the air flow meter so it is aligned with the indicator ball.

When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute to the size leak indicated by the DTC set in the PCM.

Install the service port adapter #8404-14 on the vehicle's service port and block the vent hose of the EVAP Canister (if equipped) or install the #8404-ADP service adaptor into the filter line.

Connect the Air supply hose from the EELD to the service port (if equipped) or to the #8404-ADP adapter.

Press the remote button to activate AIR flow.

NOTE: Larger volume fuel tanks, lower fuel levels, vehicles equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill.

Compare the flow meter indicator ball reading to the red flag.

ABOVE the red flag indicates a leak present.

BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes >> Go to 5

No >> Refer to the Freeze Frame data recorded in step 1. If the data indicates that the vehicle was in motion when the DTC was set, verify that all hoses are properly connected.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. EVAPORATIVE EMISSION LEAK DETECTION

NOTE: A thorough visual inspection of the EVAP system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

To continue testing, you will need Miller Tool #8404A Evaporative Emissions Leak Detector (EELD).

Remove the Air supply hose from the service port (if equipped) or from the #8404-ADP adapter.

Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the #8404-ADP adapter.

Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move in the smoke mode.

Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.

If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultra-violet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

NOTE: The EVAP System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the Zone Identification Charts below.

- ZONE 1

1 Fuel Cap

2 Recirculation Check Valve.

3 Vapor Recirculation Line.

4 Signal Vapor Line for FVM.

5 Flow Management Valve.

6 Fuel Tank to Canister Vapor Line.

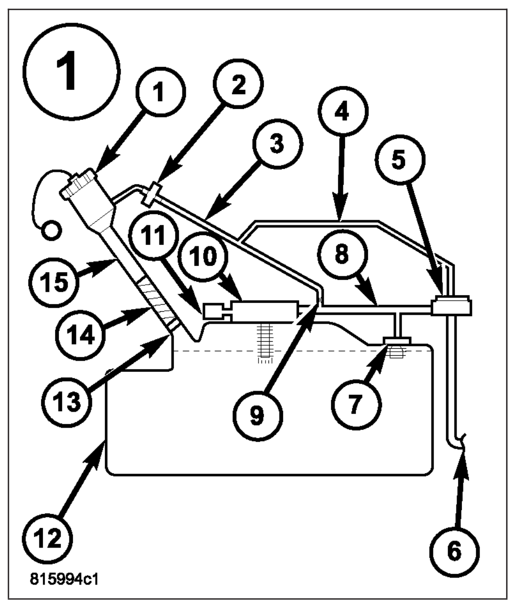
7 Fuel Tank Vent (Check Valve).

8 Vapor Line to Canister.

9 Flow Control Orifice.

10 Control Valve.

11 Liquid Trap.



12 Fuel Tank.

13 Check valve.

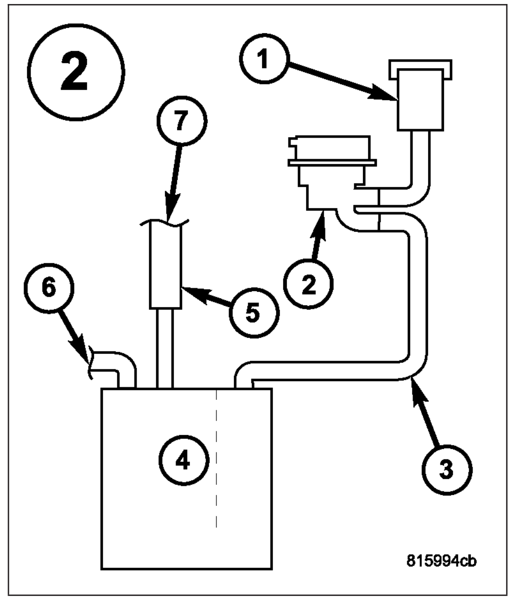
14 Fuel Fill Tube to Tank connector.

15 Fuel Fill Tube

Damaged or disconnected EVAP system components.

- ZONE 2

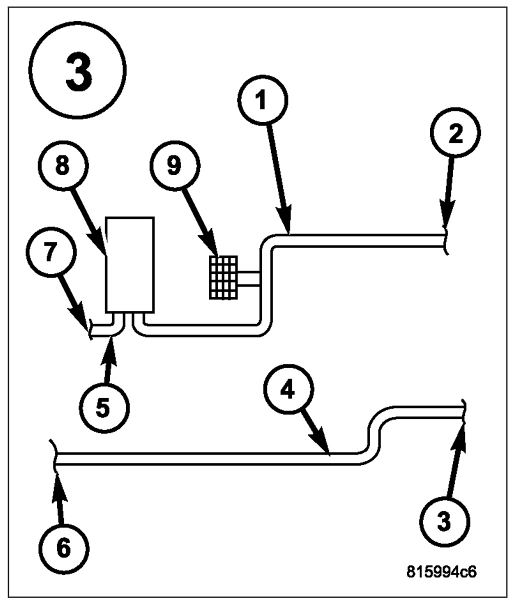
1 Filter.



2 ESM.

3 Canister Vent Line.

4 EVAP Canister.



5 Chassis Purge Valve.

6 Fuel Tank to Canister Vapor Line connection.
7 EVAP Purge connection.

- ZONE 3

1 EVAP Purge Vacuum Line.
2 Connection to Chassis Line.
3 Connection to Canister.
4 Chassis Purge Line.
5 EVAP Purge Vacuum Line.
6 Connection to EVAP Purge Harness.
7 Chassis EVAP Purge Line connection to Engine Vacuum.
8 EVAP Purge Valve.
9 Service Port.

NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke may not be as thick. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found in one or more of the EVAP System zones

Repair or replace the leaking component as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

A leak was found at the gas cap or fuel filler tube

Go to 6

No leaks were found

Go to 7

6. LEAK AT GAS CAP

Remove the SMOKE supply tip (black hose) from the service port (if equipped) or from the #8404–ADP adapter.

Install gas cap adapter, Miller Tool #8382 (1/4 turn cap) or #6922 (screw cap) and #8399* (secondary seal depressor) and repeat test 5.

Was a leak found at the gas cap adapter?

Yes >> Replace the Fuel Filler tube assembly.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the gas cap.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. EVAP PURGE SOLENOID

NOTE: After disconnecting the EVAP Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister. This may indicate a problem with the check valve. Replace/repair as necessary.

Turn the ignition off.

Disconnect the vacuum hoses at the EVAP Purge Solenoid.

To continue testing, you will need Miller Tool #8404A Evaporative Emissions Leak Detector (EELD).

Connect the SMOKE supply tip (black hose) to the “CAN” port of the EVAP Purge Solenoid.

Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move with the EELD in the smoke mode.

Press the remote smoke/air start button on the EELD.

While holding the remote smoke/air start button, check to see if smoke is leaking through the EVAP Purge Solenoid port.

NOTE: Smoke should not pass through the solenoid.

Is smoke leaking from the EVAP Purge Solenoid port?

Yes >> Replace the EVAP Purge Solenoid.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. EVAP SYSTEM MONITOR SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap System Monitor Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Evap System Monitor Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0456-EVAP SYSTEM SMALL LEAK

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition off, fuel level less than 88%, ambient temperature between 4° C and 43° C (39° F and 109° F), and the fuel system in closed loop.
- **Set Condition:**
  As temperatures change, a vacuum is created in the fuel tank and EVAP system. With the EVAP system sealed, the PCM monitors the ESM switch. If the ESM switch does not close within a calibrated time, an error is detected by the PCM. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
EVAP SYSTEM LEAK
EVAP PURGE SOLENOID
EVAP SYSTEM MONITOR SWITCH

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EVAP SYSTEM PRETEST

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the Freeze Frame data if any DTC(s) are present.

Review the vehicle repair history for items related to the current condition.

Inspect the vehicle for any aftermarket accessories that may have been installed incorrectly.

Check for any related technical service bulletins (TSBs) and, if any apply, follow the recommended procedure.

Select the appropriate response from the list below:

A technical service bulletin (TSB) repaired the condition.
Test complete.

A DTC is present, no TSBs apply, or the TSB did not repair the condition.
Go to 2

2. DTC IS ACTIVE

NOTE: Allow the vehicle to cool to ambient temperature before continuing with this procedure.

NOTE: A loose gas cap may have caused this DTC to set. Make sure gas cap is tight and in good condition. Make sure the gas cap meets OEM specifications.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. EVAPORATIVE SYSTEM INSPECTION

Perform an inspection of the entire evaporative emission system.

Check for the follow conditions:

- Holes or cracks
- Loose seal points
- Evidence of damaged components
- Incorrect routing of hoses and tubes
- Loose or missing Fuel Filler Cap
- Improper installation of the Fuel Fill Cap
- Damaged Locking tabs on Cap and/or fill tube
- Damaged seal points on Cap and/or fill tube
- Fuel cap gasket seal

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. EVAPORATIVE SYSTEM LEAKING

To continue testing you will need Miller Tool #8404A Evaporative Emission Leak Detector (EELD).

WARNING: Keep lit cigarettes, sparks, flames, and other ignition sources away from the test area to prevent the ignition of explosive gases. Keep the test area well ventilated. Failure to follow these instructions can result in personal injury or death.

NOTE: The fuel tank should have between 20% and 80% of fuel tank capacity to properly test the EVAP system.

Connect the red power lead of the EELD to the battery positive terminal and the black ground lead to battery negative terminal.

Block the vent hose of the canister if using the service port.

Connect shop air to the EELD.

Set the smoke/air control switch to AIR.

Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).

Press the remote smoke/air start button.

Position the red flag on the air flow meter so it is aligned with the indicator ball.

When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute to the size leak indicated by the DTC set in the PCM.

Install the service port adapter #8404-14 on the vehicle's service port and block the vent hose of the EVAP Canister (if equipped) or install the #8404-ADP service adaptor into the filter line.

Connect the Air supply hose from the EELD to the service port (if equipped) or to the #8404-ADP adapter.

Press the remote button to activate AIR flow.

NOTE: Larger volume fuel tanks, lower fuel levels, vehicles equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill.

Compare the flow meter indicator ball reading to the red flag.

ABOVE the red flag indicates a leak present.

BELOW the red flag indicates a sealed system.

Is the indicator ball above the red flag?

Yes >> Go to 5

No >> Refer to the Freeze Frame data recorded in step 1. If the data indicates that the vehicle was in motion when the DTC was set, verify that all hoses are properly connected.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. EVAPORATIVE EMISSION LEAK DETECTION

NOTE: A thorough visual inspection of the EVAP system hoses, tubes, and connections may save time in your diagnosis. Look for any physical damage or signs of wetness at connections. The strong smell of fuel vapors may aid diagnosis also.

To continue testing, you will need Miller Tool #8404A Evaporative Emissions Leak Detector (EELD).

Remove the Air supply hose from the service port (if equipped) or from the #8404-ADP adapter.

Connect the SMOKE supply tip (black hose) to the service port (if equipped) or to the #8404-ADP adapter.

Set the smoke/air control switch to SMOKE.

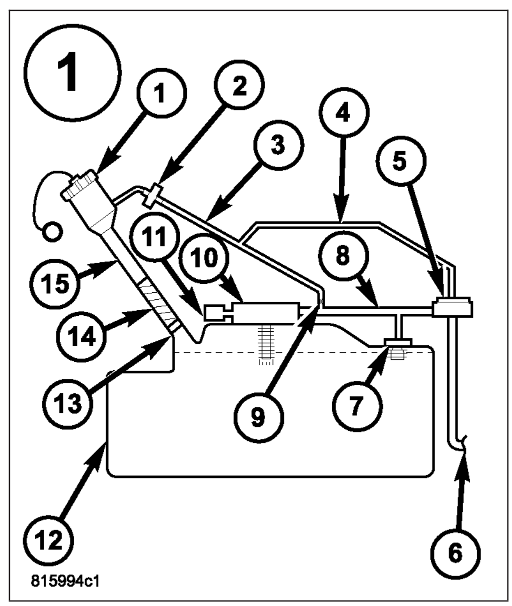
NOTE: The flow meter indicator ball will not move in the smoke mode.

Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.

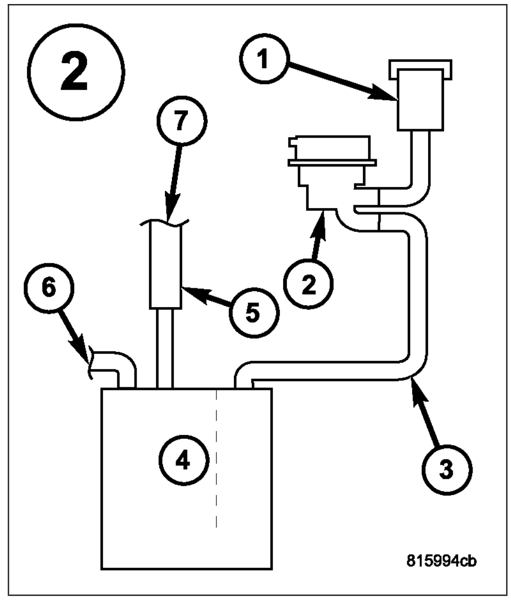


If a leak is concealed from view (i.e., top of fuel tank), release the remote smoke/air start button, and use the ultra-violet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

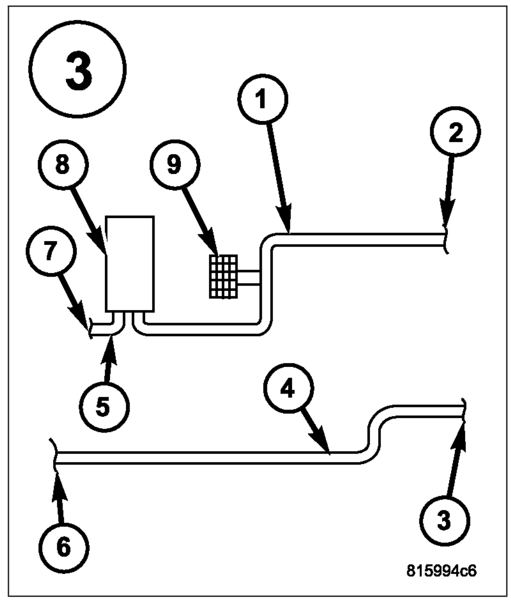
NOTE: The EVAP System is divided into three zones. A leak from any of these zones can cause this DTC to set. The lists below specify the possible leak points in that specific zone. For further assistance see the Zone Identification Charts below.

- ZONE 1



1 Fuel Cap
2 Recirculation Check Valve.
3 Vapor Recirculation Line.
4 Signal Vapor Line for FVM.
5 Flow Management Valve.
6 Fuel Tank to Canister Vapor Line.
7 Fuel Tank Vent (Check Valve).
8 Vapor Line to Canister.
9 Flow Control Orifice.
10 Control Valve.
11 Liquid Trap.
12 Fuel Tank.
13 Check valve.
14 Fuel Fill Tube to Tank connector.
15 Fuel Fill Tube
Damaged or disconnected EVAP system components.

- ZONE 2



1 Filter.
2 ESM.
3 Canister Vent Line.
4 EVAP Canister.
5 Chassis Purge Valve.

6 Fuel Tank to Canister Vapor Line connection.
7 EVAP Purge connection.

- ZONE 3

1 EVAP Purge Vacuum Line.
2 Connection to Chassis Line.
3 Connection to Canister.
4 Chassis Purge Line.
5 EVAP Purge Vacuum Line.
6 Connection to EVAP Purge Harness.
7 Chassis EVAP Purge Line connection to Engine Vacuum.
8 EVAP Purge Valve.
9 Service Port.

NOTE: Carefully inspect the vent side of the EVAP Canister. Due to the filtering system in the canister the smoke may not be as thick. Introducing smoke into the filtered side of the canister may assist in locating the leak.

Select the appropriate response from the list below:

A leak was found in one or more of the EVAP System zones

Repair or replace the leaking component as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

A leak was found at the gas cap or fuel filler tube

Go to 6

No leaks were found

Go to 7

6. LEAK AT GAS CAP

Remove the SMOKE supply tip (black hose) from the service port (if equipped) or from the #8404–ADP adapter.

Install gas cap adapter, Miller Tool #8382 (1/4 turn cap) or #6922 (screw cap) and #8399* (secondary seal depressor).

Connect the SMOKE supply tip (black hose) to the gas cap adapter.

Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move in the smoke mode.

Press the remote smoke/air start button.

NOTE: Make sure that smoke has filled the EVAP system by continuing to press the remote smoke/air start button, remove the vehicle fuel cap, and wait for the smoke to exit. Once smoke is indicated reinstall the fuel cap.

NOTE: For optimal performance, introduce smoke into the system for an additional 60 seconds; continue introducing smoke at 15 second intervals, as necessary.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the EVAP system path, and look for the source of the leak indicated by exiting smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

Was a leak found at the gas cap adapter?

Yes >> Replace the Fuel Filler tube assembly.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the gas cap.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. EVAP PURGE SOLENOID

NOTE: After disconnecting the EVAP Purge Solenoid vacuum connections, inspect the lines and solenoid for any signs of contamination from the EVAP Canister. This may indicate a problem with the check valve. Replace/repair as necessary.

Turn the ignition off.

Disconnect the vacuum hoses at the EVAP Purge Solenoid.

To continue testing, you will need Miller Tool #8404A Evaporative Emissions Leak Detector (EELD).

Connect the SMOKE supply tip (black hose) to the “CAN” port of the EVAP Purge Solenoid.

Set the smoke/air control switch to SMOKE.

NOTE: The flow meter indicator ball will not move with the EELD in the smoke mode.

Press the remote smoke/air start button on the EELD.

While holding the remote smoke/air start button, check to see if smoke is leaking through the EVAP Purge Solenoid port.

NOTE: Smoke should not pass through the solenoid.

Is smoke leaking from the EVAP Purge Solenoid port?

Yes >> Replace the EVAP Purge Solenoid.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. EVAP SYSTEM MONITOR SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap System Monitor Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Evap System Monitor Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0457-EVAP SYSTEM — LOOSE FUEL CAP

For a complete wiring diagram **Refer to Section 8W**.

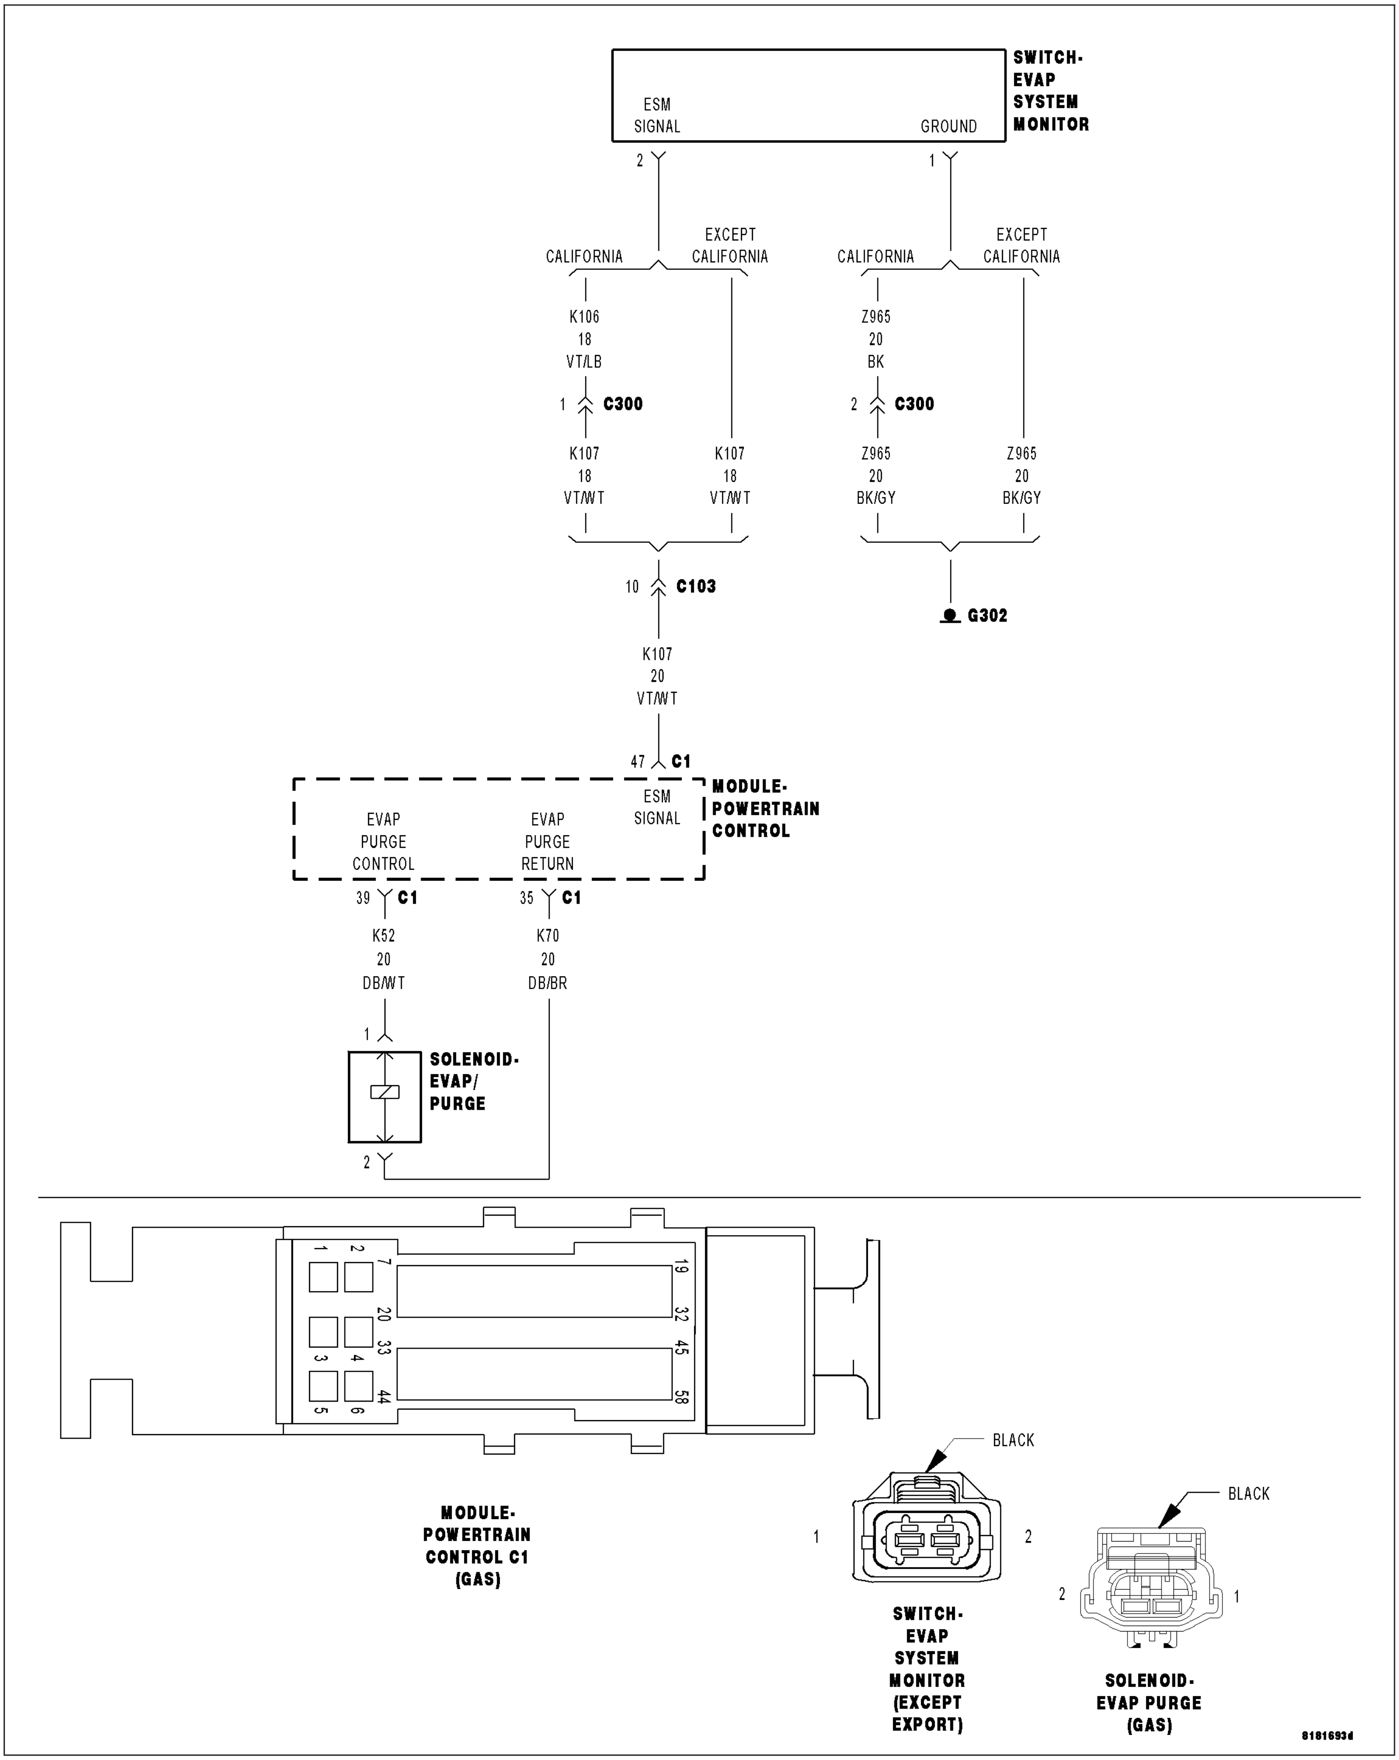
- **When Monitored:**
  After the PCM detects a significant fuel level change.
- **Set Condition:**
  If a leak greater than .090” is detected by the PCM for two consecutive cold start trips after a significant fuel level change, this DTC will set. One good trip turns off the MIL.

Possible Causes
LOOSE OR MISSING FUEL FILLER CAP

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If DTC P0455-EVAP SYSTEM LARGE LEAK is set along with this DTC, perform the diagnostic procedure for P0455 before continuing with this test.



NOTE: Do not replace the gas cap for DTC P0457-EVAP SYSTEM - LOOSE FUEL CAP.
With a scan tool, select View DTCs.

Is the status Active for DTC P0455-EVAP SYSTEM LARGE LEAK along with this DTC?

Yes >> Perform the diagnostic procedure for P0455-EVAP SYSTEM LARGE LEAK.

No >> No repair is necessary. Verify that the gas cap is in place and tight. Clear DTCs and reset the odometer or message center display.

P0458-EVAP PURGE SOLENOID CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the Evap Purge Solenoid circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND
(K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K70) EVAP PURGE RETURN CIRCUIT OPEN OR HIGH RESISTANCE
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

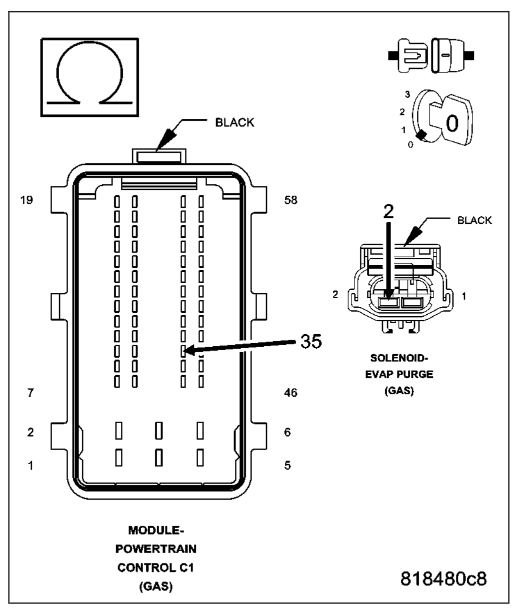
2. (K70) EVAP PURGE RETURN CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Evap Purge Solenoid connector.

Turn the ignition on.

Using a 12 volt test light connected to 12 volts, check the (K70) Evap Purge Return circuit in the Evap Purge Solenoid harness connector.



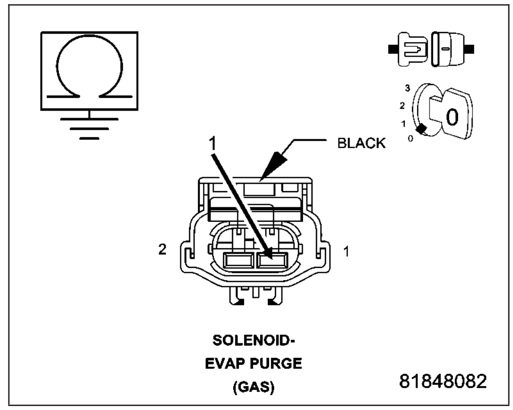
NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (K70) Evap Purge Return circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

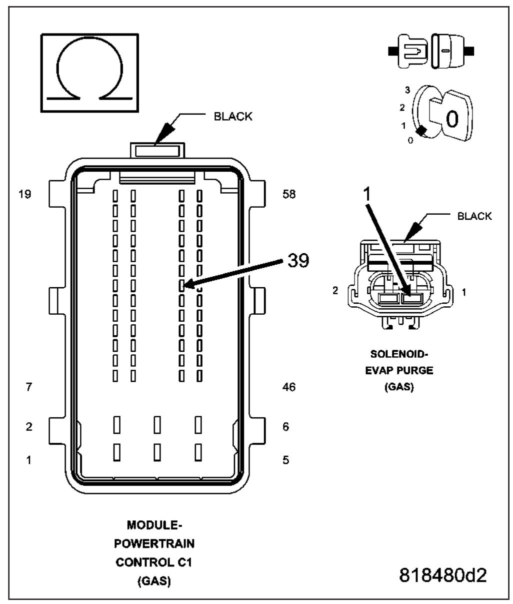


3. (K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K52) Evap Purge Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

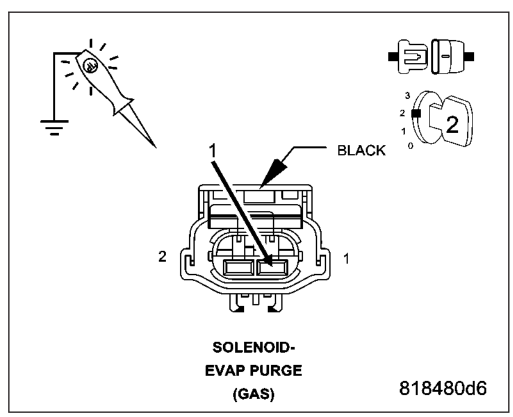
4. (K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K52) Evap Purge Control circuit between the Evap Purge Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K52) Evap Purge Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. EVAP PURGE SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Evap Purge Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

NOTE: The test light should be illuminated and bright with the control actuated ON (100%). Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Evap Purge Solenoid control to OFF (0%).

Using a 12 volt test light connected to 12 ground, check the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

NOTE: The test light should not be illuminated with the control actuated OFF (0%).

Is the test light illuminated and bright with the control actuated ON and not illuminated with the control

actuated OFF?

Yes >> Replace the Evap Purge Solenoid in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

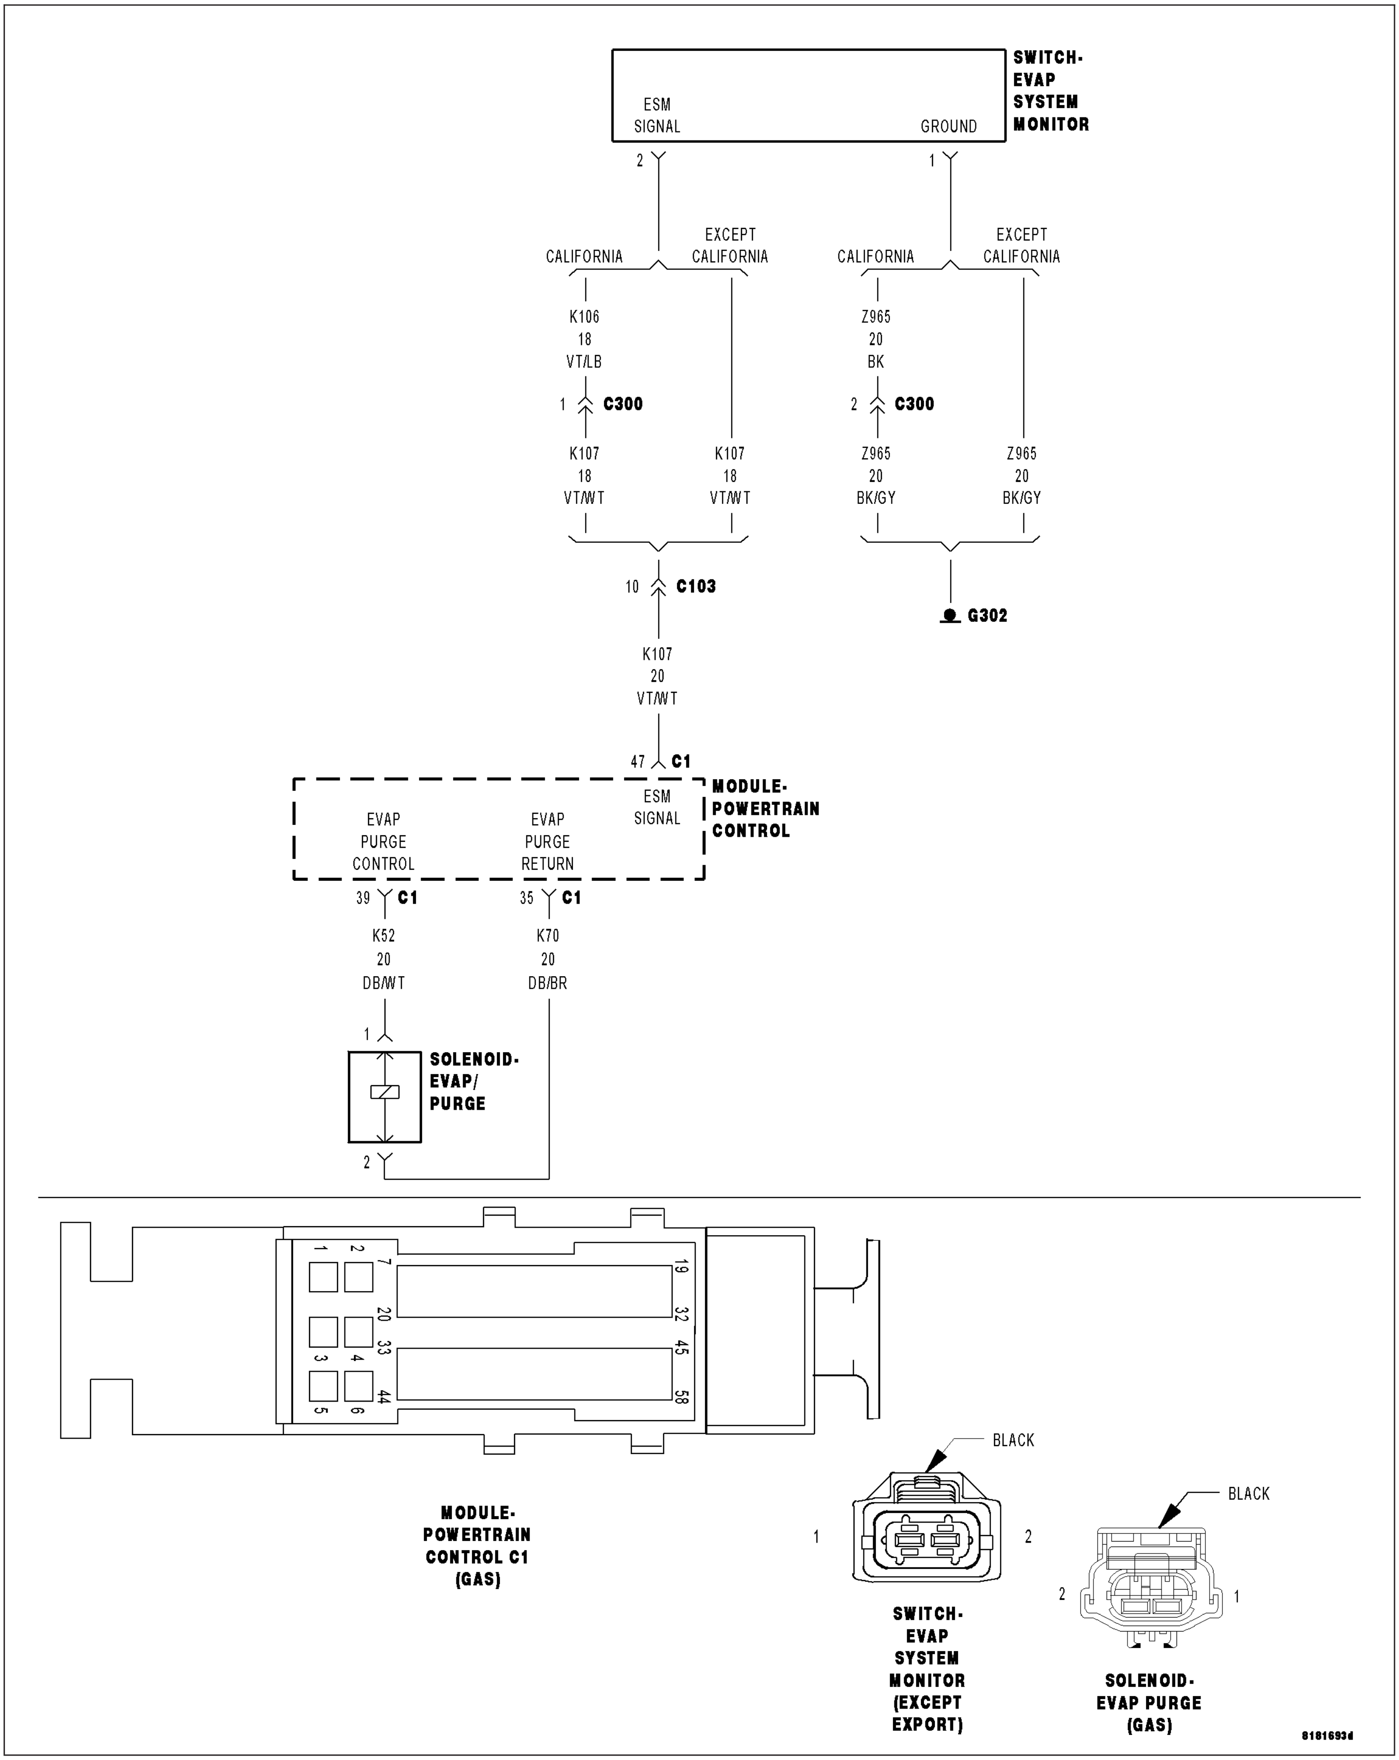
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0459-EVAP PURGE SOLENOID CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the Evap Purge Solenoid circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K70) EVAP PURGE RETURN CIRCUIT SHORTED TO VOLTAGE
(K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EVAP PURGE SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

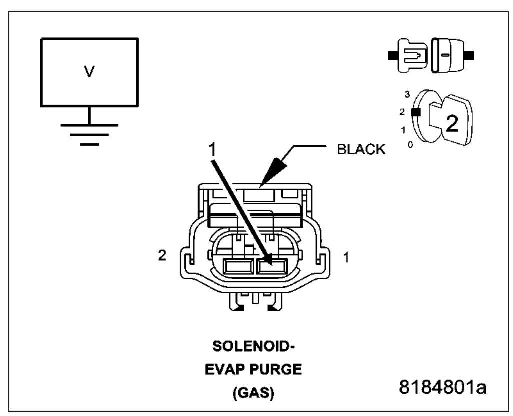
1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.



With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K52) EVAP PURGE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

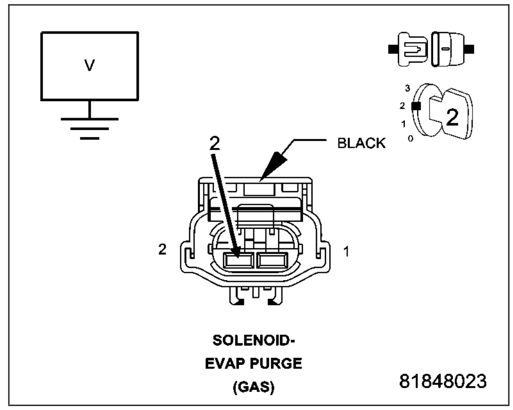
Disconnect the Evap Purge Solenoid connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

Is there any voltage present?



Yes >> Repair the (K52) Evap Purge Control circuit for a short to voltage.

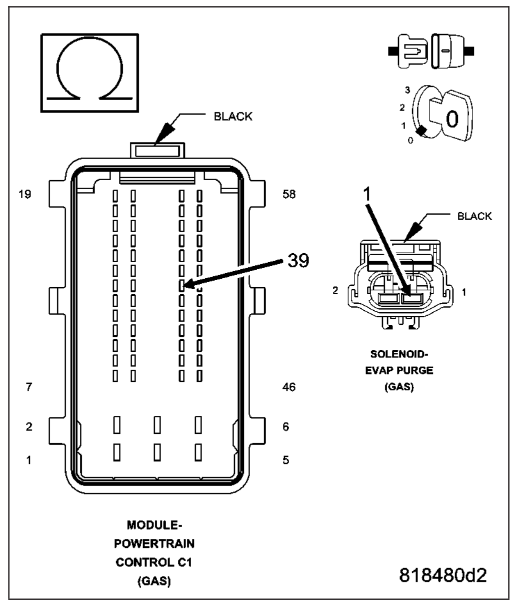
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K70) EVAP PURGE RETURN CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K70) Evap Purge Return circuit in the Evap Purge Solenoid harness connector.

Is there any voltage present?



Yes >> Repair the (K70) Evap Purge Return circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K52) EVAP PURGE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

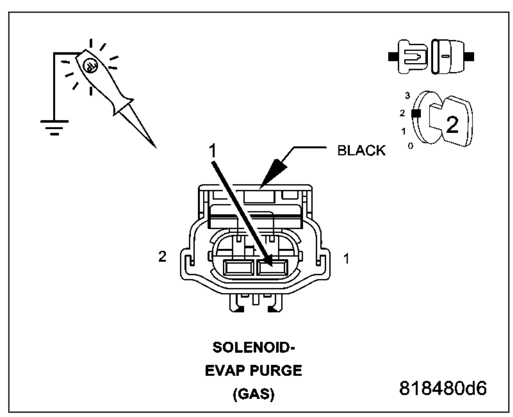
Measure the resistance of the (K52) Evap Purge Control circuit between the Evap Purge Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K52) Evap Purge Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. EVAP PURGE SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Evap Purge Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Evap Purge Solenoid control to the OFF (0%) position.

Using a 12 volt test light connected to ground, check the (K52) Evap Purge Control circuit in the Evap Purge Solenoid harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuator ON (100%) and not illuminated with the actua-

tor OFF (0%)?

Yes >> Replace the Evap Purge Solenoid in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

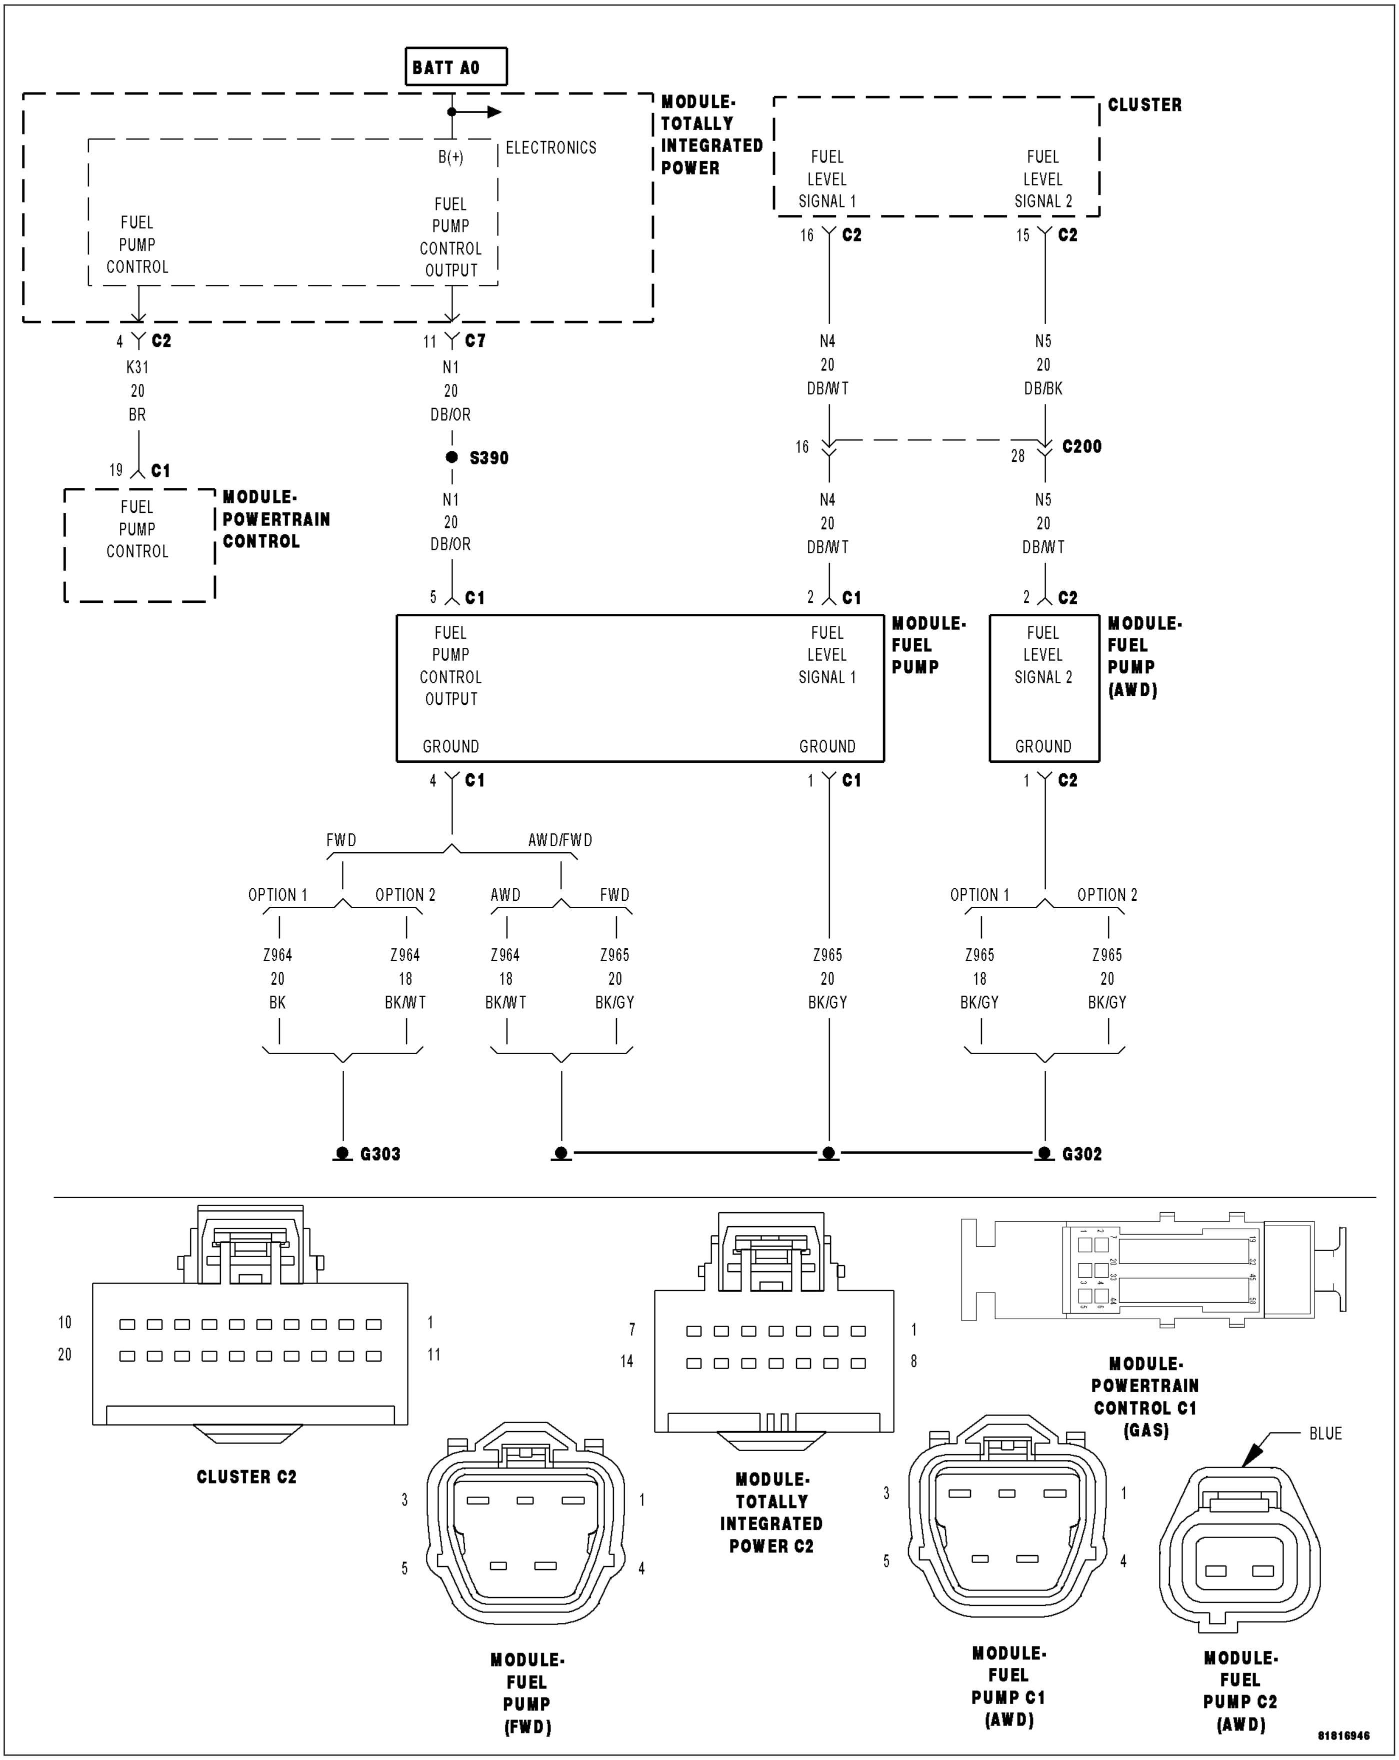
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Evap Purge Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0461-FUEL LEVEL SENSOR 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects that the Fuel Level Sensor circuit voltage is implausible.

Possible Causes
INTERMITTENT DTC
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO THE (Z965) GROUND CIRCUIT
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

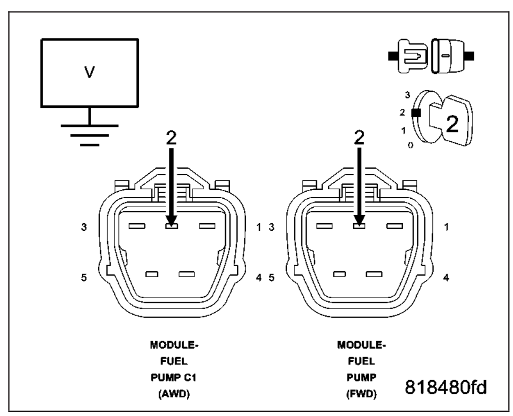
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Fuel Level Sensor connector.

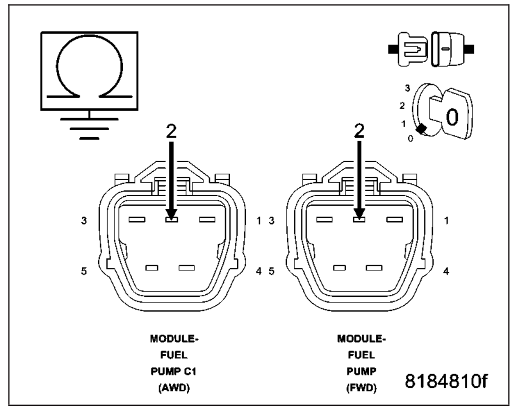
Disconnect the Instrument Cluster (CCN) connector.

Turn the ignition on.

Measure the voltage of the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (N4) Fuel Level Signal 1 circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

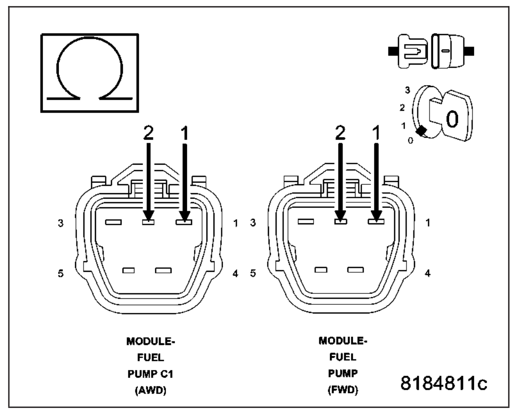
No >> Go to 3

3. (N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 4

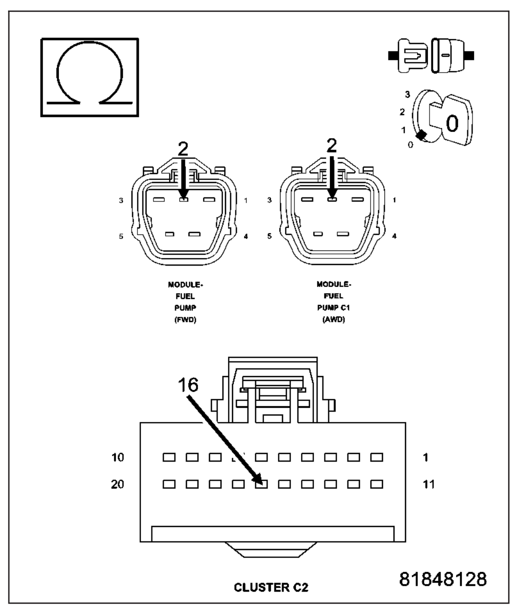
No >> Repair the (N4) Fuel Level Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO THE (Z965) GROUND CIRCUIT

Measure the resistance between the (N4) Fuel Level Signal 1 circuit and the (Z965) Ground circuit in the Fuel Level Sensor harness connector.

Is the resistance above 100 ohms?



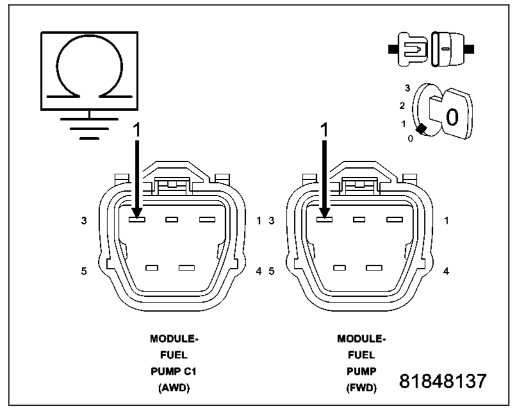
Yes >> Go to 5

No >> Repair the (N4) Fuel Level Signal 1 circuit for a short to the (Z965) Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (N4) Fuel Level Signal 1 circuit between the Fuel Level Sensor harness connector and the Instrument Cluster (CCN) harness connector.



Is the resistance below 5.0 ohms?

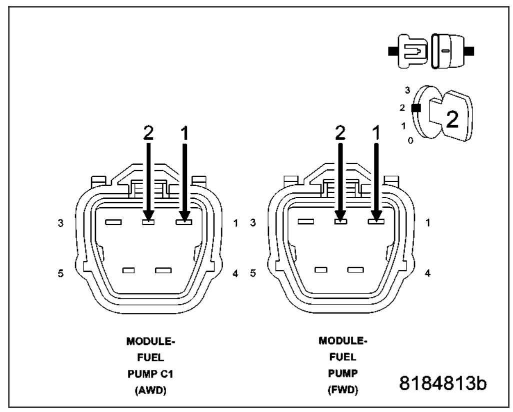
Yes >> Go to 6

No >> Repair the (N4) Fuel Level Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance between ground and the (Z965) Ground circuit in the Fuel Level Sensor harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (Z965) Ground for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. FUEL LEVEL SENSOR

Turn the ignition off.

Connect the Instrument Cluster (CCN) connector.

Connect a jumper wire between the (Z965) Ground circuit and the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Fuel Level Sensor 1 signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Fuel Level Sensor in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. INSTRUMENT CLUSTER (CCN)

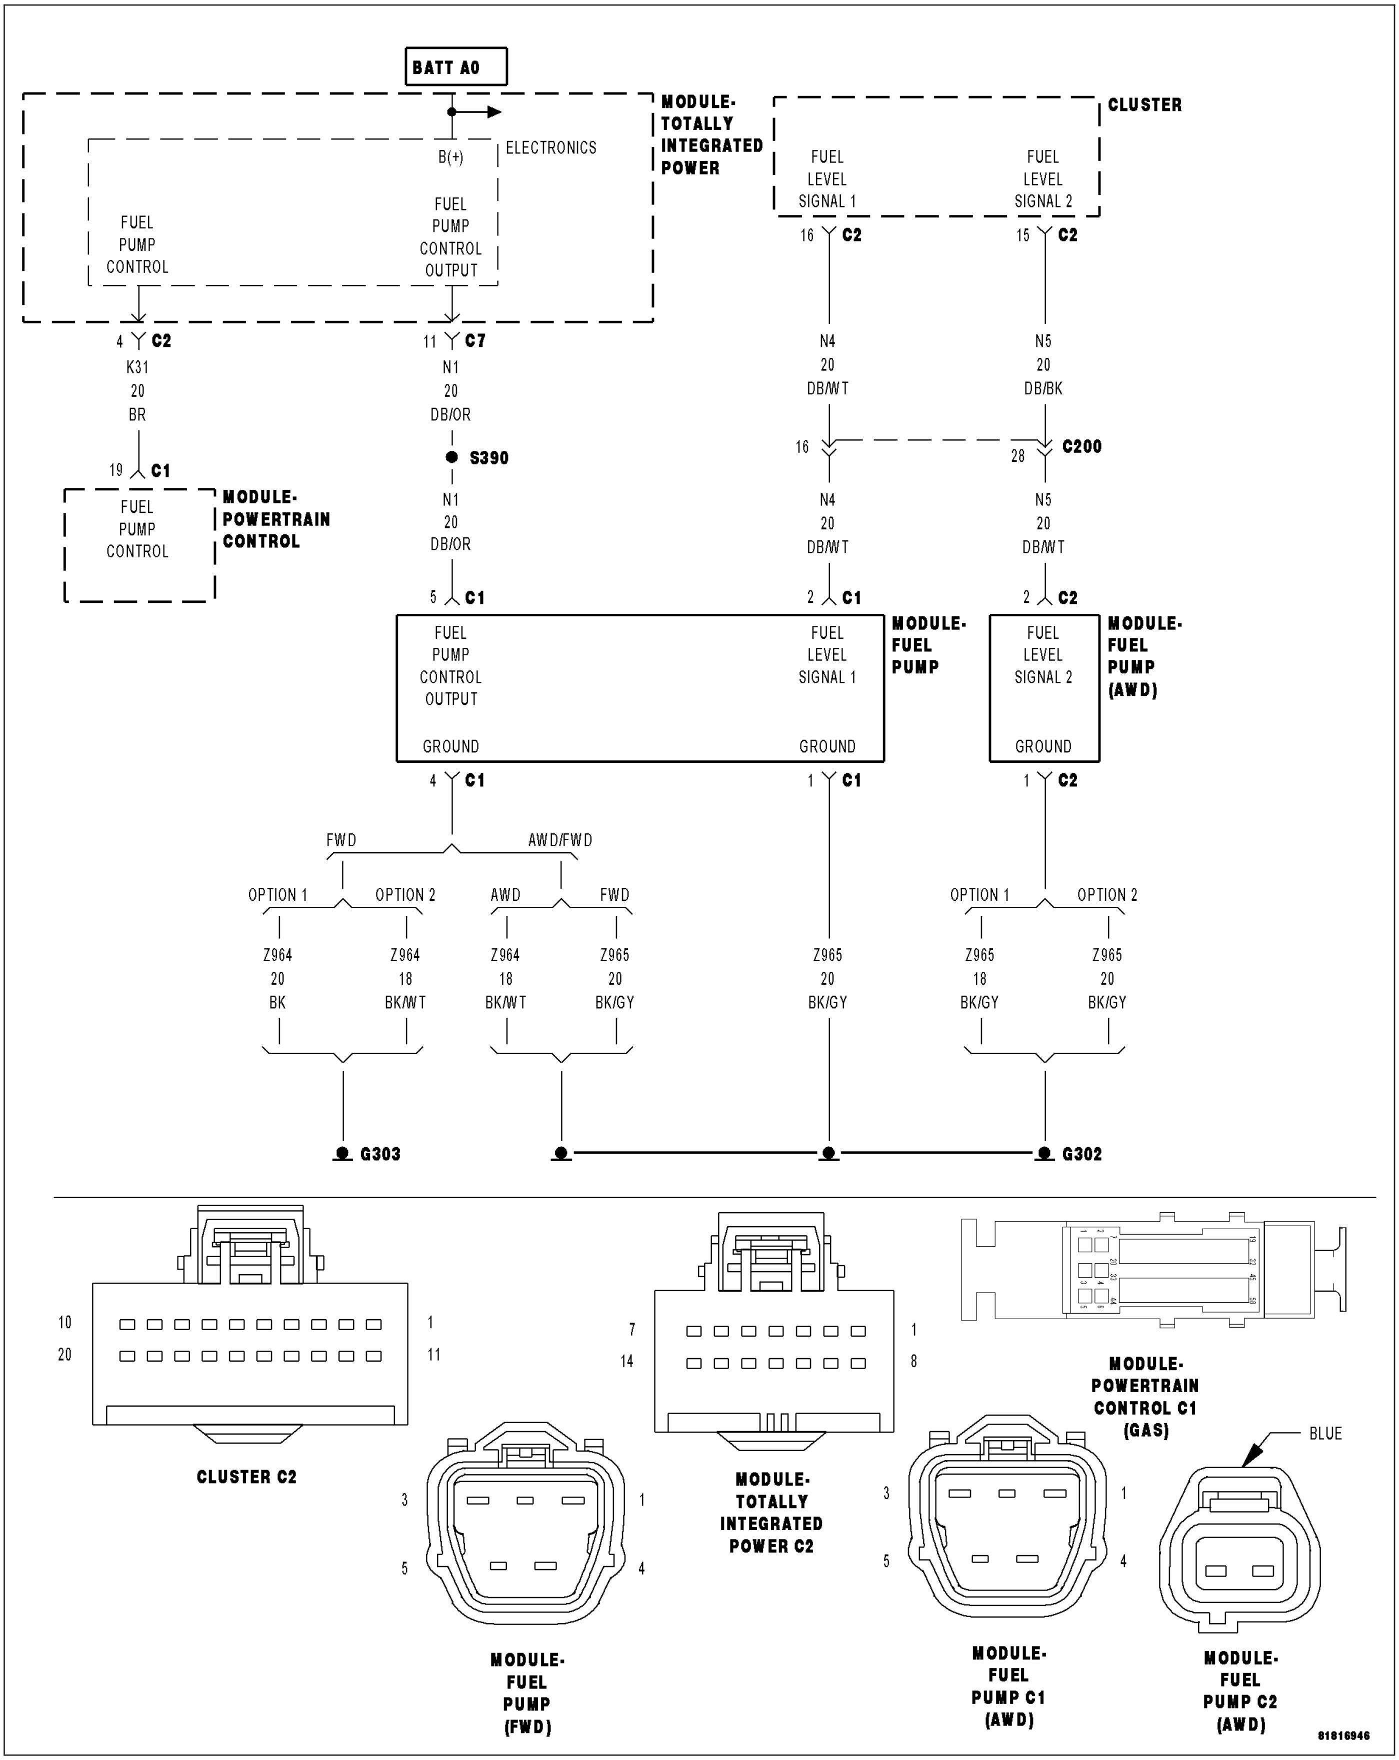
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Instrument Cluster (CCN) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0462-FUEL LEVEL SENSOR 1 LOW CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the Fuel Level Sensor circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

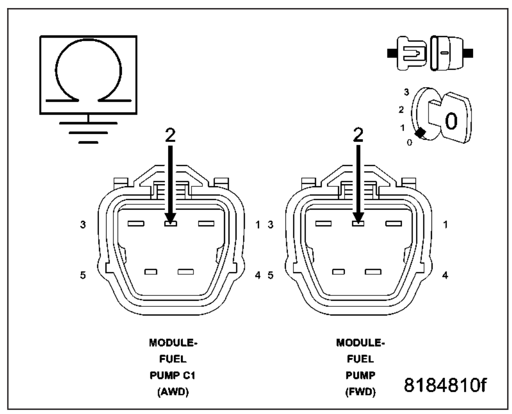
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO GROUND

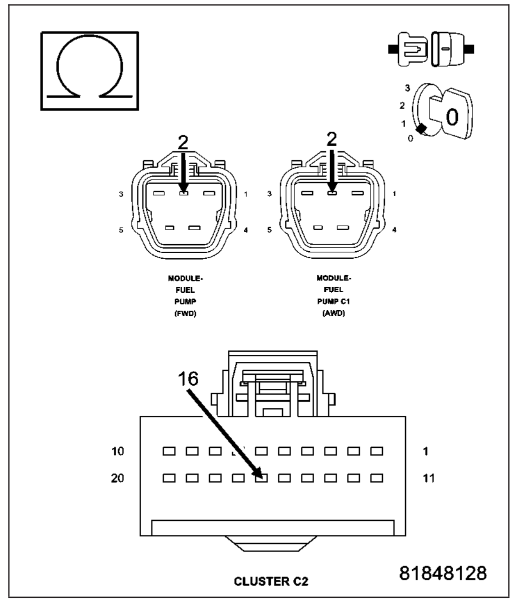
Turn the ignition off.

Disconnect the Fuel Level Sensor connector.

Disconnect the Instrument Cluster (CCN) connector.

Measure the resistance between ground and the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 3

No >> Repair the (N4) Fuel Level Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (N4) Fuel Level Signal 1 circuit between the Fuel Level Sensor harness connector and the Instrument Cluster (CCN) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (N4) Fuel Level Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. FUEL LEVEL SENSOR

Turn the ignition off.

Connect the Instrument Cluster (CCN) connector.

Turn the ignition on.

With the scan tool, read the Fuel Level Sensor 1 signal voltage.

Is the voltage above 4.5 volts with the Fuel Level Sensor harness disconnected?

Yes >> Replace the Fuel Level Sensor in accordance with the service information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. INSTRUMENT CLUSTER (CCN)

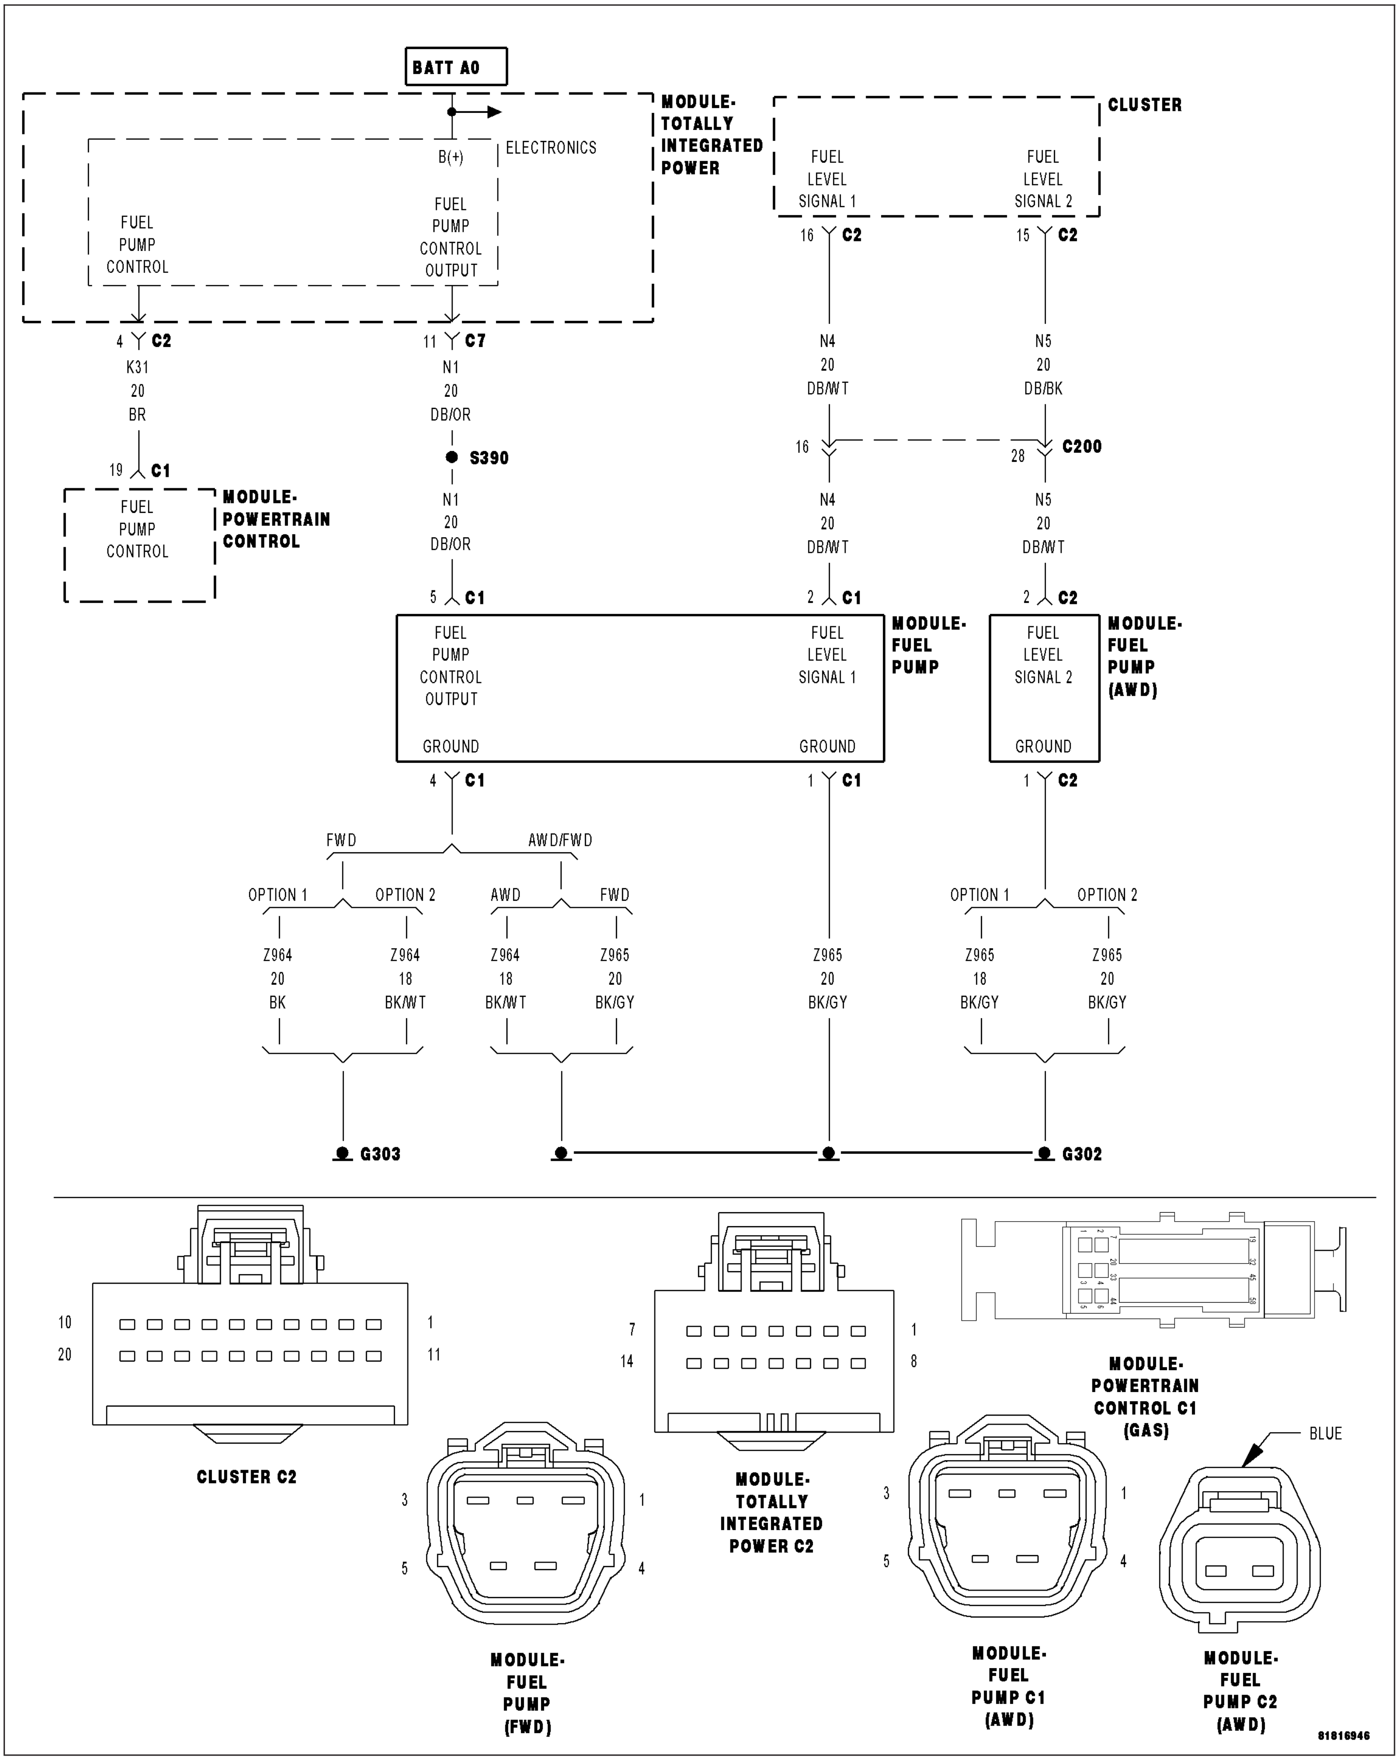
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Instrument Cluster (CCN) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0463-FUEL LEVEL SENSOR 1 HIGH CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (N4) Fuel Level Signal 1 circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(N4) FUEL LEVEL SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

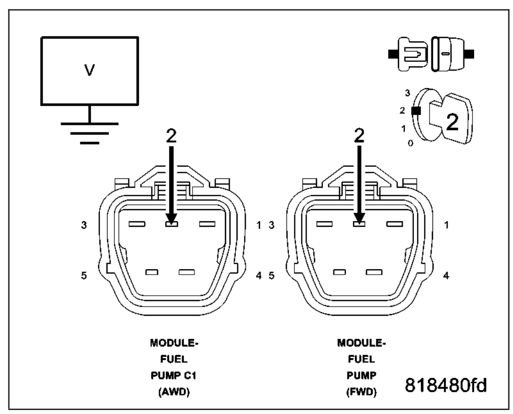
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (N4) FUEL LEVEL SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Fuel Level Sensor connector.

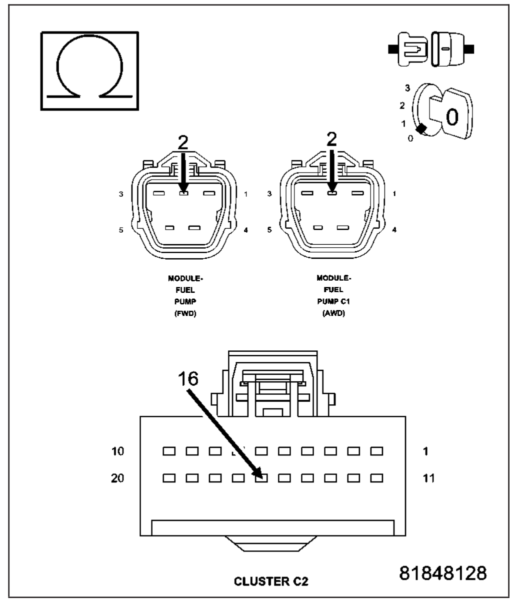
Disconnect the Instrument Cluster (CCN) connector.

Turn the ignition on.

Measure the voltage of the (N4) Fuel Level Signal 1 circuit in the Fuel Level Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (N4) Fuel Level Signal 1 circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

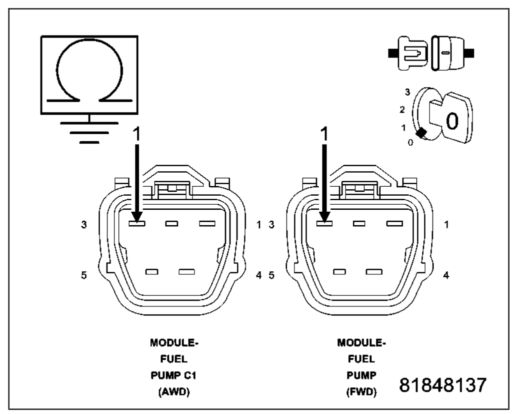
No >> Go to 3

3. (N4) FUEL LEVEL SIGNAL 1 OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (N4) Fuel Level Signal 1 circuit between the Fuel Level Sensor harness connector and the Instrument Cluster (CCN) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 4

No >> Repair the (N4) Fuel Level Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance between ground and the (Z965) Ground circuit in the Fuel Level Sensor harness connector.

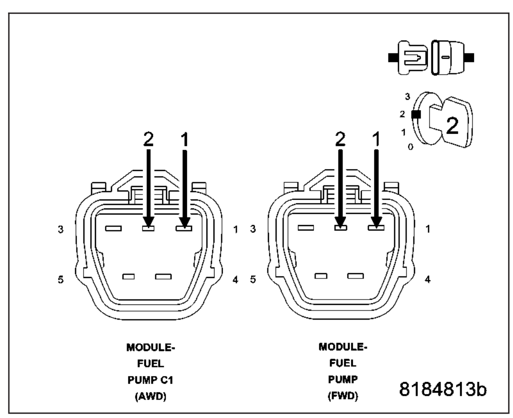
Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (Z965) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL LEVEL SENSOR



Turn the ignition off.

Connect the Instrument Cluster (CCN) connector.

Connect a jumper wire between the (N4) Fuel Level Signal 1 circuit and the (Z965) Ground in the Fuel Level Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Fuel Level Sensor 1 signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Fuel Level Sensor in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

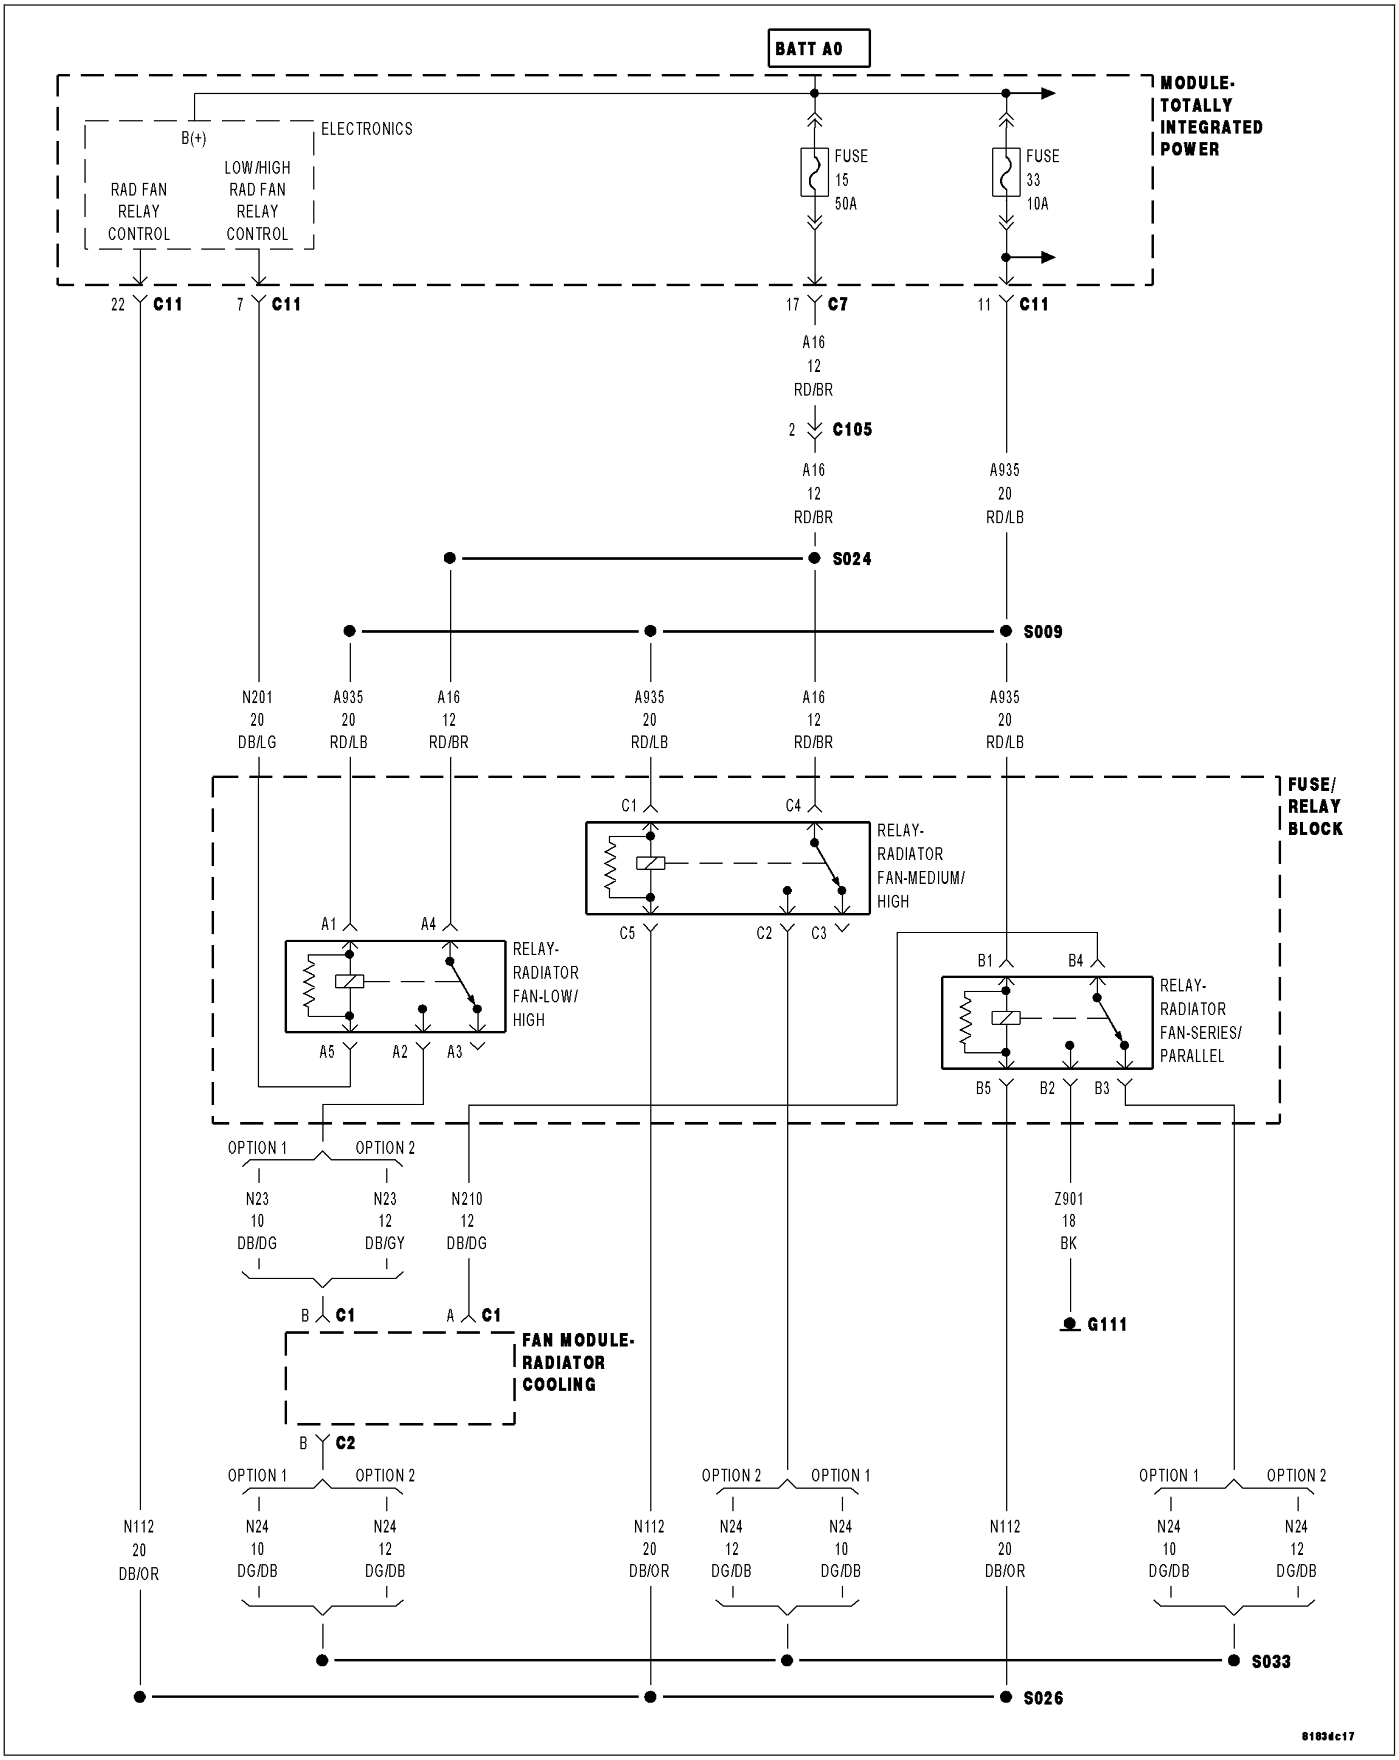
No >> Go to 6

6. INSTRUMENT CLUSTER (CCN)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Instrument Cluster (CCN) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0480-COOLING FAN 1 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  An open or shorted circuit is detected in the Low/High Rad Fan Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(A16) FUSED (B+) CIRCUITS
(N201) LOW/HIGH/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT OPEN
(N201) LOW/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO GROUND
LOW/HIGH RAD FAN RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

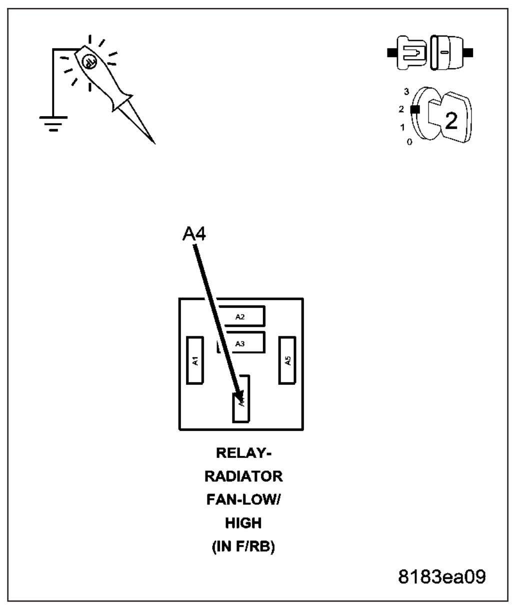
1. RADIATOR COOLING FAN MODULE OPERATION

Ignition on, engine not running.

With a scan tool, select Radiator Cooling Fan Relay #1 Control State to actuate the Cooling Fan (Low/High).

Is the one Cooling Fan operating?

Yes >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



No >> Go To 2

2. (A16) FUSED B+ CIRCUIT

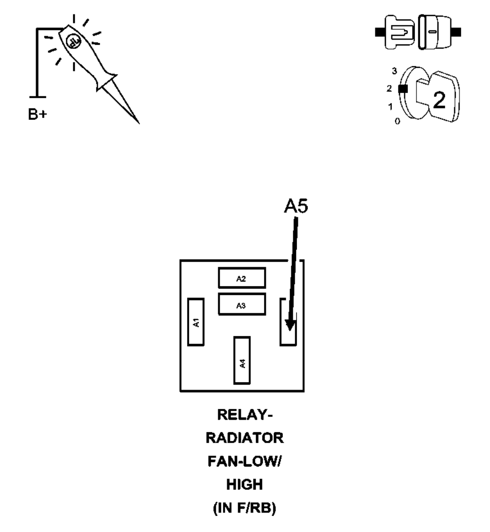
Ignition on.

Disconnect the Low/High Rad Relay harness connector.

Using a 12-volt test light connected to ground, probe the (A16) Fused B+ circuit in the Low/High Rad Relay harness connector.

Does the test light illuminate brightly?

Yes >> Go To 3



No >> Repair the (A16) Fused B+ circuit. Inspect the related fuse and repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

3. LOW/HIGH RAD FAN CONTROL CIRCUIT

Turn the ignition on, engine not running.

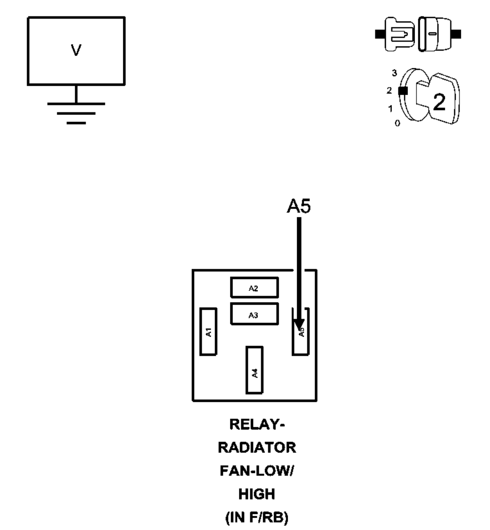
With a scan tool, select Radiator Cooling Fan Relay #1 Control State, Toggle, to actuate the Cooling Fan (Low/High).

Using a 12-volt test light connected to battery voltage, probe the (N201) Low/High Rad Fan Control circuit in the Low/High Rad Relay harness connector.

8183ea0d

Does the test light illuminate brightly and flash on and off?

Yes >> Replace the Low/High Rad Fan Relay.



Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

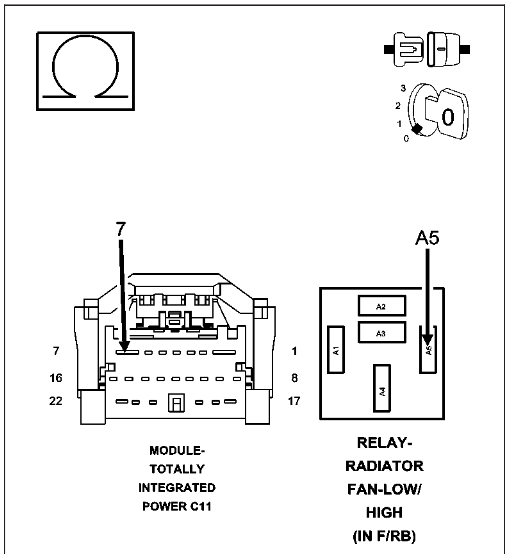
No >> Go To 4

4. (N201) LOW/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

Disconnect the TIPM C11 harness connector.

Using a voltmeter, measure the voltage of the (N201) Low/High Rad Fan Control circuit in the Low/High Rad Relay harness connector.

8183ea12



Is there voltage present?

Yes >> Repair the short to voltage in the (N201) Low/High Rad Fan Control circuit

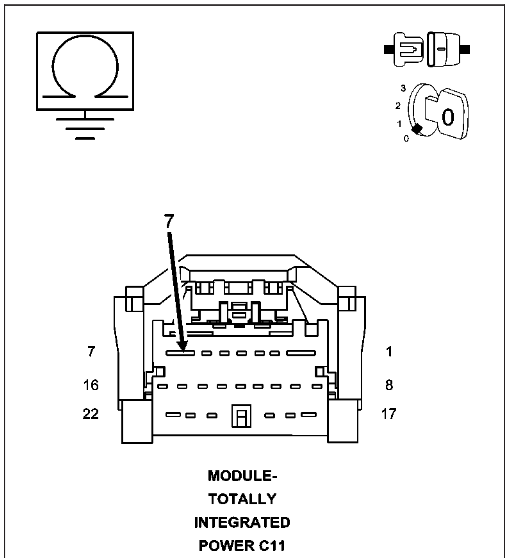
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 5

5. (N201) LOW/HIGH RAD FAN CONTROL CIRCUIT OPEN

8183ea16

Measure the resistance of the (N201) Low/High Fan Control circuit from the Low/High Rad Relay harness connector to the TIPM C11 harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 6

No >> Repair the open in the (N201) Low/High Fan Control circuit.

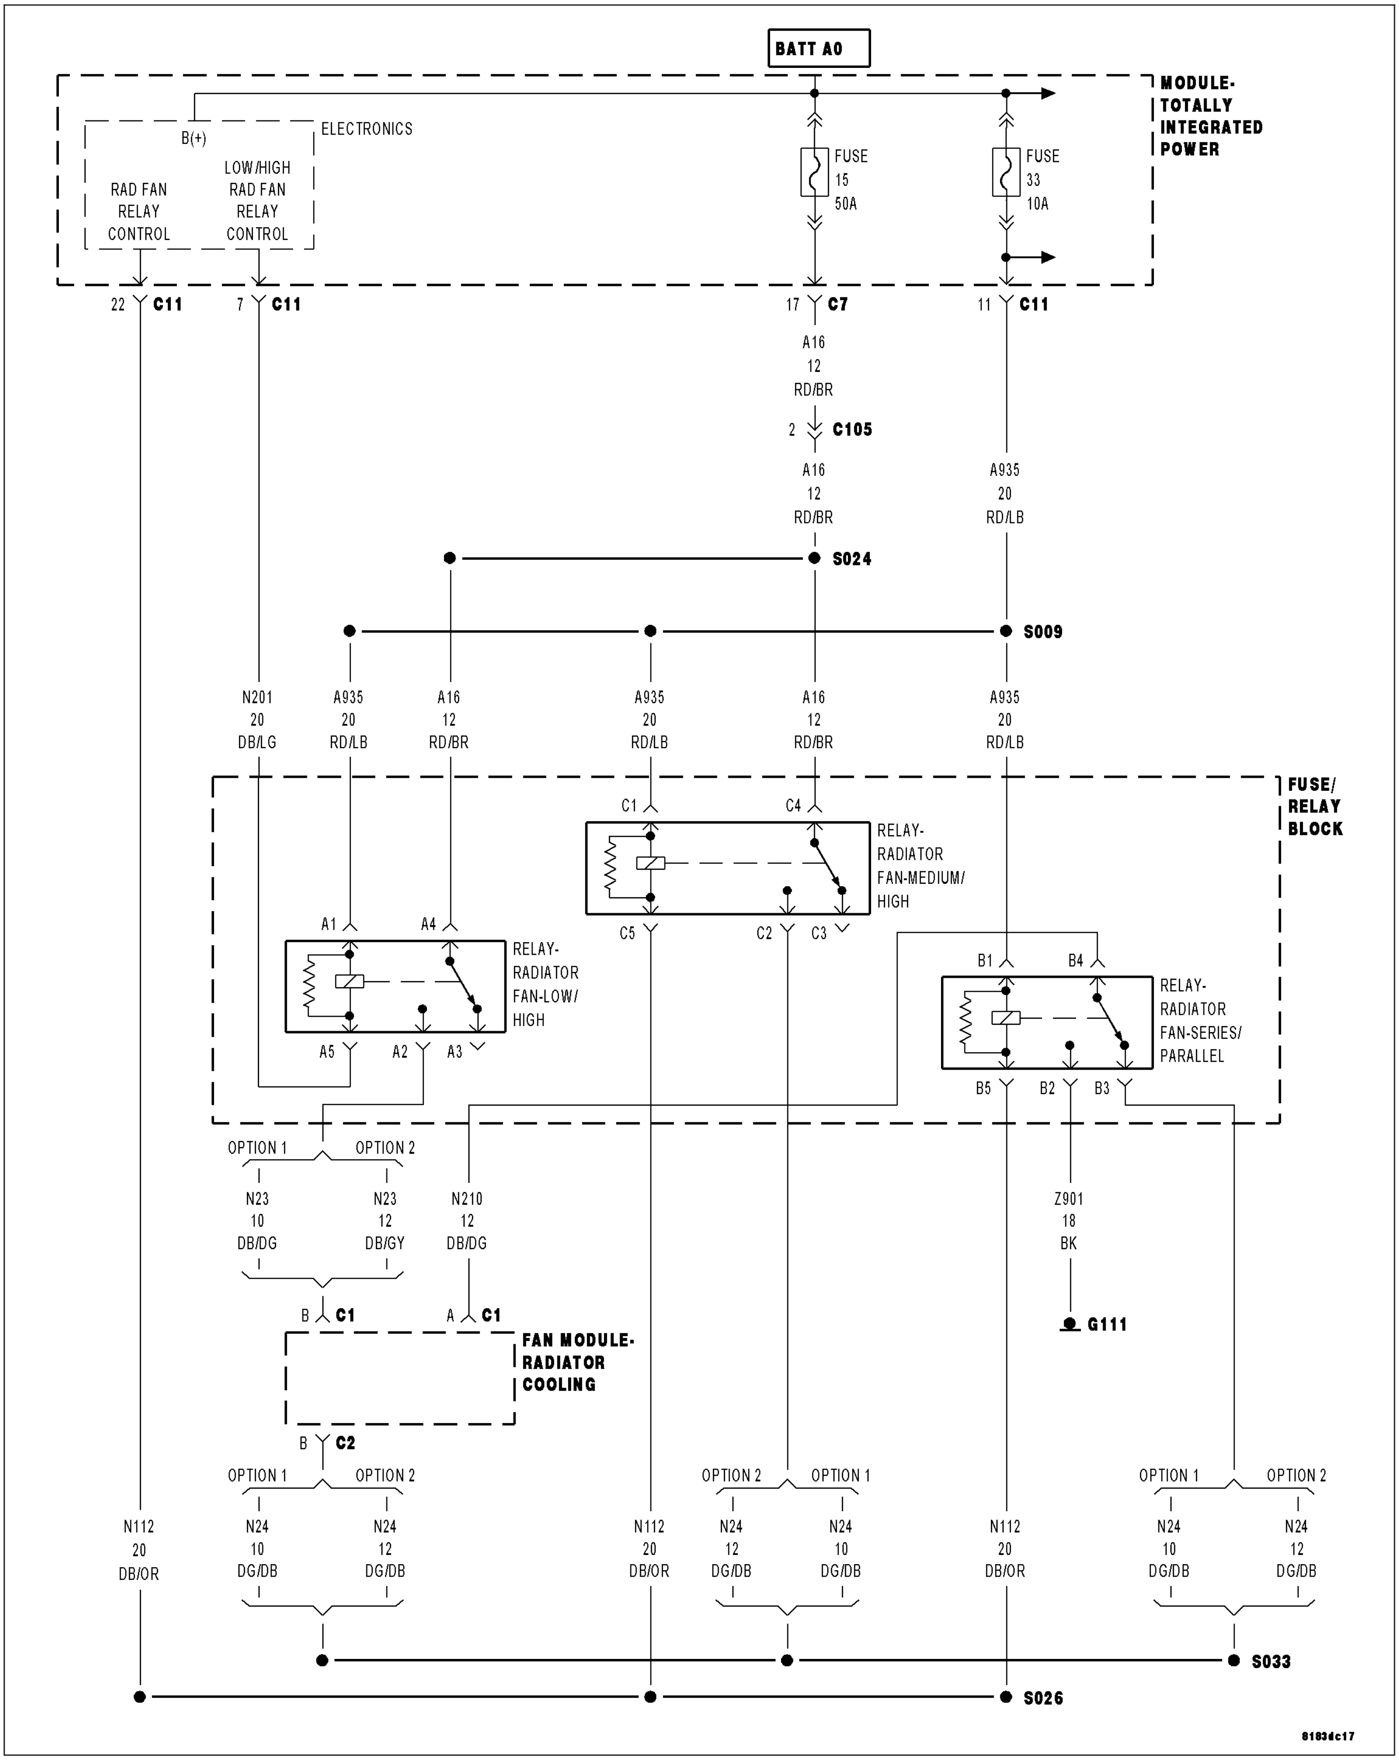
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

6. (N201) LOW/HIGH RAD FAN CONTROL CIRCUIT SHORTED TO GROUND

8183ea1a

Measure the resistance between ground and the (N201) Low/High Fan Control circuit in the TIPM C11 harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the short to ground in the (N201) Low/High Fan Control circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0481-COOLING FAN 2 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  An open or shorted circuit is detected in the High Speed Rad Fan Control circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(A16) FUSED (B+) CIRCUITS
(N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE
(N112) RAD FAN RELAY CONTROL CIRCUIT OPEN
(N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND
MED/HIGH RAD FAN RELAY
SERIES/PARALLEL RAD FAN RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. RADIATOR COOLING FAN MODULE OPERATION

Ignition on, engine not running.

With a scan tool, actuate both the Radiator Cooling Fan Relays #1 and #2.

Are both cooling fan operating at medium speed?

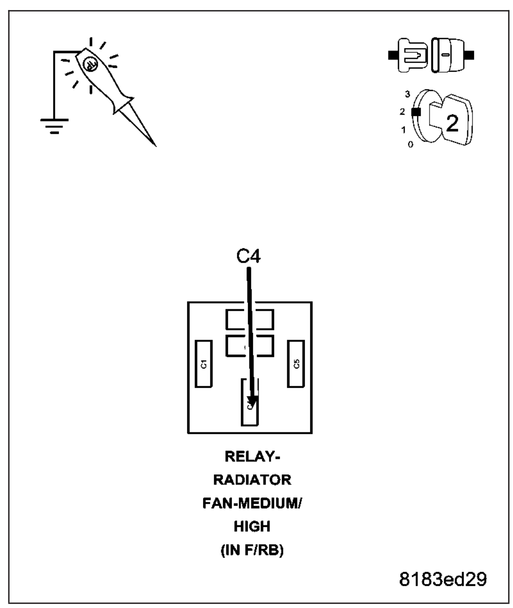
Yes >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 2

2. (A16) FUSED B+ CIRCUIT

Ignition on.

Disconnect the Med/High Rad Fan Relay from the Fuse/Relay Block.



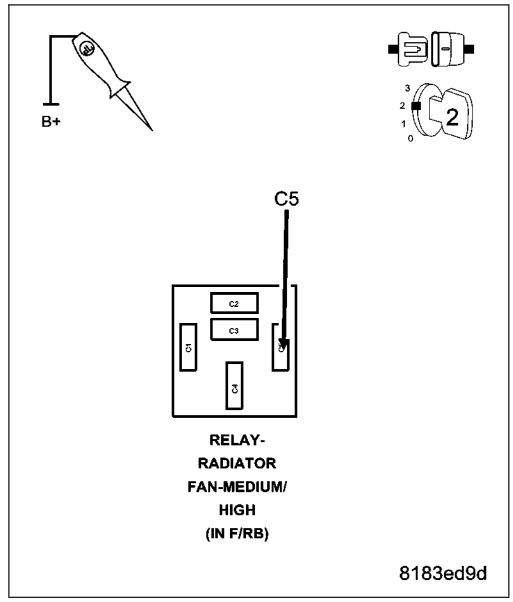
Disconnect the Series/Parallel Rad Fan Relay from the Fuse/Relay Block.

Using a 12-volt test light connected to ground, probe the (A16) Fused B+ circuit at both the Med/High Rad Fan Relay and the Series/Parallel Rad Fan Relay connectors.

Does the test light illuminate brightly at each terminal?

Yes >> Go To 3

No >> Repair the (A16) Fused B+ circuit. Inspect the related fuse and repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



3. MED/HIGH RAD FAN RELAY

Install the Series/Parallel Rad Fan Relay.

Turn the ignition on, engine not running.

With a scan tool, select Radiator Cooling Fan Relay #2 Control State, Toggle, to actuate the Cooling Fan (Med/High Rad Fan Relay).

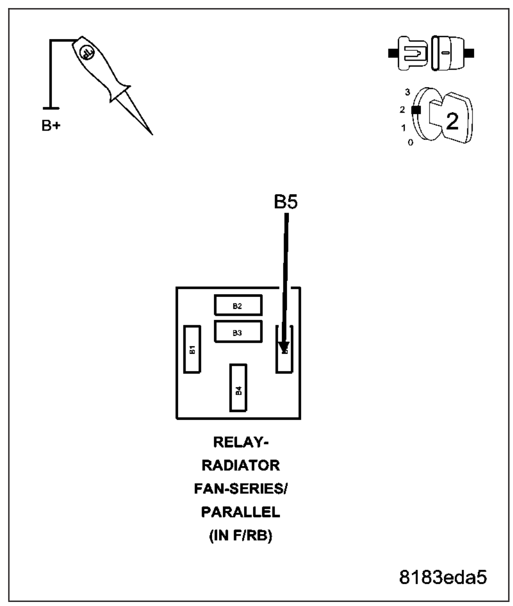
Using a 12-volt test light connected to battery voltage, probe the (N112) Rad Fan Relay Control circuit at the Med/High Rad Fan Relay.

Does the test light illuminate brightly and flash on and off?

Yes >> Replace the Med/High Rad Fan Relay.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 4

4. SERIES/PARALLEL RAD FAN RELAY)



Remove the Series/Parallel Rad Fan Relay.

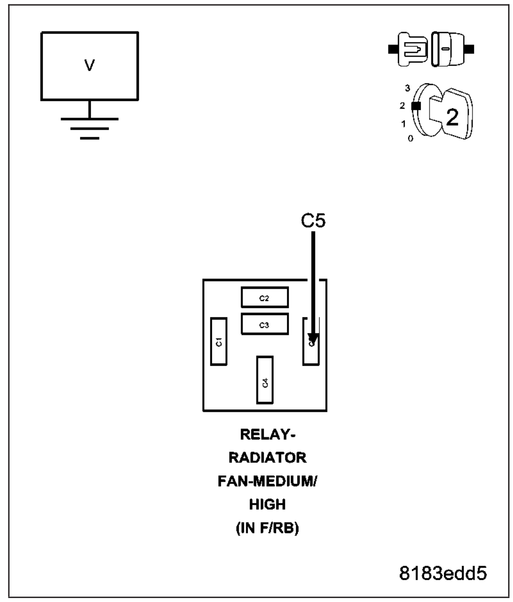
Install the Med/High Rad Fan Relay.

Turn the ignition on, engine not running.

With a scan tool, select Radiator Cooling Fan Relay #2 Control State, Toggle, to actuate the Cooling Fan (Series/Parallel Rad Fan Relay).

Using a 12-volt test light connected to battery voltage, probe the (N112) Rad Fan Relay Control circuit at the Series/Parallel Rad Fan Relay.

Does the test light illuminate brightly and flash on and off?



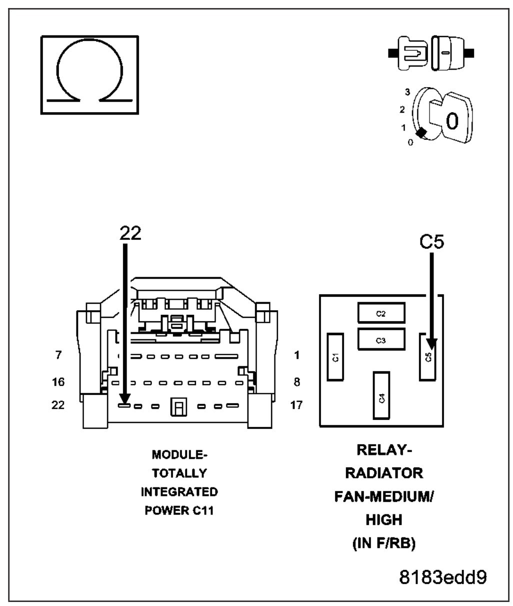
Yes >> Replace the Series/Parallel Rad Fan Relay.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 5

5. (N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE

Disconnect the TIPM C11 harness connector.

Using a voltmeter, measure the voltage of the (N112) Rad Fan Relay Control circuit in the Med/High Rad Fan Relay harness connector.



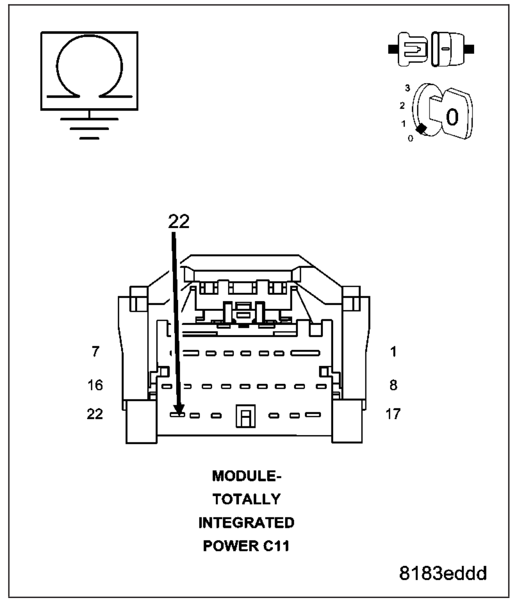
Is there voltage present?

Yes >> Repair the short to voltage in the (N112) Rad Fan Relay Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 6

6. (N112) RAD FAN RELAY CONTROL CIRCUIT OPEN

Measure the resistance of the (N112) Rad Fan Relay Control circuit from the Med/High Rad Fan Relay harness connector to the TIPM C11 harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go To 7

No >> Repair the open in the (N112) Rad Fan Relay Control circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

7. (N112) RAD FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (N112) Rad Fan Relay Control circuit in the TIPM C11 harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (N112) Rad Fan Relay Control circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P0501-VEHICLE SPEED SENSOR 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The vehicle speed sensor rationality is a continuous test that monitors the vehicle speed sensor for lack of activity. The rationality will not run if a limp-in exists for MAP, Throttle Position, and Engine Coolant Temperature. If vehicle speed sensor is below a minimum threshold for a period of time after the vehicle is operated at a sufficient load, a failure will be indicated.

- **When Monitored:**
  With the engine running, transmission not in park or neutral, brakes not applied, and engine RPM greater than 1500.
- **Set Condition:**
  This code will set if no vehicle speed signal is received from the ABS Module for more than 11 seconds for 2 consecutive trips. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active DTCs in the Anti-Lock Brake Module. Any bus, communication, or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VISUAL INSPECTION

NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.

Check tire pressure of all the tires.

Check tire wear on all the tires.

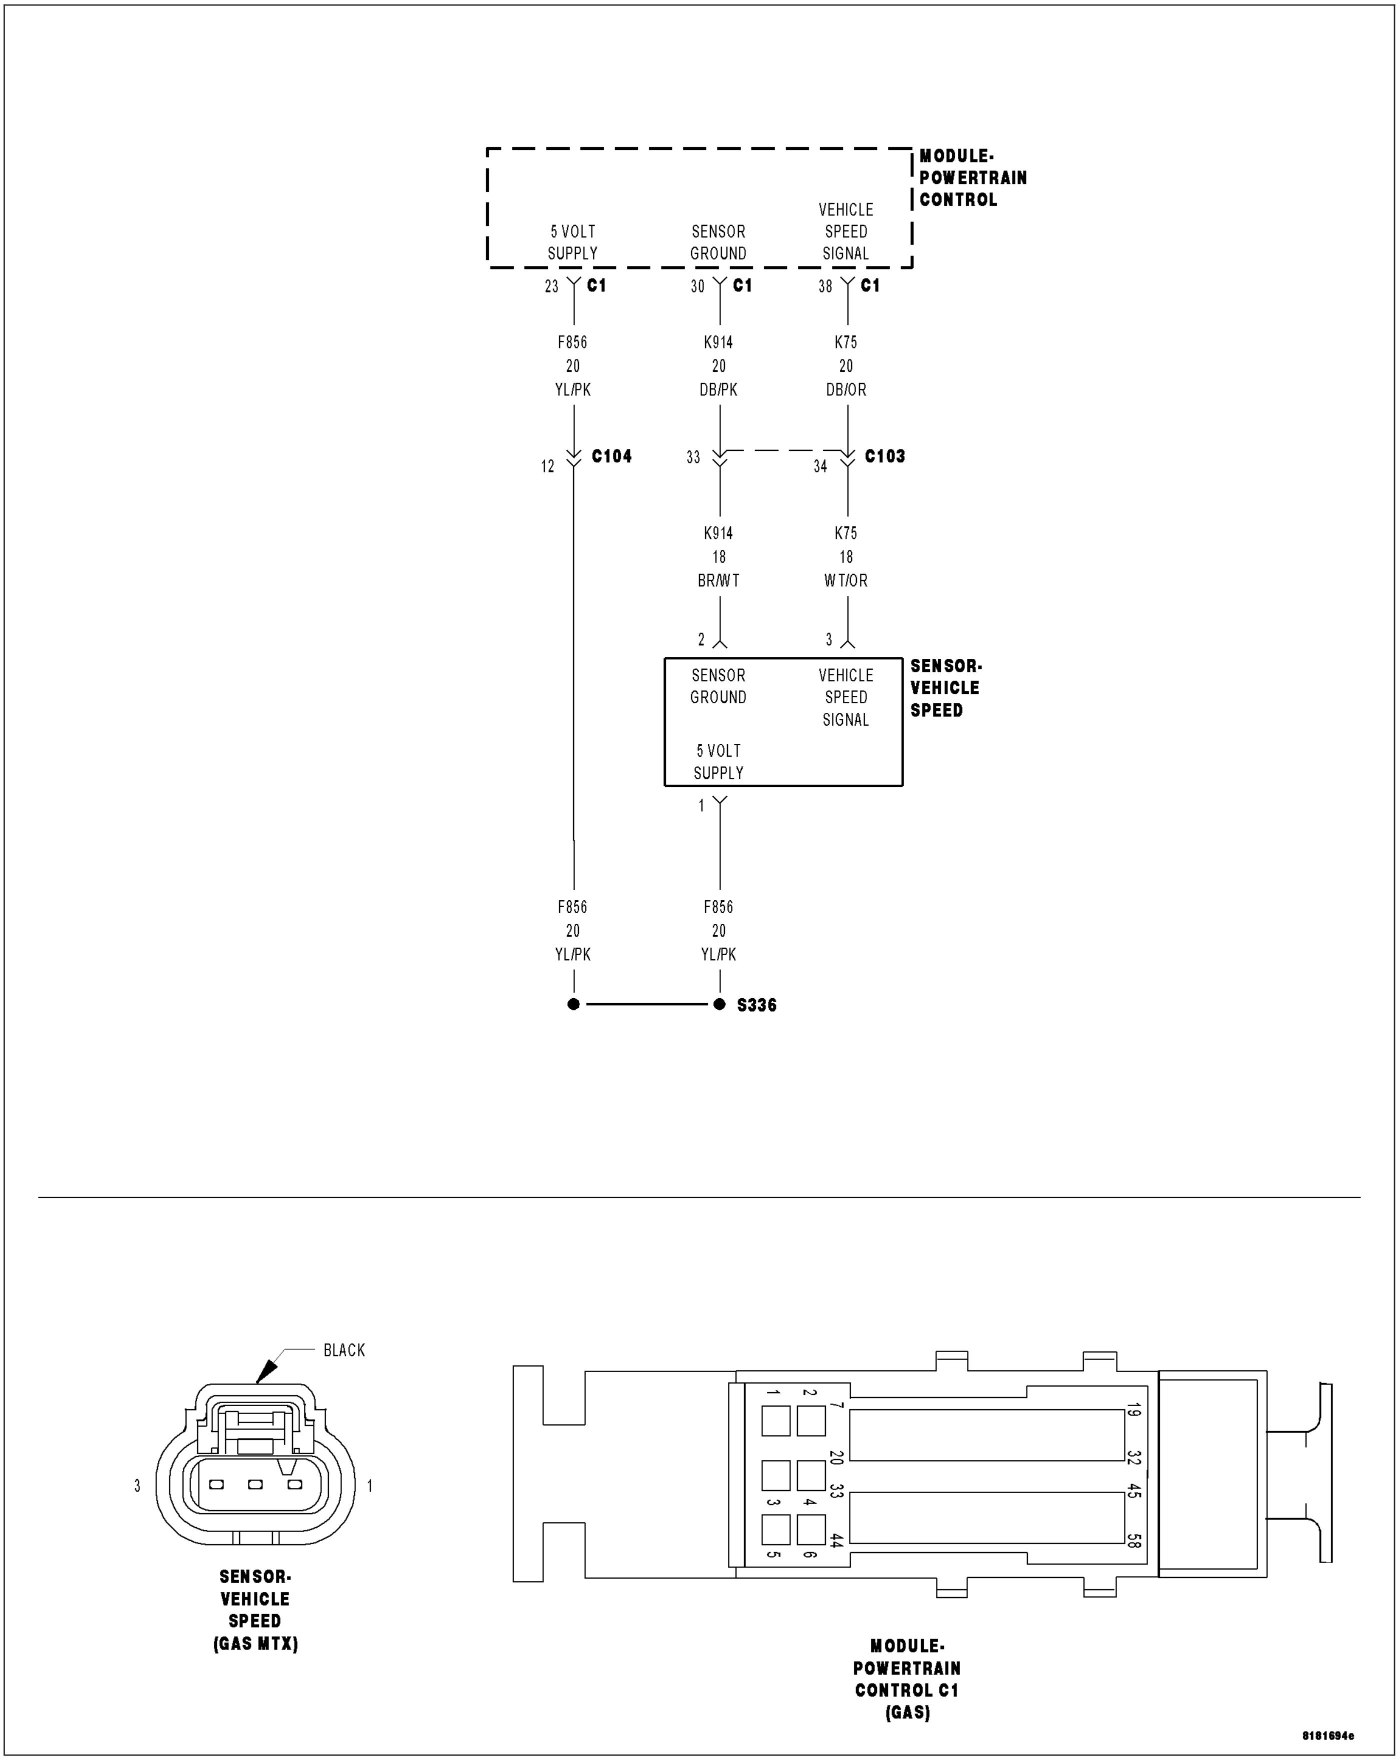
Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes >> Repair as necessary. If the code set during a front OR rear wheel spin condition, no repair is necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. POWERTRAIN CONTROL MODULE (PCM)



Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to this circuit.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0501-VEHICLE SPEED SENSOR 1 PERFORMANCE (MTX NON-ABS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects an implausible voltage on the Vehicle Speed Sensor circuit.

Possible Causes
INTERMITTENT DTC
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
VEHICLE SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

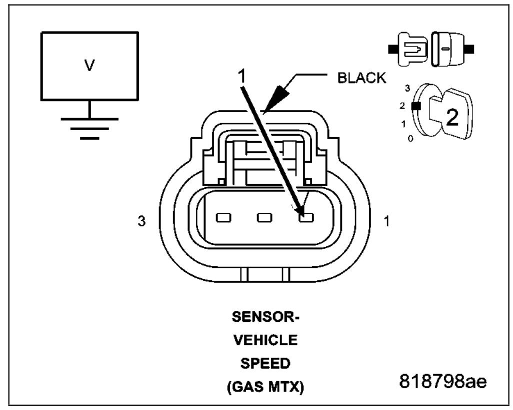
NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



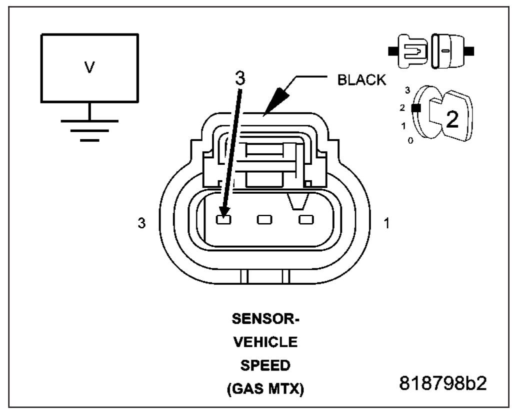
2. (F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Vehicle Speed Sensor connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.



Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 3

No >> Go to 7

3. (K75) VEHICLE SPEED SIGNAL CIRCUIT VOLTAGE

Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 4

No >> Go to 11

4. (K914) SENSOR GROUND CIRCUIT TEST

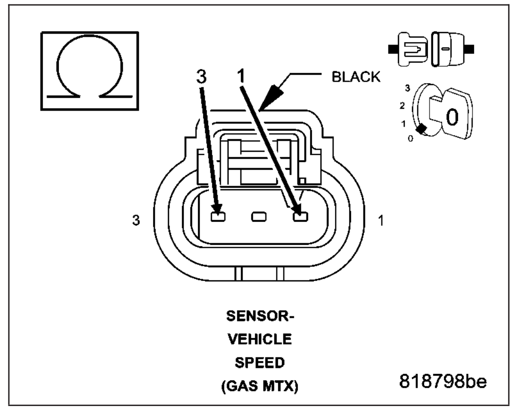
Turn the ignition off.

Using a 12 volt test light connected to 12 volts, check the (K914) Sensor Ground in the Vehicle Speed Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 5



No >> Go to 15

5. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K75) Vehicle Speed Signal circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. VEHICLE SPEED SENSOR

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

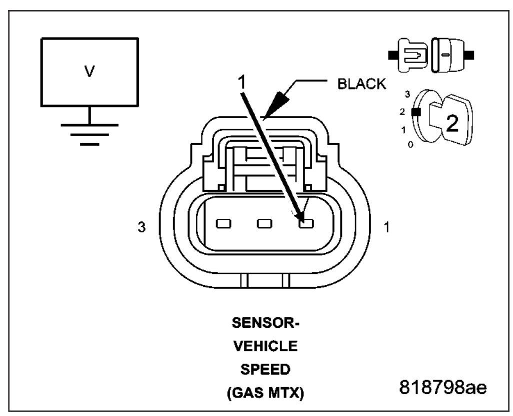
Look for broken, bent, pushed out or corroded terminals.

Inspect the Vehicle Speed Sensor for any condition that would result in an incorrect signal, such as damage, corrosion, or contamination.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Vehicle Speed Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

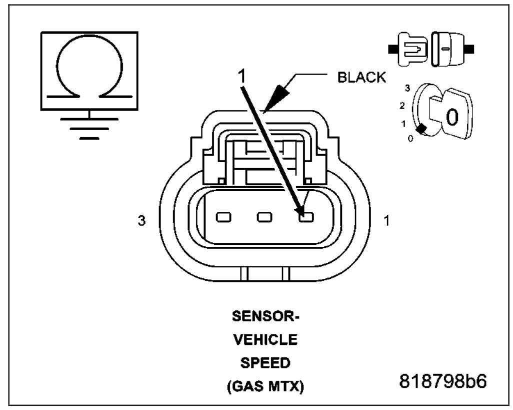
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

Is there any voltage present?



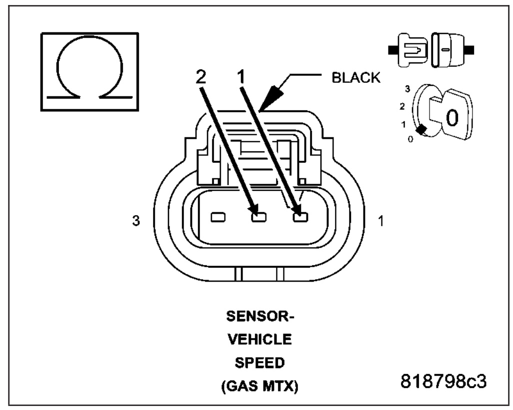
Yes >> Repair the (F856) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.



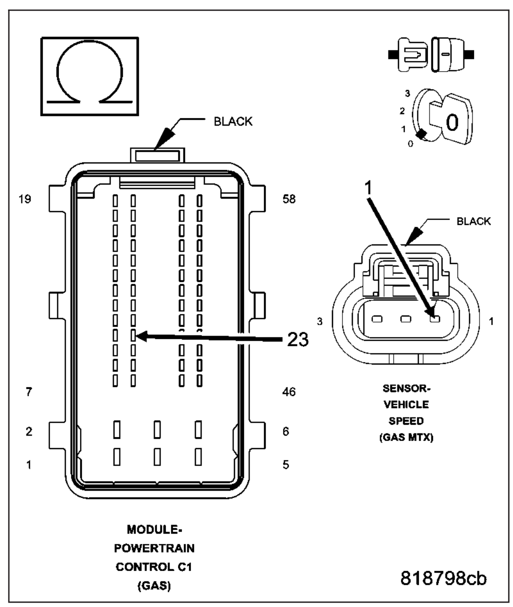
Is the resistance above 100 ohms?

Yes >> Go to 9

No >> Repair the (F856) 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 10

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K914) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

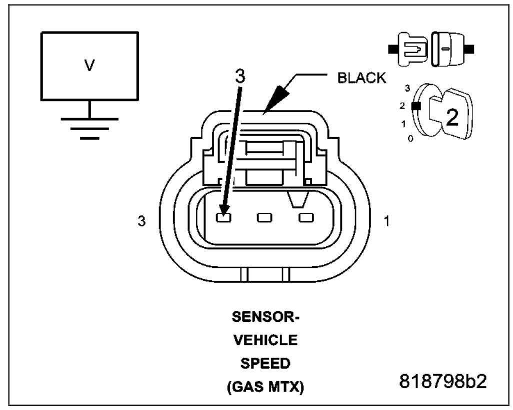
10. (F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (F856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



11. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE

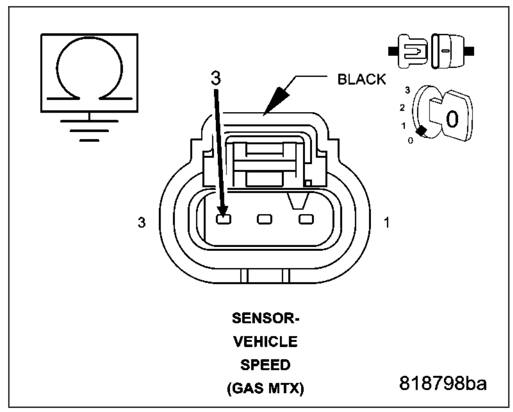
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is there any voltage present?



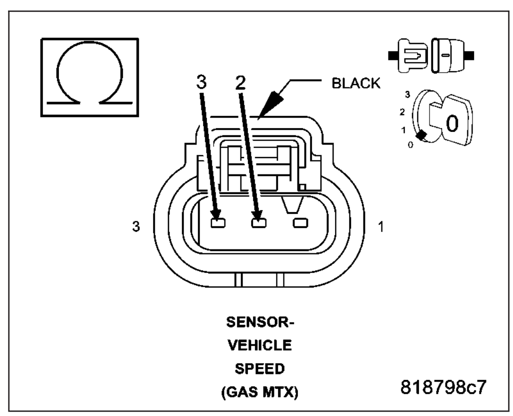
Yes >> Repair the (K75) Vehicle Speed Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 12

12. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.



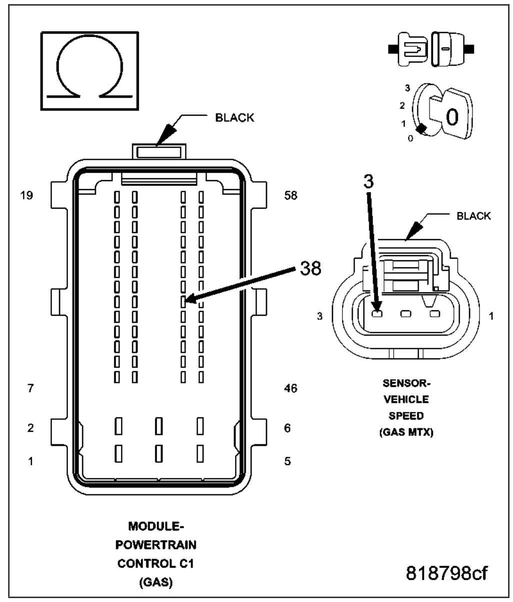
Is the resistance above 100 ohms?

Yes >> Go to 13

No >> Repair the (K75) Vehicle Speed Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO (K914) SENSOR GROUND CIRCUIT

Measure the resistance between the (K75) Vehicle Speed Signal circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 14

No >> Repair the (K75) Vehicle Speed Signal circuit for a short to the (K914) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

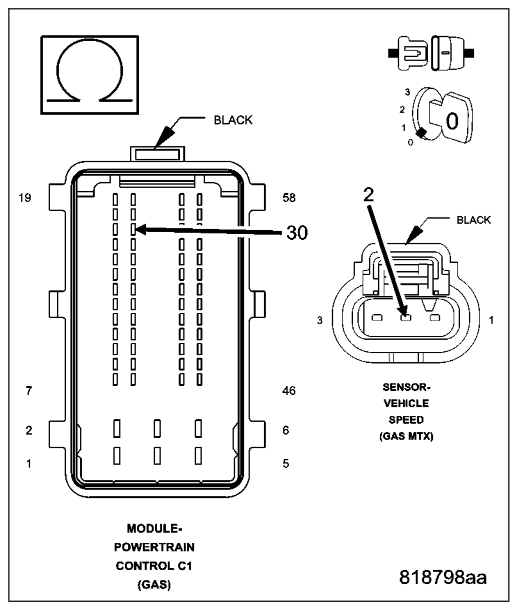
14. (K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K75) Vehicle Speed Signal circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (K75) Vehicle Speed Signal circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

15. (K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance of the (K914) Sensor Ground circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

16. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0501-VEHICLE SPEED SENSOR 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The vehicle speed sensor rationality is a continuous test that monitors the vehicle speed sensor for lack of activity. The rationality will not run if a limp-in exists for MAP, Throttle Position, and Engine Coolant Temperature. If vehicle speed sensor is below a minimum threshold for a period of time after the vehicle is operated at a sufficient load, a failure will be indicated.

- **When Monitored:**
  With the engine running, transmission not in park or neutral, brakes not applied, and engine rpm greater than 1500.
- **Set Condition:**
  This code will set if no vehicle speed signal is received from the ABS Module for more than 11 seconds for 2 consecutive trips. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
ACTIVE BUS OR COMMUNICATION DTCS
TIRE CIRCUMFERENCE
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active DTCs in the Anti-Lock Brake Module. Any bus, communication, or VSS DTCs in the Anti-Lock Brake Module must be properly diagnosed before continuing.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VISUAL INSPECTION

NOTE: This code can set due to tire circumference differences and from the front or rear wheels being on a slippery surface while the opposite tires are not.

This code may also set on a hard acceleration on loose gravel or during other off road driving conditions.

Check tire pressure of all the tires.

Check tire wear on all the tires.

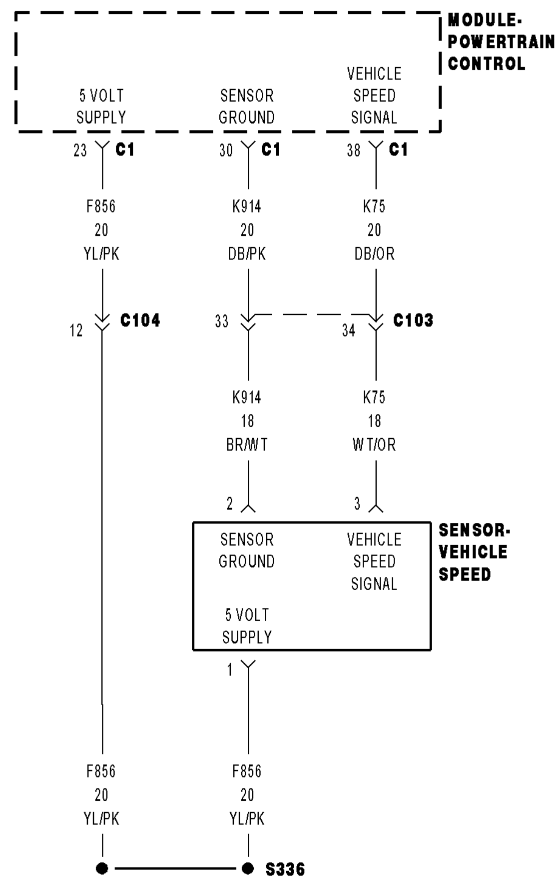
Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

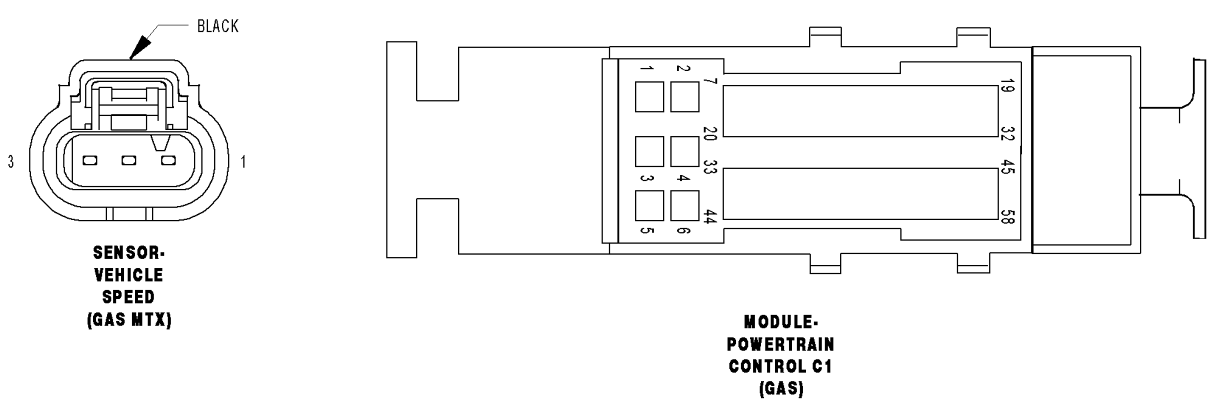
Yes >> Repair as necessary. If the code set during a front OR rear wheel spin condition, no repair is necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. POWERTRAIN CONTROL MODULE (PCM)



Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to this circuit.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.



Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0503-VEHICLE SPEED SENSOR 1 ERRATIC (MTX NON-ABS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects an implausible voltage on the Vehicle Speed Sensor circuit.

Possible Causes
INTERMITTENT DTC
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
VEHICLE SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

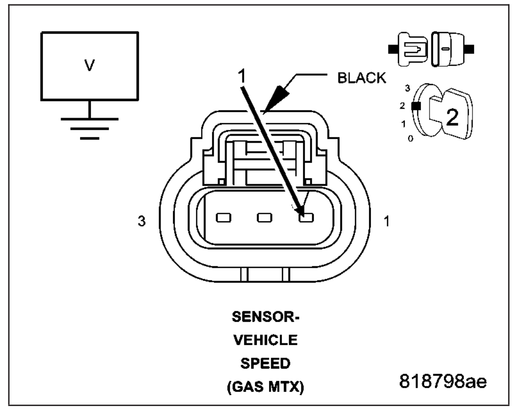
NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



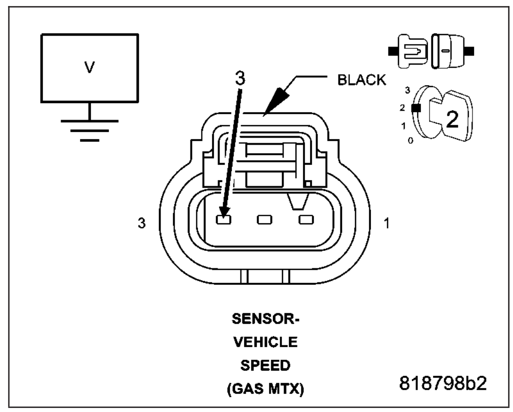
2. (F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Vehicle Speed Sensor connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.



Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 3

No >> Go to 7

3. (K75) VEHICLE SPEED SIGNAL CIRCUIT VOLTAGE

Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 4

No >> Go to 11

4. (K914) SENSOR GROUND CIRCUIT TEST

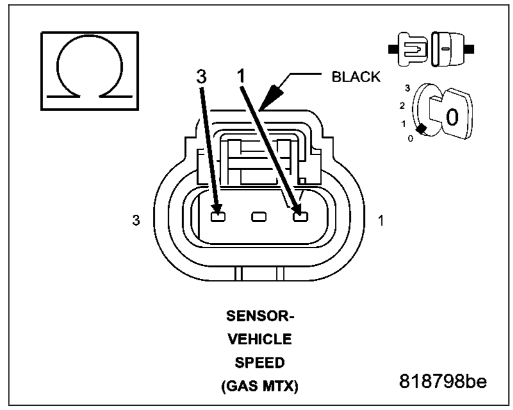
Turn the ignition off.

Using a 12 volt test light connected to 12 volts, check the (K914) Sensor Ground in the Vehicle Speed Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 5



No >> Go to 15

5. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K75) Vehicle Speed Signal circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. VEHICLE SPEED SENSOR

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Inspect the Vehicle Speed Sensor for any condition that would result in an incorrect signal, such as damage, corrosion, or contamination.

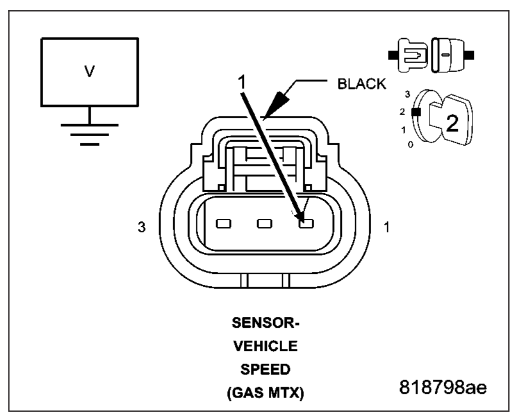
Were any problems found?

Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Vehicle Speed Sensor.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

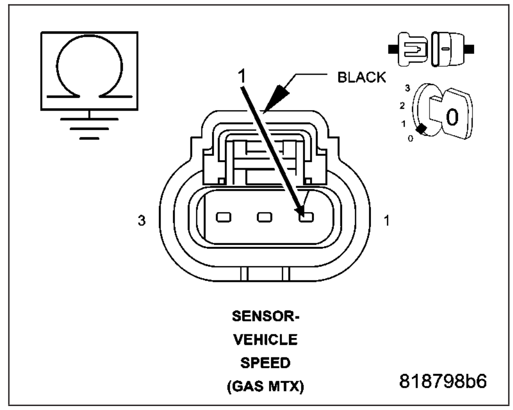
Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (F856) 5 Volt Supply circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

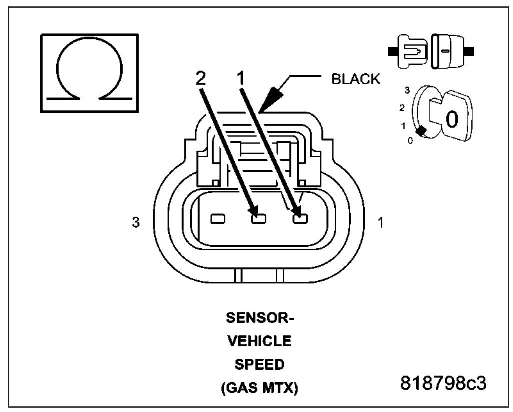
No >> Go to 8

8. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 9

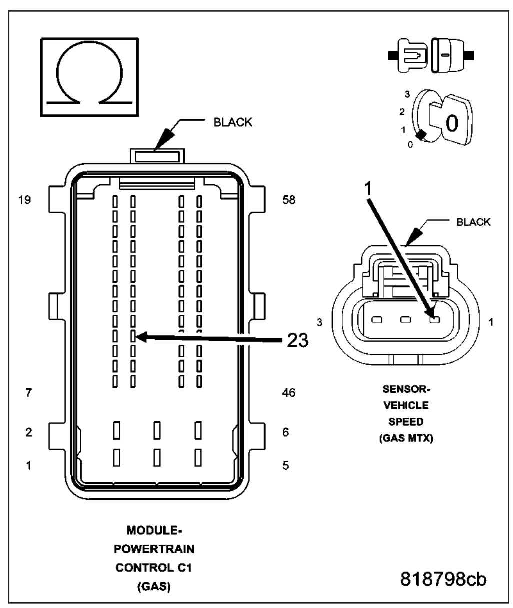
No >> Repair the (F856) 5 Volt Supply circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 10

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K914) Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

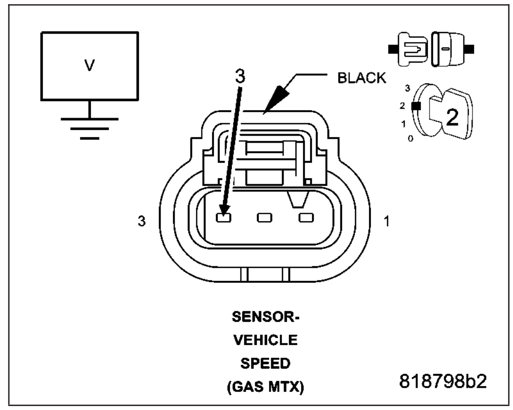
Measure the resistance of the (F856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



11. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE

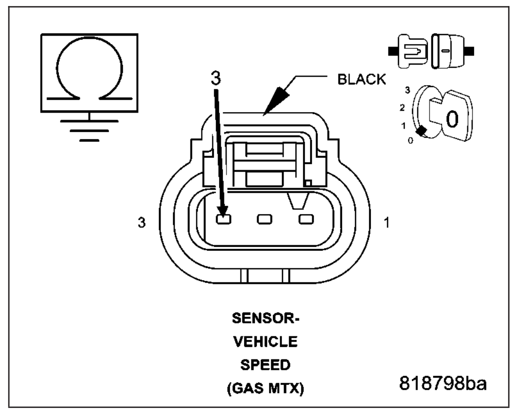
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is there any voltage present?



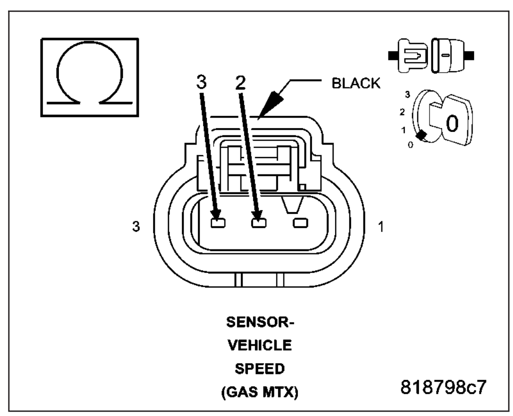
Yes >> Repair the (K75) Vehicle Speed Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 12

12. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.



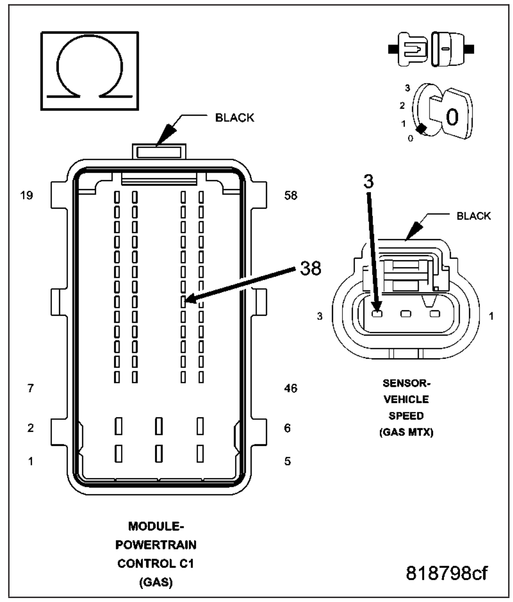
Is the resistance above 100 ohms?

Yes >> Go to 13

No >> Repair the (K75) Vehicle Speed Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO (K914) SENSOR GROUND CIRCUIT

Measure the resistance between the (K75) Vehicle Speed Signal circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 14

No >> Repair the (K75) Vehicle Speed Signal circuit for a short to the (K914) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

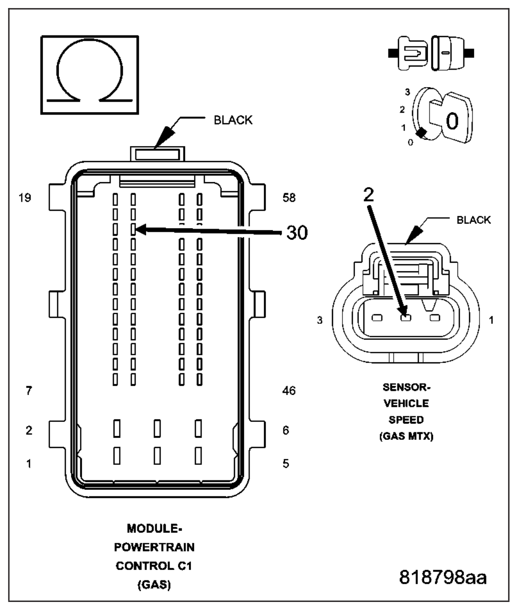
14. (K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K75) Vehicle Speed Signal circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (K75) Vehicle Speed Signal circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

15. (K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance of the (K914) Sensor Ground circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

16. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0506-IDLE SPEED PERFORMANCE LOWER THAN EXCEPTED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The objective of the Idle Speed Rationality monitor is to evaluate the ability of the idle speed control system to achieve and maintain a steady idle, by monitoring engine RPM during idle. If engine RPM is not within a calibrated deadband of target idle speed, a timer is started. If the timer reaches a maximum threshold without any sign of the RPM trending towards control, a soft failure is generated.

- **When Monitored:**
  With the engine idling in drive (for CVT vehicles) with the brake applied, MAF < 250 mg/tdc, air temp > -17.8° C (0° F) enable after coolant temp > 70° C (158° F), canister purge < 100% duty cycle, and no VSS, MAF/MAP, ECT, TPS, ETC, CKP Sensor, fuel system, or injector DTCs present.
- **Set Condition:**
  Engine speed is 100 RPM or more below target idle speed for 30 seconds. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
AIR INDUCTION SYSTEM LEAKS OR RESTRICTIONS
PCV SYSTEM LEAKS OR RESTRICTIONS
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: It is possible for ETC DTCs to be set at the same time as this DTC. Proceed with this test only if the other DTCs that are present are ETC related, but clear them before proceeding. If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. AIR INDUCTION SYSTEM

Inspect the air induction system for the following problems:

Restrictions - dirty air cleaner, foreign material trapped in the air intake tube, etc.

Leaks - air intake tube connection, air cleaner housing, etc.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. PCV SYSTEM

Inspect the PCV system for the following problems:

Restrictions - sticking valve, collapsed hoses or tubes, obstructed passages or ports, etc.

Leaks - cracked or damaged hoses or tubes, poor hose or tube connections, PCV valve stuck open, etc.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. THROTTLE BODY OPERATION

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Inspect the throttle body for carbon build up or other restrictions.

Using a straight edge, verify that the throttle plate is not bent. If the throttle plate is bent, the throttle body must be replaced.

Start the engine.

While the engine is running, lightly tap on the ETC Motor, and listen for the idle to change.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the throttle body and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0507-IDLE SPEED PERFORMANCE HIGHER THAN EXCEPTED

For a complete wiring diagram **Refer to Section 8W**.

Theory of Operation

The objective of the Idle Speed Rationality monitor is to evaluate the ability of the idle speed control system to achieve and maintain a steady idle, by monitoring engine RPM during idle. If engine RPM is not within a calibrated deadband of target idle speed, a timer is started. If the timer reaches a maximum threshold without any sign of the RPM trending towards control, a soft failure is generated.

- **When Monitored:**
  With the engine idling in drive (for CVT vehicles) with the brake applied, MAF < 250 mg/tdc, air temp > -17.8° C (0° F) enable after coolant temp > 70° C (158° F), canister purge < 100% duty cycle, and no VSS, MAF/MAP, ECT, TPS, ETC, CKP Sensor, fuel system, or injector DTCs present.
- **Set Condition:**
  If the idle speed is 175 RPM or more above the target idle speed for 30 seconds. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
AIR INDUCTION SYSTEM LEAKS OR RESTRICTIONS
PCV SYSTEM LEAKS OR RESTRICTIONS
VACUUM LEAKS
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: It is possible for ETC DTCs to be set at the same time as this DTC. Proceed with this test only if the other DTCs that are present are ETC related, but clear them before proceeding. If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. AIR INDUCTION SYSTEM LEAKS OR RESTRICTIONS

Inspect the air induction system for the following problems:

Restrictions - dirty air cleaner, foreign material trapped in the air intake tube, etc.

Leaks - air intake tube connection, air cleaner housing, etc.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. PCV SYSTEM

Inspect the PCV system for the following problems:

Restrictions - sticking valve, collapsed hoses or tubes, obstructed passages or ports, etc.

Leaks - cracked or damaged hoses or tubes, hose or tube connections disconnected at PCV valve or throttle body, PCV valve stuck open, etc.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. ENGINE VACUUM LEAKS

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.

Inspect the engine for external vacuum leaks.

Inspect the engine for internal leaks.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. THROTTLE BODY OPERATION

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Inspect the throttle body for carbon build up or other restrictions.

Using a straight edge, verify that the throttle plate is not bent. If the throttle plate is bent, the throttle body must be replaced.

Start the engine.

While the engine is running, lightly tap on ETC Motor, and listen for the idle to change.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the throttle body and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module per Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0513-INVALID SKIM KEY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM detects an invalid ignition key. One Trip Fault.

Possible Causes
INCORRECT VIN PROGRAMMED IN THE PCM
NO COMMUNICATION WITH SKREEM/WCM
NO VIN PROGRAMMED IN THE PCM
IGNITION KEY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Go to 6

2. NO COMMUNICATION WITH SKREEM/WCM

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

With the scan tool, attempt to communicate with the SKREEM/WCM.

Can the scan tool communicate with the SKREEM/WCM?

Yes >> Go to 3

No >> Refer to Section 8 - Electrical VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS and perform the appropriate Diagnostic Procedure.

Perform the SKREEM/WCM VERIFICATION Test.

3. SKREEM/WCM TROUBLE CODES SET

With the scan tool, check for SKREEM/WCM DTCs.

Are any DTCs present in the SKREEM/WCM?

Yes >> Refer to Section 8 - Electrical VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS and perform the appropriate Diagnostic Procedure.

Perform the SKREEM/WCM VERIFICATION Test.

No >> Go to 4

4. VIN PROGRAMMED INTO PCM

With the scan tool, display the VIN that is programmed in the PCM.

Has a VIN been programmed into the PCM?

Yes >> Go to 5

No >> Program the correct VIN into the PCM and retest.
Perform the SKREEM/WCM VERIFICATION Test.

5. POWERTRAIN CONTROL MODULE (PCM)

Turn the ignition off.

Replace and program the SKREEM/WCM in accordance with the Service Information.

Ignition on, engine not running.

With the scan tool, erase all SKREEM/WCM and PCM DTCs.

Attempt to start the engine.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> NOTE: Before continuing, check the PCM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary. Replace and program the Powertrain Control Module in accordance with the Service Information.
Perform the SKREEM/WCM VERIFICATION Test.

No >> Test Complete.

6. IGNITION KEY

NOTE: This DTC could have been set if the SKREEM/WCM harness connector was disconnected, or if the SKREEM/WCM was replaced recently.

NOTE: All of the ignition keys for this vehicle must be tested to verify proper operation.

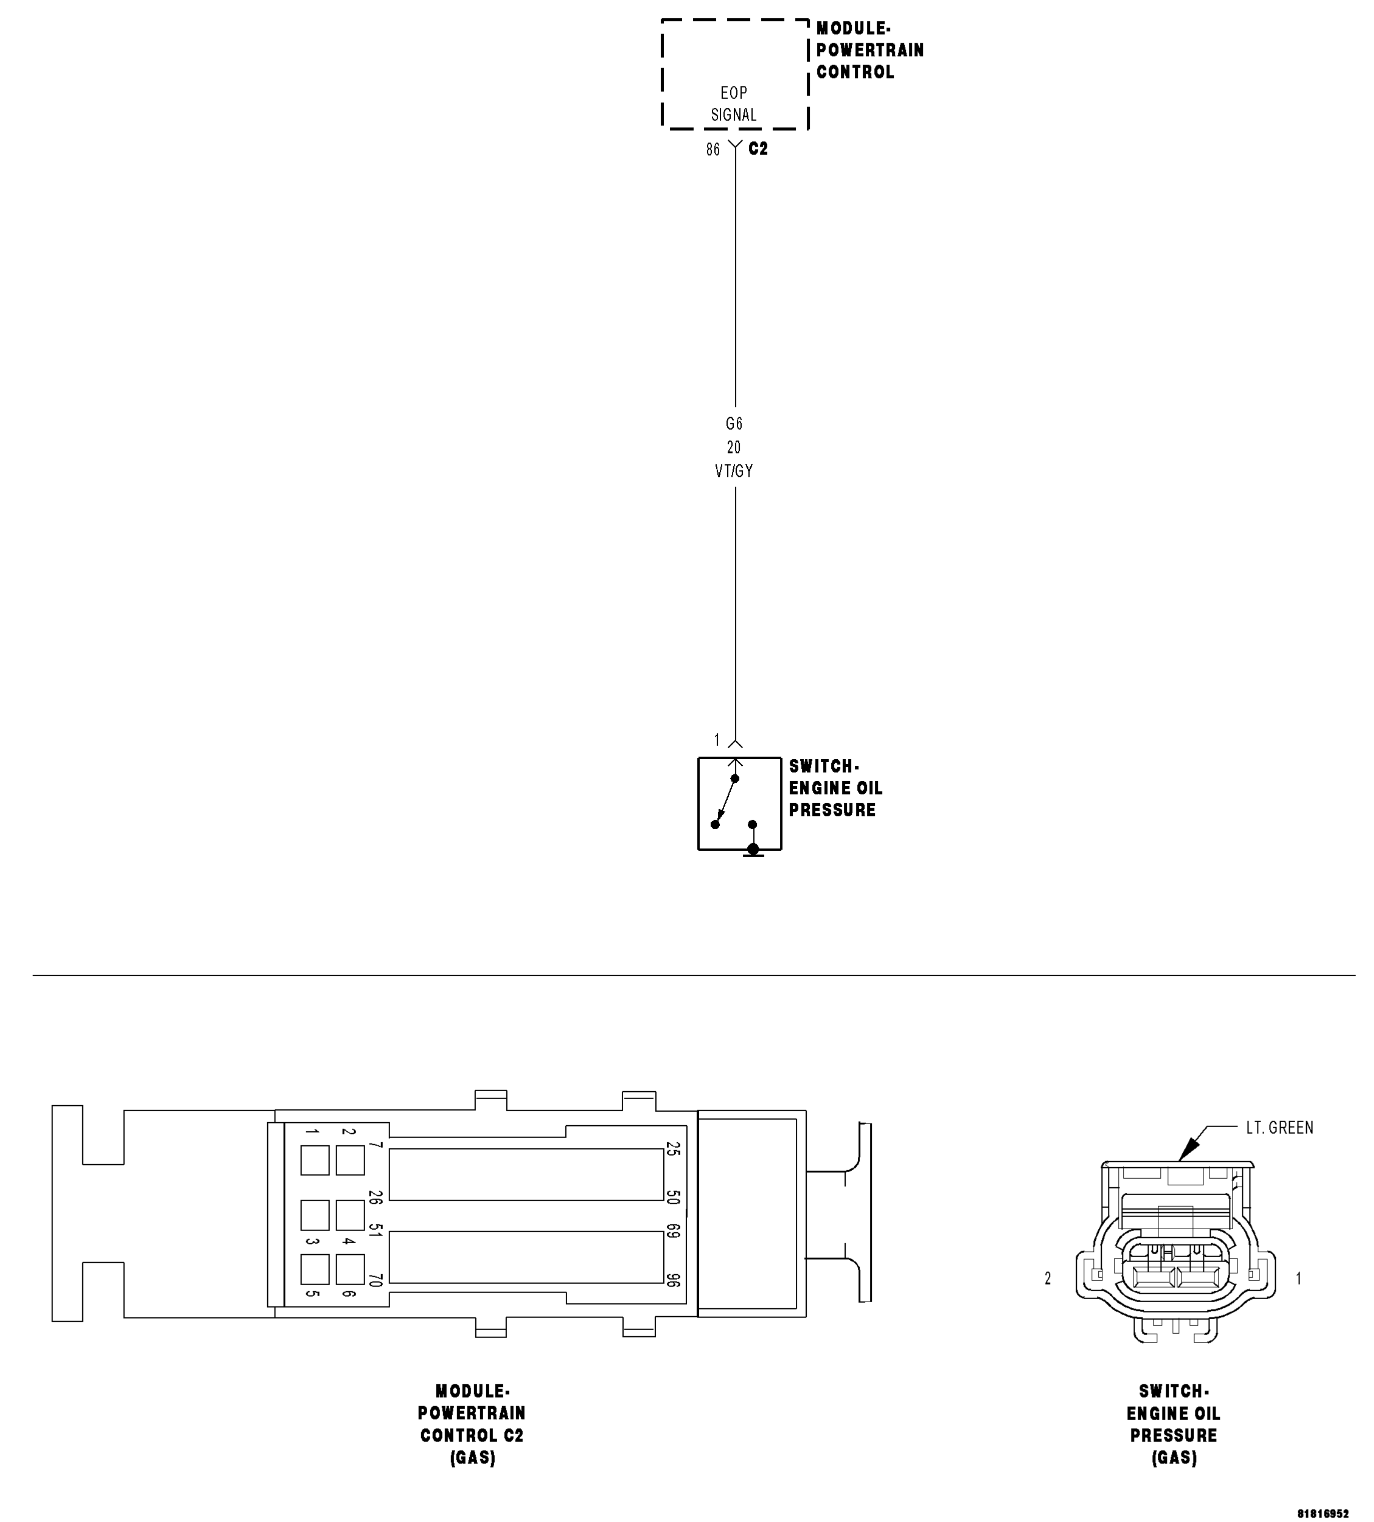
Ignition on, engine not running.

Verify that the correct VIN is programmed into the PCM and SKREEM/WCM.

Turn the ignition off.

Using each vehicle key, turn the ignition on and start the engine.

With a scan tool, View DTCs for each key.



Is the status Active for this DTC?

Yes >> Replace the ignition key.
Perform the SKREEM/WCM VERIFICATION Test.

No >> Test Complete.

NOTE: If this DTC cannot be reset, it could have been an actual theft attempt.

P0522-ENGINE OIL PRESSURE SWITCH CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (G6) EOP Signal circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(G6) EOP SIGNAL CIRCUIT SHORTED TO GROUND
(G6) EOP SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL PRESSURE SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

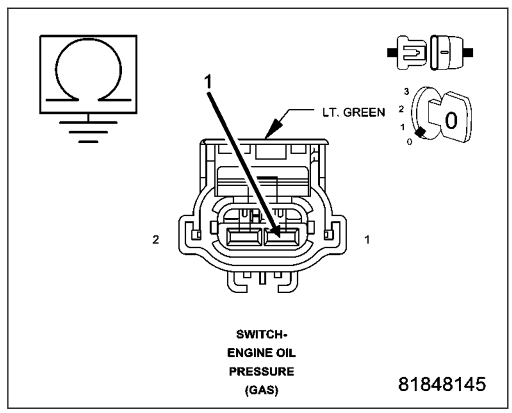
Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (G6) EOP SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

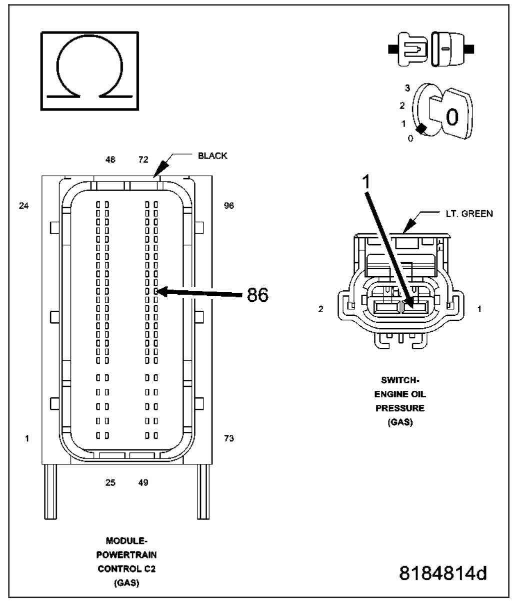
Disconnect the Engine Oil Pressure Switch connector.



Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (G6) EOP Signal circuit in the Engine Oil Pressure Switch harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 3

No >> Repair the (G6) EOP Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (G6) EOP SIGNAL CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (G6) EOP Signal circuit between the Engine Oil Pressure Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (G6) EOP Signal circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. ENGINE OIL PRESSURE SWITCH

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, select View DTCs.

NOTE: The PCM should display an Engine Oil Pressure Sensor Circuit High DTC with the switch disconnected.

Is the status Active for an Engine Oil Pressure Sensor Circuit High DTC with the switch disconnected?

Yes >> Replace the Engine Oil Pressure Switch in accordance with the service information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

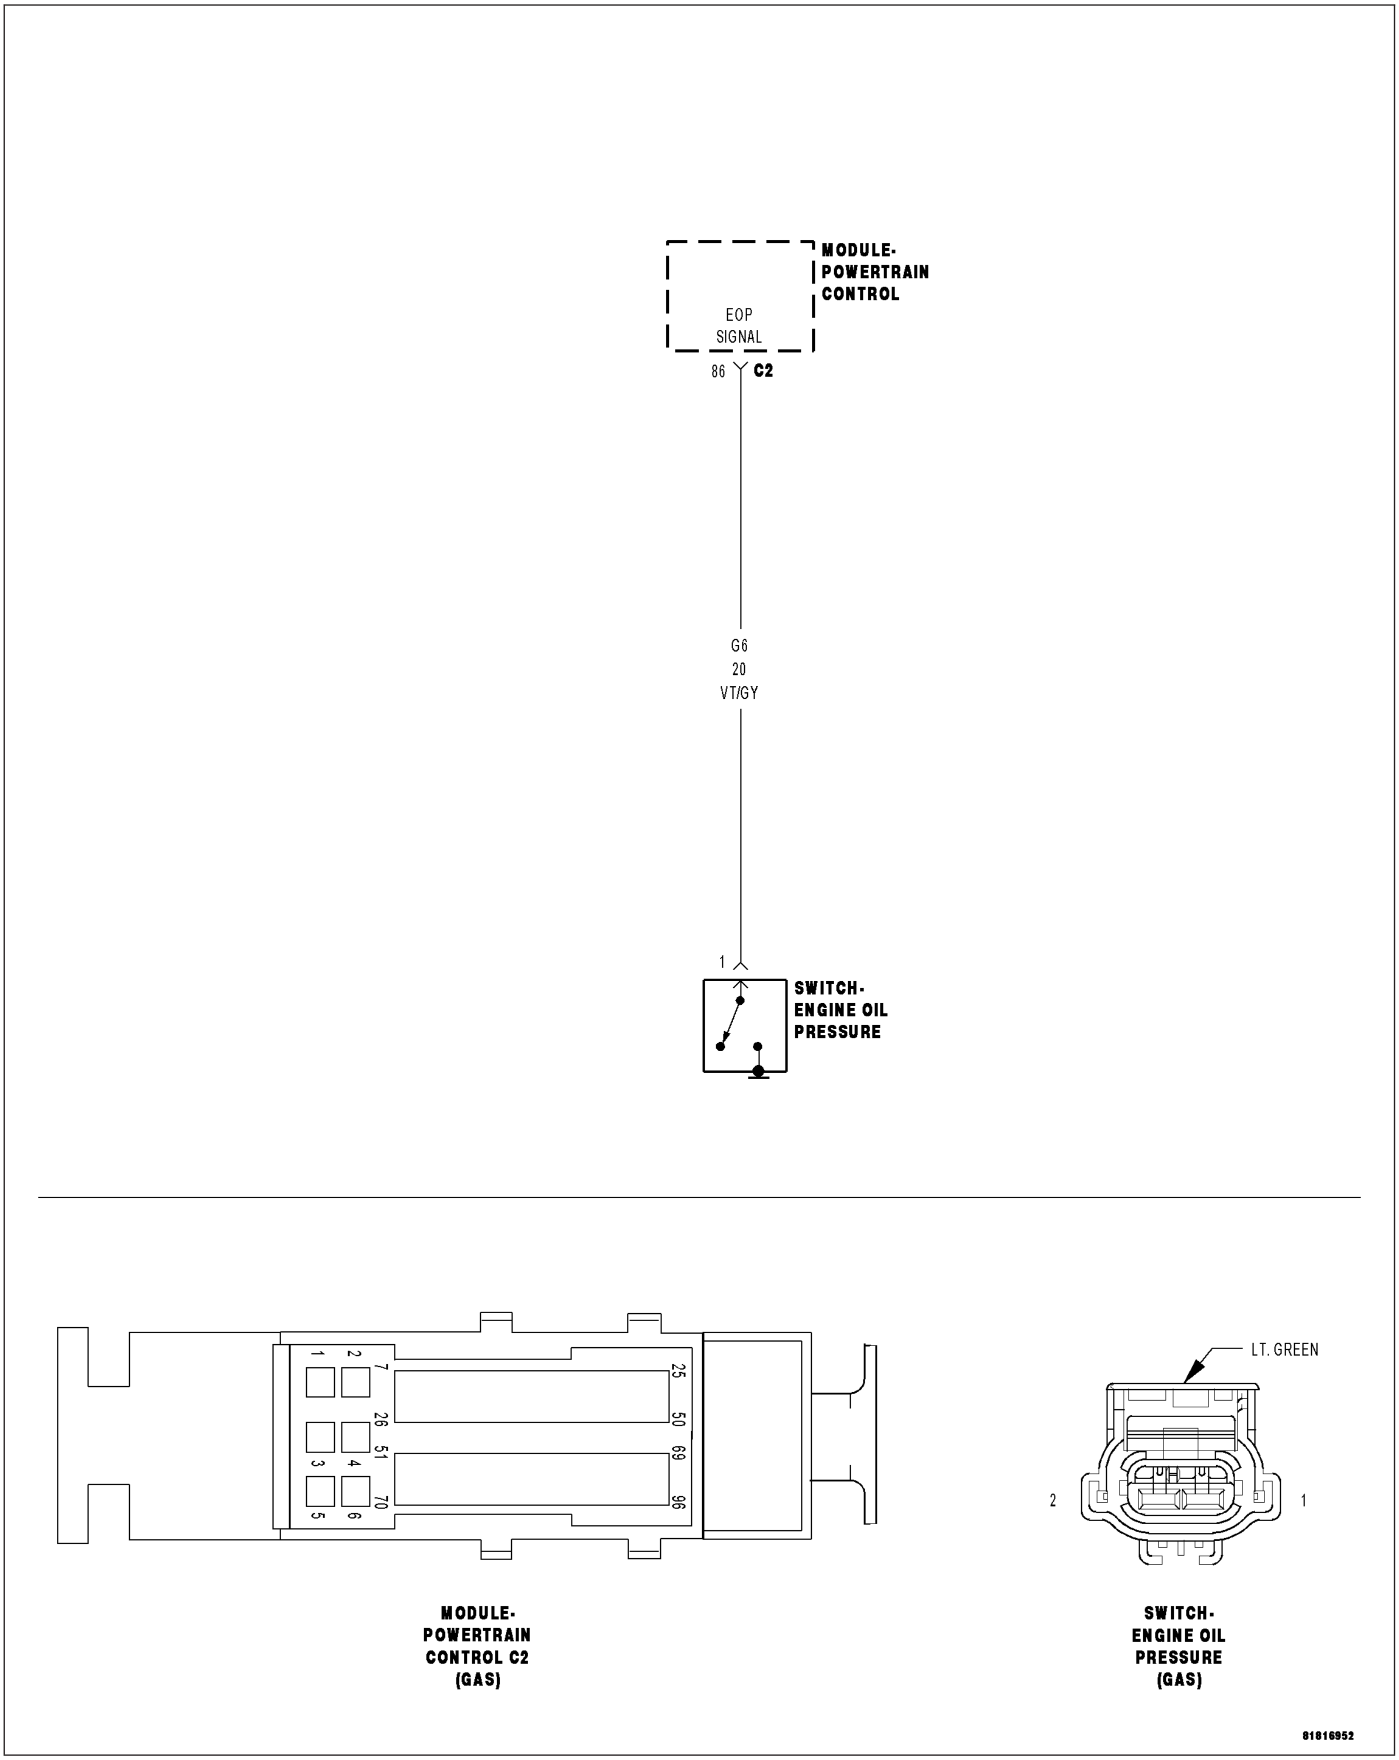
No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Pressure Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0523-ENGINE OIL PRESSURE SWITCH CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (G6) EOP Signal circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(G6) EOP SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G6) EOP SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE OIL PRESSURE SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

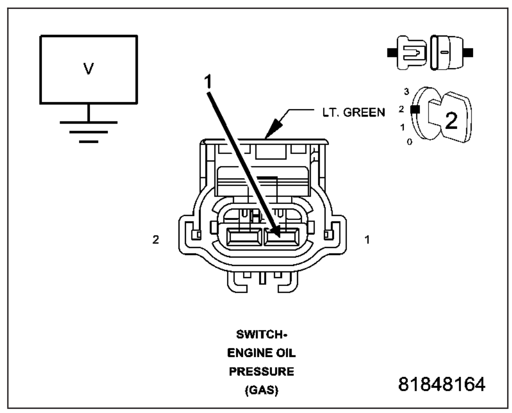
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (G6) EOP SIGNAL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Engine Oil Pressure Switch connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (G6) EOP Signal circuit in the Engine Oil Pressure Switch harness connector.

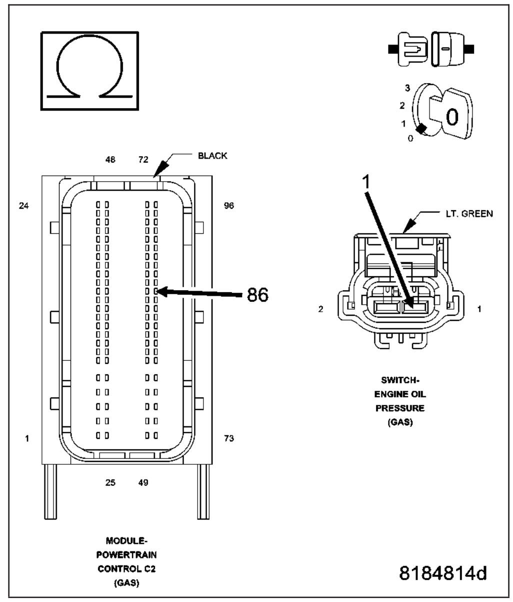
Is there any voltage present?

Yes >> Repair the (G6) EOP Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (G6) EOP SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.



Measure the resistance of the (G6) EOP Signal circuit between the Engine Oil Pressure Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (G6) EOP Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

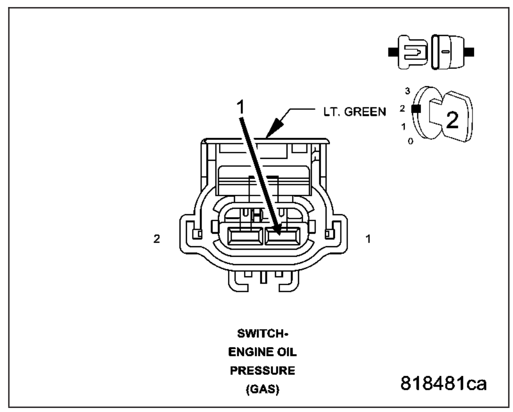
4. ENGINE OIL PRESSURE SWITCH

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between ground and the (G6) EOP Signal circuit in the Engine Oil Pressure Switch harness connector.

Turn the ignition on.



NOTE: The PCM should display an Engine Oil Pressure Sensor Circuit Low DTC with the jumper wire in place.

Is the status Active for an Engine Oil Pressure Sensor Circuit High DTC with the jumper wire in place?

Yes >> Replace the Engine Oil Pressure Switch in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

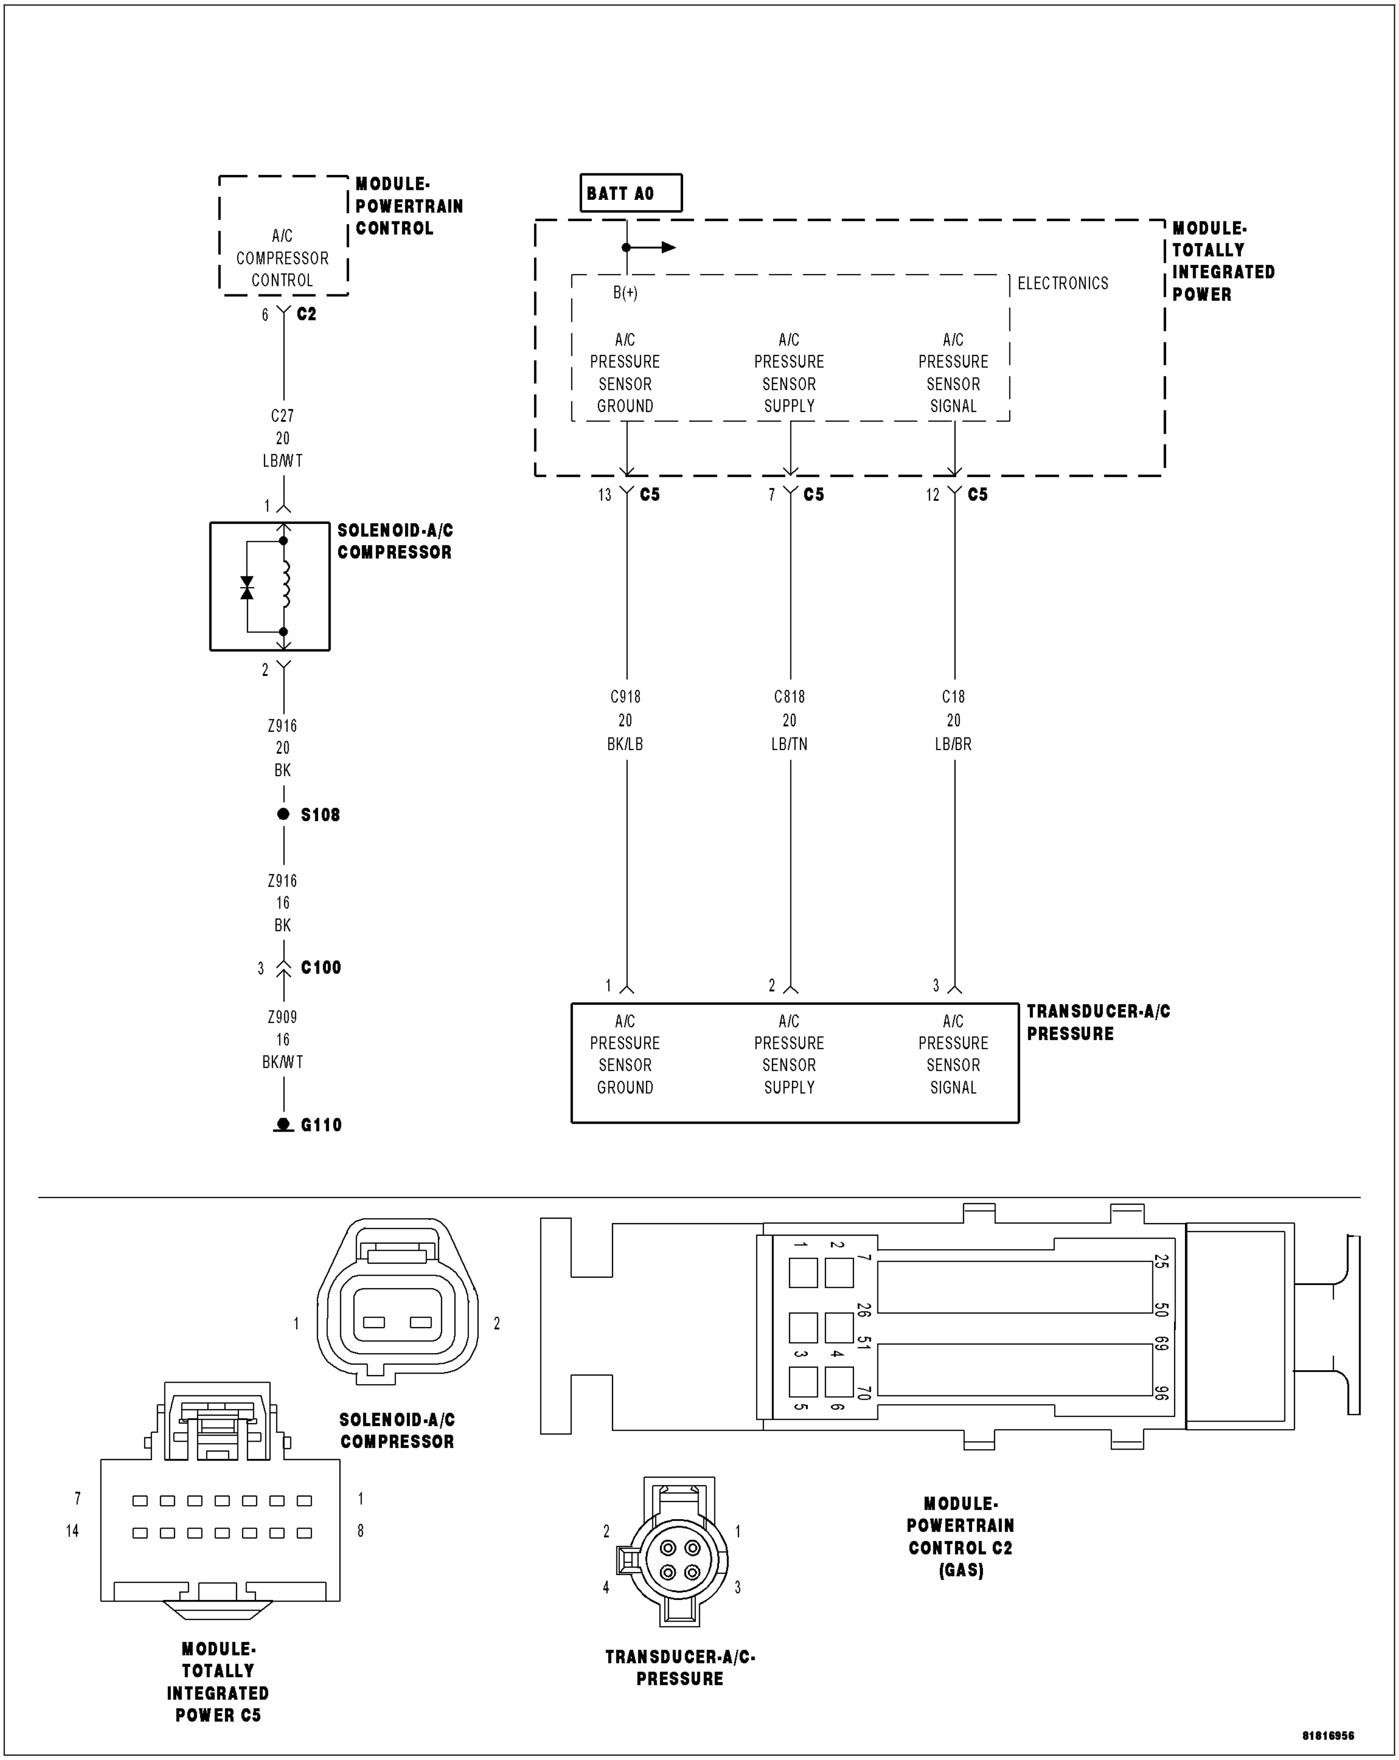
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Oil Pressure Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0532-A/C PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (C18) A/C Pressure Sensor Signal circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO (C918) A/C PRESSURE SENSOR GROUND CIRCUIT
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (C918) A/C PRESSURE SENSOR GROUND CIRCUIT
(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
A/C PRESSURE TRANSDUCER
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

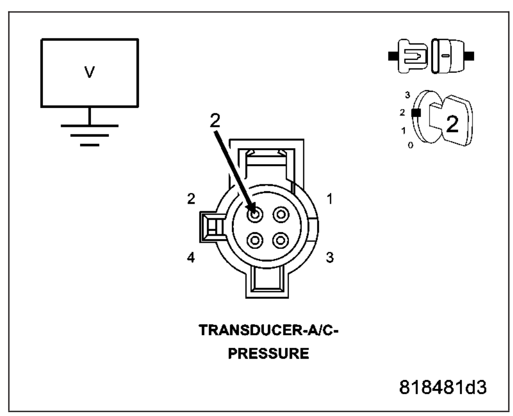
NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

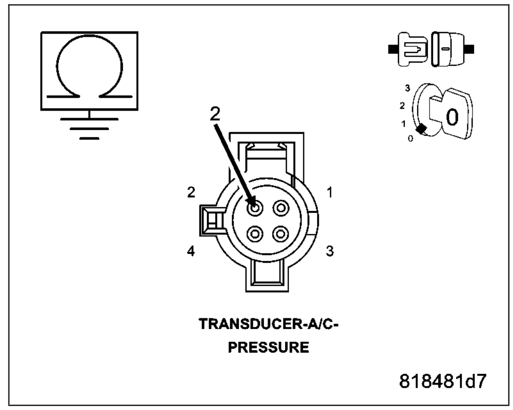
Disconnect the A/C Pressure Transducer connector.

Turn the ignition on.

Measure the voltage of the (C818) A/C Pressure Sensor Supply circuit in the A/C Pressure Transducer harness connector.

Is the voltage above 4.5 volts?

Yes >> Go to 6



No >> Go to 3

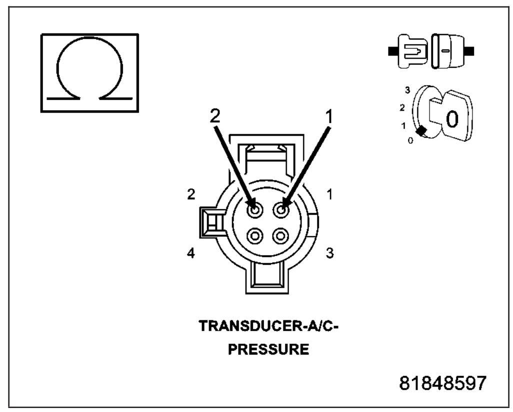
3. (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition on.

Disconnect the Totally Integrated Power Module (TIPM) connector.

Measure the resistance between ground and the (C818) A/C Pressure Sensor Supply circuit in the A/C Pressure Transducer harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 4

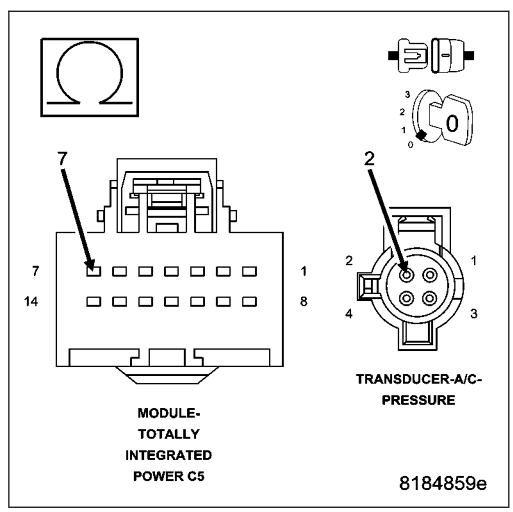
No >> Repair the (C818) A/C Pressure Sensor Supply circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO (C918) A/C PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (C818) A/C Pressure Sensor Supply circuit and the (C918) A/C Pressure Sensor Ground circuit in the A/C Pressure Transducer harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 5

No >> Repair the (C818) A/C Pressure Sensor Supply circuit for a short to the (C918) A/C Pressure Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

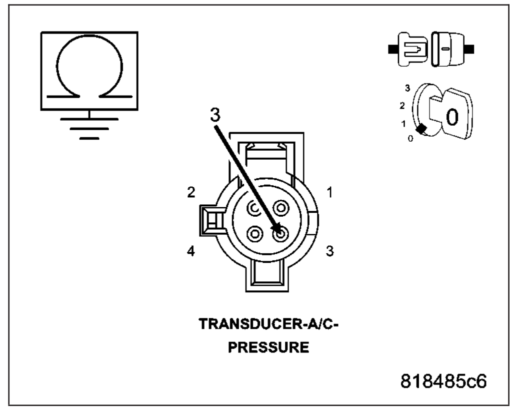
5. (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C818) A/C Pressure Sensor Supply circuit between the A/C Pressure Transducer harness connector and the Totally Integrated Power Module (TIPM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (C818) A/C Pressure Sensor Supply circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

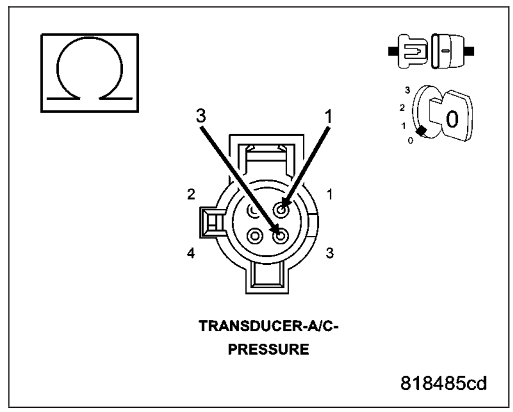
6. (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) connector.

Measure the resistance between ground and the (C18) A/C Pressure Sensor Signal circuit in the A/C Pressure Transducer harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 7

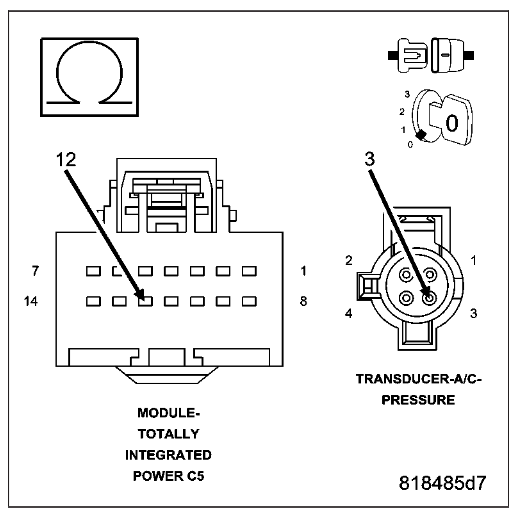
No >> Repair the (C18) A/C Pressure Sensor Signal circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (C918) A/C PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (C18) A/C Pressure Sensor Signal circuit and the (C918) A/C Pressure Sensor Ground circuit in the A/C Pressure Transducer harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 8

No >> Repair the (C18) A/C Pressure Sensor Signal circuit for a short to the (C918) A/C Pressure Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C18) A/C Pressure Sensor Signal circuit between the A/C Pressure Transducer harness connector and the Totally Integrated Power Module (TIPM) harness connector.

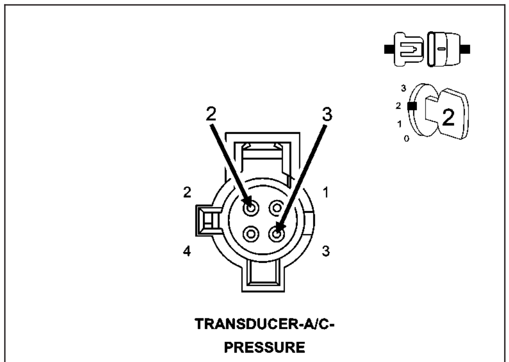
Is the resistance below 5.0 ohms?

Yes >> Go to 9

No >> Repair the (C18) A/C Pressure Sensor Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. AC PRESSURE TRANSDUCER



Turn the ignition off.

Connect the Totally Integrated Power Module (TIPM) connector.

Connect a jumper wire between the (C818) A/C Pressure Sensor Supply circuit and the (C18) A/C Pressure Sensor Signal circuit in the A/C Pressure Transducer harness connector.

Turn the ignition on.

With the scan tool, read the AC Pressure Transducer signal voltage.

818485de

Is the voltage above 4.5 volts with the jumper wire in place?

Yes >> Replace the A/C Pressure Transducer in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 10

10. TOTALLY INTEGRATED POWER MODULE (TIPM)

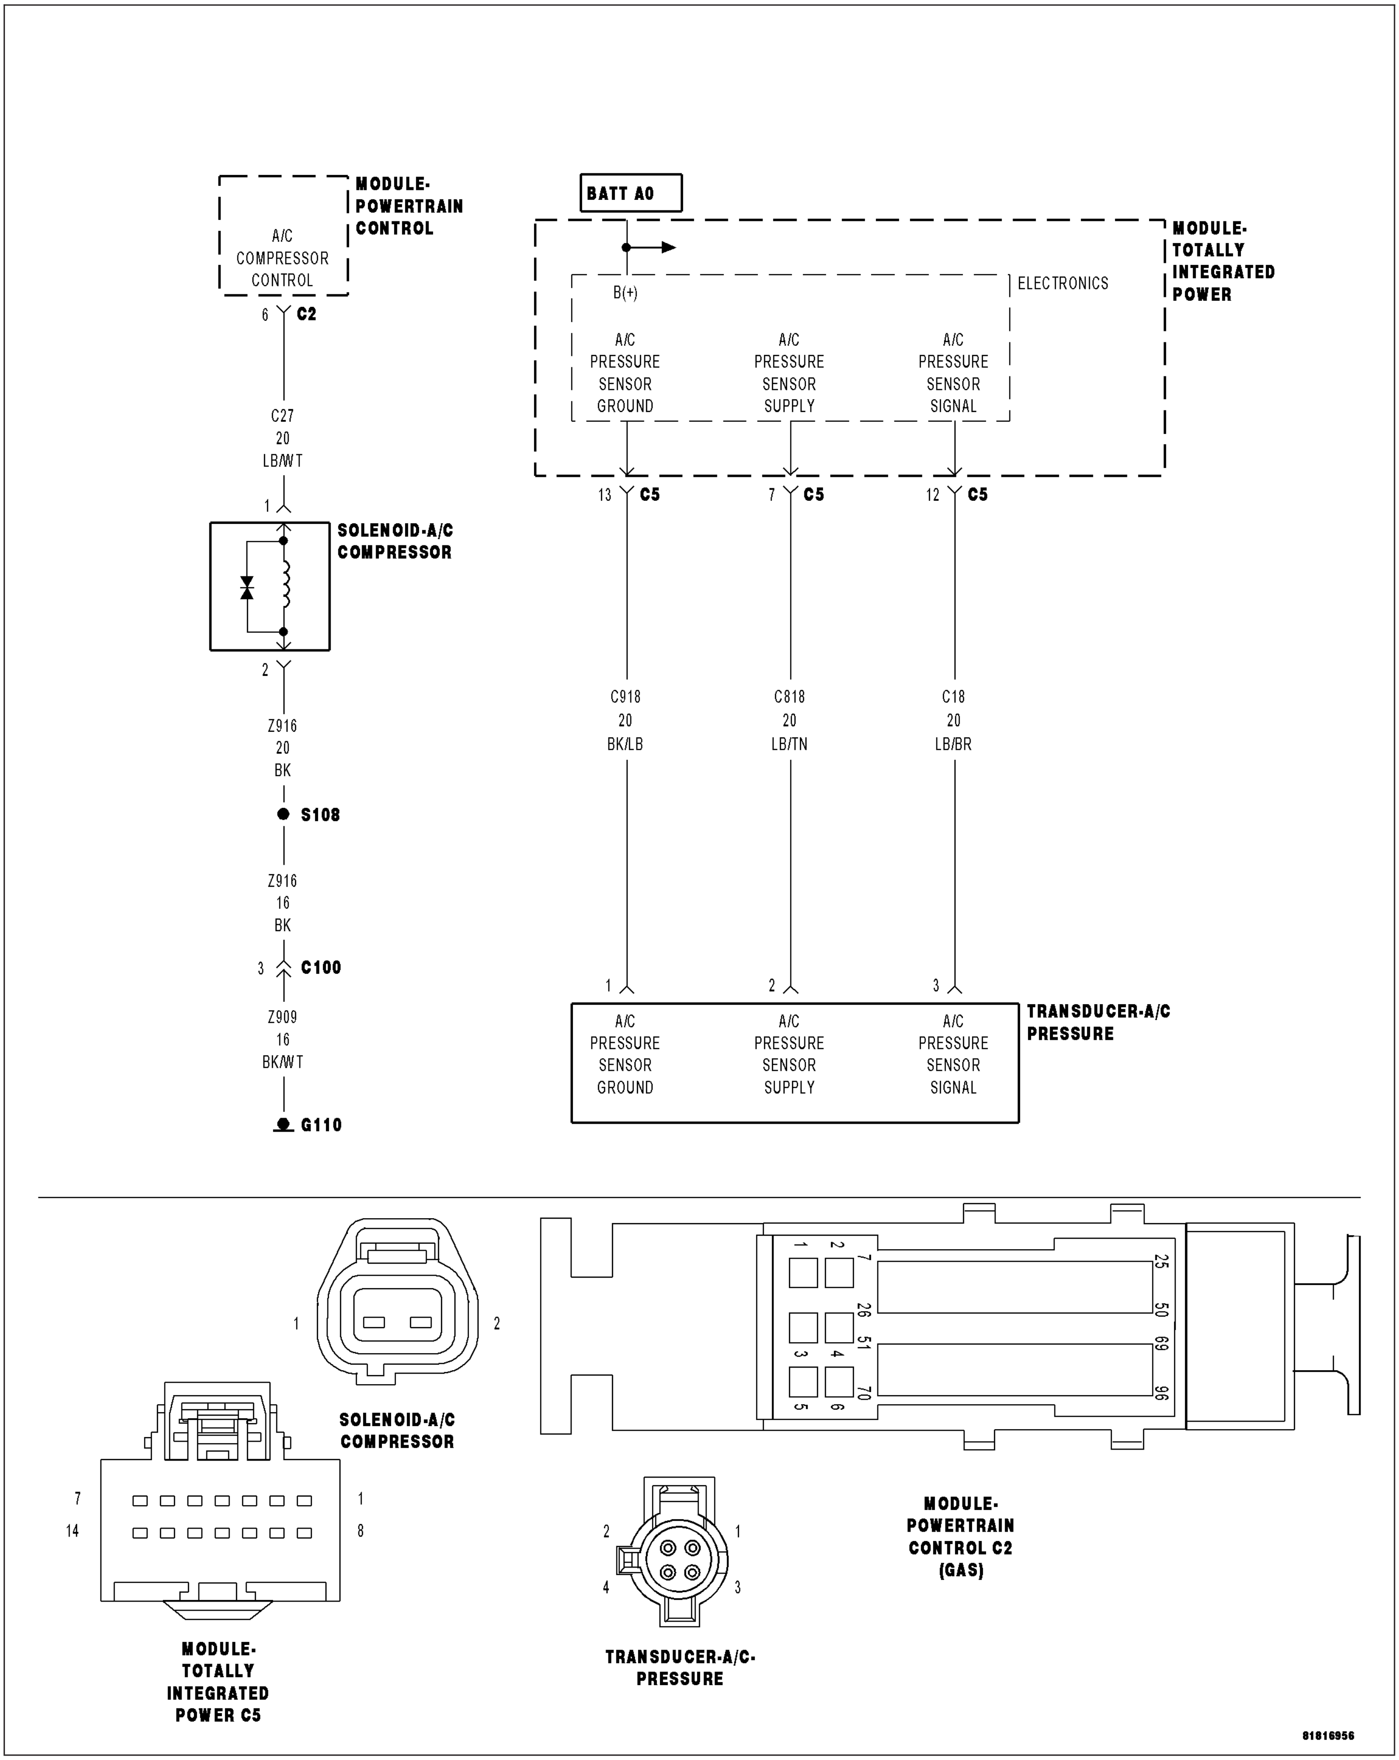
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Pressure Transducer and the Totally Integrated Power Module (TIPM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0533-A/C PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (C18) A/C Pressure Sensor Signal circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT
(C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(C918) A/C PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
A/C PRESSURE TRANSDUCER
TOTALLY INTEGRATED POWER MODULE (TIPM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

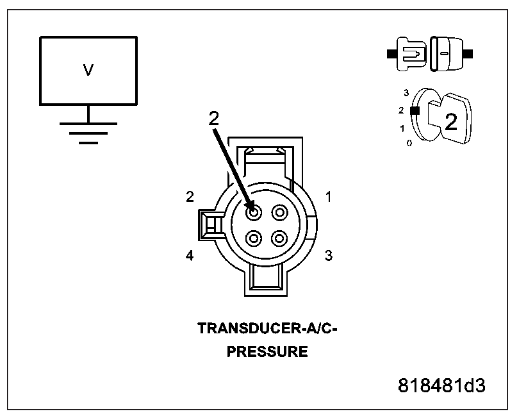
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

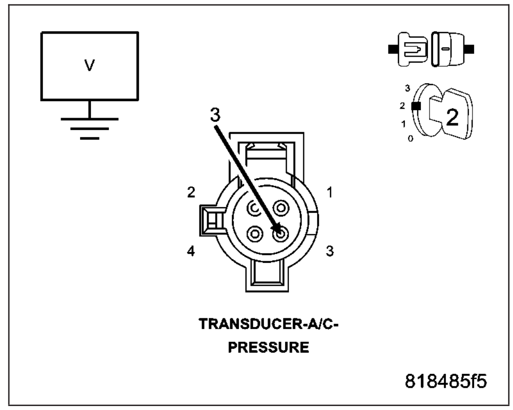
Disconnect the A/C Pressure Transducer connector.

Disconnect the Totally Integrated Power Module (TIPM) connector.

Turn the ignition on.

Measure the voltage of the (C818) A/C Pressure Sensor Supply circuit in the A/C Pressure Transducer harness connector.

Is there any voltage present?



Yes >> Repair the (C818) A/C Pressure Sensor Supply circuit for a short to voltage.

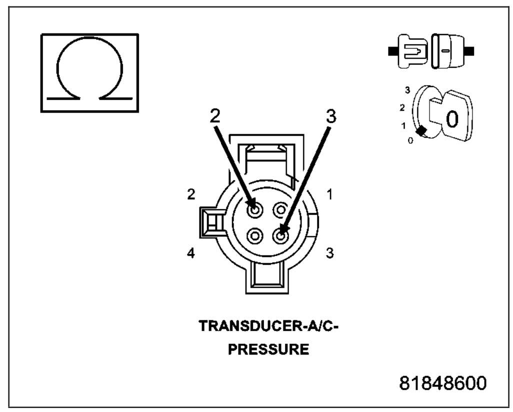
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (C18) A/C Pressure Sensor Signal circuit in the A/C Pressure Transducer harness connector.

Is there any voltage present?



Yes >> Repair the (C18) A/C Pressure Sensor Signal circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

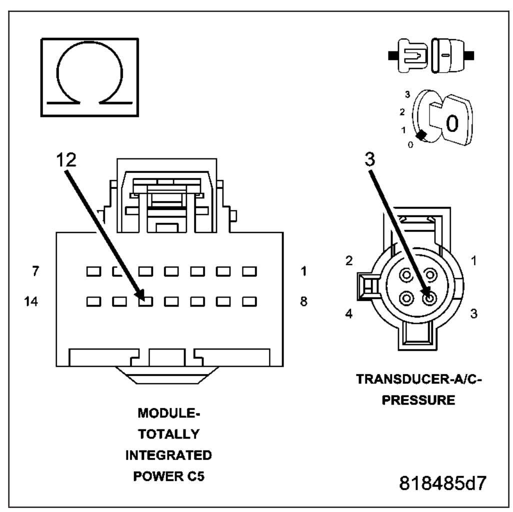
No >> Go to 4

4. (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO THE (C818) A/C PRESSURE SENSOR SUPPLY CIRCUIT

Measure the resistance between the (C18) A/C Pressure Sensor Signal circuit and the (C818) A/C Pressure Sensor Supply in the A/C Pressure Transducer harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (C18) A/C Pressure Sensor Signal circuit for a short to the (C818) A/C Pressure Sensor Supply circuit.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

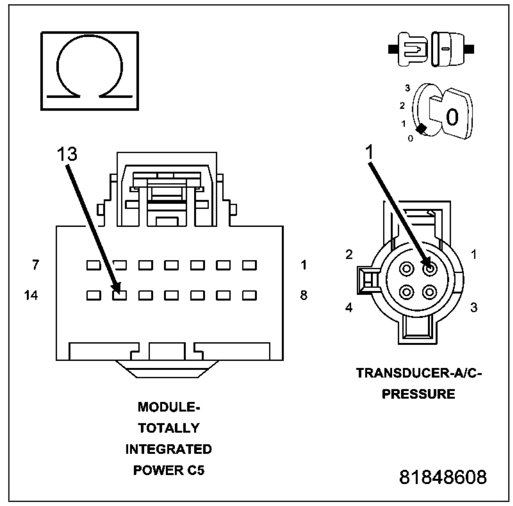
No >> Go to 5

5. (C18) A/C PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (C18) A/C Pressure Sensor Signal between the A/C Pressure Transducer harness connector and the Totally Integrated Power Module (TIPM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 6

No >> Repair the (C18) A/C Pressure Sensor Signal for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (C918) A/C PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C918) A/C Pressure Sensor Ground circuit between the A/C Pressure Transducer harness connector and the Totally Integrated Power Module (TIPM) harness connector.

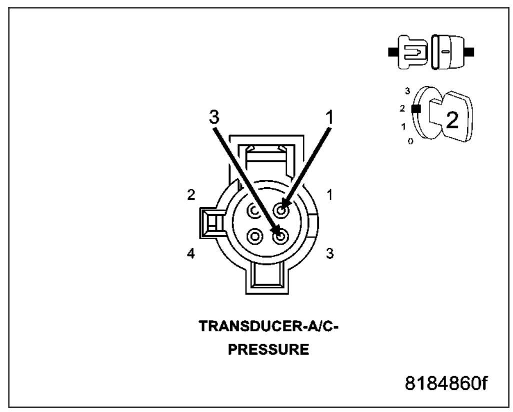
Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (C918) A/C Pressure Sensor Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. A/C PRESSURE TRANSDUCER



Turn the ignition off.

Connect the Totally Integrated Power Module (TIPM) connector.

Connect a jumper wire between the (C918) A/C Pressure Sensor Ground circuit and the (C18) A/C Pressure Sensor Signal circuit in the A/C Pressure Transducer harness connector.

Turn the ignition on.

With the scan tool, read the A/C Pressure Transducer signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the A/C Pressure Transducer in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. TOTALLY INTEGRATED POWER MODULE (TIPM)

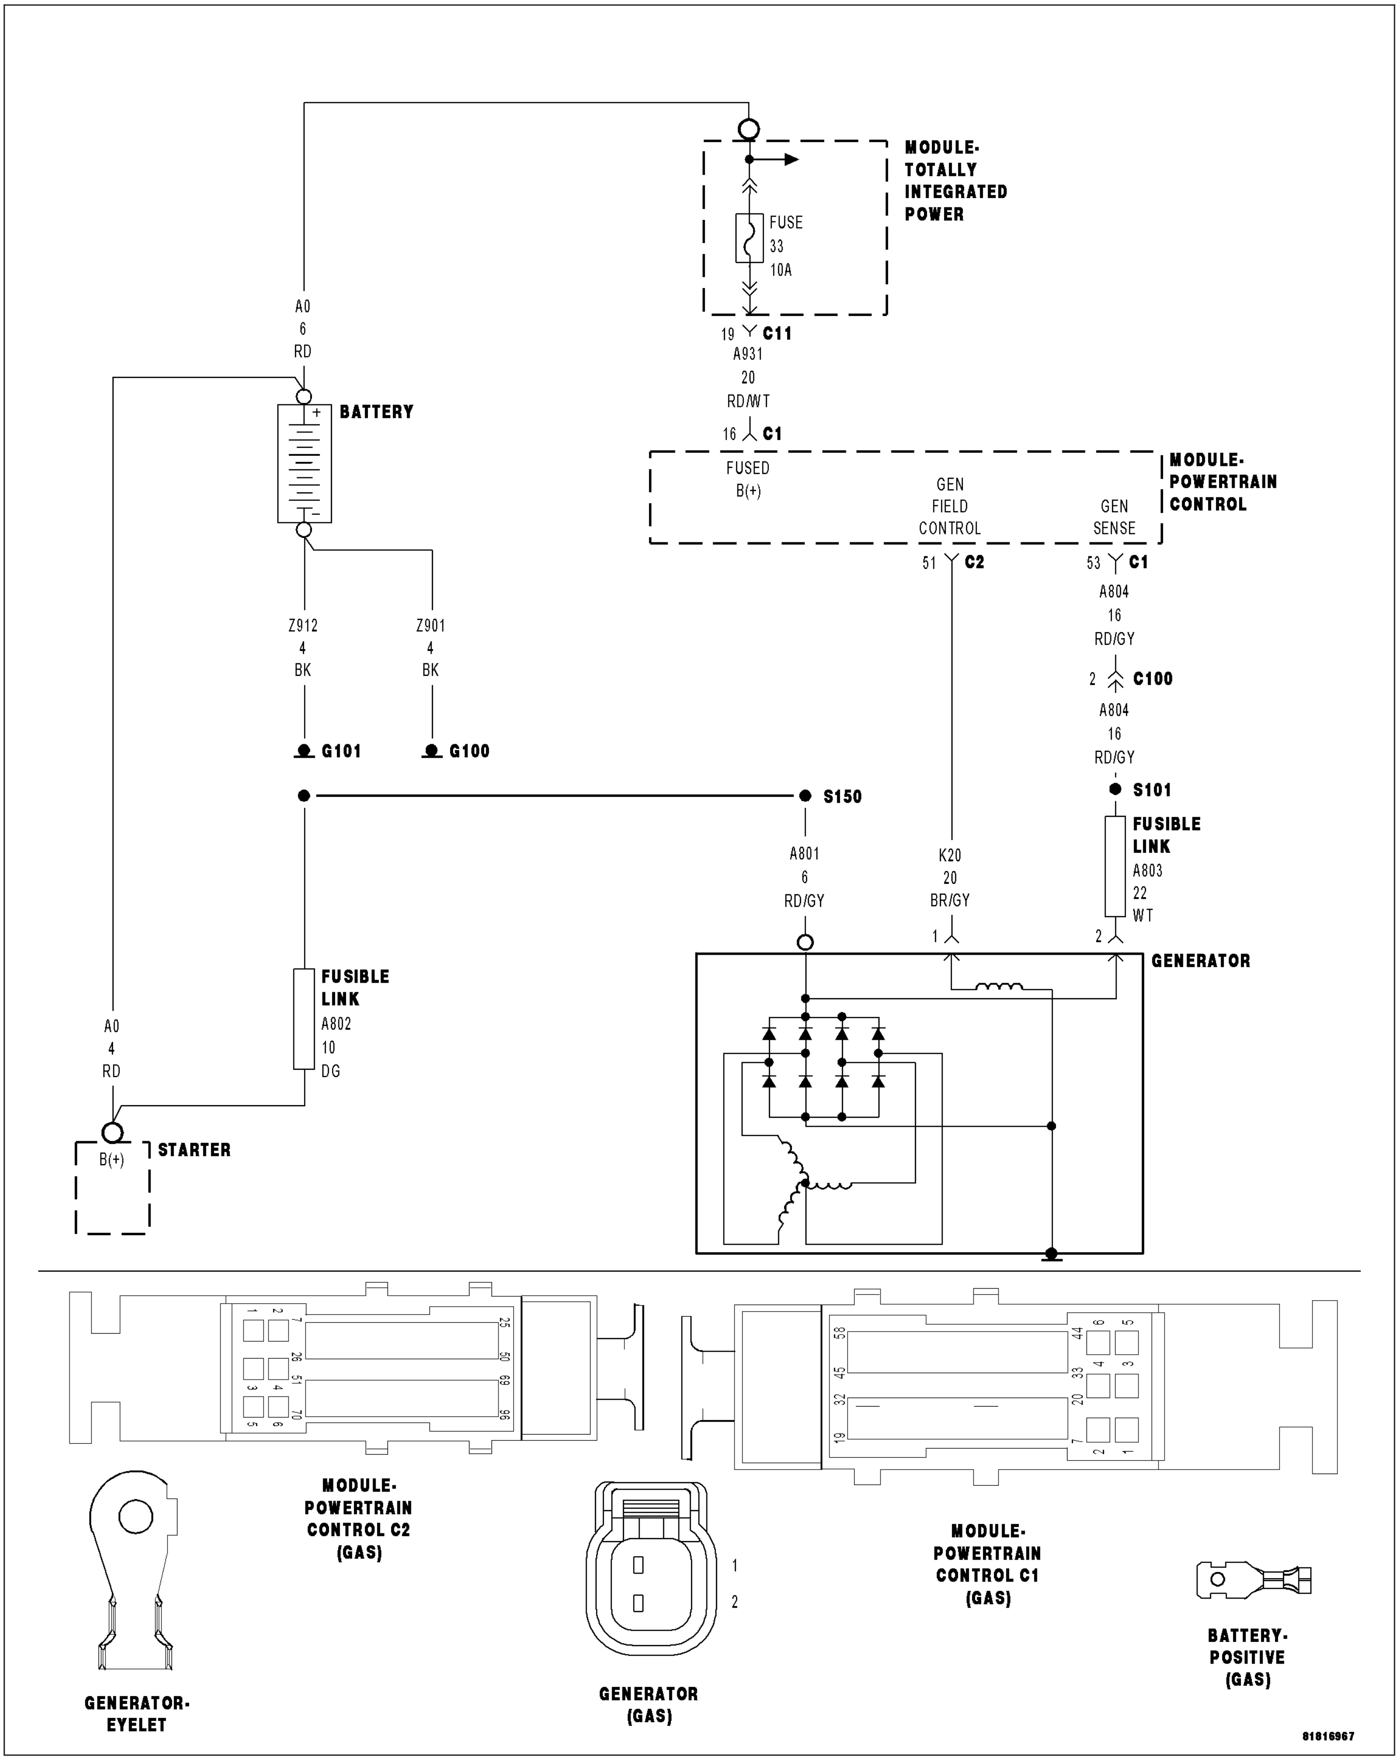
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Pressure Transducer and the Totally Integrated Power Module (TIPM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0562-BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With engine running for more than 30 seconds.
- **Set Condition:**
  Battery voltage at the PCM is less than 11.7 volts for a set period of time. One Trip Fault.

Possible Causes
INTERMITTENT DTC
BATTERY POSITIVE CIRCUIT HIGH RESISTANCE
GENERATOR CASE GROUND HIGH RESISTANCE
(A931) FUSED B+ CIRCUIT HIGH RESISTANCE
(Z925) GROUND CIRCUIT(S) HIGH RESISTANCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose and repair any charging system DTCs before proceeding with this test.

NOTE: Inspect and test the battery in accordance with the Service Information before continuing with this test.

NOTE: Inspect the generator drive belt before continuing with this test.

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.

NOTE: Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide and inspect the wiring and connectors for damage.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. BATTERY POSITIVE (+) CIRCUIT HIGH RESISTANCE

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Make sure all testing equipment and cables are clear of any engine parts before starting the engine.

Start the engine.

Measure the voltage between the B (+) Terminal at the Generator and the Battery Positive (+) Post.

Is the voltage above 0.4 volts?

Yes >> Repair the Battery Positive (+) circuit for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. GENERATOR CASE GROUND HIGH RESISTANCE

NOTE: Make sure all testing equipment and cables are clear of any engine parts before starting the engine.

Start the engine and allow it to reach operating temperature.

Measure the voltage between the Generator case and the Battery Negative (-) post.

Is the voltage above 0.1 volt?

Yes >> Repair the Generator Case ground for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. (A931) FUSED B+ CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Disconnect the Powertrain Control Module connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (A931) Fused B+ circuit in the Powertrain Control Module (PCM) harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 5

No >> Repair the (A931) Fused B+ circuit for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (Z925) GROUND CIRCUIT(S) HIGH RESISTANCE

Turn the ignition off.

Using a 12 volt test light connected to 12 volts, check the (Z925) Ground circuits in the Powertrain Control Module (PCM) harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 6

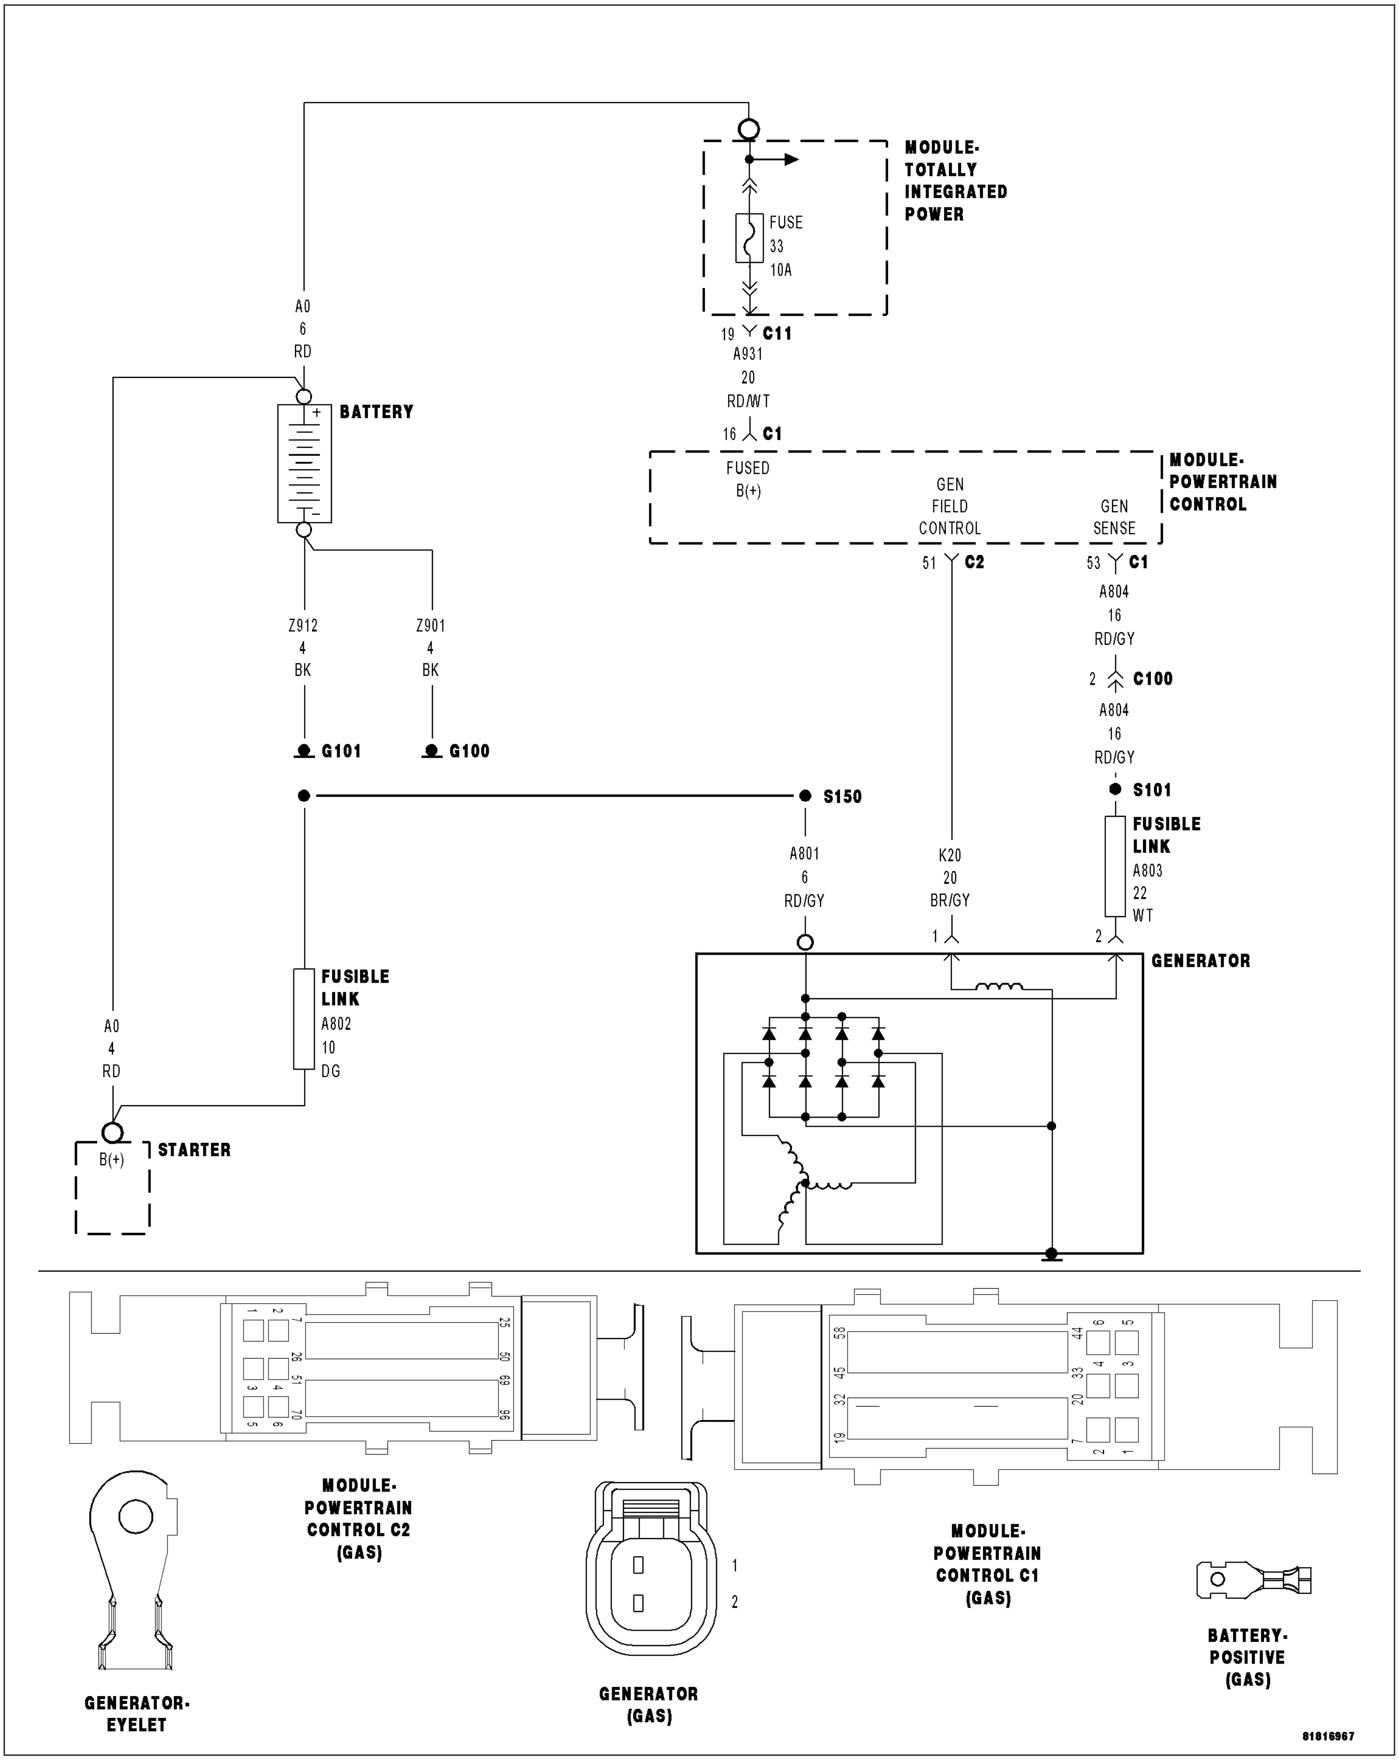
No >> Repair the (Z925) Ground circuit(s) for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0563-BATTERY VOLTAGE HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running for more than 30 seconds.
- **Set Condition:**
  Battery voltage is 1 volt greater than desired voltage for more than 5 seconds. One Trip Fault.

Possible Causes
INTERMITTENT DTC
(A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose and repair any charging system or generator DTCs before continuing with this test.

NOTE: Inspect and test the battery in accordance with the Service Information before continuing with this test.

NOTE: Inspect the generator drive belt before continuing with this test.

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator System output.

NOTE: Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide and inspect the wiring and connectors for damage.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (A804) Gen Sense circuit in the Generator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (A804) Gen Sense circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) harness connector.

Turn the ignition on.

Measure the voltage on the (K20) Gen Field Control circuit in the Generator harness connector.

Is there any voltage present?

Yes >> Repair the (K20) Gen Field Control for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

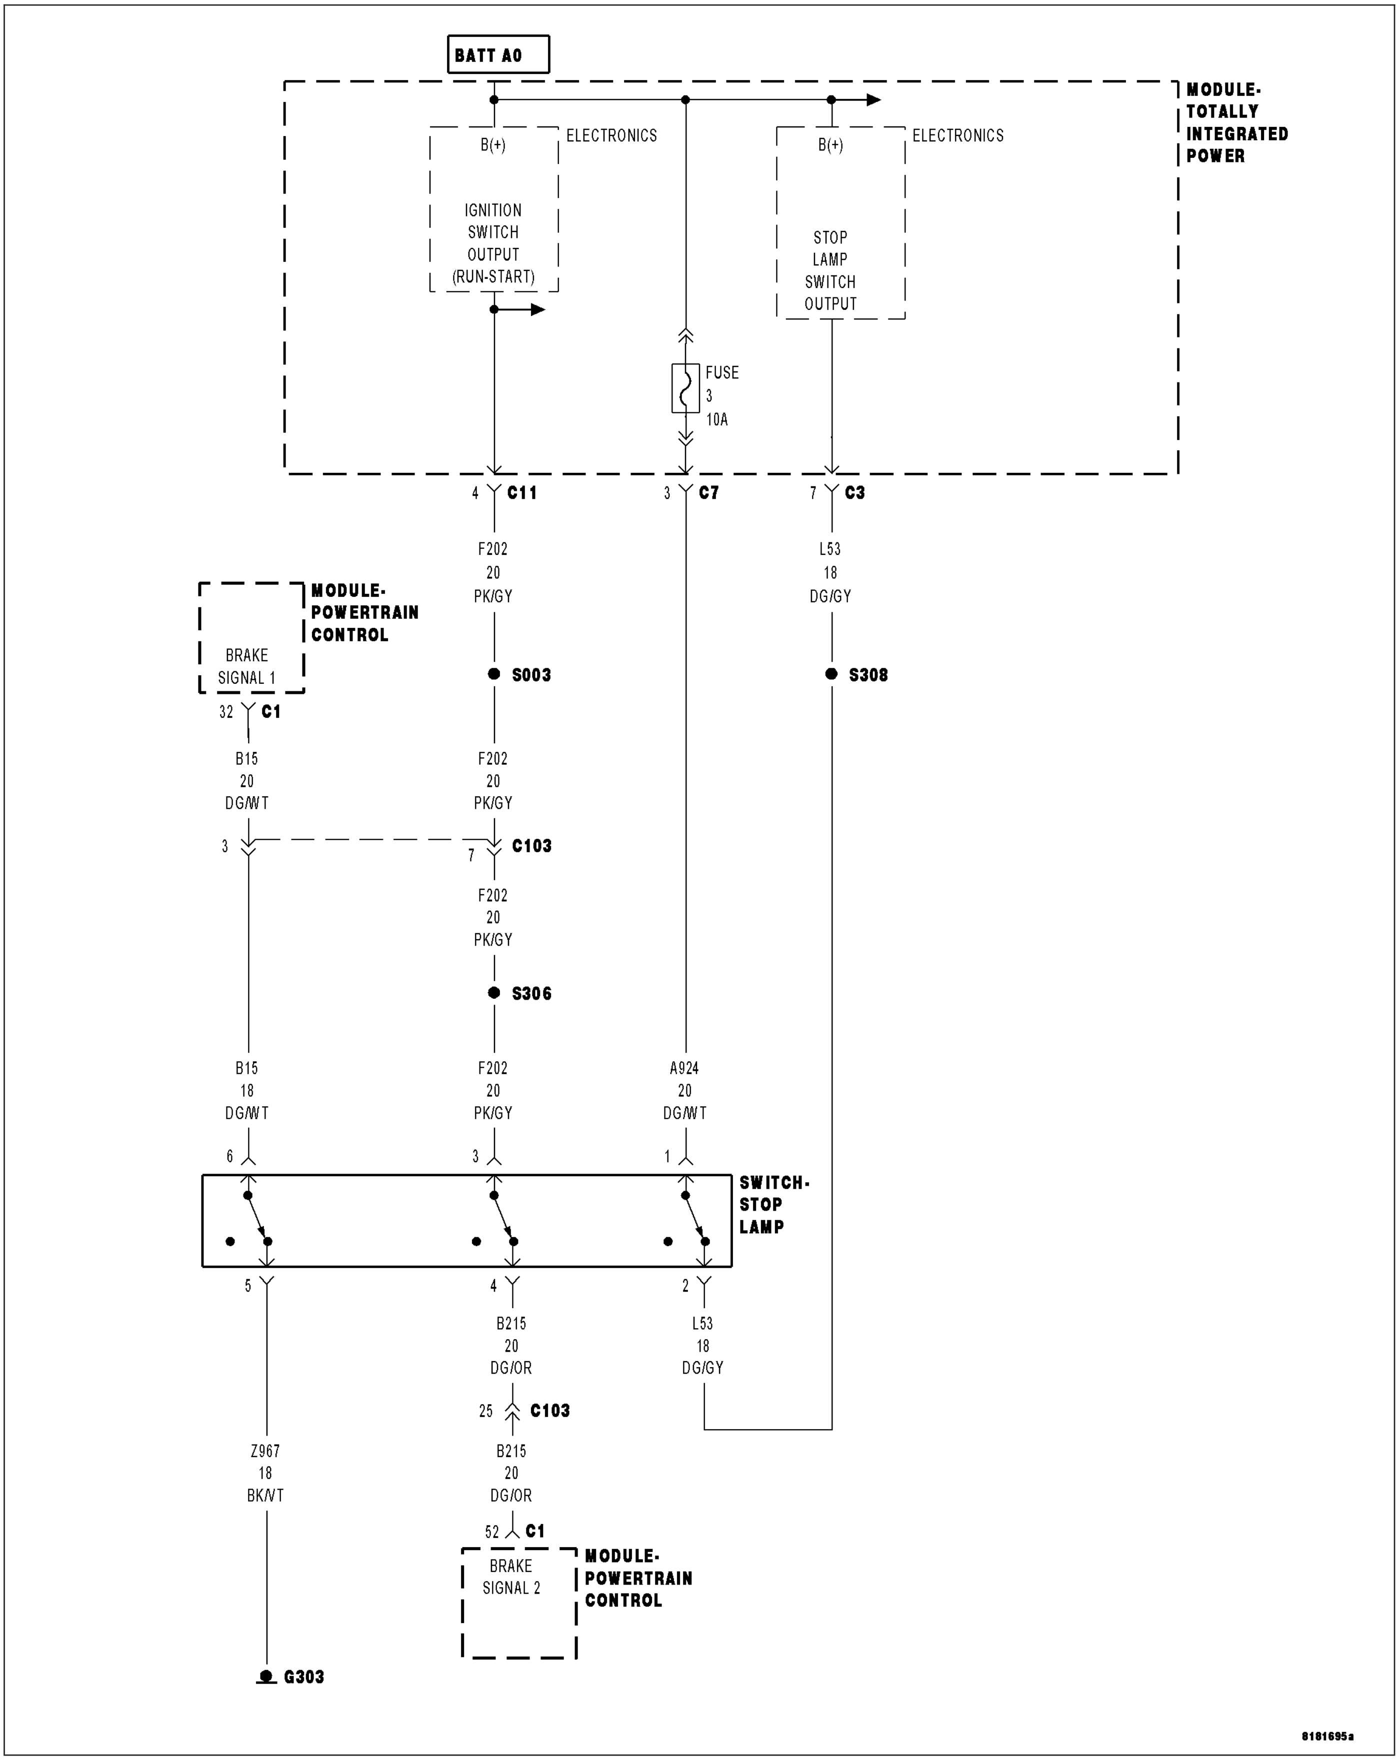
No >> Go To 4

4. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0571-BRAKE SWITCH 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the states of Brake Signal 1 and Brake Signal 2 do not match for more than 50 ms.

Possible Causes
INTERMITTENT DTC
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

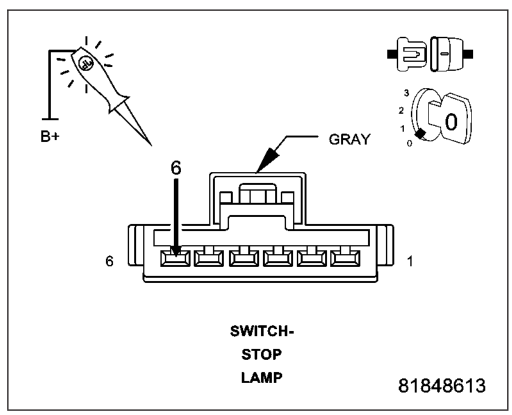
1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 2

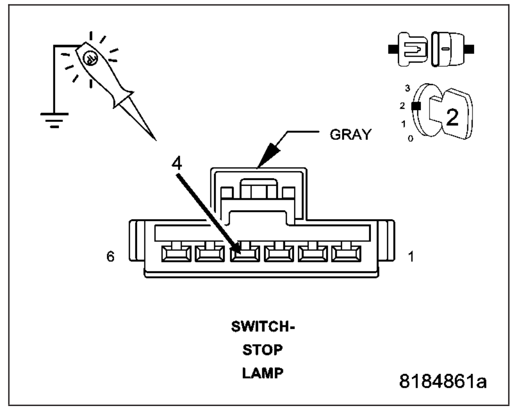
2. (B15) BRAKE SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?



Yes >> Go to 3.

No >> Go to 4

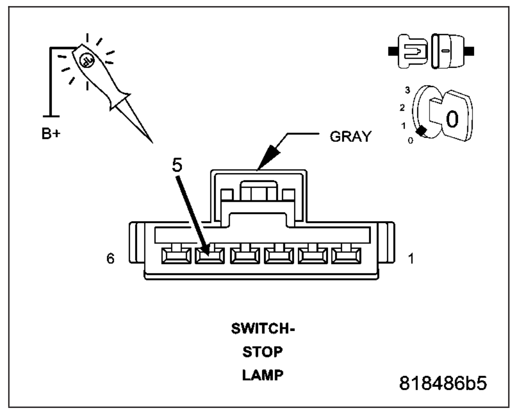
3. (B16) BRAKE SIGNAL 2 CIRCUIT

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

Yes >> Go to 11



No >> Go to 7

4. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

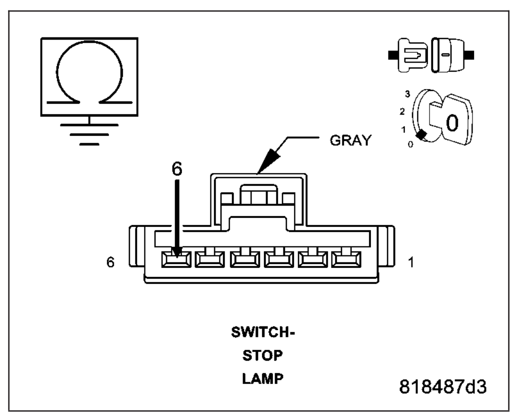
Turn the ignition off.

Disconnect the Stop Lamp Switch connector.

Using a 12 volt test light connected to 12 volts, check the (Z967) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 5

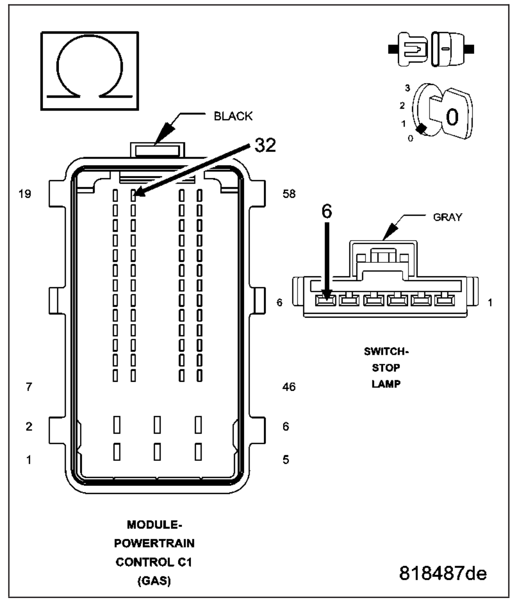
No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 6

No >> Repair the (B15) Brake Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

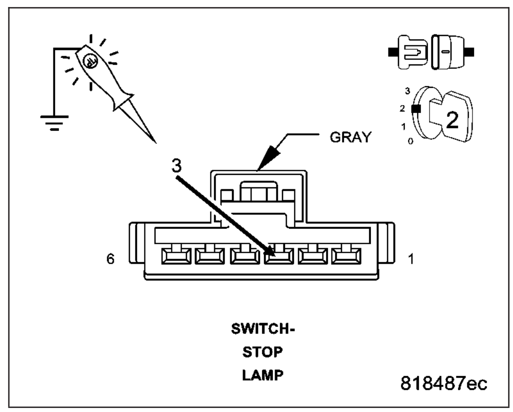
Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B15) Brake Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

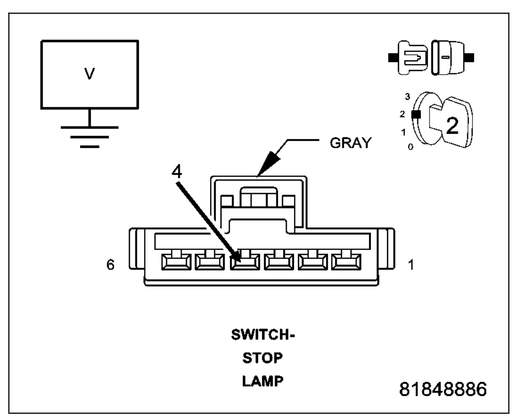
Disconnect the Stop Lamp Switch connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 8

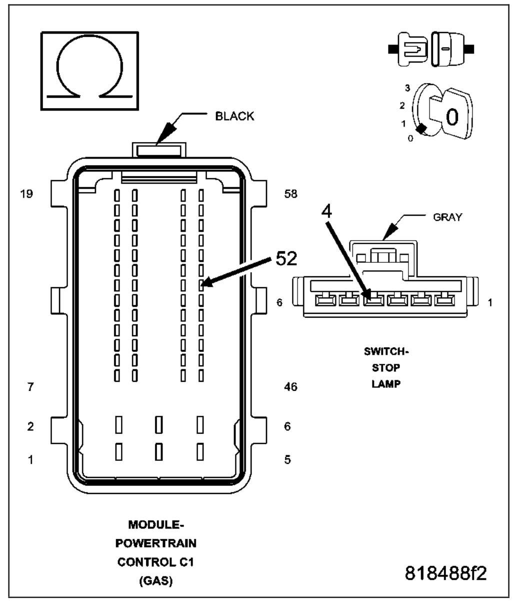
No >> Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is there any voltage present?



Yes >> Repair the (B16) Brake Signal 2 circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B16) Brake Signal 2 circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. STOP LAMP SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

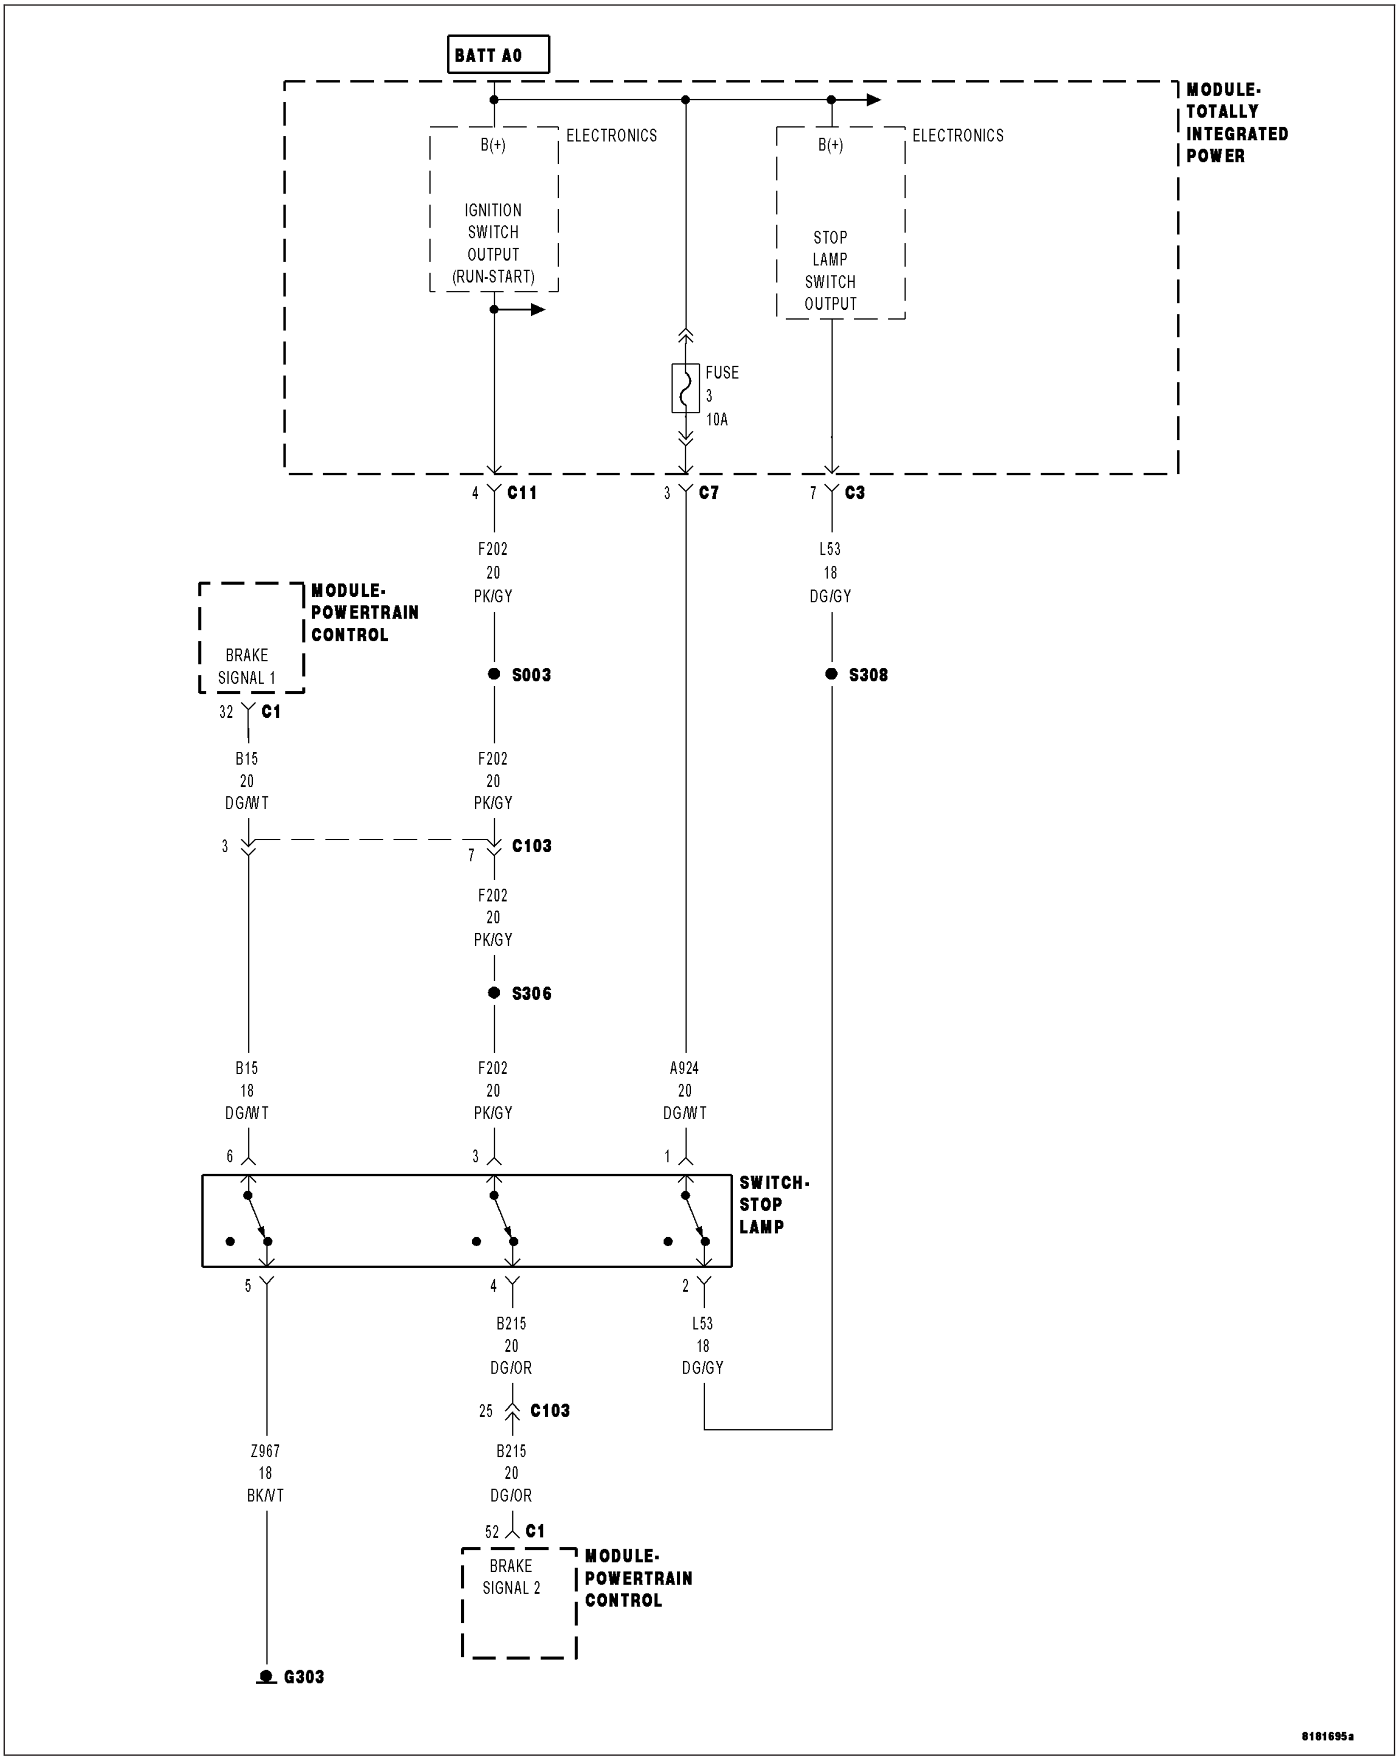
No >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0572-BRAKE SWITCH 1 STUCK ON

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, battery voltage greater than 10.4 volts, and ambient temperature above -23 C.
- **Set Condition:**
  The PCM detects that the state of Brake Signal 1 does not change as expected.

Possible Causes
INTERMITTENT DTC
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

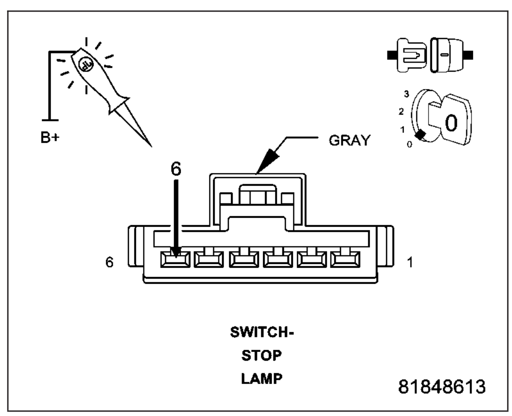
1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



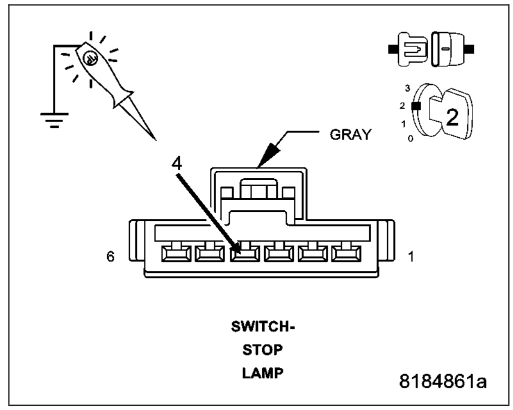
No >> Go to 2

2. (B15) BRAKE SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.



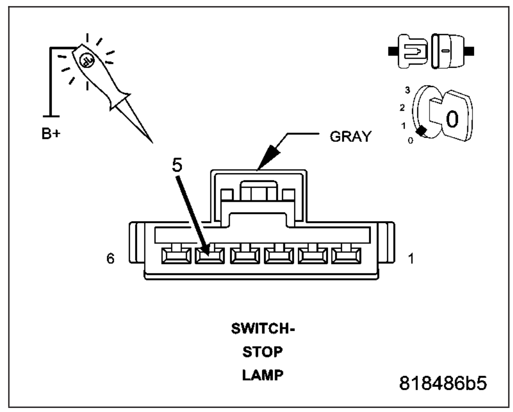
Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

Yes >> Go to 3.

No >> Go to 4

3. (B16) BRAKE SIGNAL 2 CIRCUIT

Turn the ignition on.



Using a 12 volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

Yes >> Go to 11

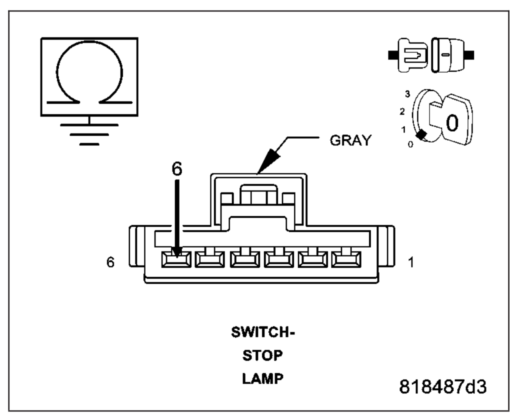
No >> Go to 7

4. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Stop Lamp Switch connector.

Using a 12 volt test light connected to 12 volts, check the (Z967) Ground circuit in the Stop Lamp Switch harness connector.



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

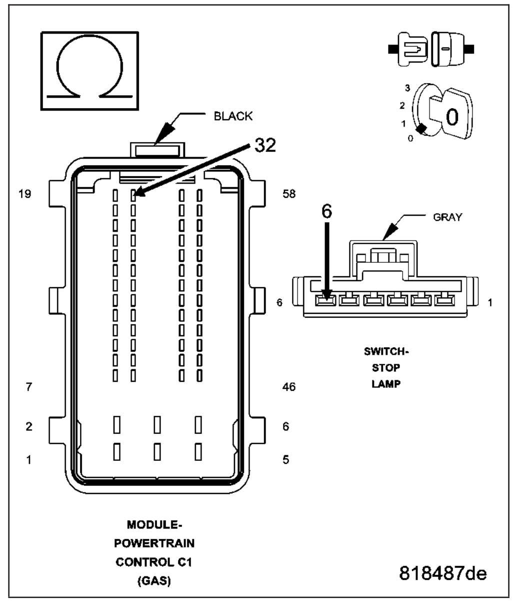
Is the test light illuminated and bright?

Yes >> Go to 5

No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (B15) Brake Signal 1 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

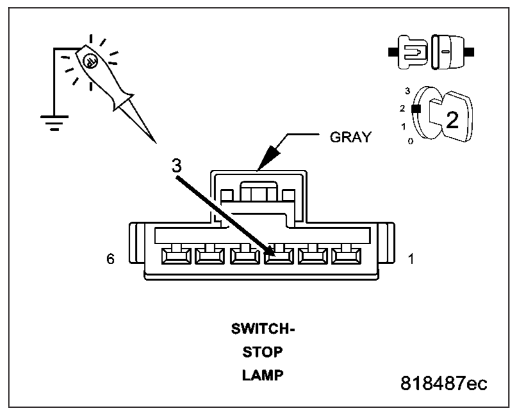
Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B15) Brake Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

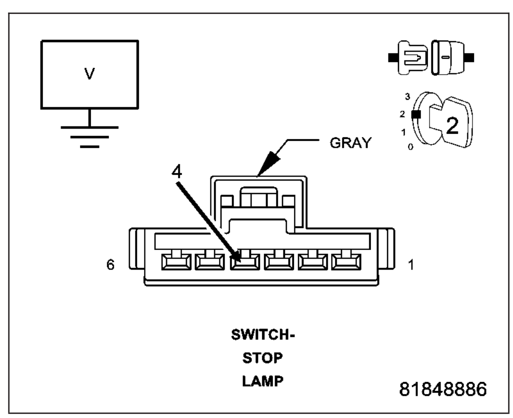
Disconnect the Stop Lamp Switch connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 8

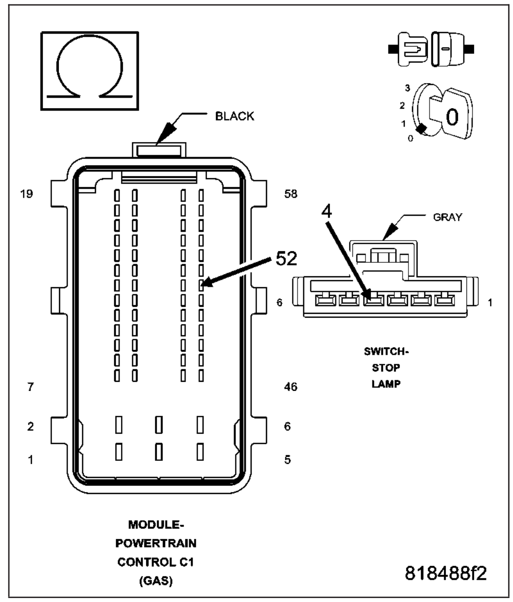
No >> Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is there any voltage present?



Yes >> Repair the (B16) Brake Signal 2 circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B16) Brake Signal 2 circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. STOP LAMP SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

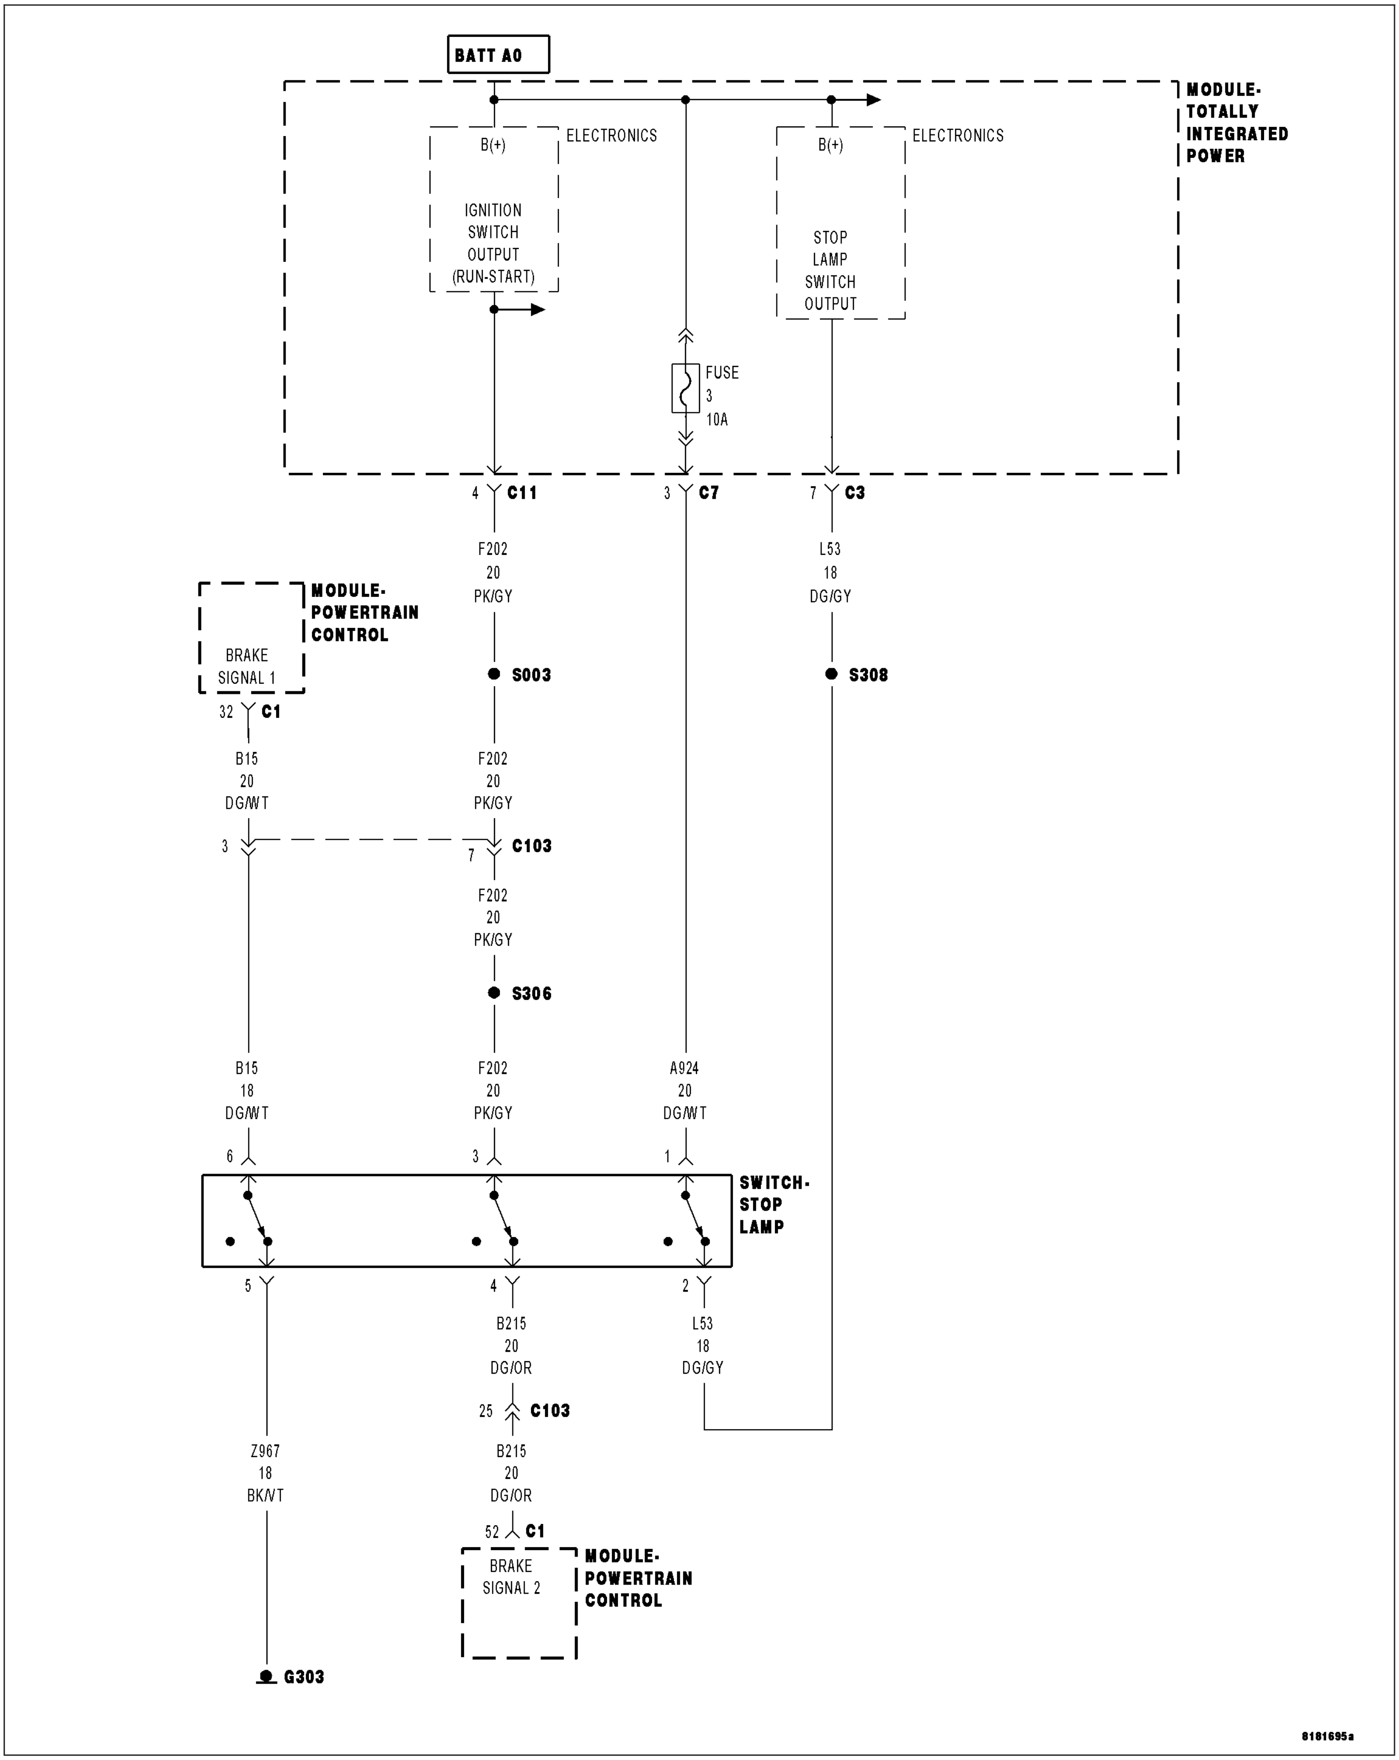
No >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0573-BRAKE SWITCH 1 STUCK OFF

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, battery voltage greater than 10.4 volts, ambient temperature above -23 C.
- **Set Condition:**
  The PCM detects that the state of Brake Signal 1 does not change as expected.

Possible Causes
INTERMITTENT DTC
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

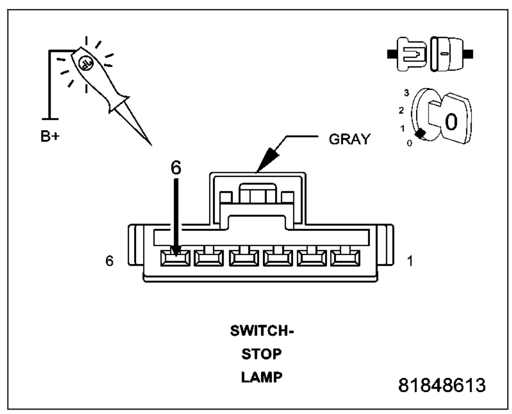
1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

Do the Brake Signal states change appropriately as the pedal is pressed and released?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go To 2

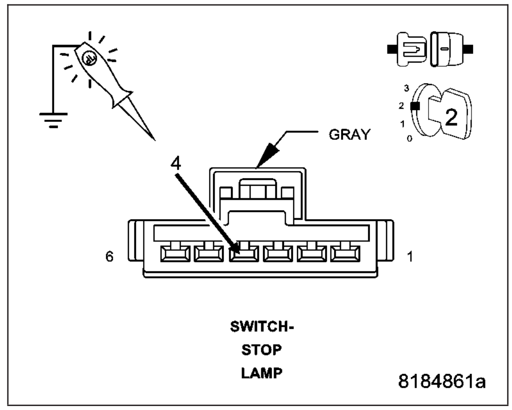
2. (B15) BRAKE SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?



Yes >> Go to 3.

No >> Go to 4

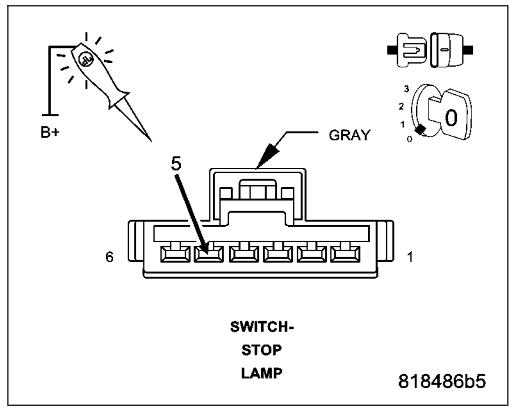
3. (B16) BRAKE SIGNAL 2 CIRCUIT

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated to not illuminated as the brake pedal is pressed and released?

Yes >> Go to 11



No >> Go to 7

4. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

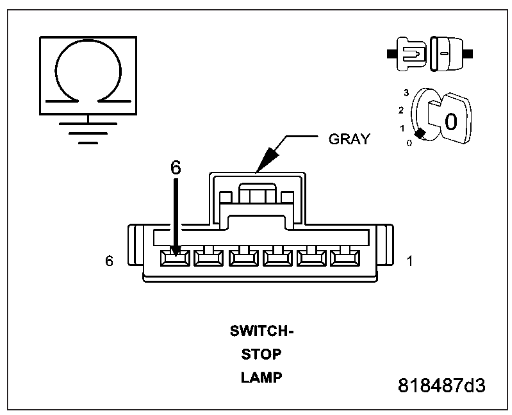
Turn the ignition off.

Disconnect the Stop Lamp Switch connector.

Using a 12 volt test light connected to 12 volts, check the (Z967) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 5

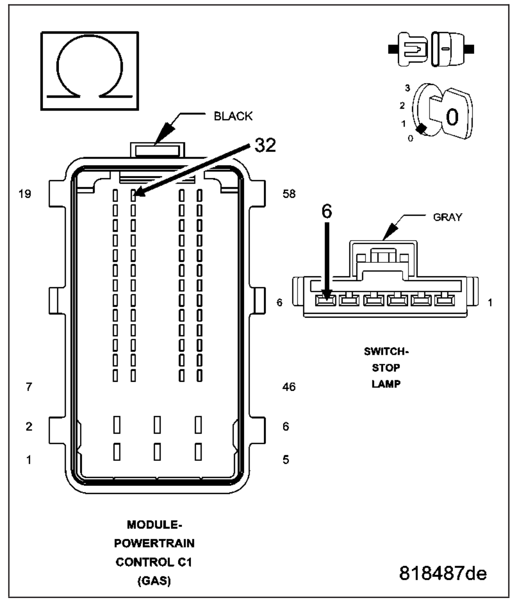
No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 6

No >> Repair the (B15) Brake Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

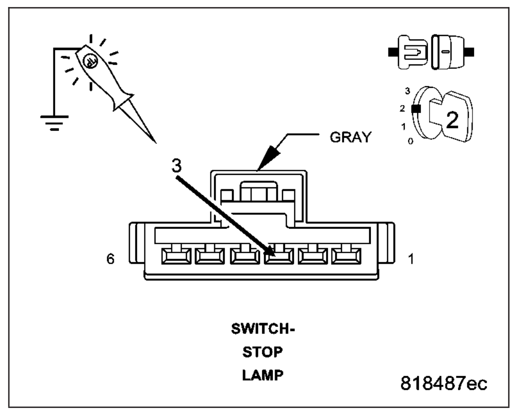
Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B15) Brake Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

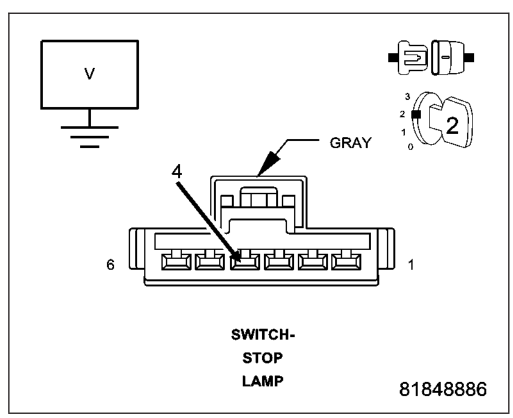
Disconnect the Stop Lamp Switch connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



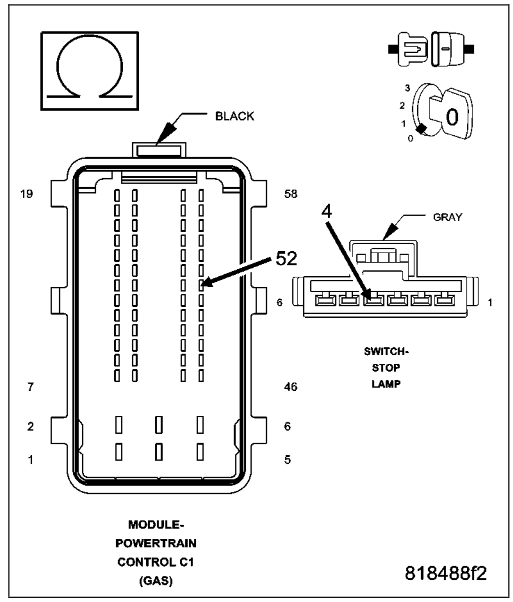
Yes >> Go to 8

No >> Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.



Is there any voltage present?

Yes >> Repair the (B16) Brake Signal 2 circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B16) Brake Signal 2 circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. STOP LAMP SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

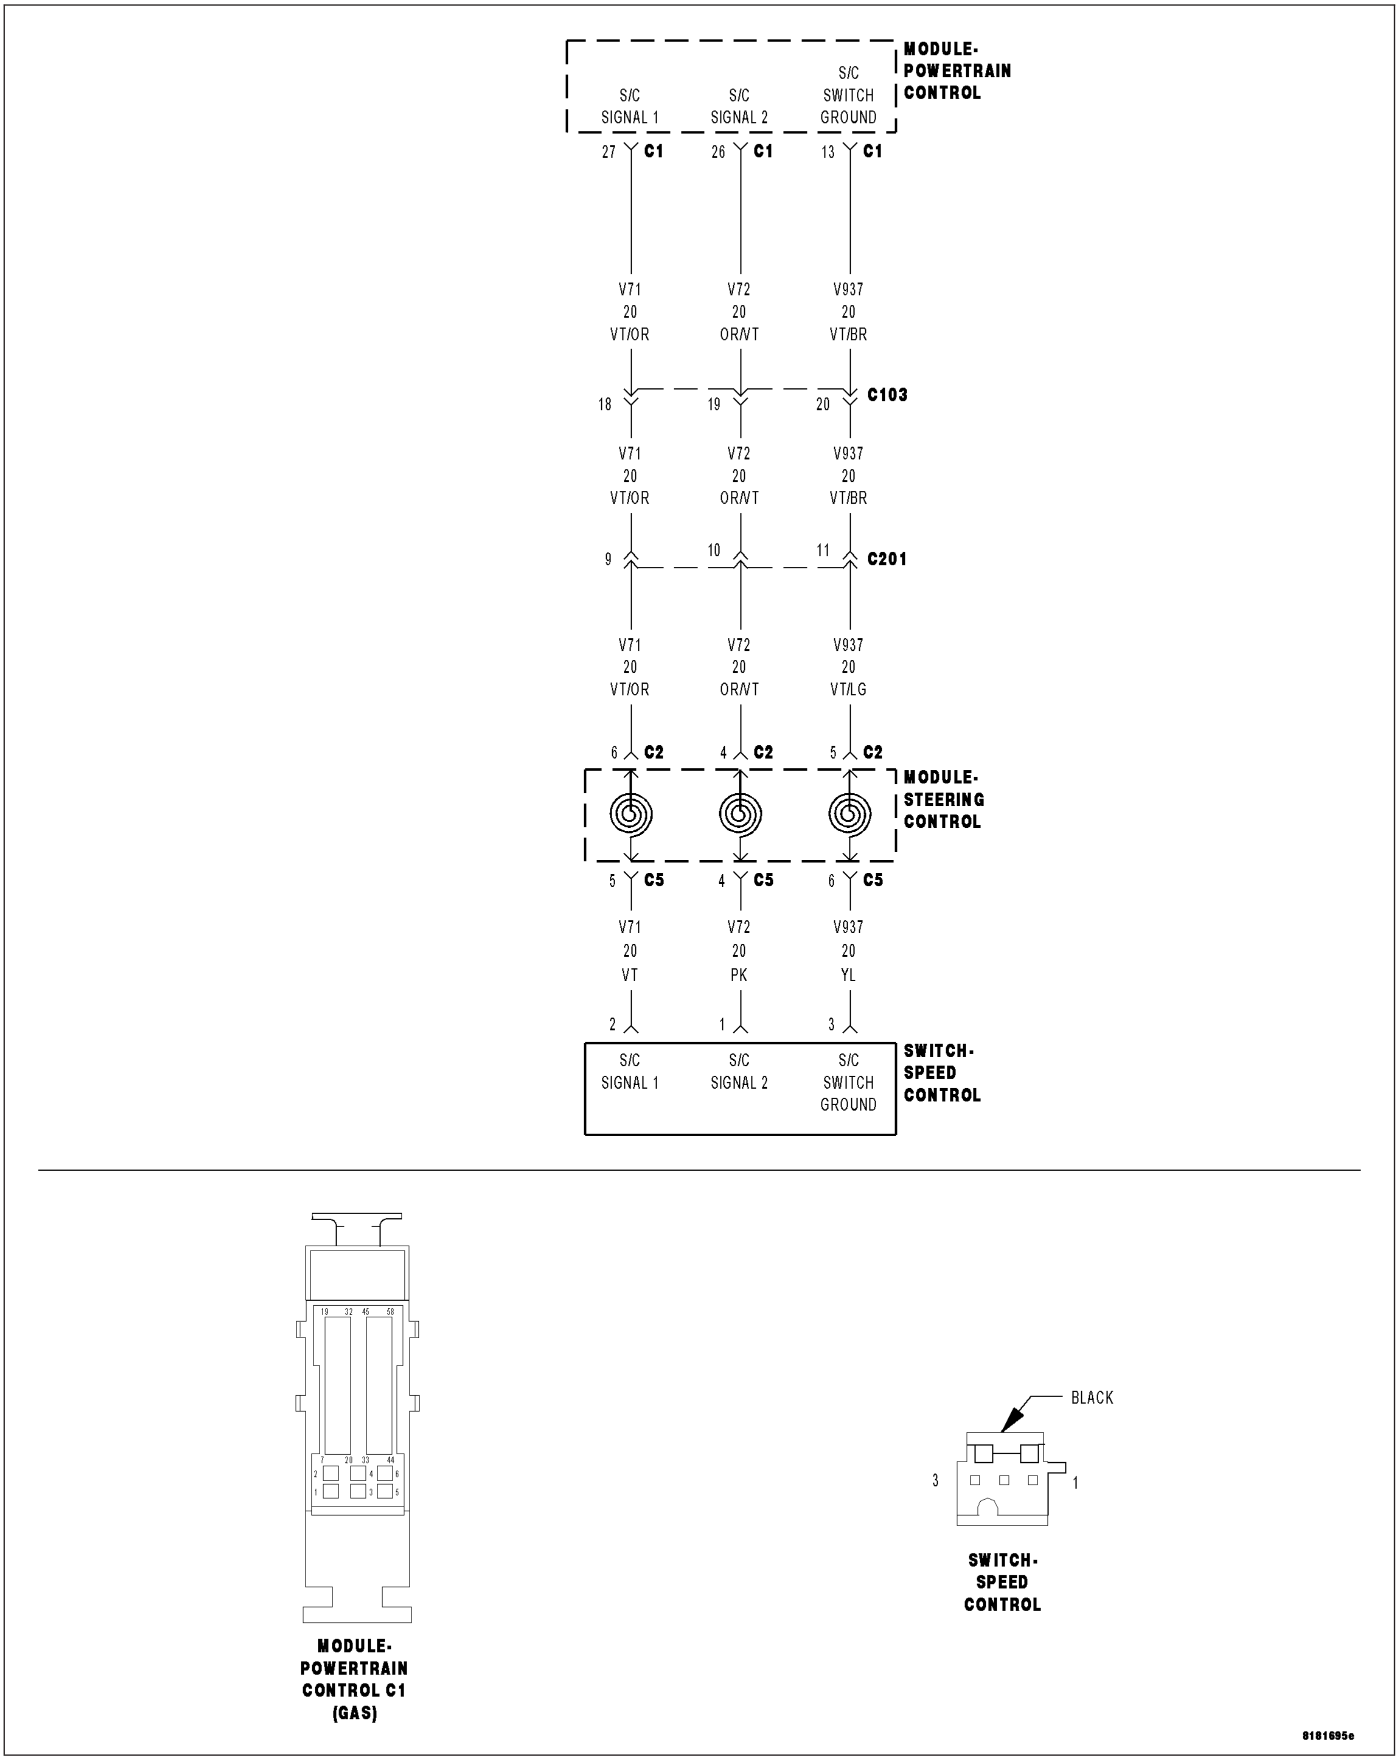
No >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0579-SPEED CONTROL SWITCH 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the Speed Control signal voltage is implausible.

Possible Causes
INTERMITTENT DTC
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

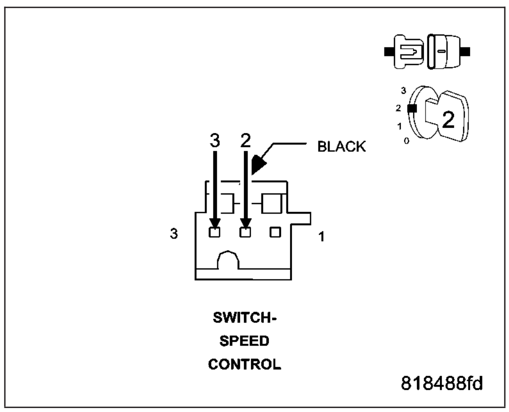
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.

Remove the Speed Control Switch in accordance with the Service Information.

Turn the ignition on.



With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be above 4.8 volts with the Speed Control Switch removed.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Is the (V71) S/C Signal 1 voltage above 4.8 volts with the Speed Control Switch removed and below .2 volts with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C5 harness connector.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The voltage should be above 4.8 volts with the Steering Control Module (SCM) C5 connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit at the Steering Control Module (SCM) C5 connector, not at the harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

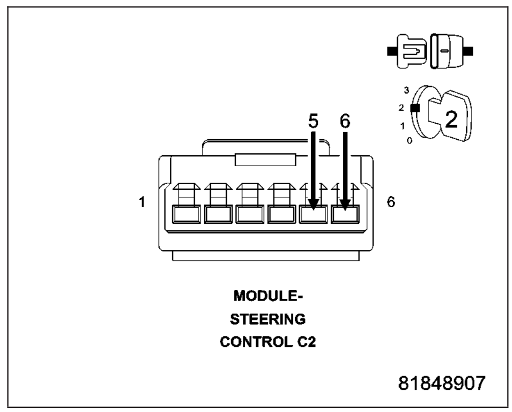
No >> Go to 4

4. STEERING CONTROL MODULE (SCM)

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C2 connector.

Turn the ignition on.



With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The voltage should be above 4.8 volts with the connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

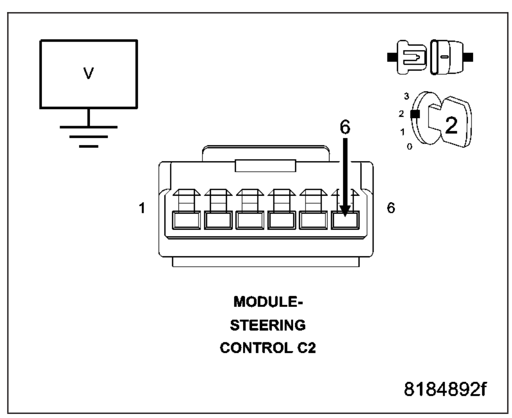
With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5



5. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) harness connector.

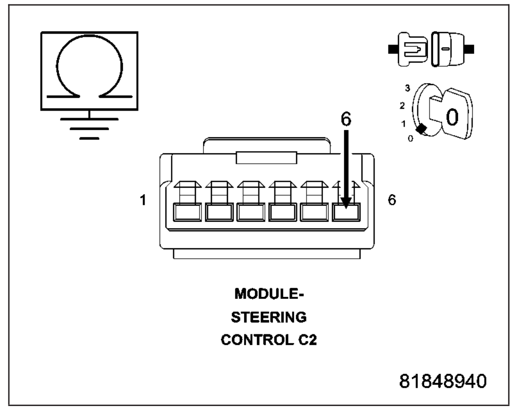
Is there any voltage present?

Yes >> Repair the (V71) S/C Signal 1 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.



Measure the resistance between ground and the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) harness connector.

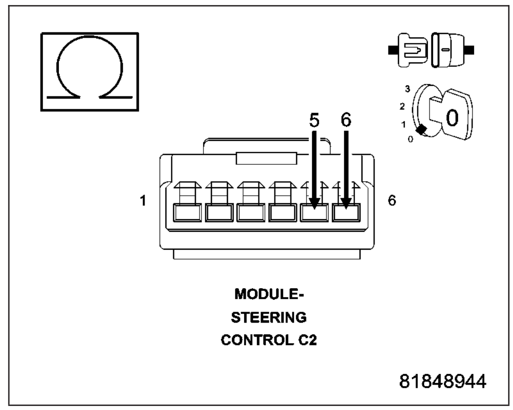
Is the resistance above 100 ohms?

Yes >> Go to 7

No >> Repair the (V71) S/C Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT



Measure the resistance between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) harness connector.

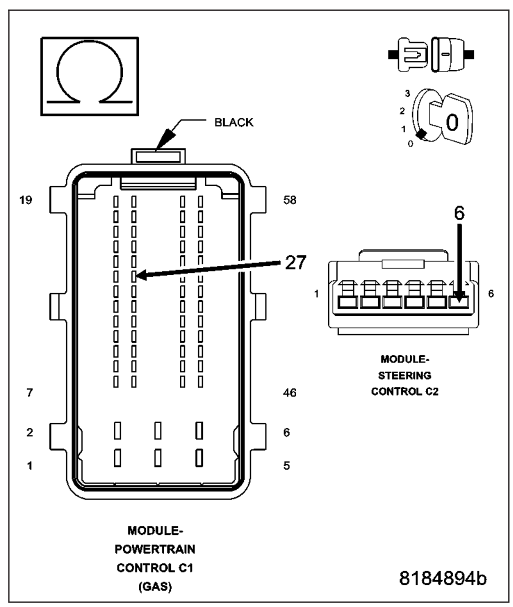
Is the resistance above 100 ohms?

Yes >> Go to 8

No >> Repair the (V71) S/C Signal 1 circuit for a short to the Steering Control Module (SCM) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

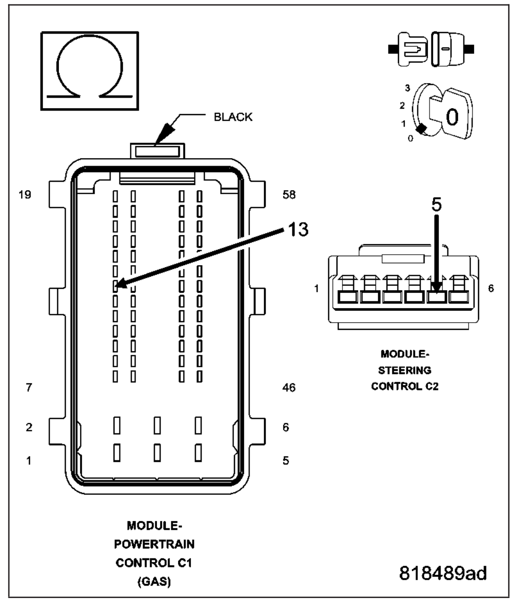
8. (V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (V71) S/C Signal 1 circuit between the Steering Control Module (SCM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 9



No >> Repair the (V71) S/C Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. POWERTRAIN CONTROL MODULE (PCM)

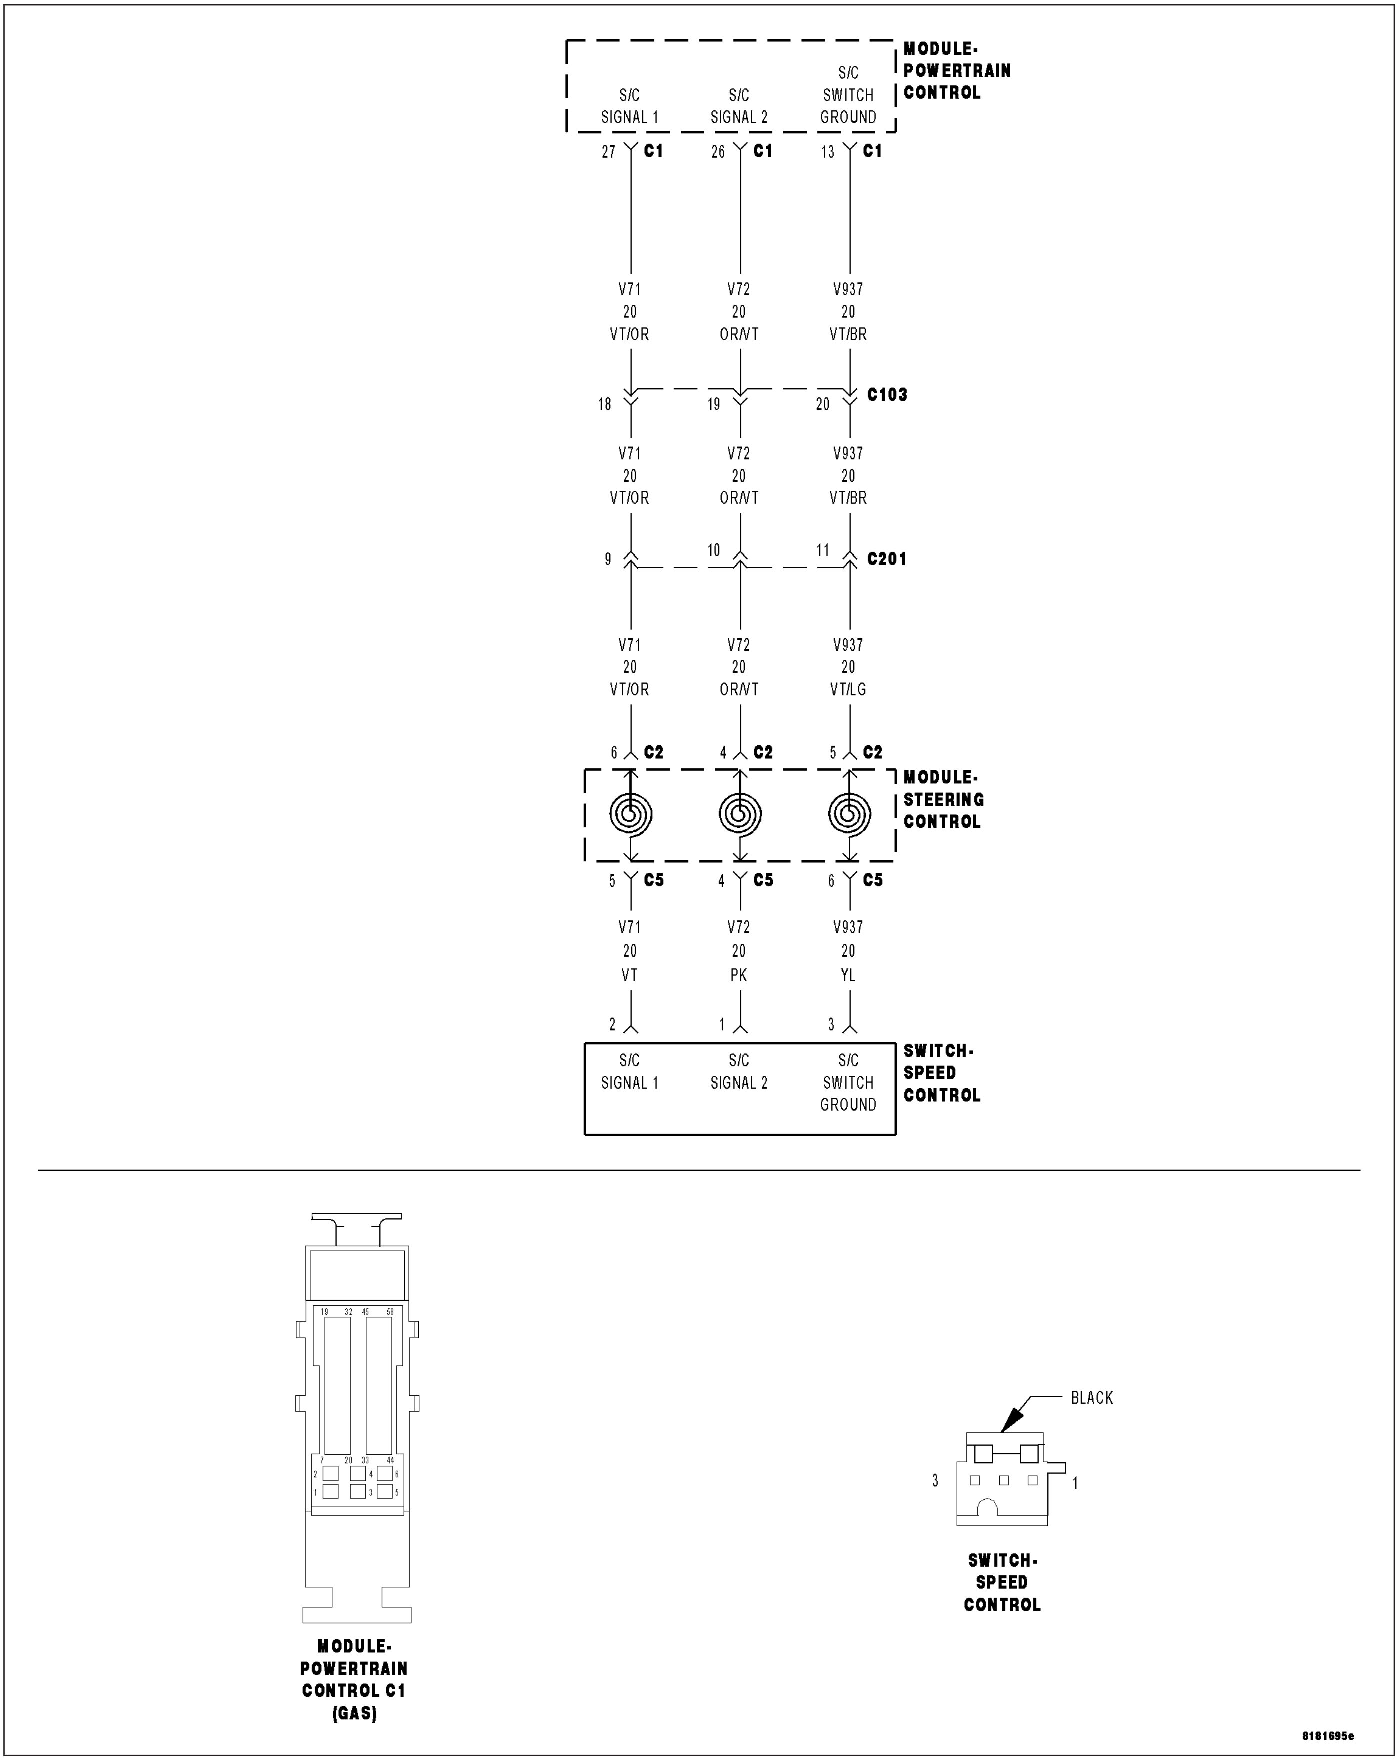
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the Speed Control signal voltage is implausible.

Possible Causes
INTERMITTENT DTC
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.

Remove the Speed Control Switch in accordance with the Service Information.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be above 4.8 volts with the Speed Control Switch removed.

Is the (V71) S/C Signal 1 voltage above 4.8 volts with the Speed Control Switch removed?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.
Disconnect the Steering Control Module (SCM) C5 connector.
Turn the ignition on.
With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be above 4.8 volts with the connector disconnected.

Is the (V71) S/C Signal 1 voltage above 4.8 volts with the connector disconnected?

Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. STEERING CONTROL MODULE (SCM)

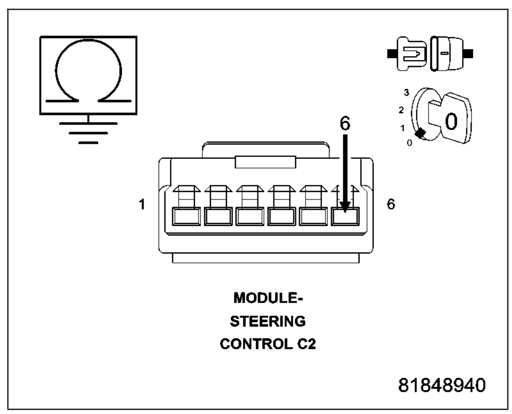
Turn the ignition off.
Disconnect the Steering Control Module (SCM) C2 connector.
Turn the ignition on.
With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be above 4.8 volts with the connector disconnected.

Is the (V71) S/C Signal 1 voltage above 4.8 volts with the connector disconnected?

Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

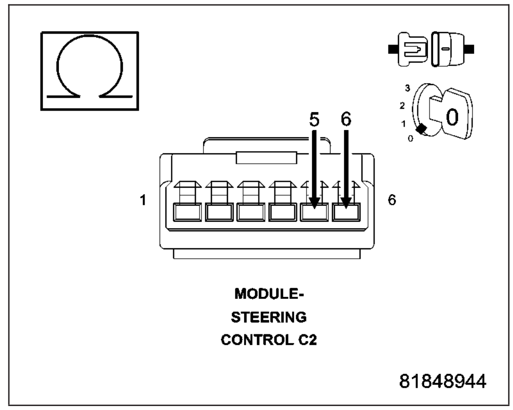
No >> Go to 5



5. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Measure the resistance between ground and the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?



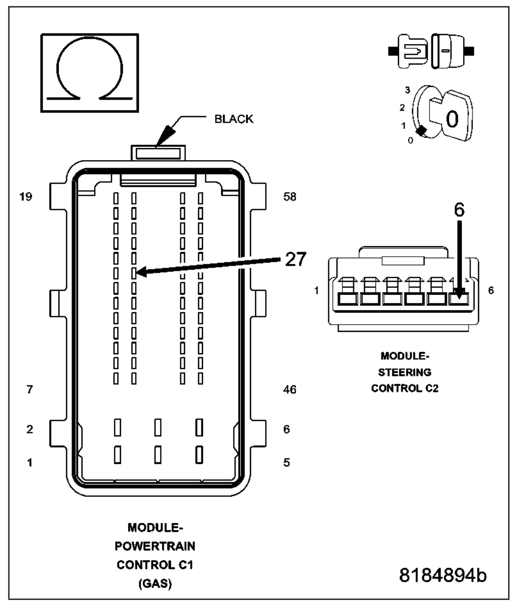
Yes >> Go to 6

No >> Repair the (V71) S/C Signal 1 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 7

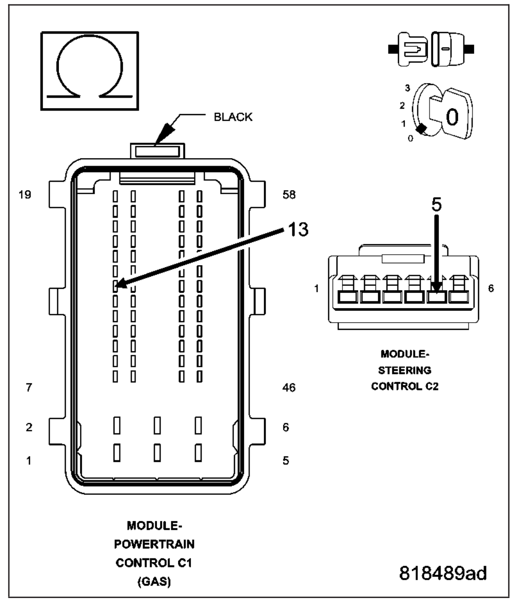
No >> Repair the (V71) S/C Signal 1 circuit for a short to the Steering Control Module (SCM) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V71) S/C Signal 1 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 8

No >> Repair the (V71) S/C Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 9

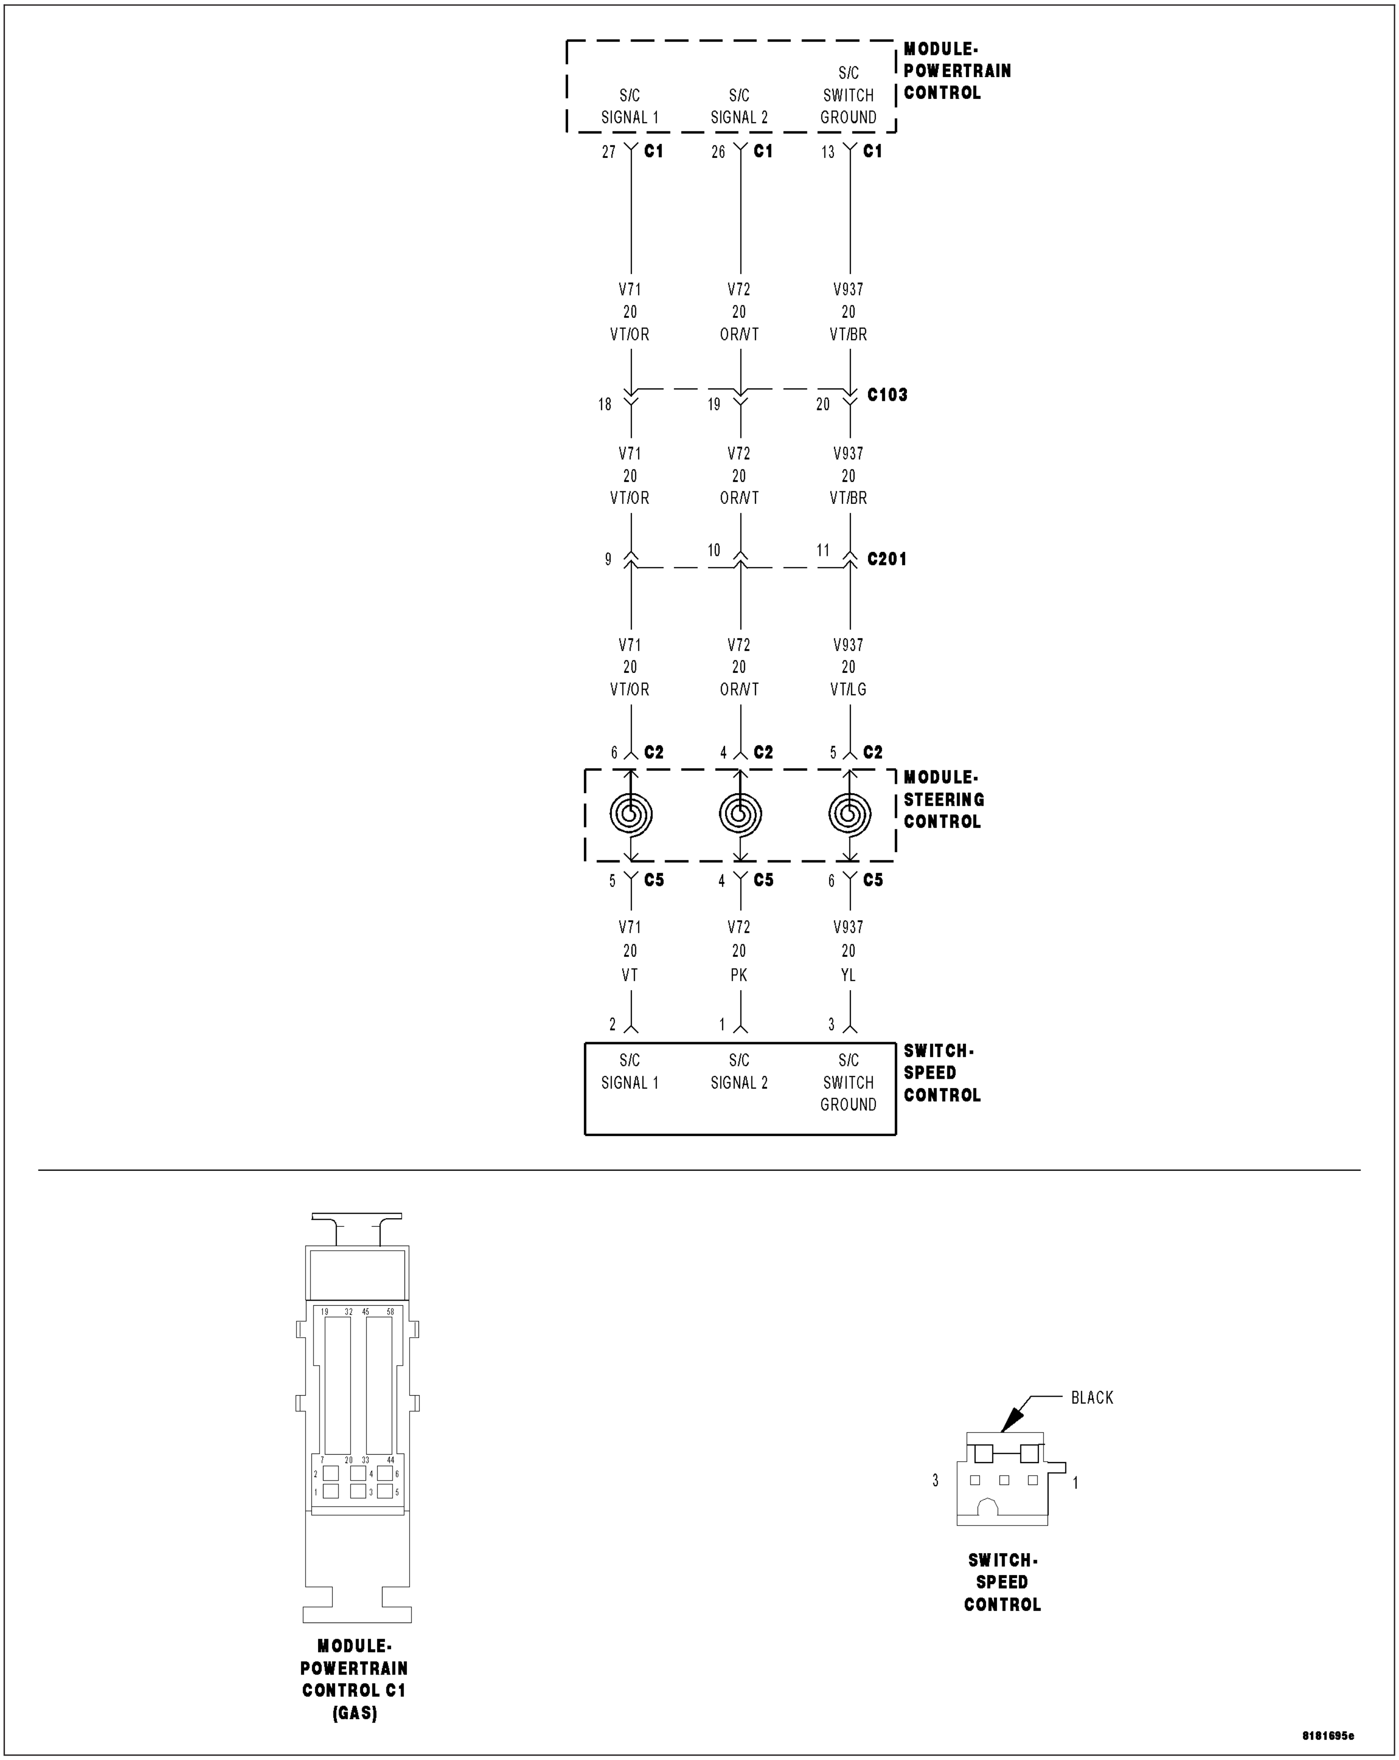
No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the Speed Control signal voltage is implausible.

Possible Causes
INTERMITTENT DTC
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

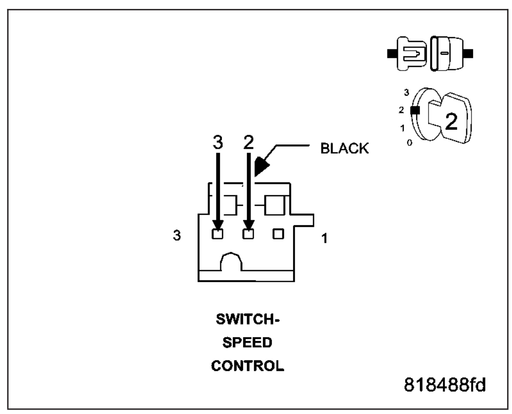
Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.

Remove the Speed Control Switch in accordance with the Service Information.



Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Is the (V71) S/C Signal 1 voltage below .2 volts with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C5 connector.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C5 connector, not at the harness connector.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 voltage.

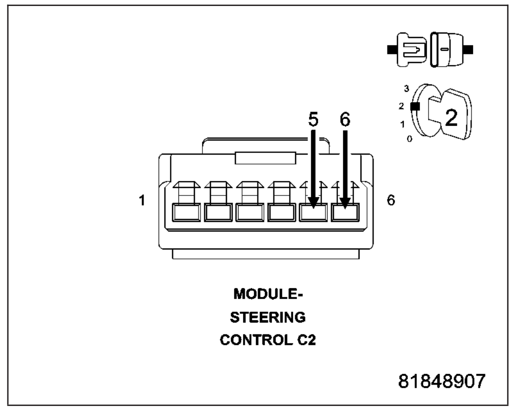
NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Is the (V71) S/C Signal 1 voltage below .2 volts with the jumper wire in place?

Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. STEERING CONTROL MODULE (SCM)



Turn the ignition off.

Disconnect the Steering Control Module (SCM) C2 connector.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

Turn the ignition on.

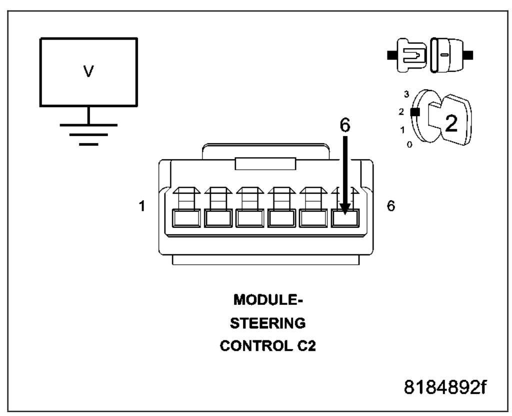
With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Is the (V71) S/C Signal 1 voltage below .2 volts with the jumper wire in place?

Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5



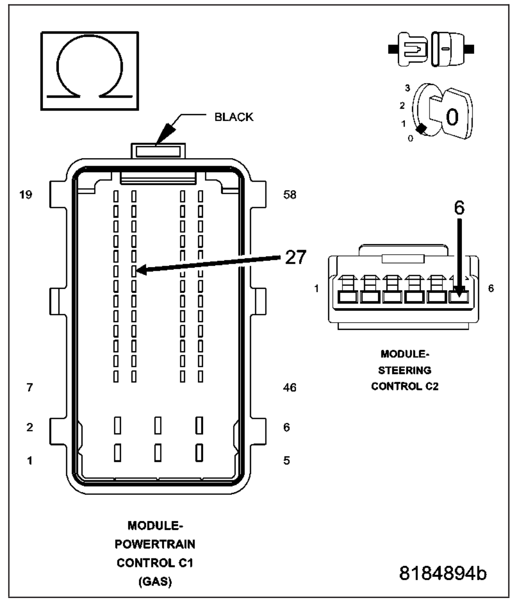
5. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) C2 harness connector.



Is there any voltage present?

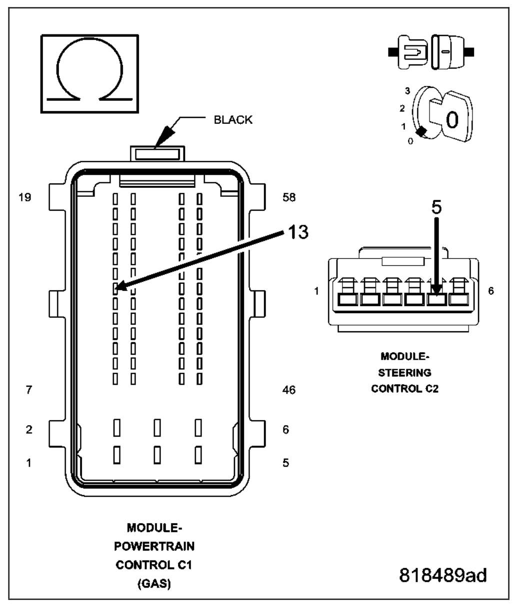
Yes >> Repair the (V71) S/C Signal 1 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V71) S/C Signal 1 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 7

No >> Repair the (V71) S/C Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 8

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

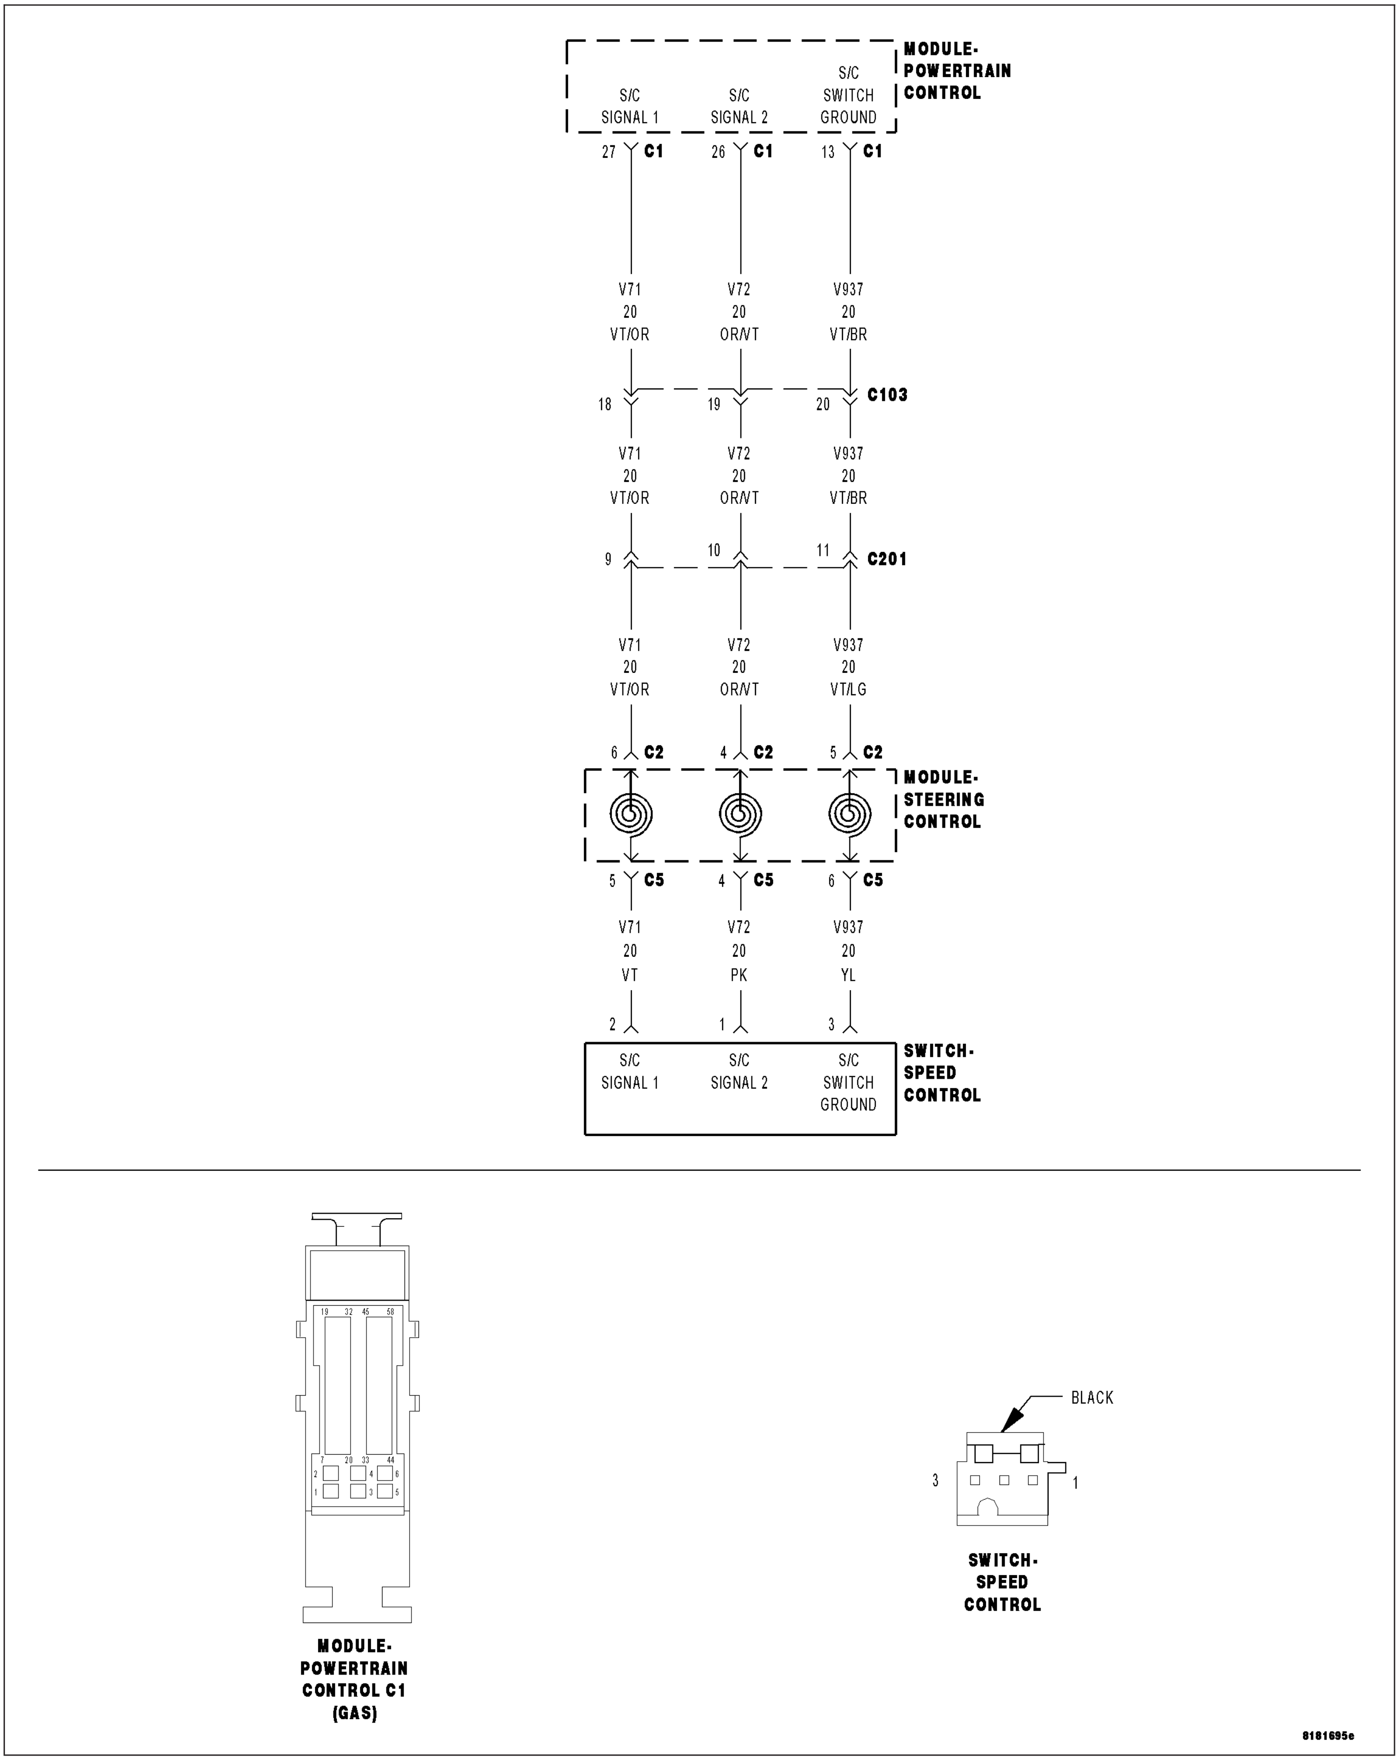
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0585-SPEED CONTROL SWITCH 1-2 CORRELATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the (V71) S/C Signal 1 voltage does not match the (V72) S/C Signal 2 voltage.

Possible Causes
INTERMITTENT DTC
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

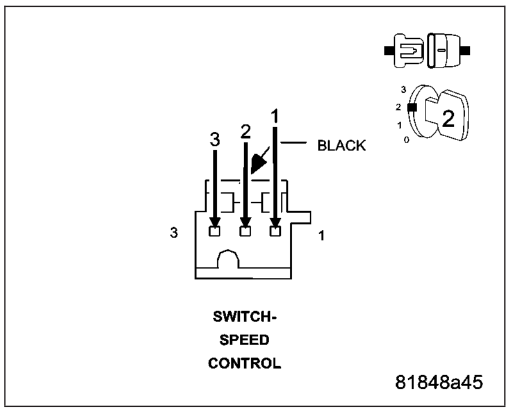
Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.

Remove the Speed Control Switch in accordance with the Service Information.



Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2 voltages.

NOTE: The voltages should be above 4.8 volts with the Speed Control Switch connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C5 harness connector.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2 voltages.

NOTE: The voltages should be above 4.8 volts with the Steering Control Module (SCM) C5 connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit at the Steering Control Module (SCM) C5 connector, not at the harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit at the Steering Control Module (SCM) C5 connector, not at the harness connector.

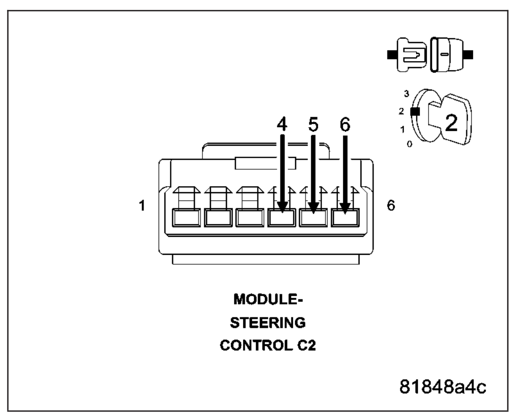
With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4



4. STEERING CONTROL MODULE (SCM)

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C2 connector.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2 voltages.

NOTE: The voltages should be above 4.8 volts with the connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

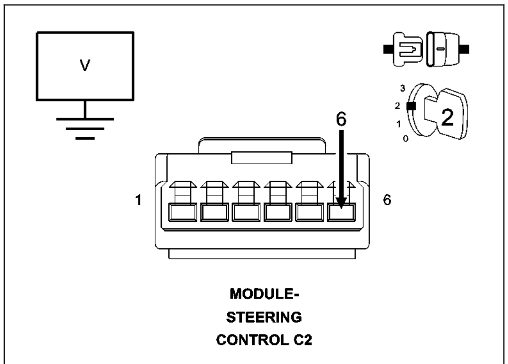
With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information. Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5



5. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

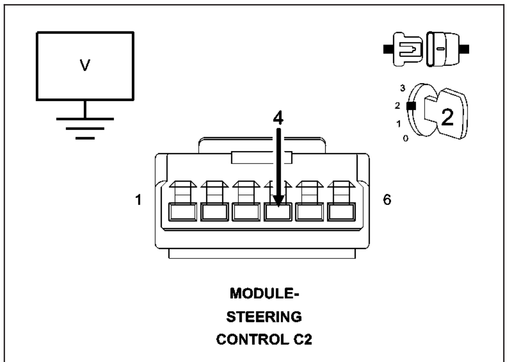
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) C2 harness connector.

8184892f



Is there any voltage present?

Yes >> Repair the (V71) S/C Signal 1 circuit for a short to voltage. Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

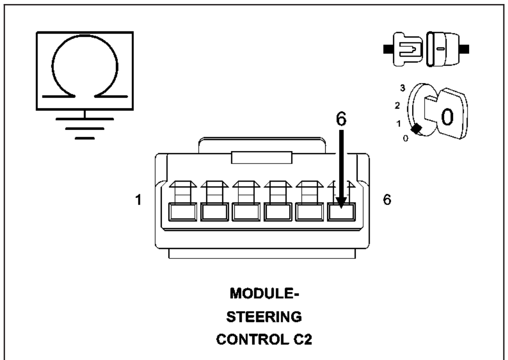
No >> Go to 6

6. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) C2 harness connector.

81848a53

Is there any voltage present?



Yes >> Repair the (V72) S/C Signal 2 circuit for a short to voltage. Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

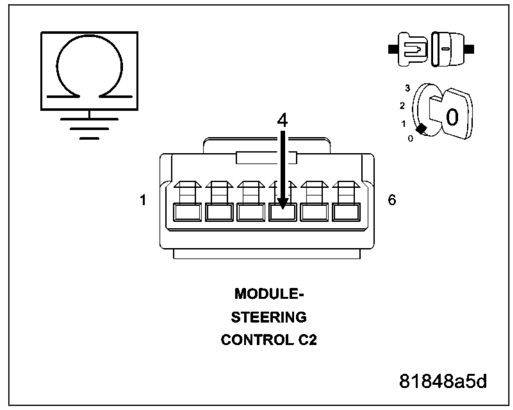
7. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) C2 harness connector.

81848940

Is the resistance above 100 ohms?



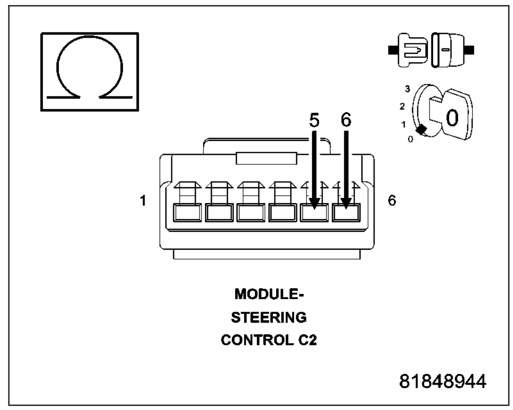
Yes >> Go to 8

No >> Repair the (V71) S/C Signal 1 circuit for a short to ground. Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) C2 harness connector.



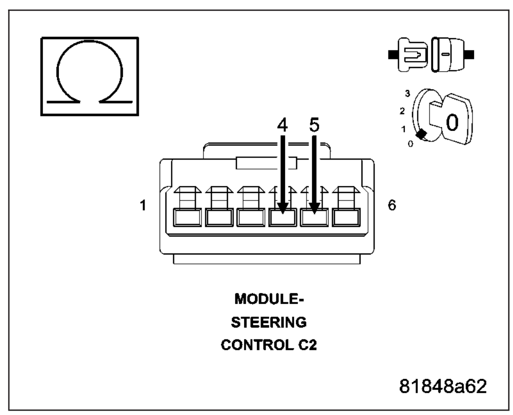
Is the resistance above 100 ohms?

Yes >> Go to 9

No >> Repair the (V72) S/C Signal 2 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the C2 Steering Control Module (SCM) harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 10

No >> Repair the (V71) S/C Signal 1 circuit for a short to the Steering Control Module (SCM) circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

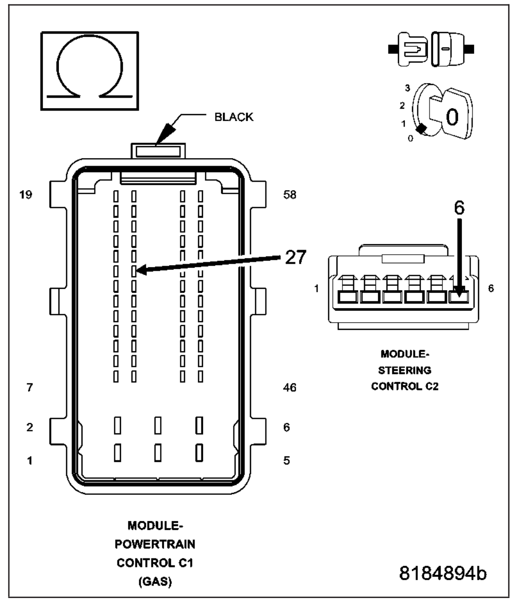
Measure the resistance between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 11

No >> Repair the (V72) S/C Signal 2 circuit for a short to the (V937) S/C Switch Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. (V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (V71) S/C Signal 1 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

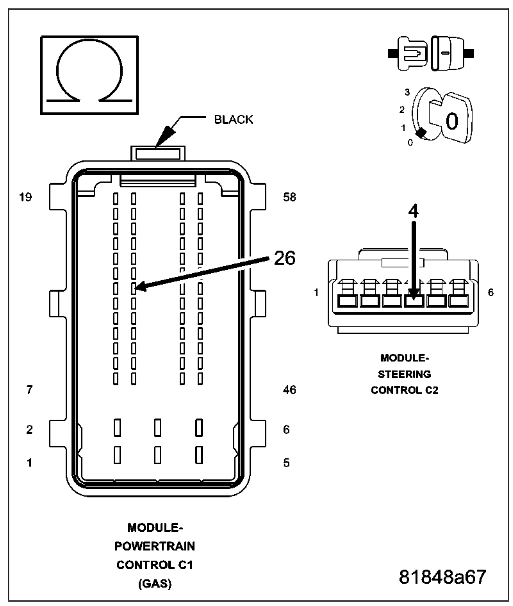
Is the resistance below 5.0 ohms?

Yes >> Go to 12

No >> Repair the (V71) S/C Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

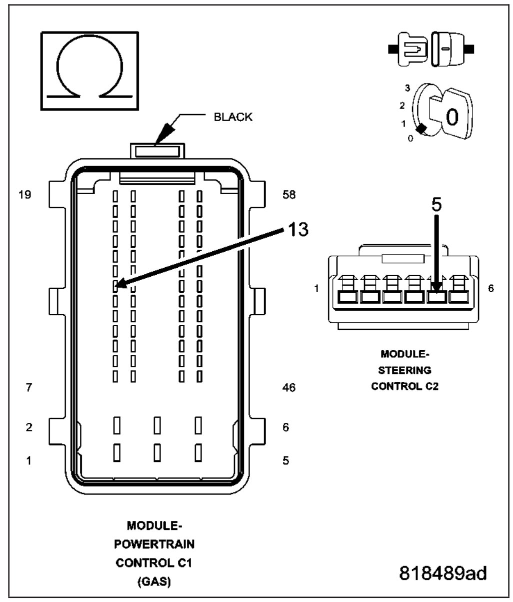
12. (V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (V72) S/C Signal 2 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 13



No >> Repair the (V72) S/C Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 14

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

14. POWERTRAIN CONTROL MODULE (PCM)

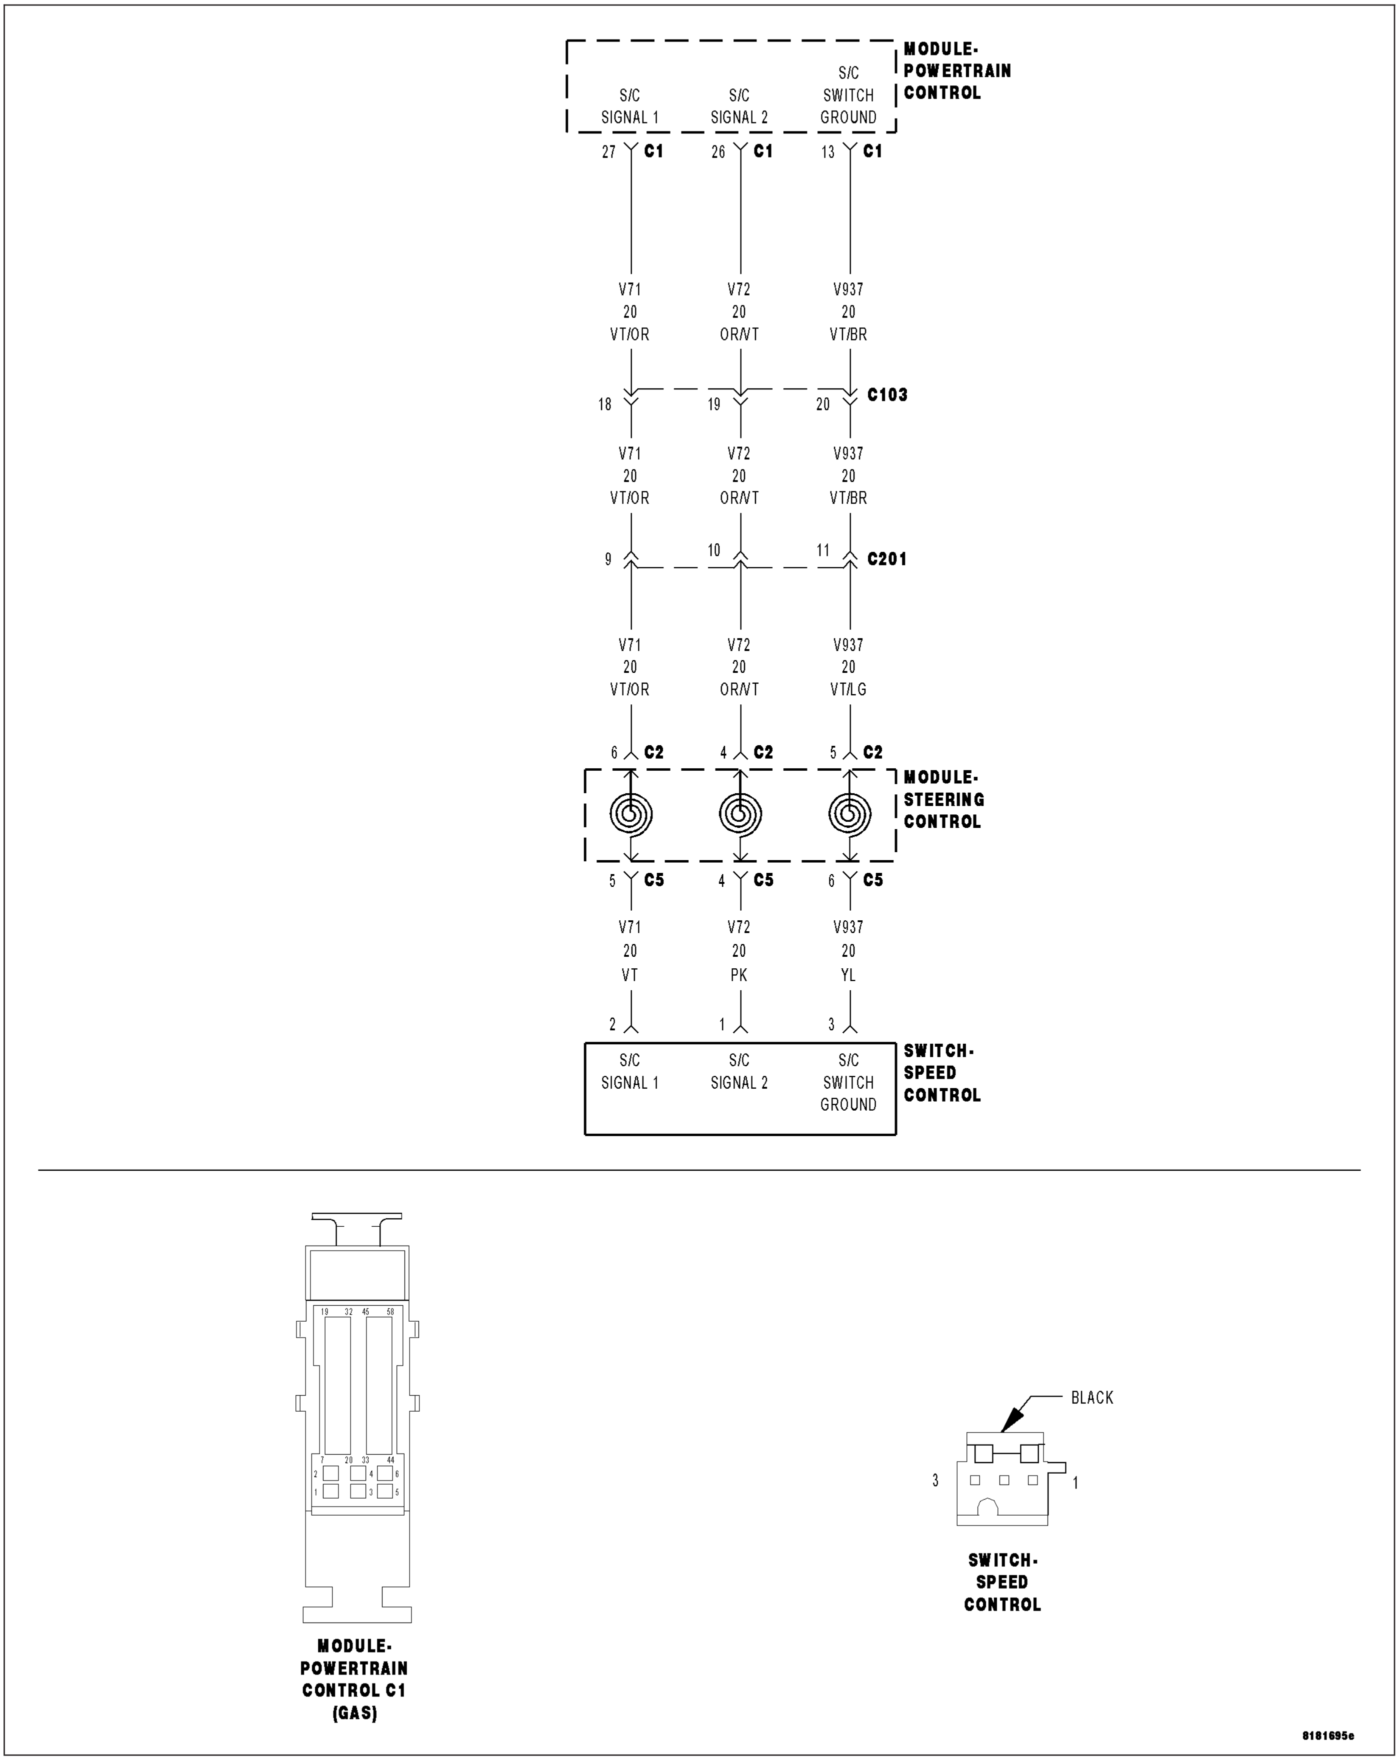
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0591-SPEED CONTROL SWITCH 2 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the Speed Control signal voltage is implausible.

Possible Causes
INTERMITTENT DTC
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

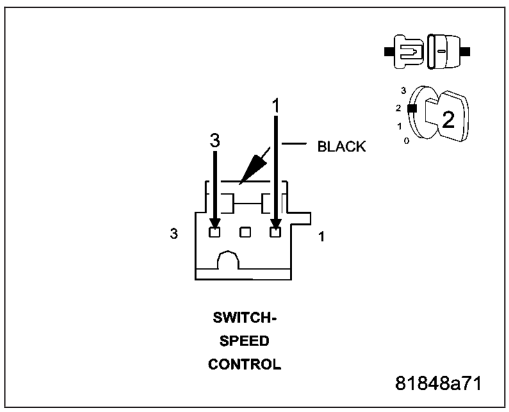
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.

Remove the Speed Control Switch in accordance with the Service Information.

Turn the ignition on.



With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be above 4.8 volts with the Speed Control Switch removed.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Is the (V72) S/C Signal 2 voltage above 4.8 volts with the Speed Control Switch removed and below .2 volts with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C5 harness connector.

Turn the ignition on.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The voltage should be above 4.8 volts with the Steering Control Module (SCM) C5 connector disconnected.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit at the Steering Control Module (SCM) C5 connector, not at the harness connector.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

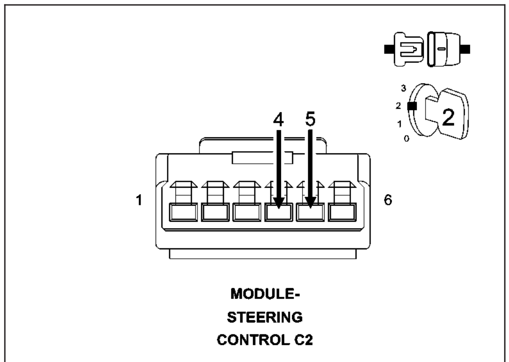
No >> Go to 4

4. STEERING CONTROL MODULE (SCM)

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C2 connector.

Turn the ignition on.



With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The voltage should be above 4.8 volts with the connector disconnected.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

81848a75

Are the Speed Control voltages displayed as described?

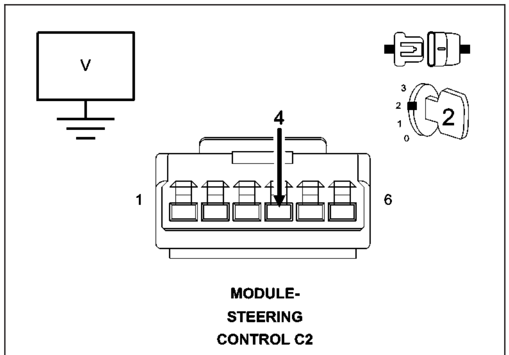
Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.



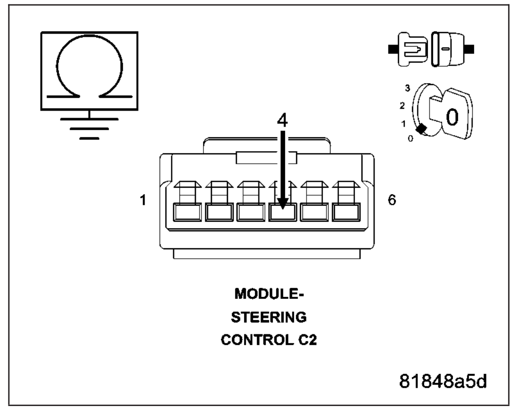
Turn the ignition on.

Measure the voltage of the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) harness connector.

Is there any voltage present?

Yes >> Repair the (V72) S/C Signal 2 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6



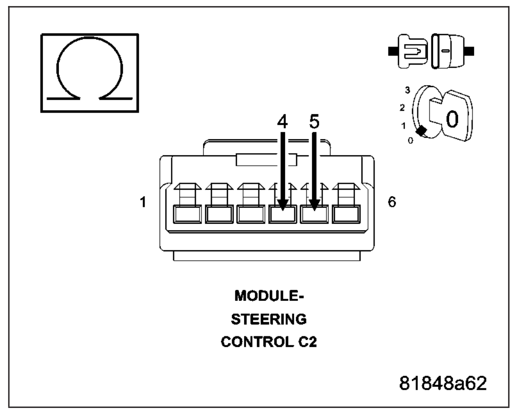
81848a53

6. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 7

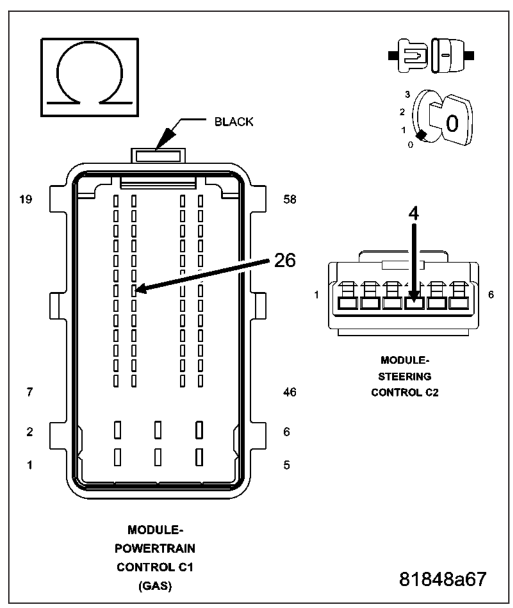
No >> Repair the (V72) S/C Signal 2 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 8

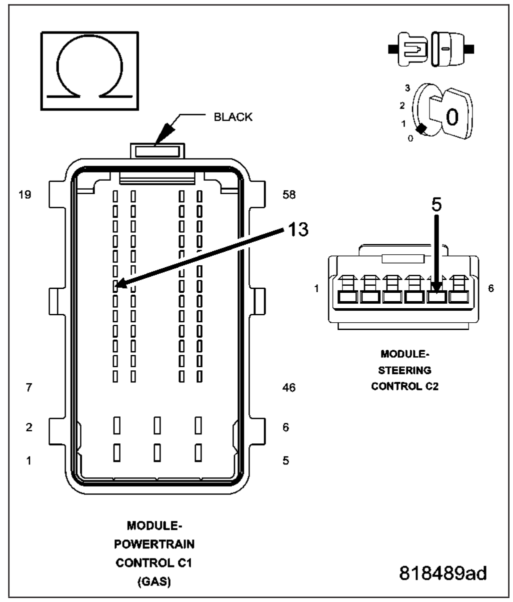
No >> Repair the (V72) S/C Signal 2 circuit for a short to the Steering Control Module (SCM) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V72) S/C Signal 2 circuit between the Steering Control Module (SCM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 9

No >> Repair the (V72) S/C Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. POWERTRAIN CONTROL MODULE (PCM)

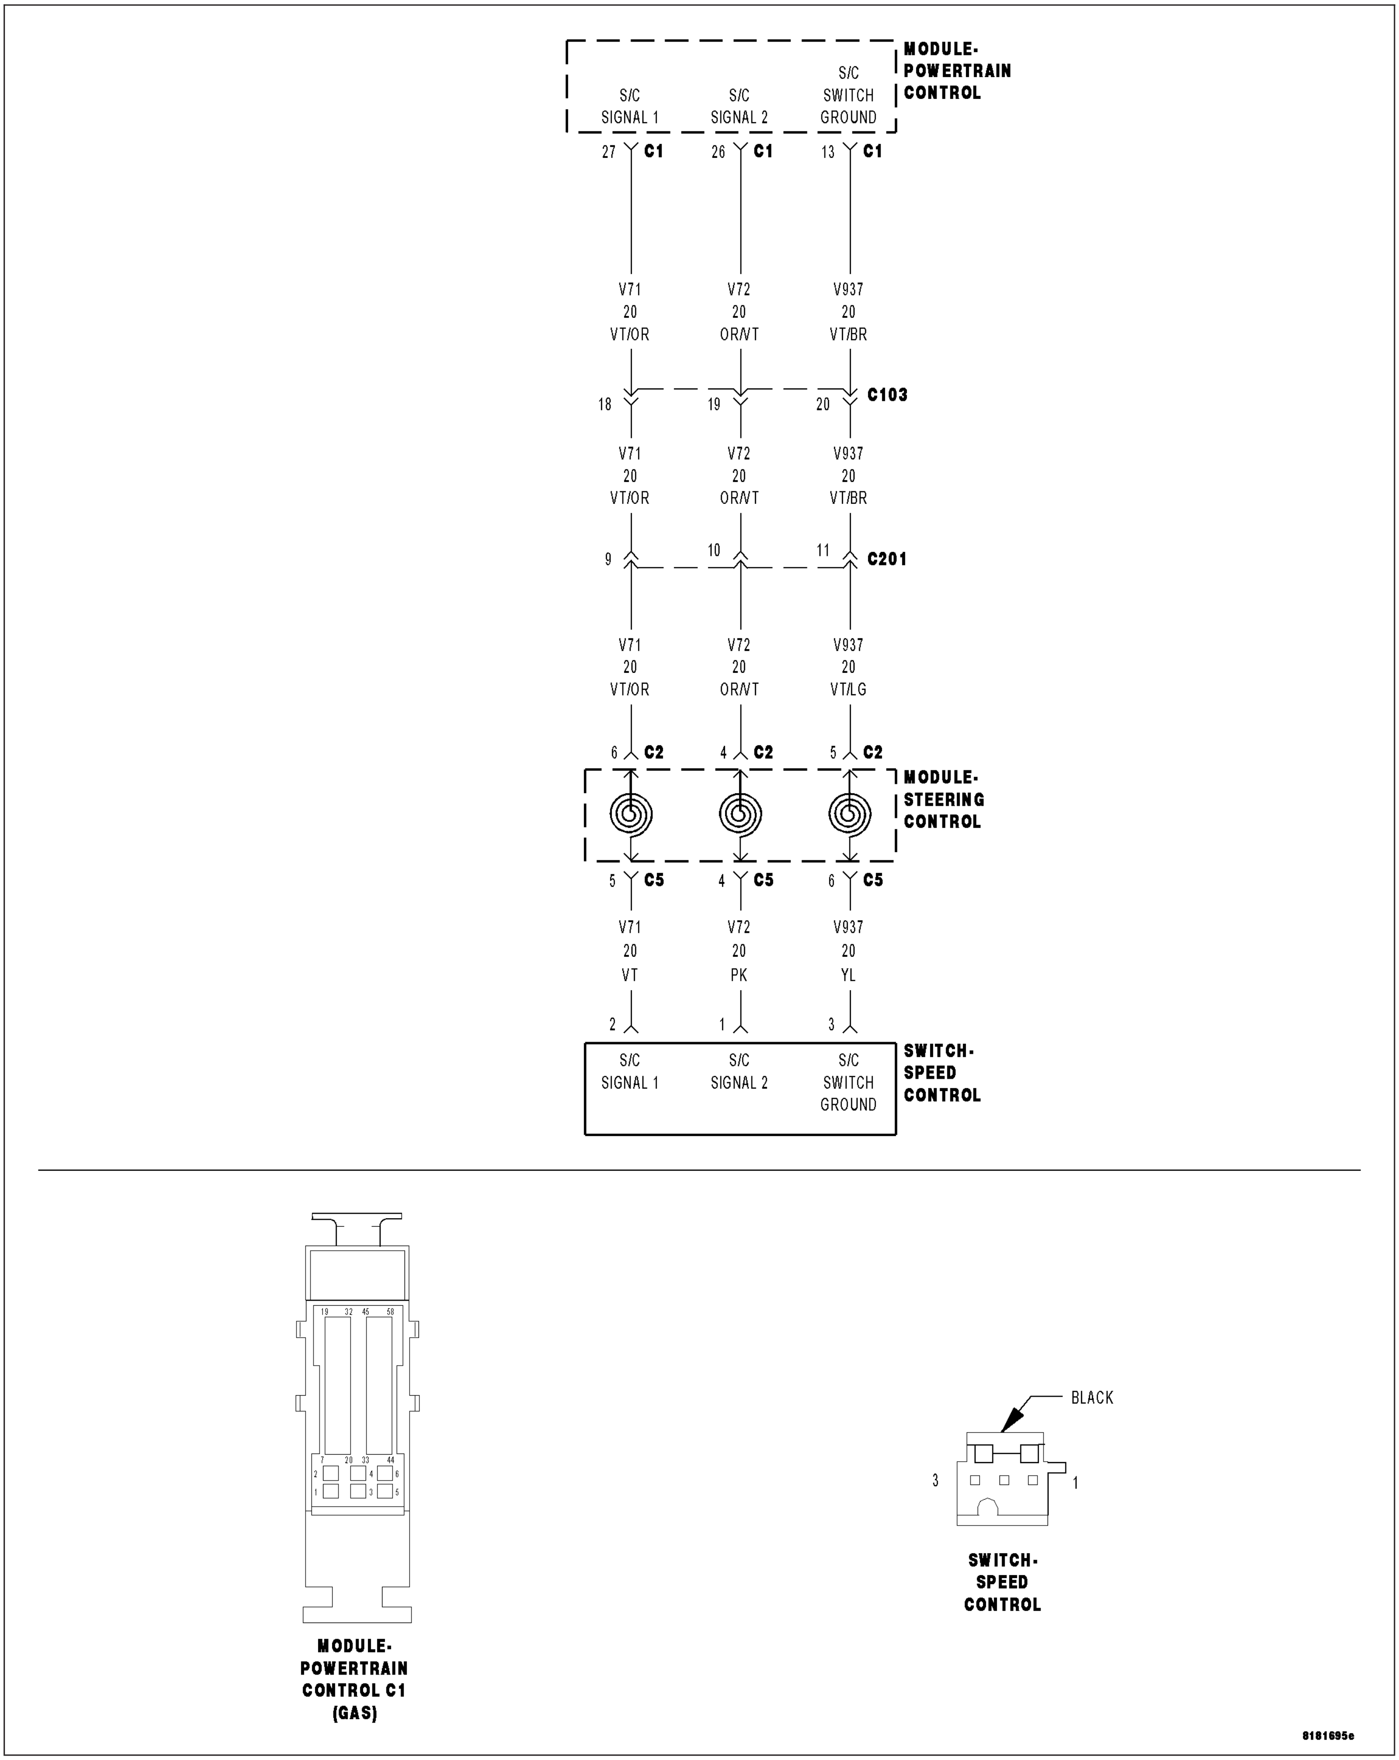
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the Speed Control signal voltage is implausible.

Possible Causes
INTERMITTENT DTC
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.

Remove the Speed Control Switch in accordance with the Service Information.

Turn the ignition on.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be above 4.8 volts with the Speed Control Switch removed.

Is the (V72) S/C Signal 2 voltage above 4.8 volts with the Speed Control Switch removed?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C5 connector.

Turn the ignition on.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be above 4.8 volts with the connector disconnected.

Is the (V72) S/C Signal 2 voltage above 4.8 volts with the connector disconnected?

Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. STEERING CONTROL MODULE (SCM)

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C2 connector.

Turn the ignition on.

With a scan tool, read the (V72) S/C Signal 2 voltage.

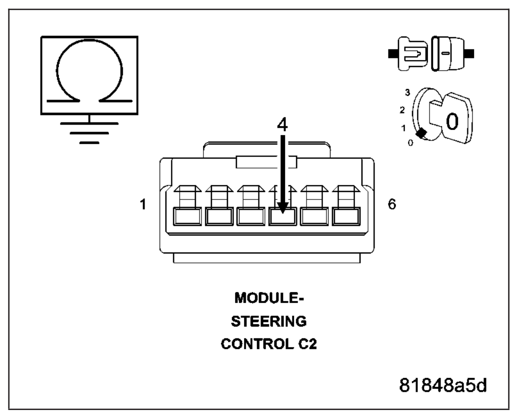
NOTE: The (V72) S/C Signal 2 voltage should be above 4.8 volts with the connector disconnected.

Is the (V72) S/C Signal 2 voltage above 4.8 volts with the connector disconnected?

Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

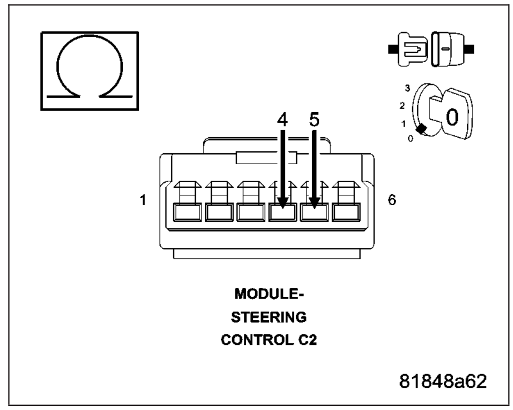
5. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND



Turn the ignition off.

Measure the resistance between ground and the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?



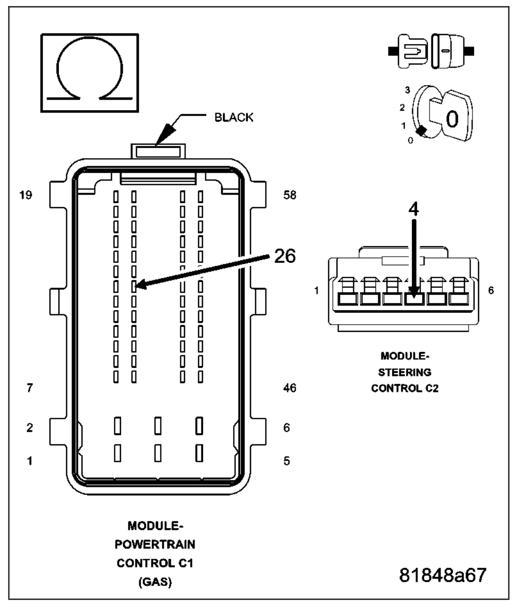
Yes >> Go to 6

No >> Repair the (V72) S/C Signal 2 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 7

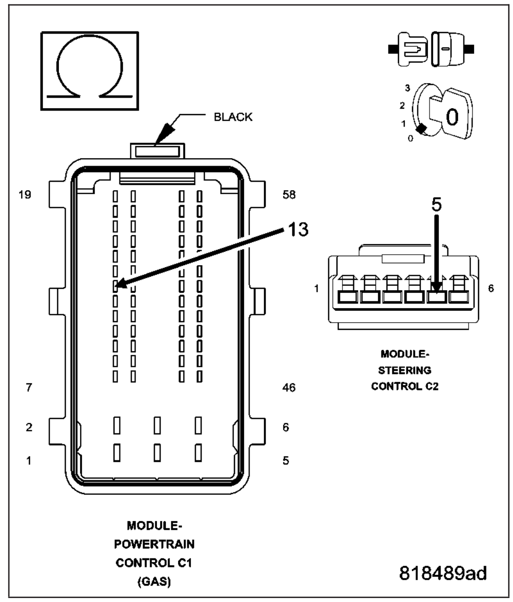
No >> Repair the (V72) S/C Signal 2 circuit for a short to the Steering Control Module (SCM) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V72) S/C Signal 2 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 8

No >> Repair the (V72) S/C Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 9

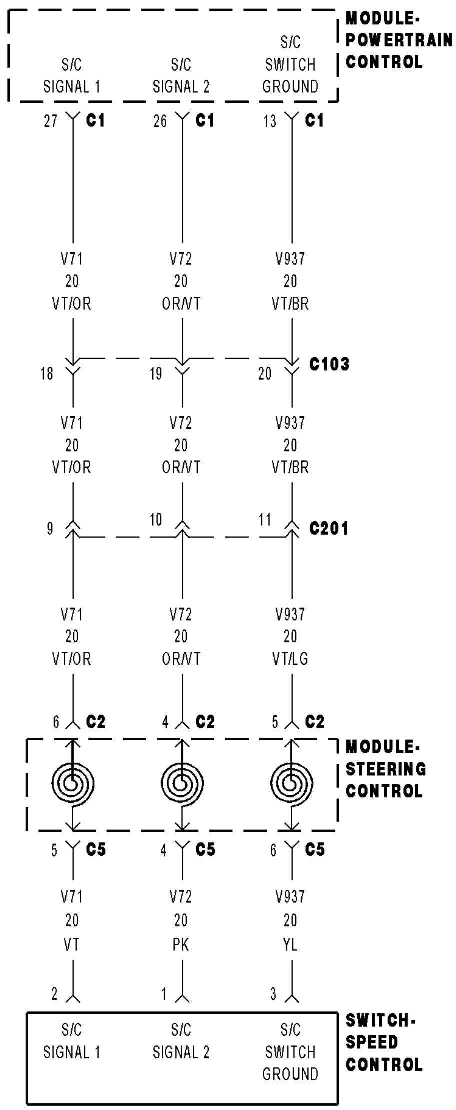
No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. POWERTRAIN CONTROL MODULE (PCM)

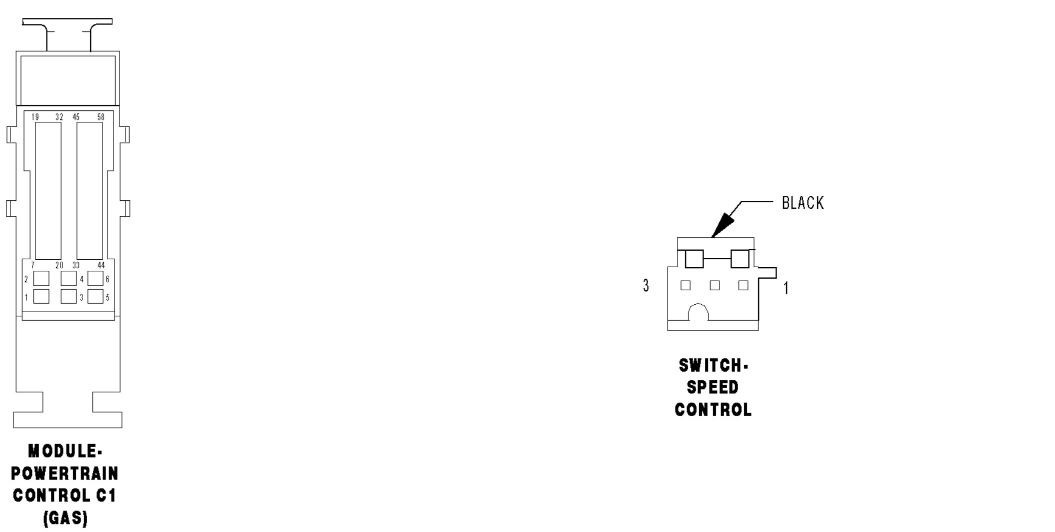
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.



Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the Speed Control signal voltage is implausible.

Possible Causes
INTERMITTENT DTC
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

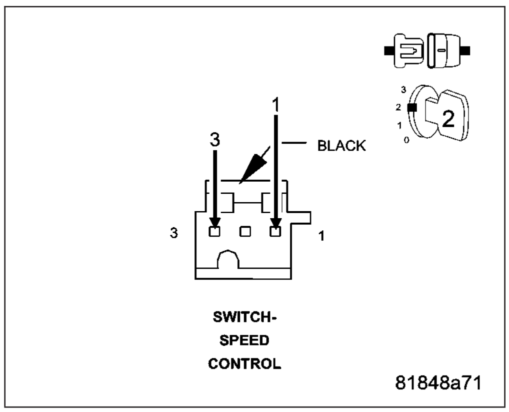
Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.



Remove the Speed Control Switch in accordance with the Service Information.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

Turn the ignition on.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Is the (V72) S/C Signal 2 voltage below .2 volts with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C5 connector.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C5 connector, not at the harness connector.

Turn the ignition on.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Is the (V72) S/C Signal 2 voltage below .2 volts with the jumper wire in place?

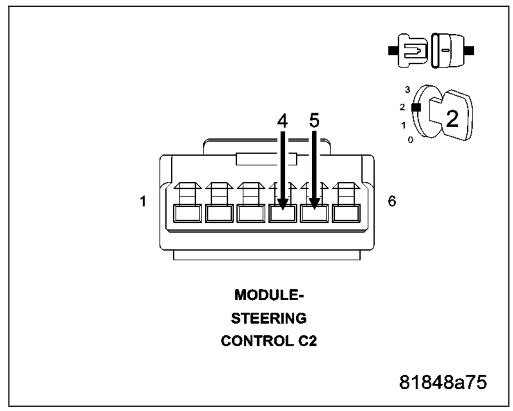
Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. STEERING CONTROL MODULE (SCM)

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C2 connector.



Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

Turn the ignition on.

With a scan tool, read the (V72) S/C Signal 2 voltage.

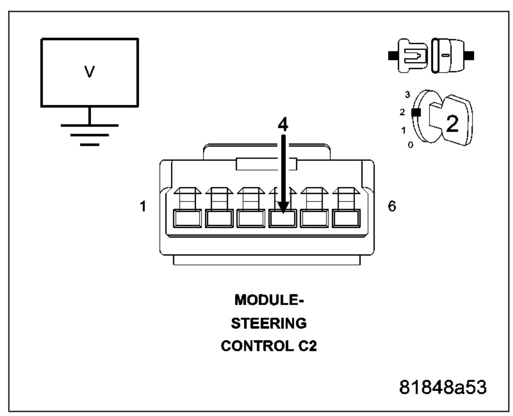
NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Is the (V72) S/C Signal 2 voltage below .2 volts with the jumper wire in place?

Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

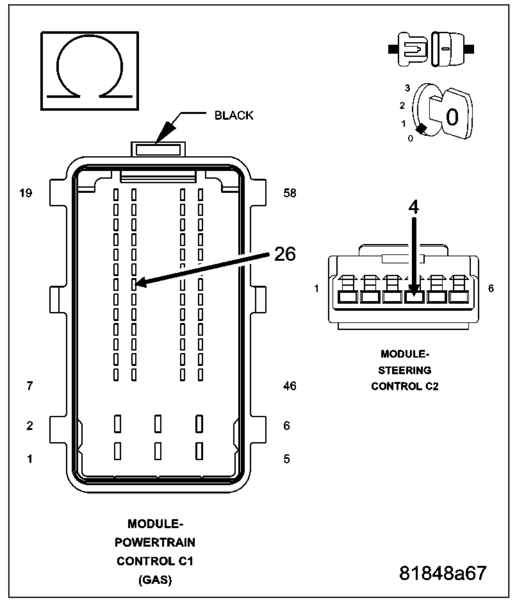


Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) C2 harness connector.



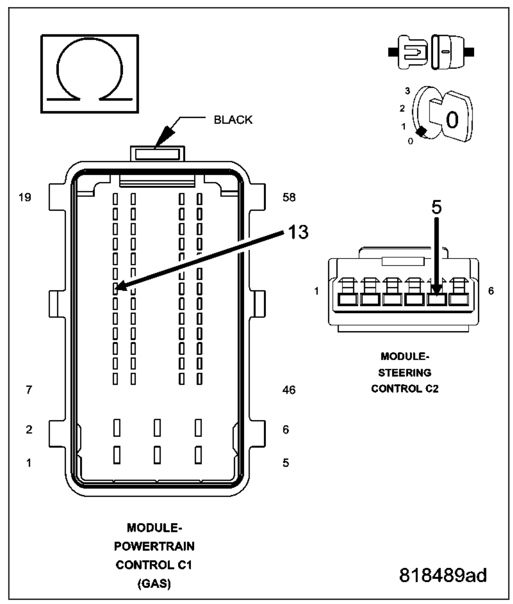
Is there any voltage present?

Yes >> Repair the (V72) S/C Signal 2 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V72) S/C Signal 2 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (V72) S/C Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 8

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0600-SERIAL COMMUNICATION LINK

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module (PCM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0601-INTERNAL MEMORY CHECKSUM INVALID

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module (PCM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0606-INTERNAL ECM PROCESSOR

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the Powertrain Control Module (PCM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P060B-ETC A/D GROUND PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When the A/D reading does not return to ground within a set period of time during test activation, this DTC will set. Reprogramming the module may not fix this DTC. ETC lamp will flash.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P060D-ETC LEVEL 2 APP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When secondary software determines that the APPS 1 and APPS 2 signals do not match for a period of time. ETC lamp will flash

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P060E-ETC LEVEL 2 TPS PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When secondary software determines that the TPS 1 and TPS 2 signals do not match for a period of time. ETC lamp will flash.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P060F-ETC LEVEL 2 ECT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When secondary software determines that the Coolant Temperature is implausible for a period of time. ETC lamp will flash.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

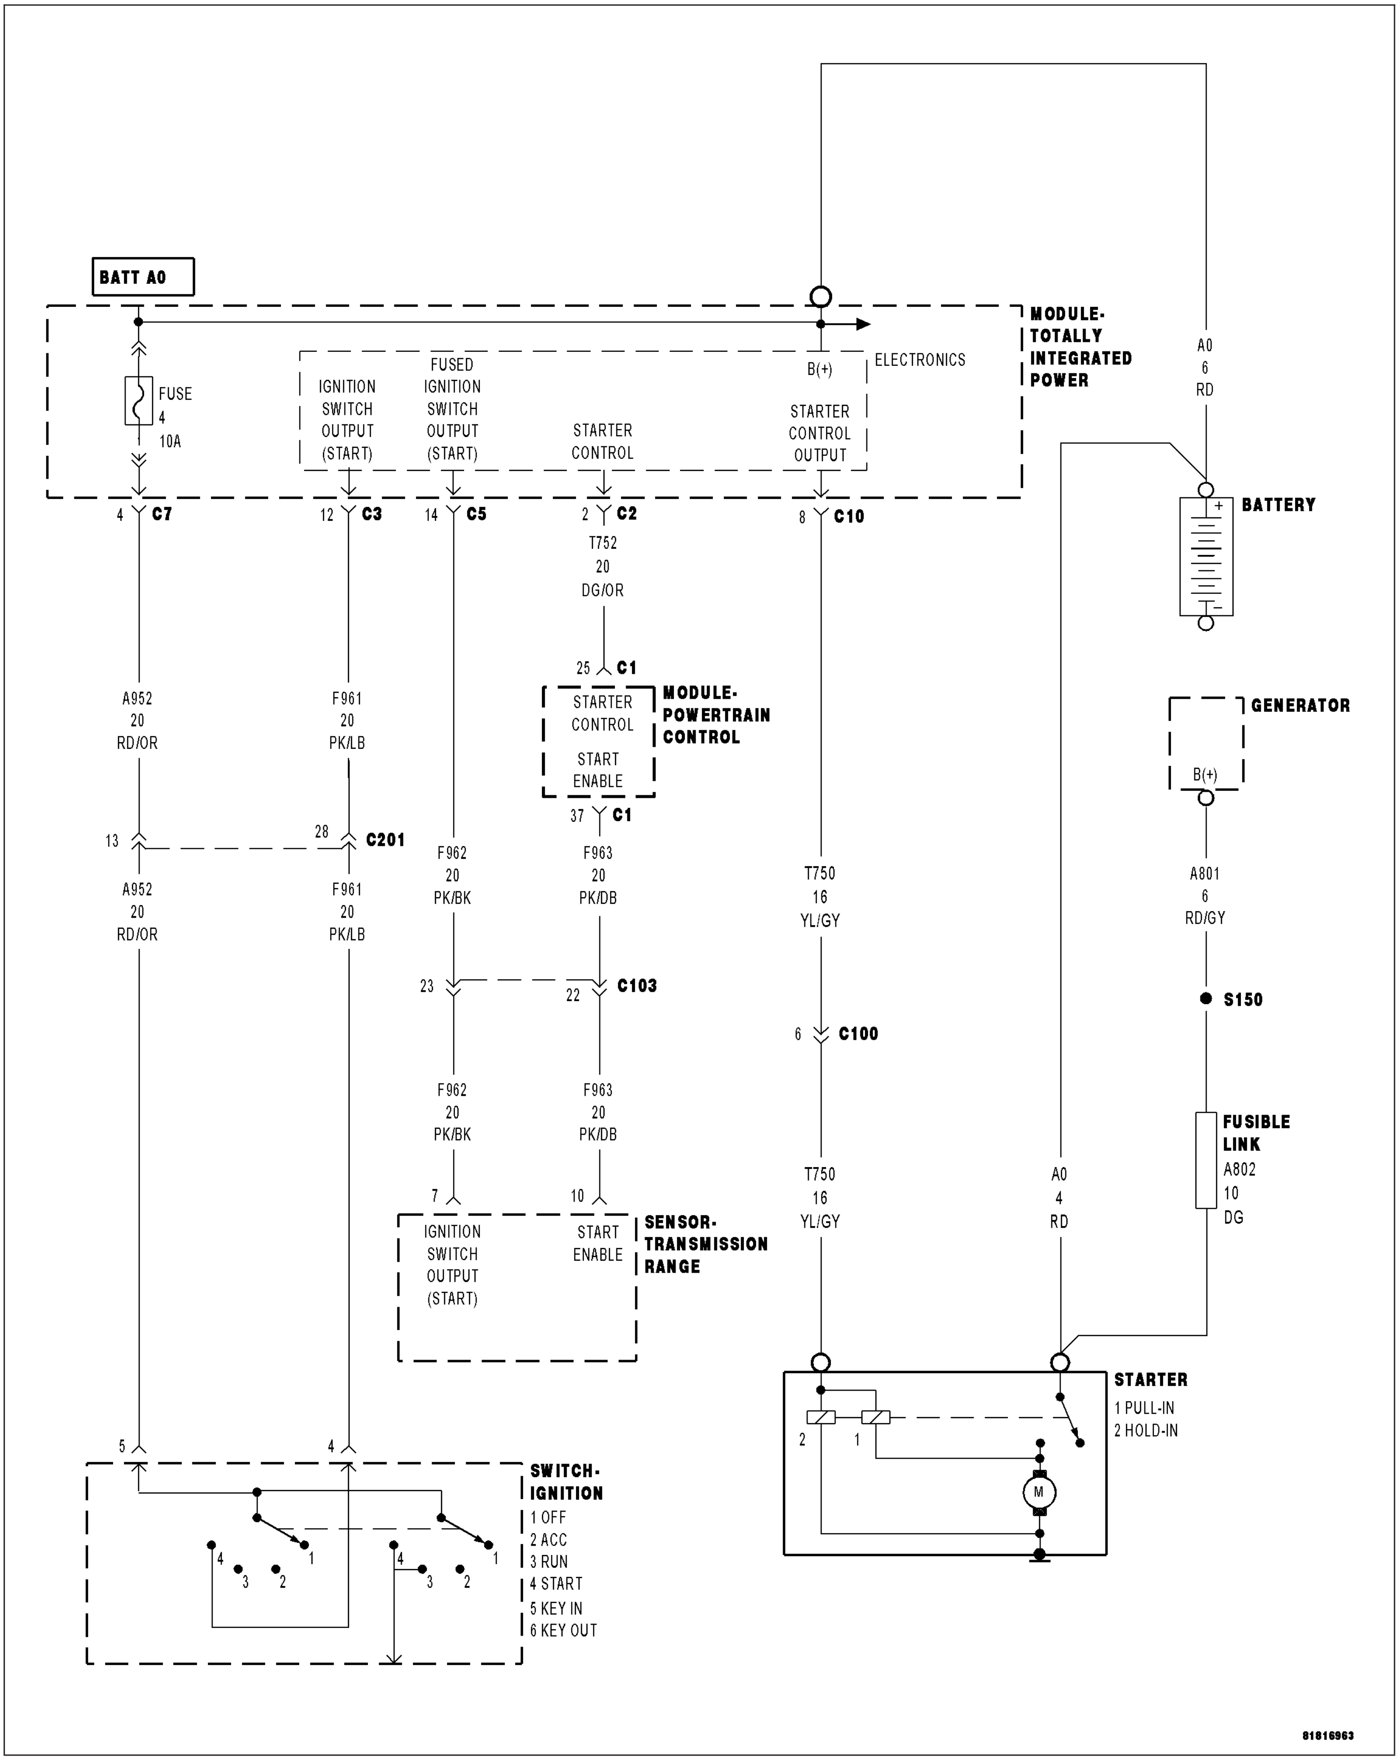
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0615-STARTER CONTROL CIRCUIT-OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the actual state of the starter control does not match the intended state.

Possible Causes
INTERMITTENT DTC
(T752) STARTER CONTROL CIRCUIT SHORTED TO VOLTAGE
(T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

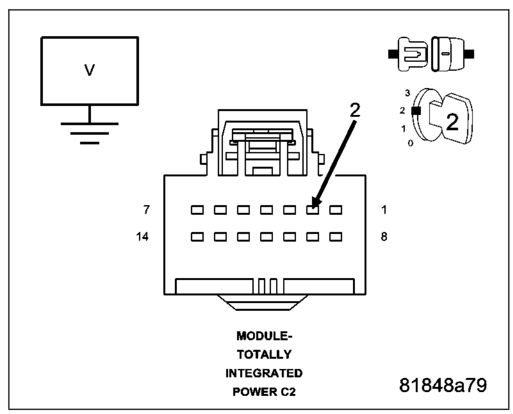
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (T752) STARTER CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

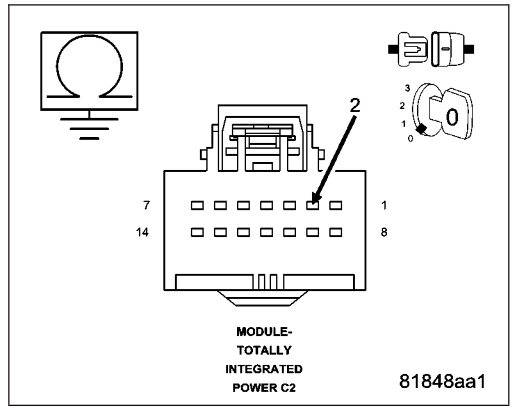
Disconnect the Totally Integrated Power Module (TIPM) connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (T752) Starter Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Is there any voltage present?



Yes >> Repair the (T752) Starter Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

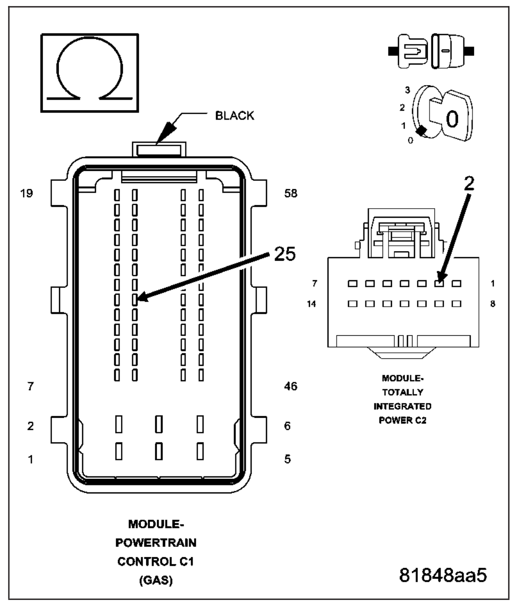
No >> Go to 3

3. (T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (T752) Starter Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (T752) Starter Control circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

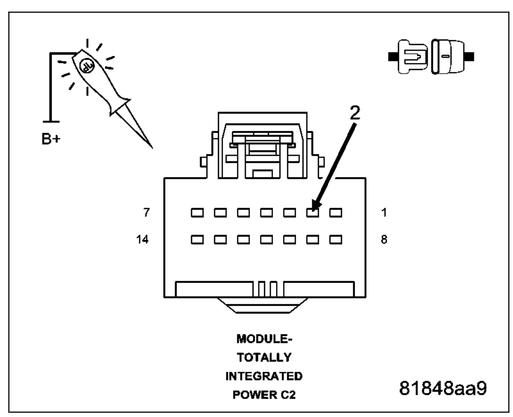
4. (T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T752) Starter Control circuit between the Totally Integrated Power Module (TIPM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (T752) Starter Control circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. TOTALLY INTEGRATED POWER MODULE (TIPM)

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Using a 12 volt test light connected to 12 volts, check the (T752) Starter Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

NOTE: The test light should not be illuminated.

While monitoring the test light, move the ignition to the start position.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light not illuminated with the ignition in the run position and illuminated and bright with the ignition in the start

position?

Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

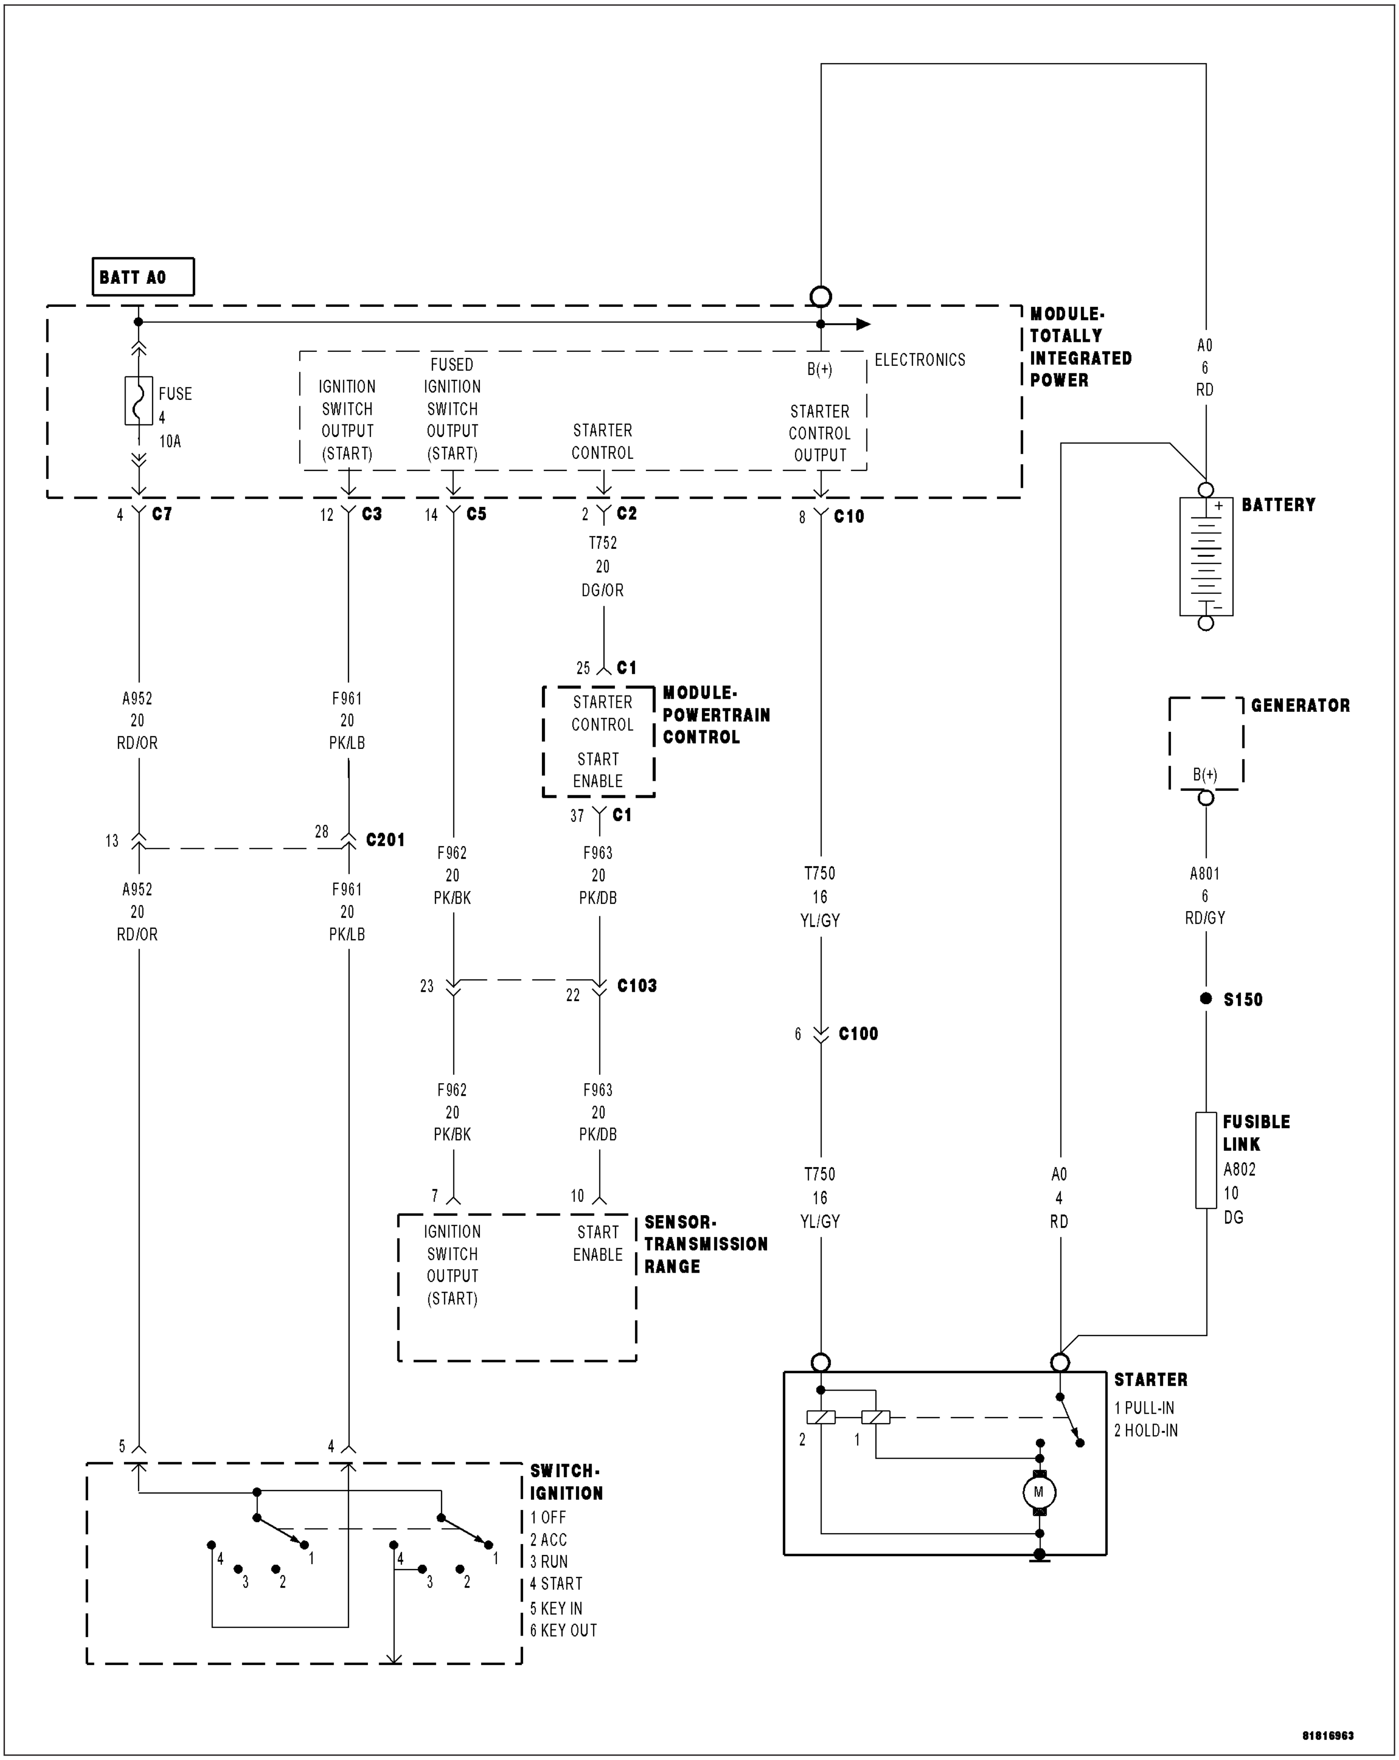
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0616-STARTER CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the starter control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

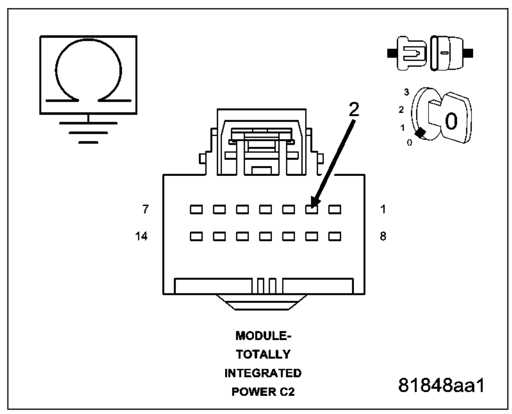
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND

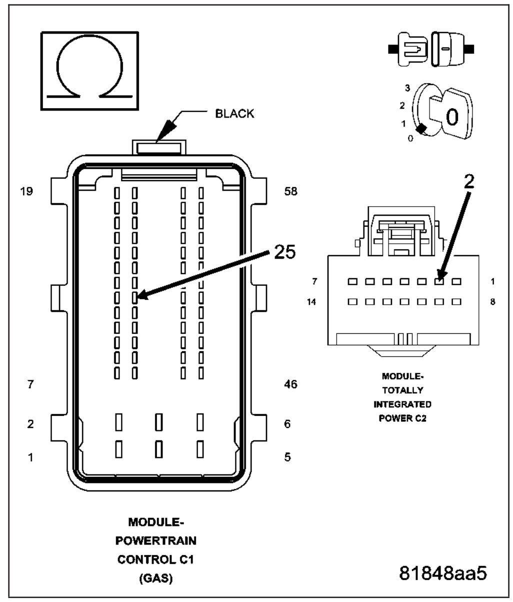
Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) connector.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (T752) Starter Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (T752) Starter Control circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

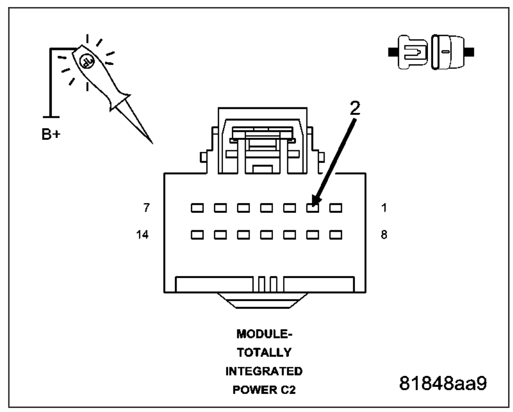
3. (T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T752) Starter Control circuit between the Totally Integrated Power Module (TIPM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (T752) Starter Control circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. TOTALLY INTEGRATED POWER MODULE (TIPM)

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Using a 12 volt test light connected to 12 volts, check the (T752) Starter Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

NOTE: The test light should not be illuminated.

While monitoring the test light, move the ignition to the start position.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light not illuminated with the ignition in the run position and illuminated and bright with the ignition in the start position?

Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

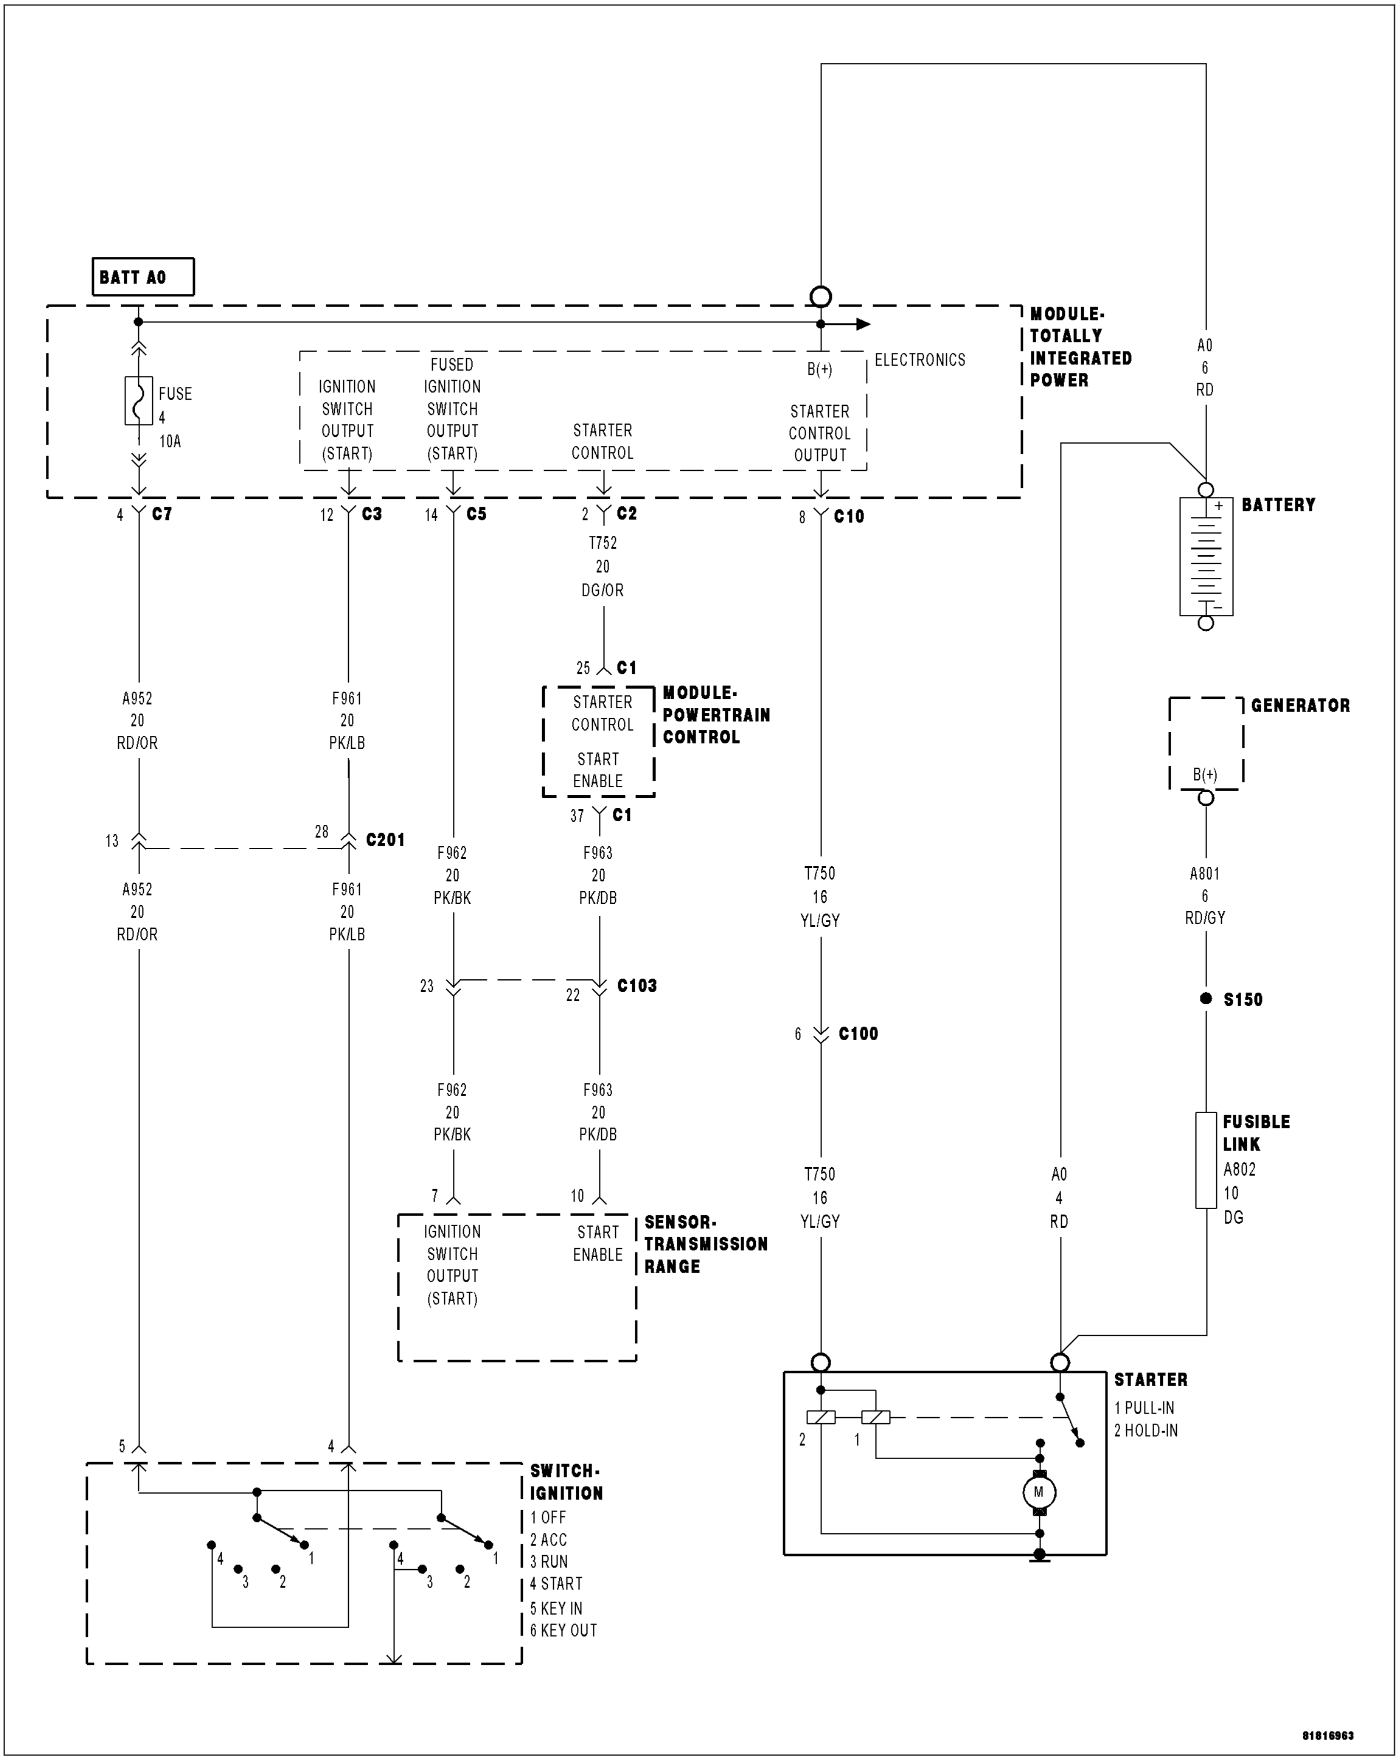
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0617-STARTER CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the starter control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(T752) STARTER CONTROL CIRCUIT SHORTED TO VOLTAGE
(T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

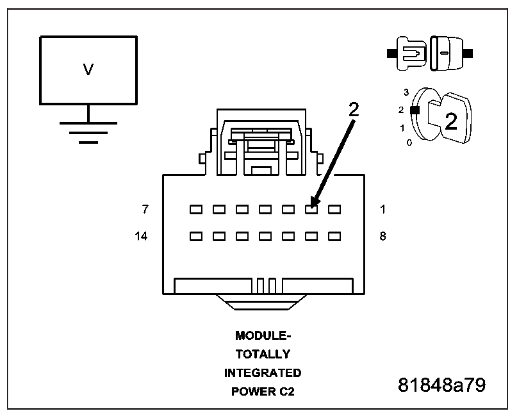
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (T752) STARTER CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

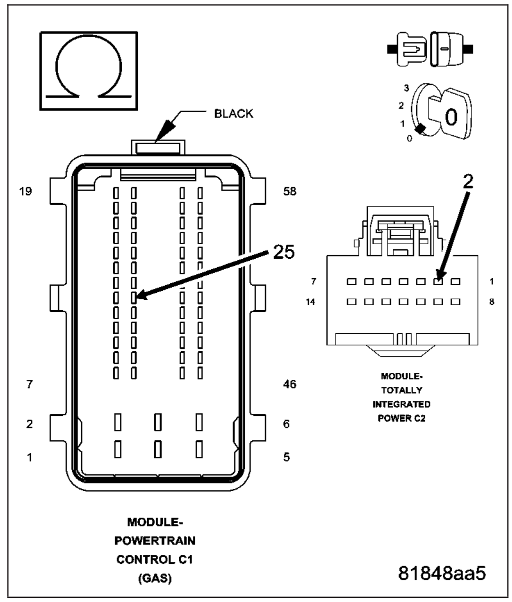
Disconnect the Totally Integrated Power Module (TIPM) connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (T752) Starter Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Is there any voltage present?



Yes >> Repair the (T752) Starter Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

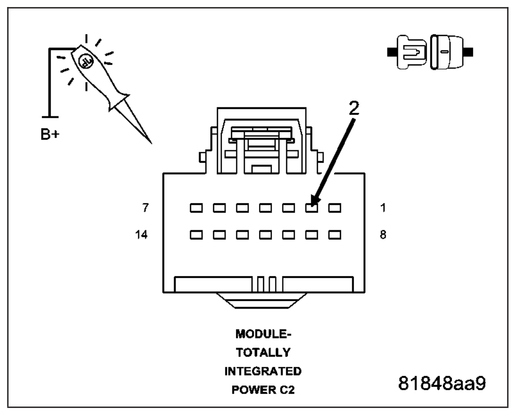
Turn the ignition off.

Measure the resistance of the (T752) Starter Control circuit between the Totally Integrated Power Module (TIPM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (T752) Starter Control circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. TOTALLY INTEGRATED POWER MODULE (TIPM)

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Using a 12 volt test light connected to 12 volts, check the (T752) Starter Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

NOTE: The test light should not be illuminated.

While monitoring the test light, move the ignition to the start position.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light not illuminated with the ignition in the run position and illuminated and bright with the ignition in the start position?

Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P061A-ETC LEVEL 2 TORQUE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When secondary software determines that the requested output is not being achieved by the engine for a period of time. ETC lamp will flash.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P061C-ETC LEVEL 2 RPM PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When secondary software determines that the engine speed is implausible for a period of time. ETC lamp will flash.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

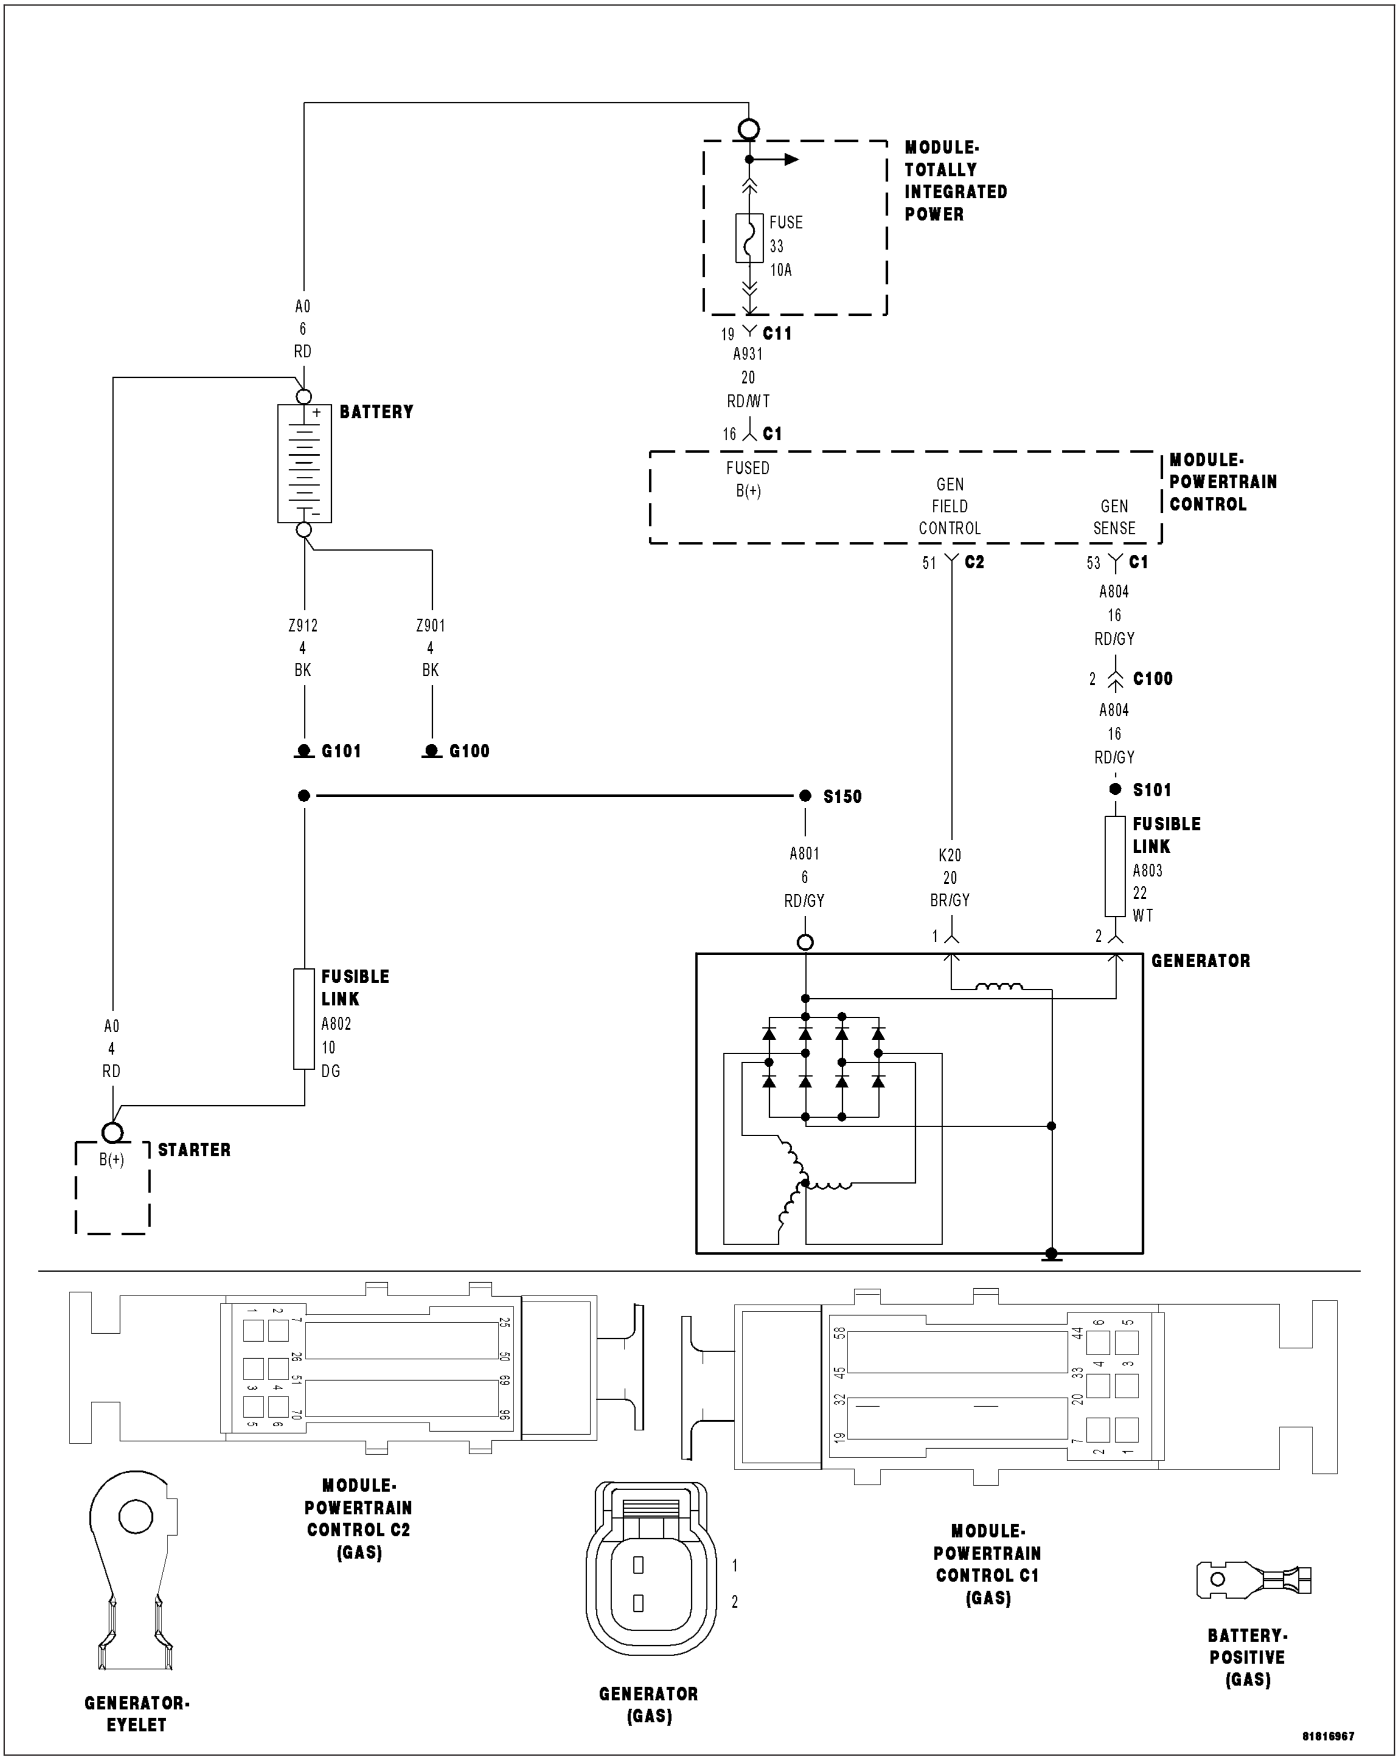
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0622-GENERATOR FIELD CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the actual state of the generator field control does not match the intended state.

Possible Causes
INTERMITTENT DTC
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND
(K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

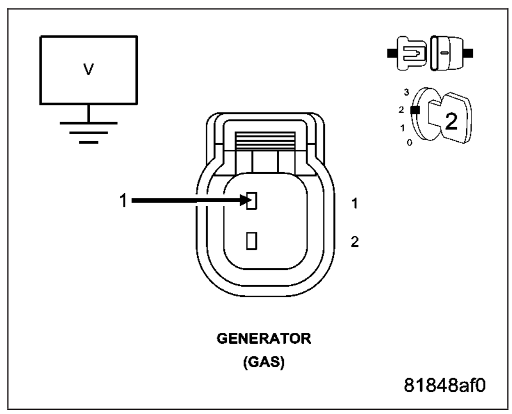
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Generator connector.

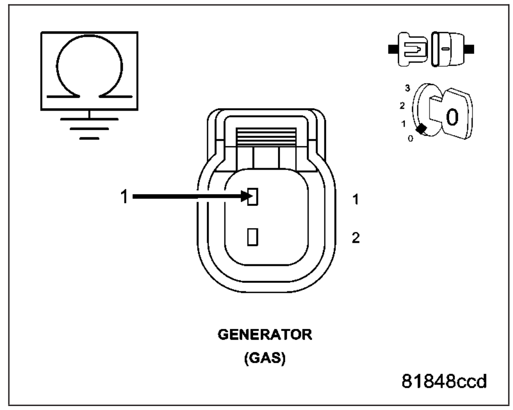
Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K20) Gen Field Control circuit in the Generator harness connector.

Is there any voltage present?

Yes >> Repair the (K20) Gen Field Control circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

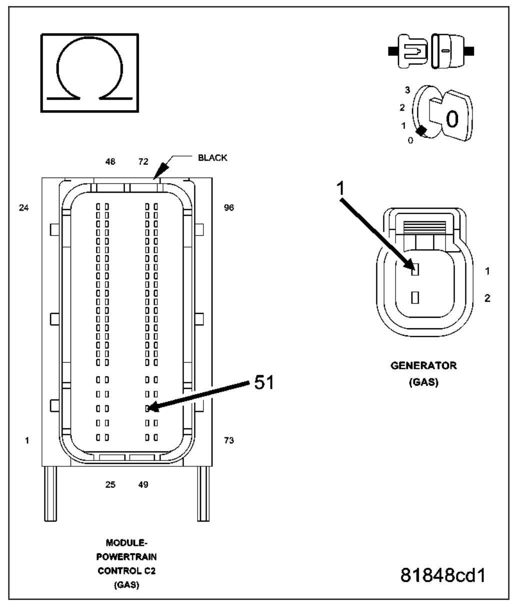
No >> Go to 3

3. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K20) Gen Field Control circuit in the Generator harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (K20) Gen Field Control circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

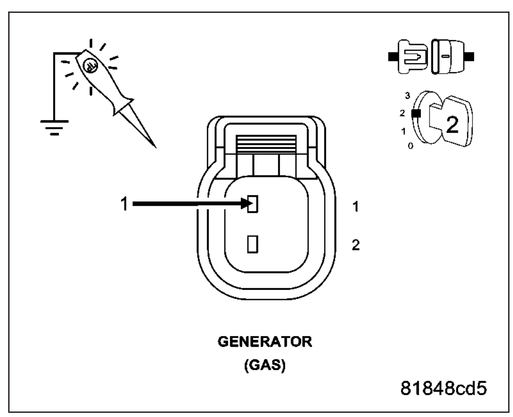
Measure the resistance of the (K20) Gen Field Control circuit between the Generator harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K20) Gen Field Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. GENERATOR

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Generator field control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K20) Gen Field Control circuit in the Generator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Generator field control to the OFF (0%) position.

Using a 12 volt test light connected to ground, check the (K20) Gen Field Control circuit in the Generator harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation ON (100%) and not illuminated with the actua-

tion OFF (0%)?

Yes >> Replace the Generator in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

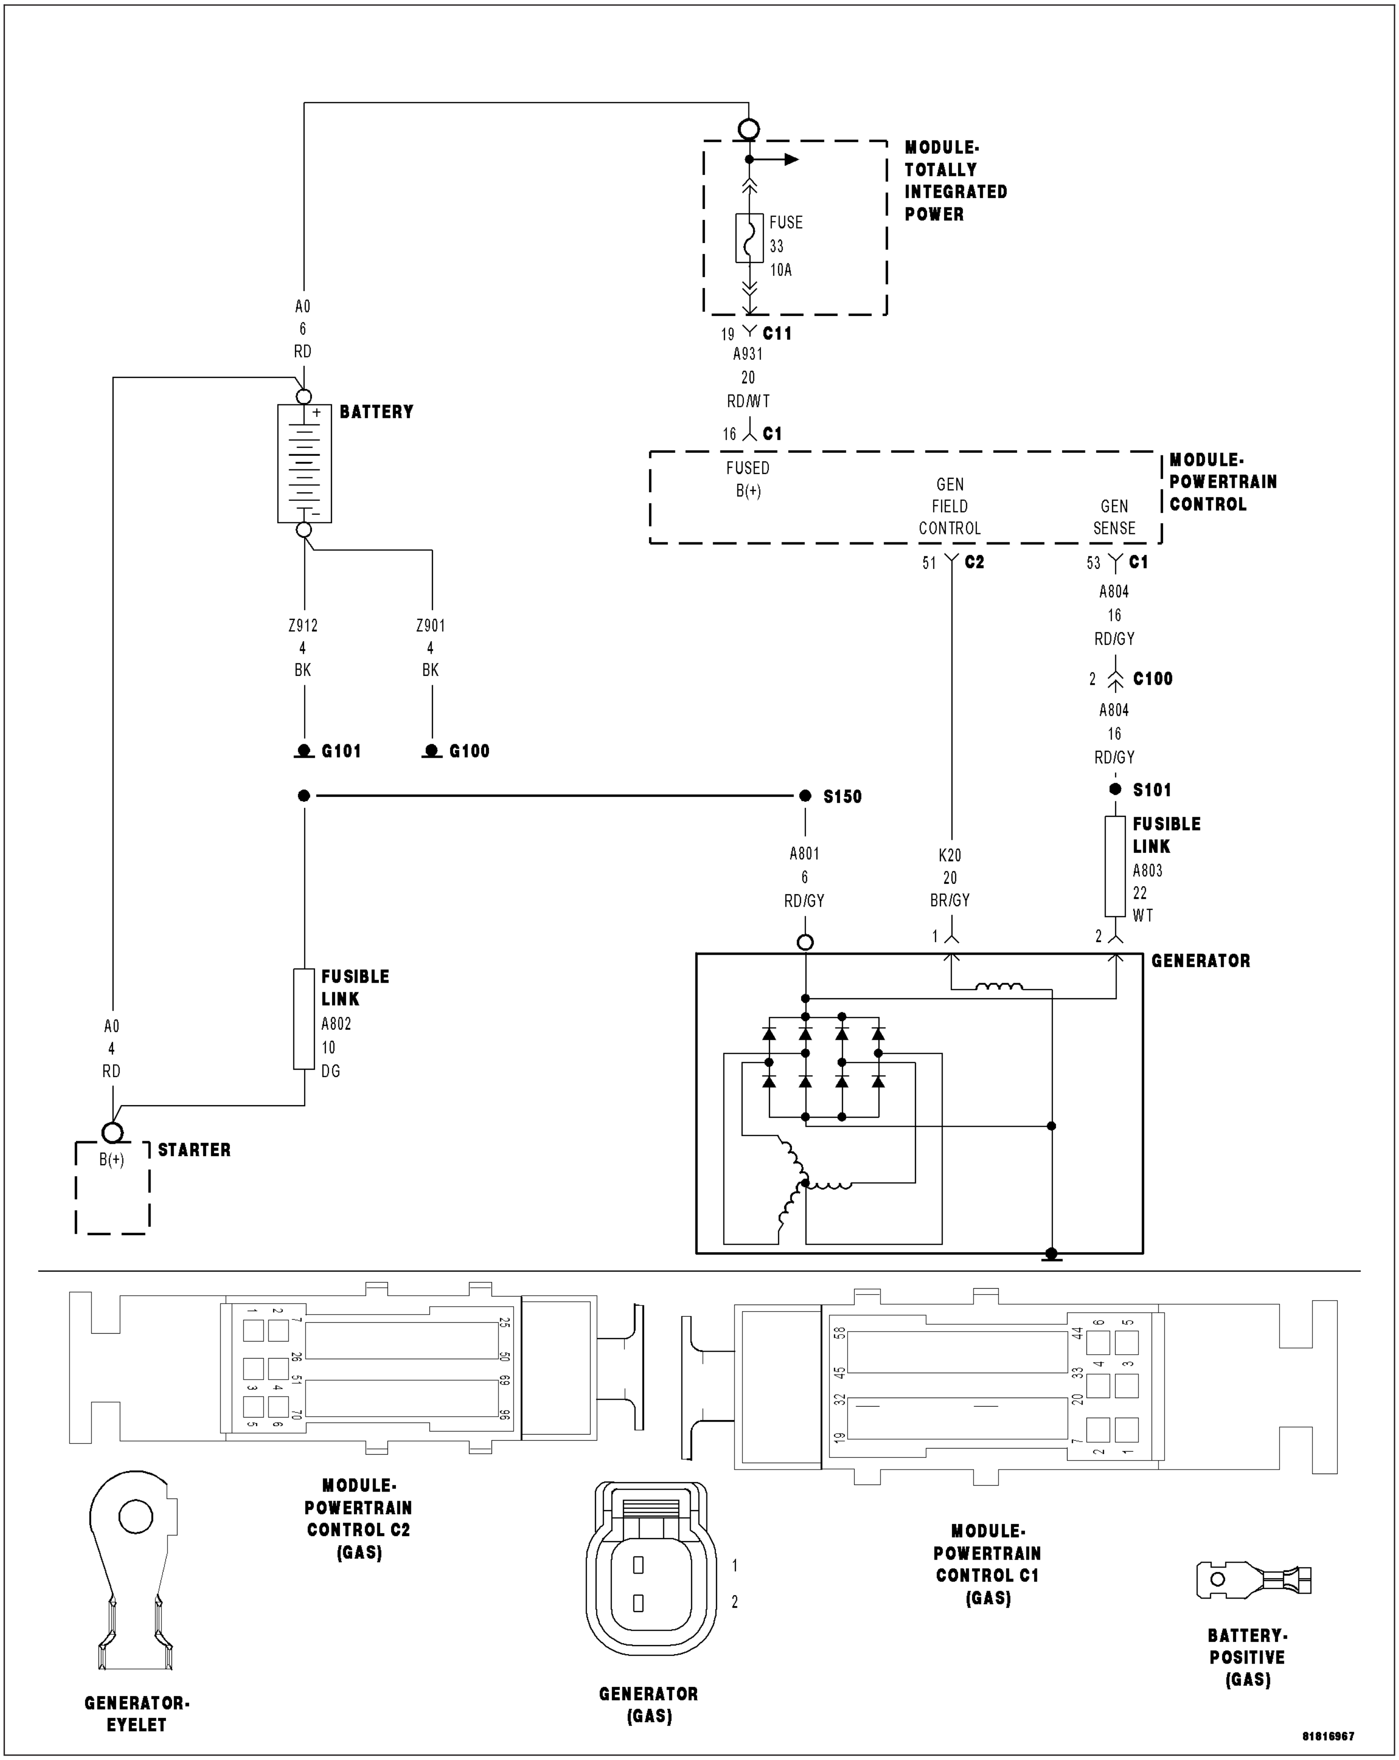
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0625-GENERATOR FIELD CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the generator field control is shorted low.

Possible Causes
INTERMITTENT DTC
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND
(K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

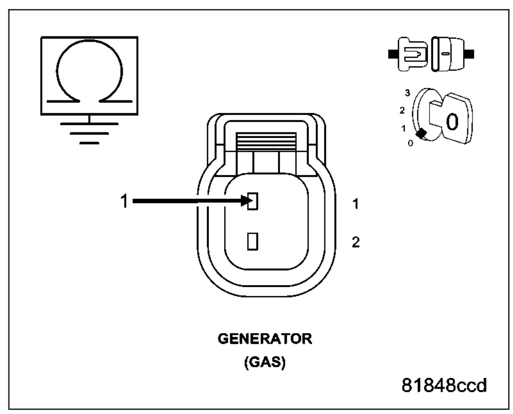
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



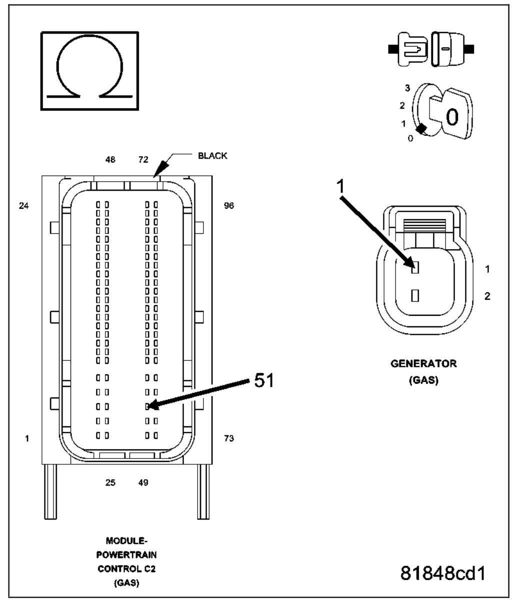
2. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Generator connector.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K20) Gen Field Control circuit in the Generator harness connector.



Is the resistance below 100 ohms?

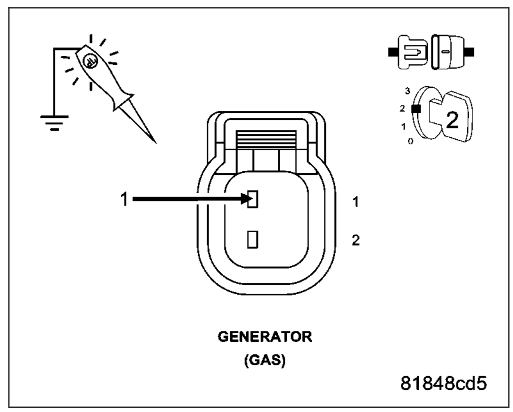
Yes >> Repair the (K20) Gen Field Control circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K20) Gen Field Control circuit between the Generator harness connector and the Powertrain Control Module (PCM) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (K20) Gen Field Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. GENERATOR

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Generator field control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K20) Gen Field Control circuit in the Generator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Generator field control to the OFF (0%) position.

Using a 12 volt test light connected to ground, check the (K20) Gen Field Control circuit in the Generator harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation ON (100%) and not illuminated with the actuation OFF (0%)?

Yes >> Replace the Generator in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

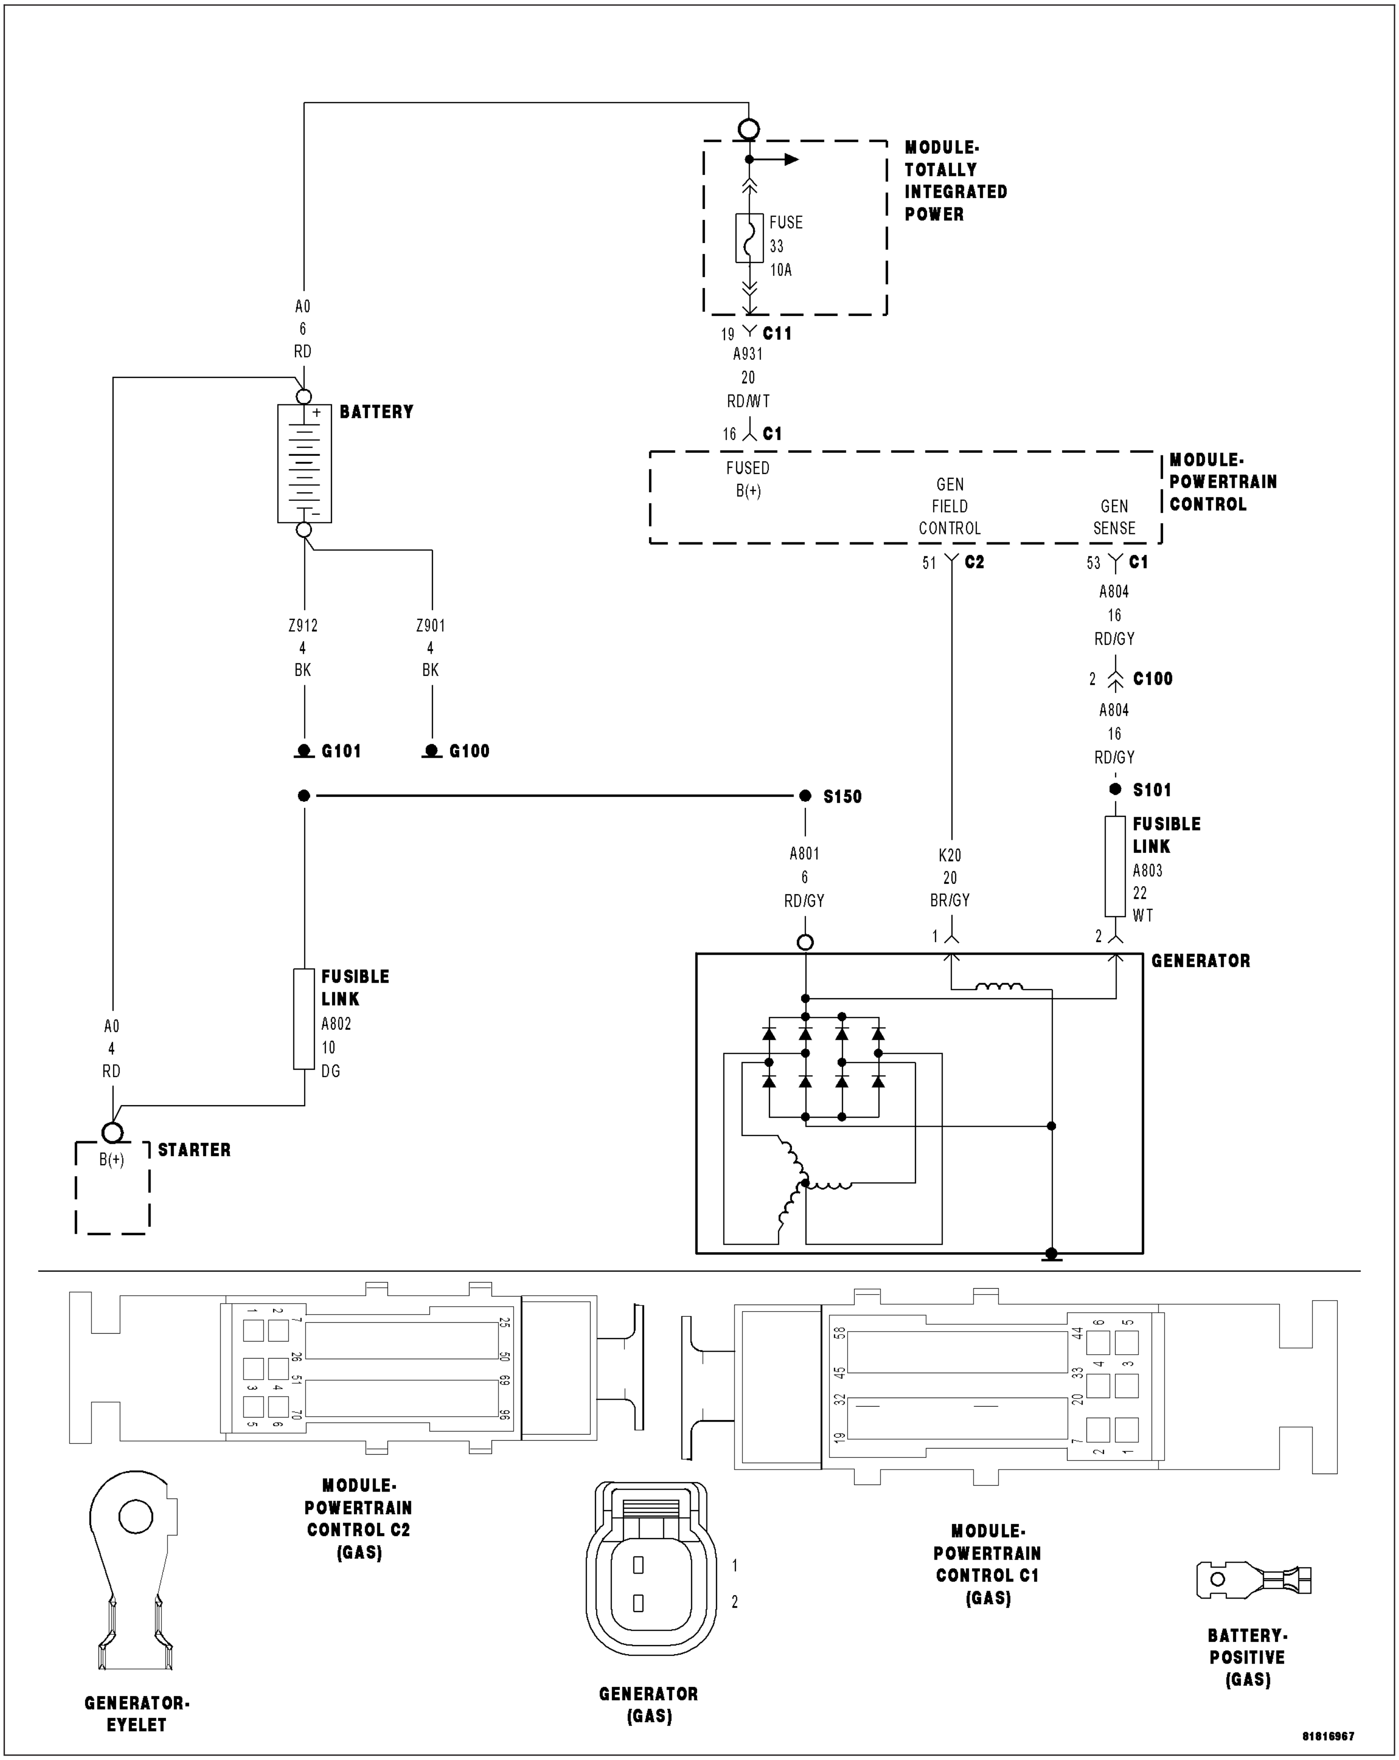
No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0626-GENERATOR FIELD CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the generator field control is shorted high.

Possible Causes
INTERMITTENT DTC
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
(K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

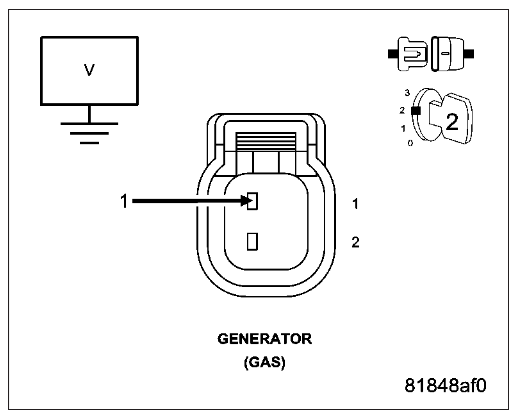
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

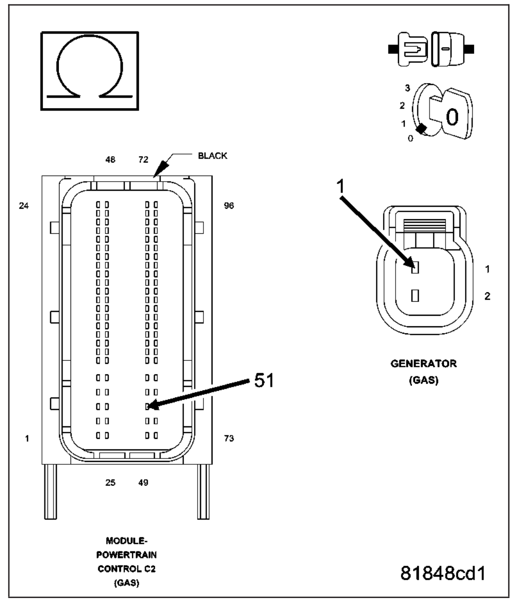
Disconnect the Generator connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K20) Gen Field Control circuit in the Generator harness connector.

Is there any voltage present?



Yes >> Repair the (K20) Gen Field Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

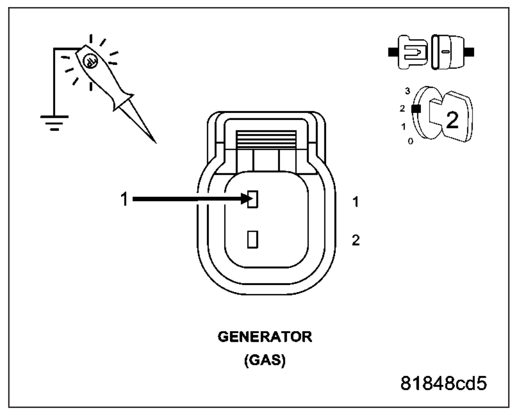
3. (K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K20) Gen Field Control circuit between the Generator harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4



No >> Repair the (K20) Gen Field Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. GENERATOR

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Generator field control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K20) Gen Field Control circuit in the Generator harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Generator field control to the OFF (0%) position.

Using a 12 volt test light connected to ground, check the (K20) Gen Field Control circuit in the Generator harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation ON (100%) and not illuminated with the actuation OFF (0%)?

Yes >> Replace the Generator in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

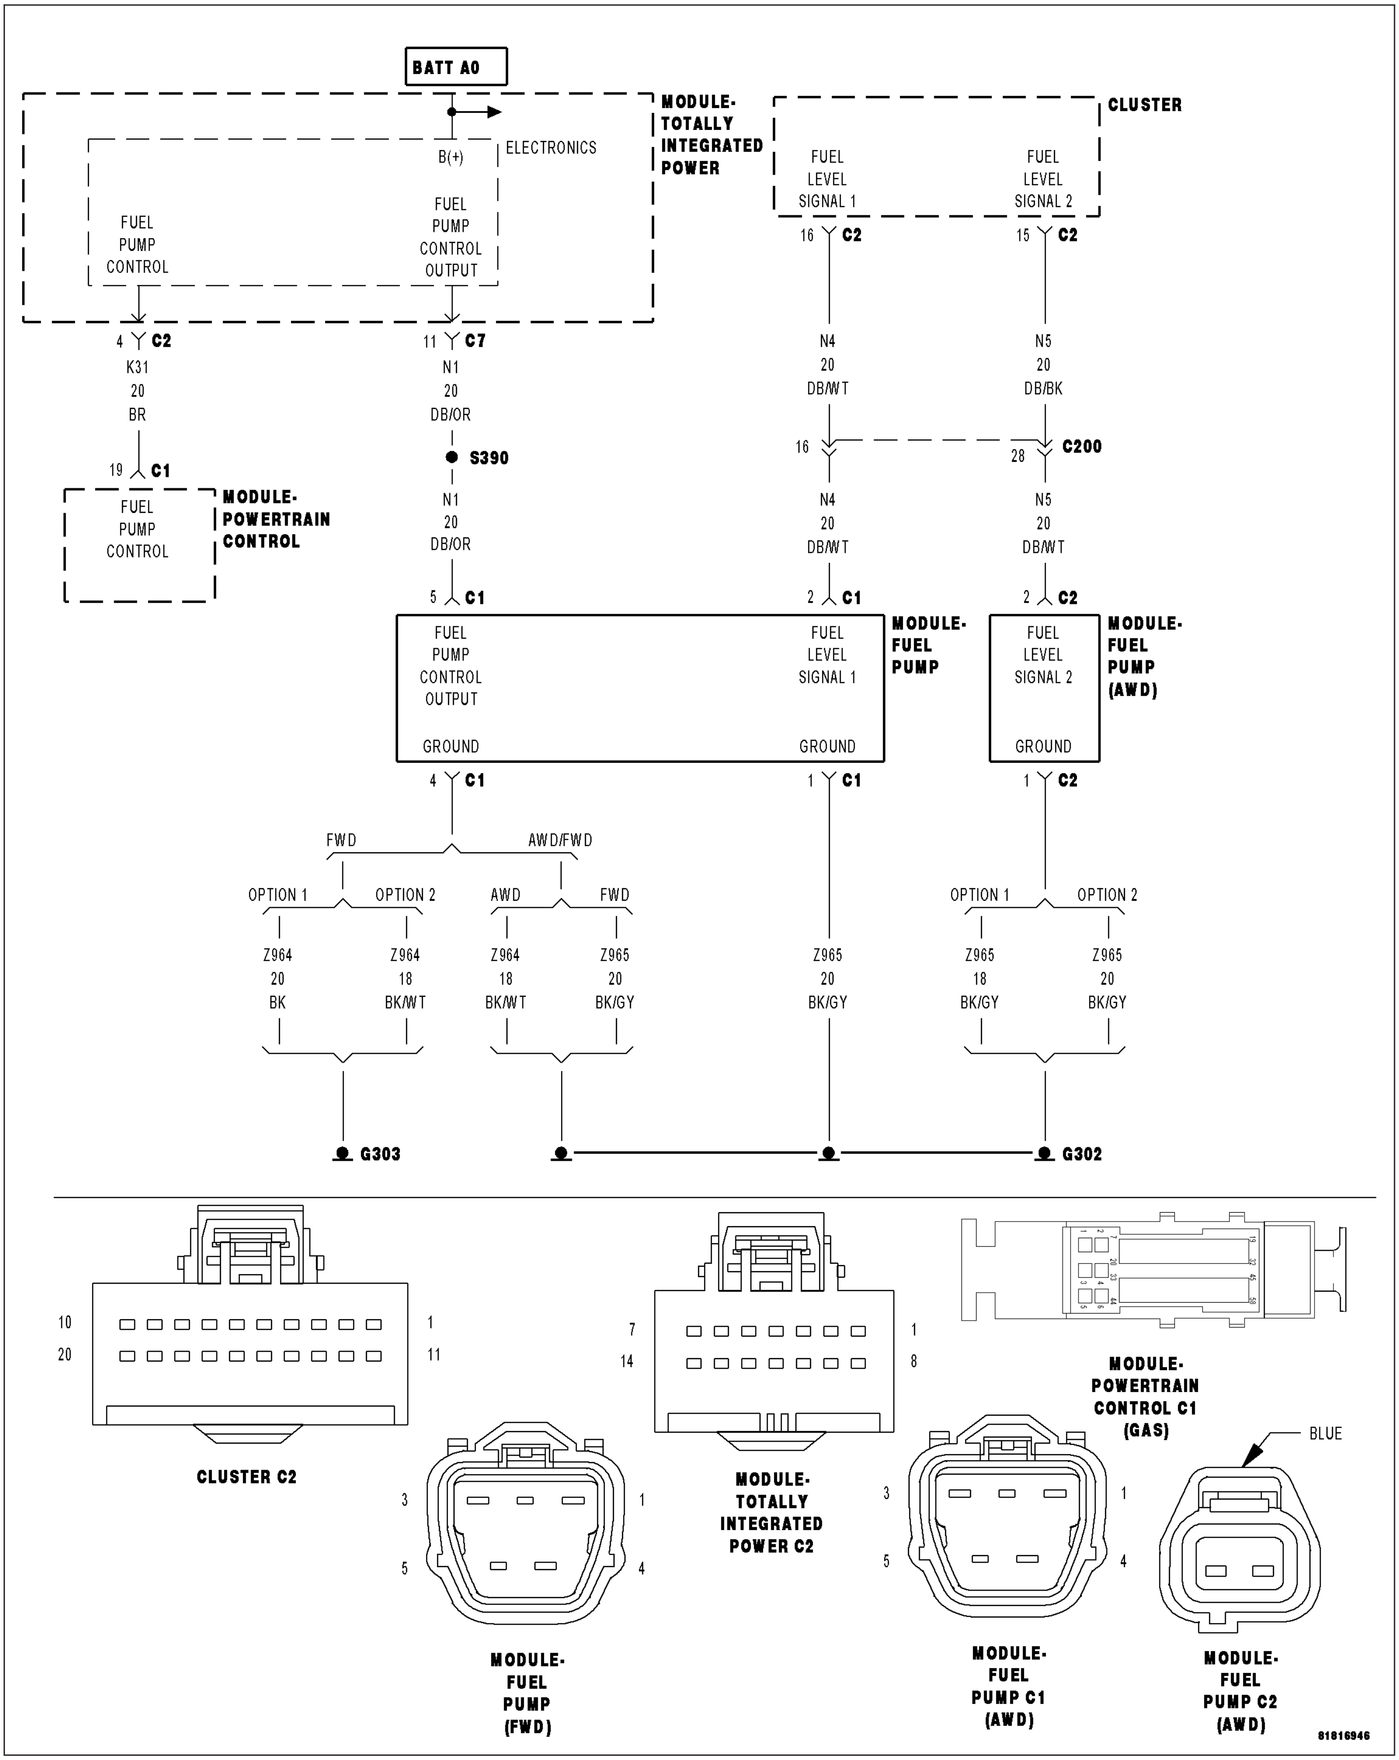
No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0627-FUEL PUMP CONTROL CIRCUIT/OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the actual state of the fuel pump control does not match the intended state.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO VOLTAGE
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

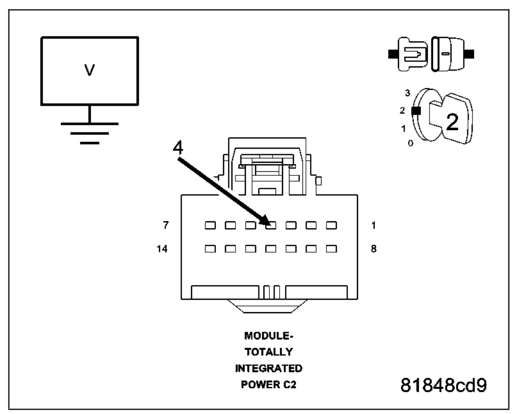
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) connector.

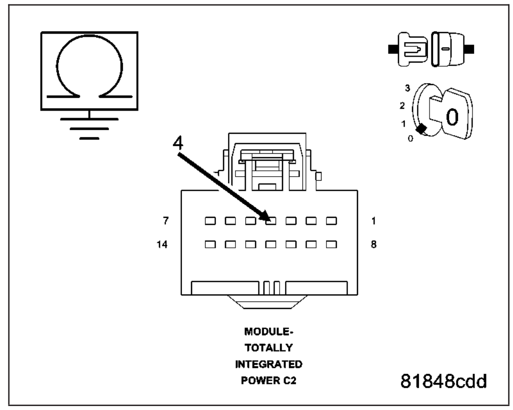
Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K31) Fuel Pump Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Is there any voltage present?

Yes >> Repair the (K31) Fuel Pump Control circuit for a short to voltage.



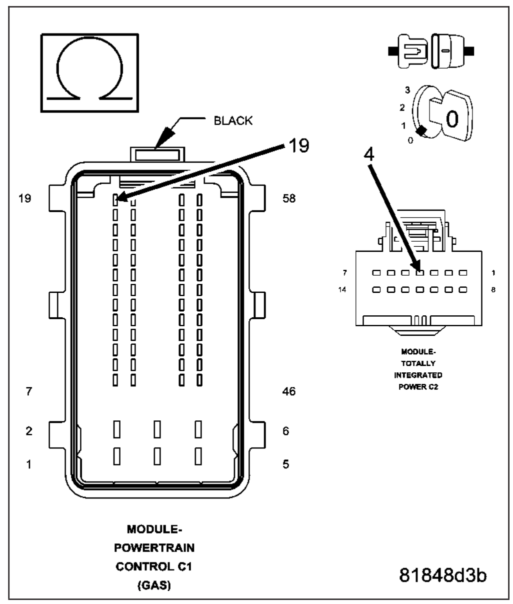
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the Totally Integrated Power Module (TIPM) harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K31) Fuel Pump Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K31) Fuel Pump Control circuit between the Totally Integrated Power Module (TIPM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. TOTALLY INTEGRATED POWER MODULE (TIPM)

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between ground and the (K31) Fuel Pump Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for the Fuel Pump Control circuit shorted low DTC?

Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

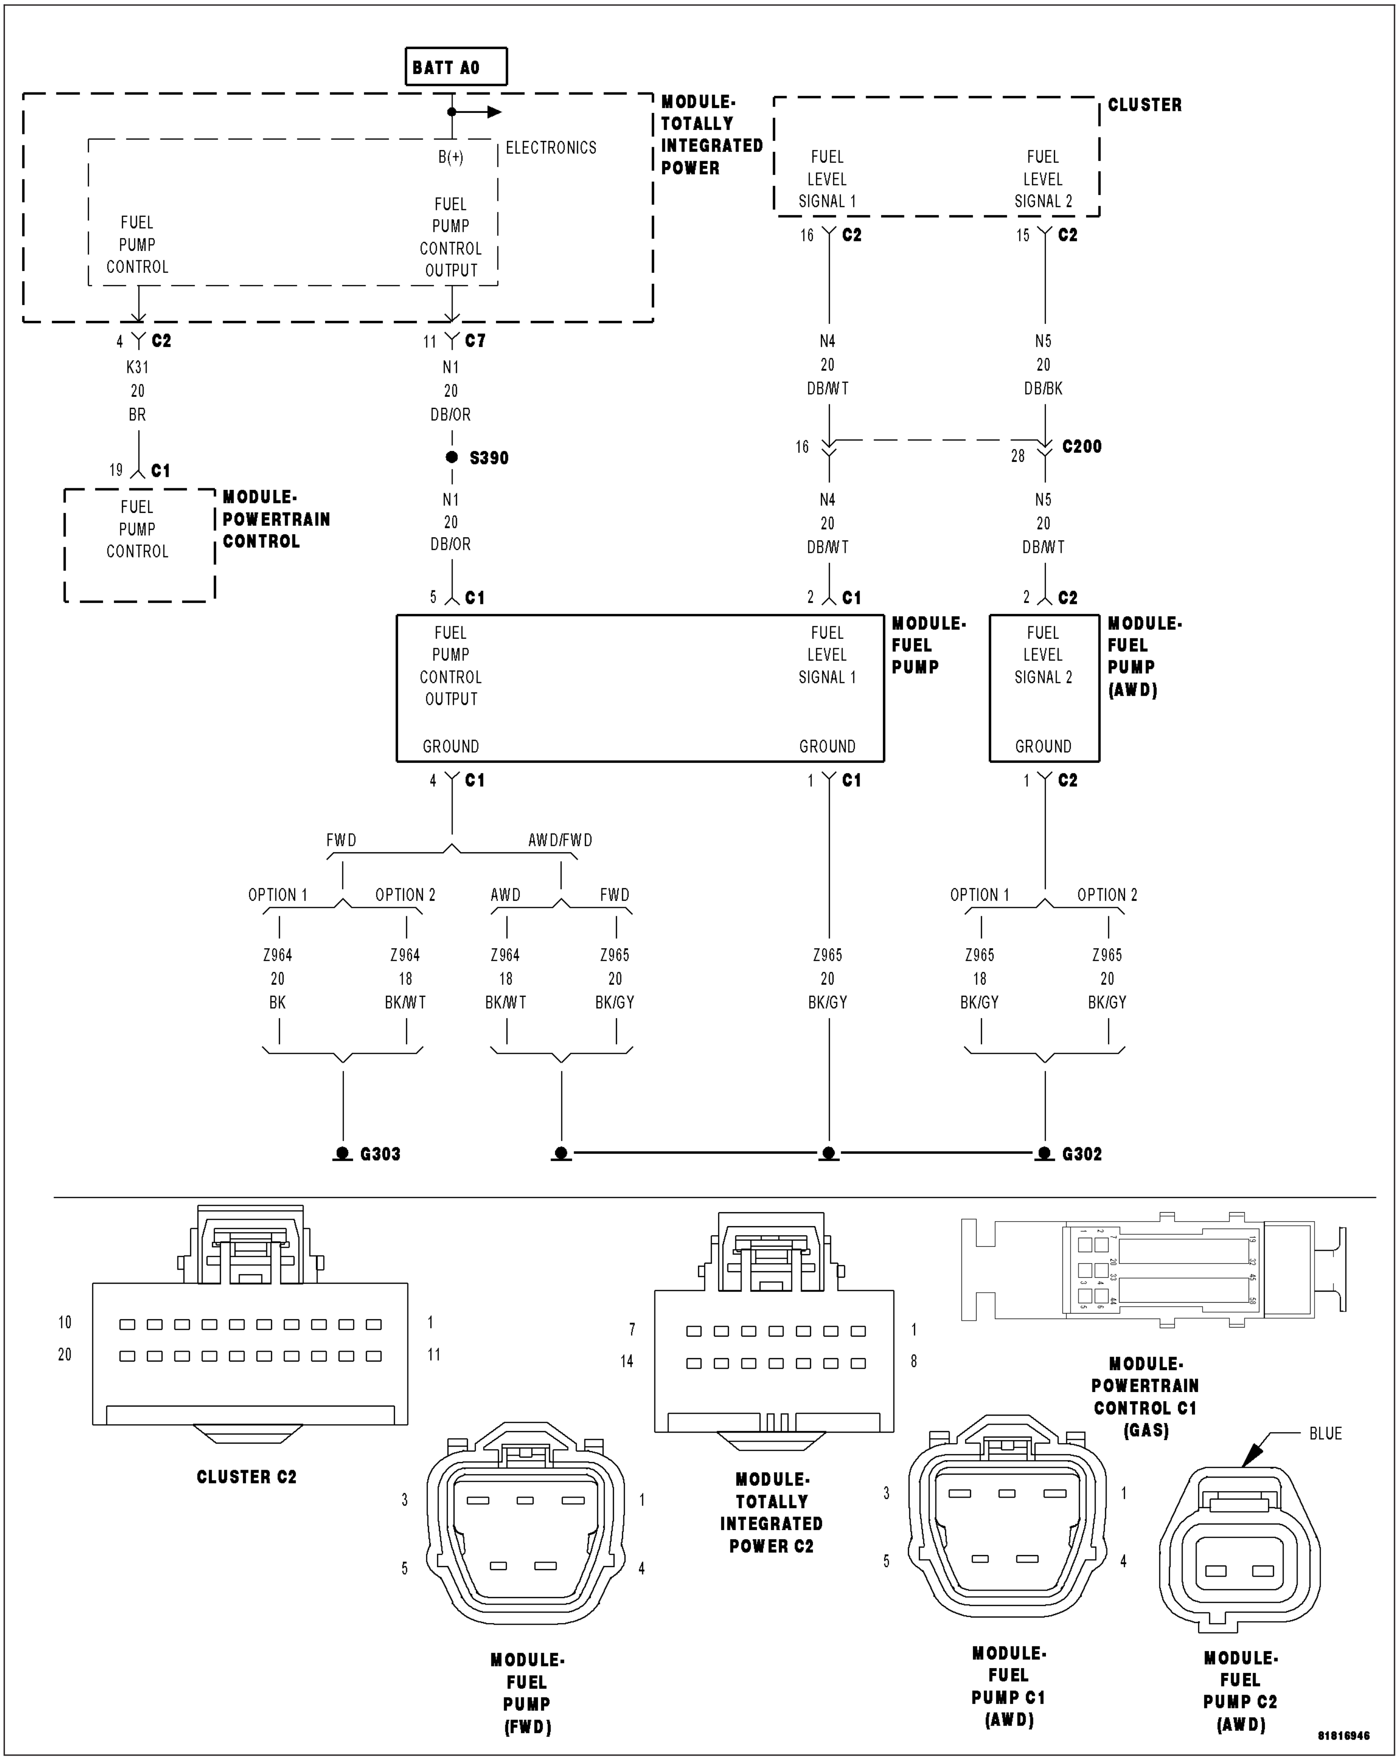
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0628-FUEL PUMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the fuel pump control is shorted low.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

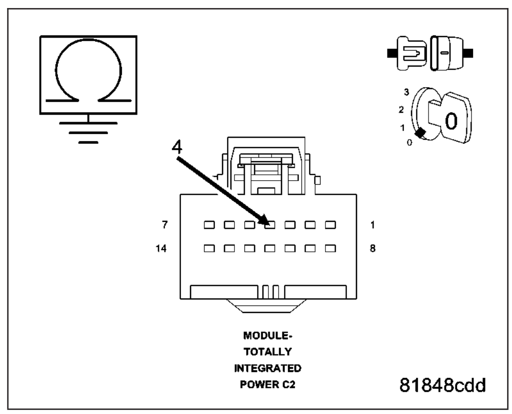
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



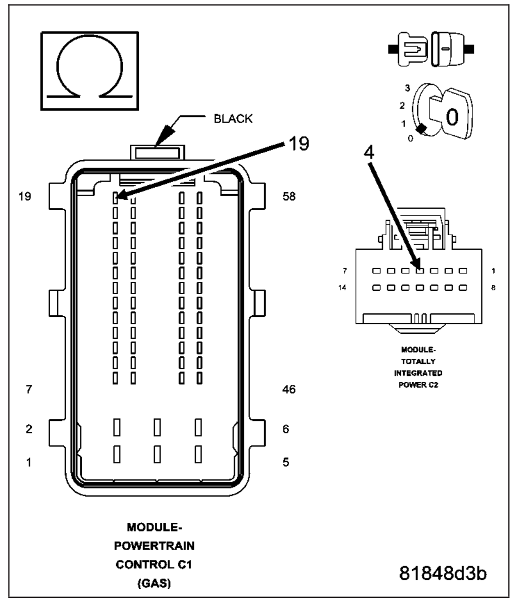
2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Totally Integrated Power Module (TIPM) connector.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the Totally Integrated Power Module (TIPM) harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K31) Fuel Pump Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K31) Fuel Pump Control circuit between the Totally Integrated Power Module (TIPM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. TOTALLY INTEGRATED POWER MODULE (TIPM)

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, select View DTCs.

NOTE: With the TIPM connector disconnected, the PCM should display a Fuel Pump Control circuit open DTC.

Is the status Active for the Fuel Pump Control circuit open DTC?

Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

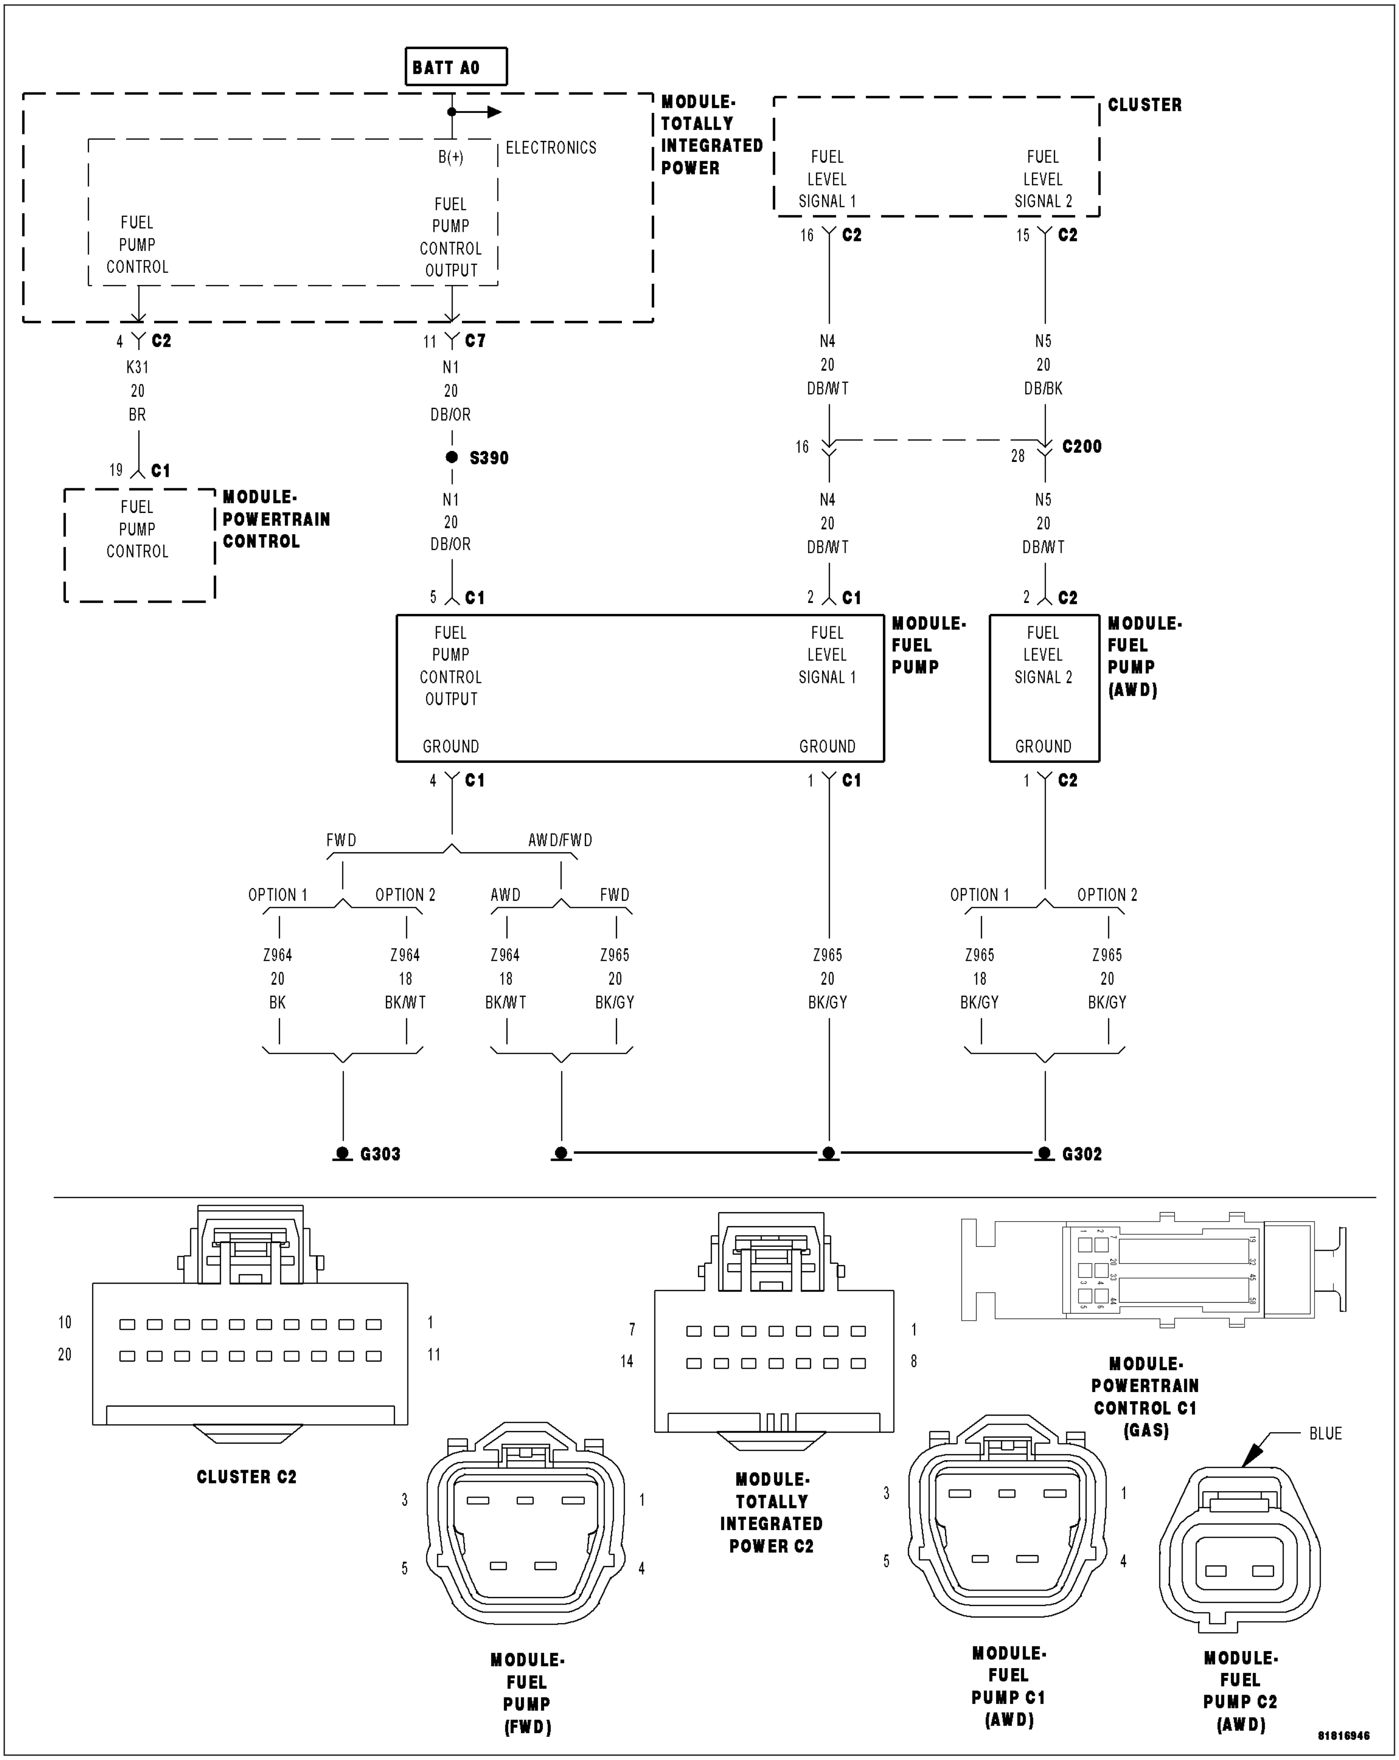
No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0629-FUEL PUMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the fuel pump control is shorted high.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO VOLTAGE
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

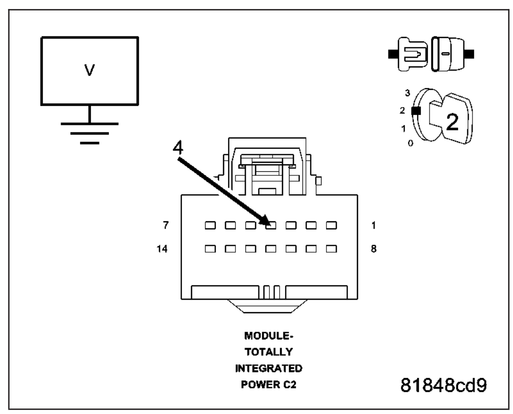
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

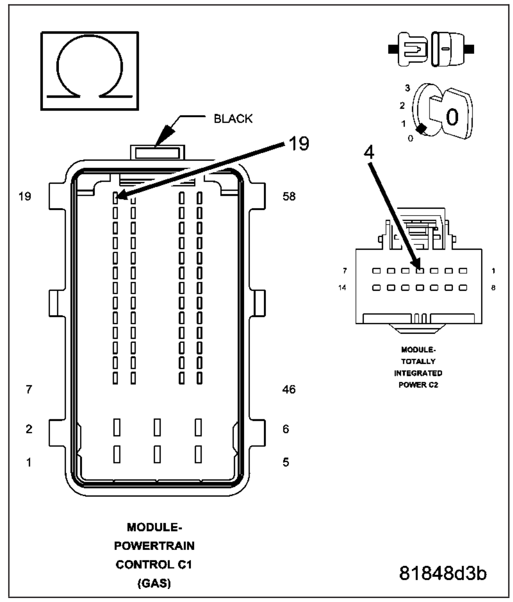
Disconnect the Totally Integrated Power Module (TIPM) connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K31) Fuel Pump Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Is there any voltage present?



Yes >> Repair the (K31) Fuel Pump Control circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K31) Fuel Pump Control circuit between the Totally Integrated Power Module (TIPM) harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. TOTALLY INTEGRATED POWER MODULE (TIPM)

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between ground and the (K31) Fuel Pump Control circuit in the Totally Integrated Power Module (TIPM) harness connector.

Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for the Fuel Pump Control circuit shorted low DTC?

Yes >> Replace the Totally Integrated Power Module (TIPM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Totally Integrated Power Module (TIPM) and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P062C-ETC LEVEL 2 MPH PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  When secondary software determines that the vehicle speed is implausible for a period of time. ETC lamp will flash.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0630-VIN NOT PROGRAMMED IN PCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  At initialization.
- **Set Condition:**
  The VIN has not been programmed into the PCM. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
VIN NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. VIN NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)

Ignition on, engine not running.

Using the scan tool, program the VIN into the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

NOTE: If the engine will not start, crank the engine for 15 seconds. Crank at least 2 times with the ignition switch returning to the off position each time.
With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test complete.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0632-ODOMETER NOT PROGRAMMED IN PCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The vehicle mileage is not programed into the PCM. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
MILEAGE NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. MILEAGE NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)

Ignition on, engine not running.
With a scan tool, Clear DTCs.
Using the scan tool, program the vehicle mileage into the Powertrain Control Module (PCM).
Start the engine and allow it to reach normal operating temperature.
With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test complete.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0633-SKIM SECRET KEY NOT STORED IN PCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The Secret Key information has not been programmed into the PCM. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
SECRET KEY INFORMATION NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

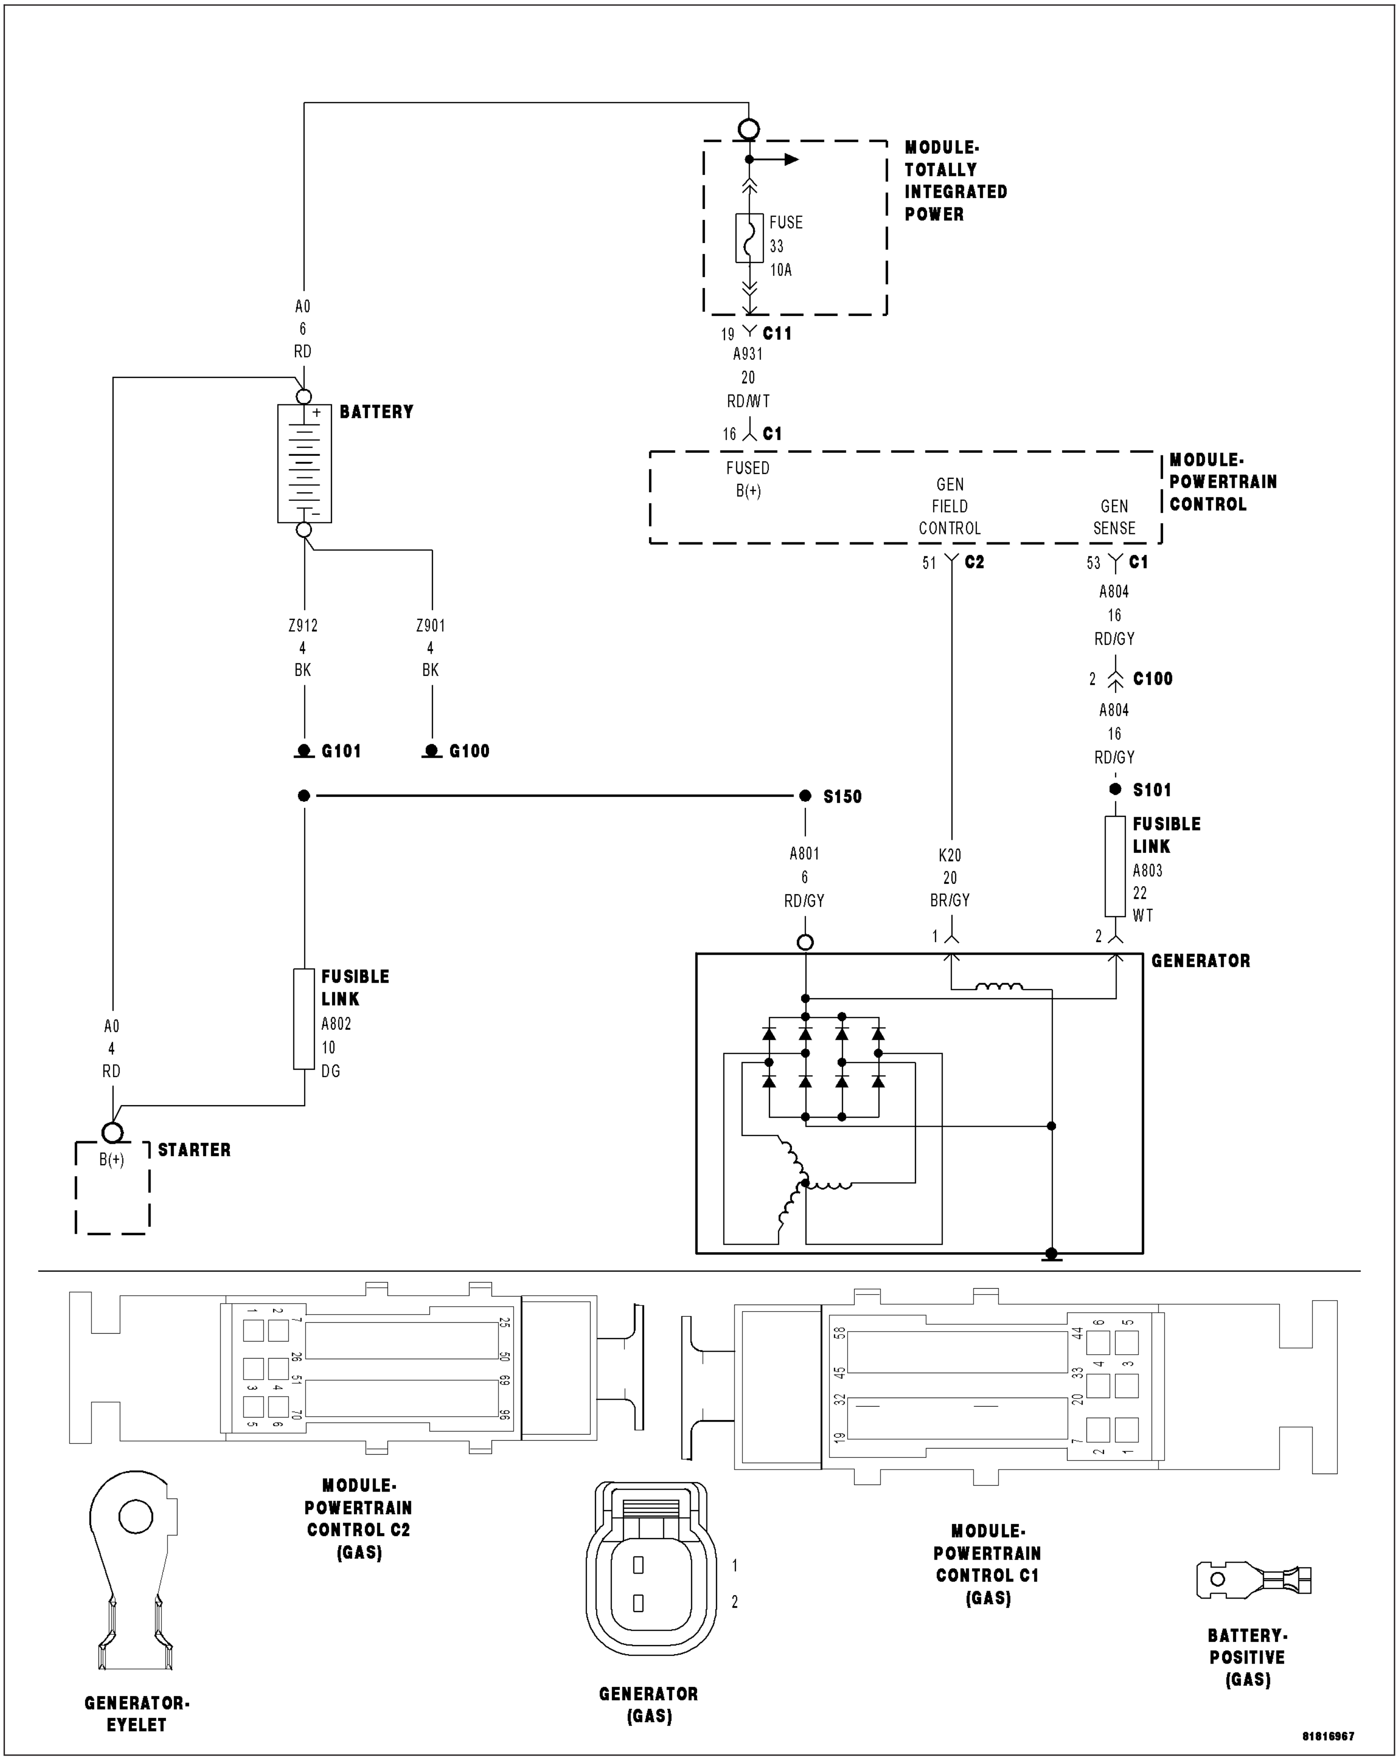
Diagnostic Test

1. SECRET KEY INFORMATION NOT PROGRAMMED IN THE POWERTRAIN CONTROL MODULE (PCM)

Ignition on, engine not running.

Using the scan tool, program the Secret Key information into the Powertrain Control Module (PCM) using the PCM Replaced function in the WCM.

Start the engine and allow it to reach normal operating temperature.



NOTE: If the engine will not start, crank the engine for 15 seconds. Crank at least 2 times with the ignition switch returning to the off position each time.
With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test complete.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P063A-GENERATOR VOLTAGE SENSE CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects no change when attempting to regulate the generator output.

Possible Causes
INTERMITTENT DTC
(A804) GEN SENSE CIRCUIT SHORTED TO VOLTAGE
(A804) GEN SENSE CIRCUIT SHORTED TO GROUND
(A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start the engine and allow it reach operating temperature.

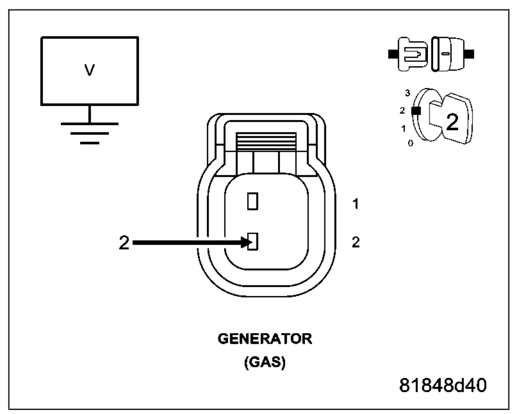
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (A804) GEN SENSE CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Generator connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

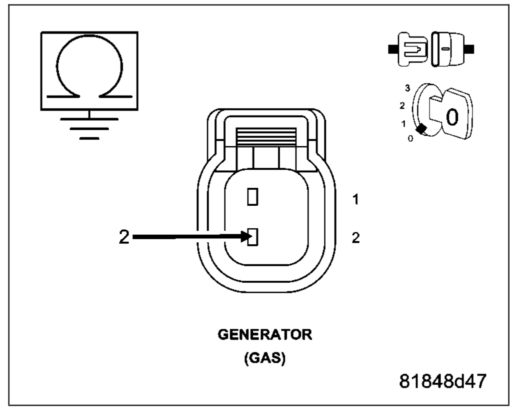
Measure the voltage of the (A804) Gen Sense circuit in the Generator harness connector.

Is there any voltage present?

Yes >> Repair the (A804) Gen Sense circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (A804) GEN SENSE CIRCUIT SHORTED TO GROUND



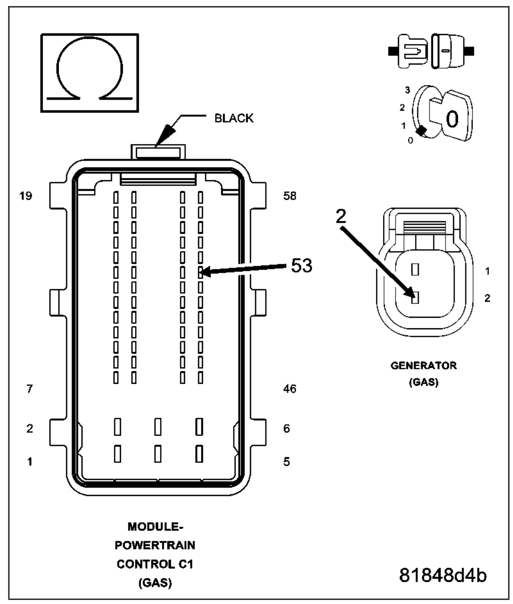
Turn the ignition off.

Measure the resistance between ground and the (A804) Gen Sense circuit in the Generator harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (A804) Gen Sense circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4



4. (A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (A804) Gen Sense circuit between the Generator harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

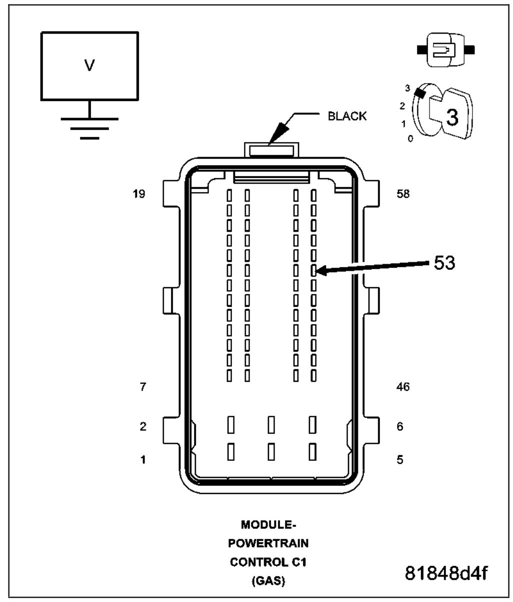
No >> Repair the (A804) Gen Sense circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. GENERATOR

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Connect the Generator connector.

Connect the Powertrain Control Module (PCM) connector.



Turn the ignition on.

While backprobing, measure the voltage of the (K20) Gen Field Control circuit in the Powertrain Control Module (PCM) harness connector.

Start the engine.

With the scan tool, perform the Generator Full Field test.

Monitor the voltage of the (K20) Gen Field Control circuit with the Generator Full Field test actuated.

NOTE: The voltage should increase more than 1 volt.

Does the voltage increase by at least 1 volt with the Generator Full Field Test on?

Yes >> Go to 6

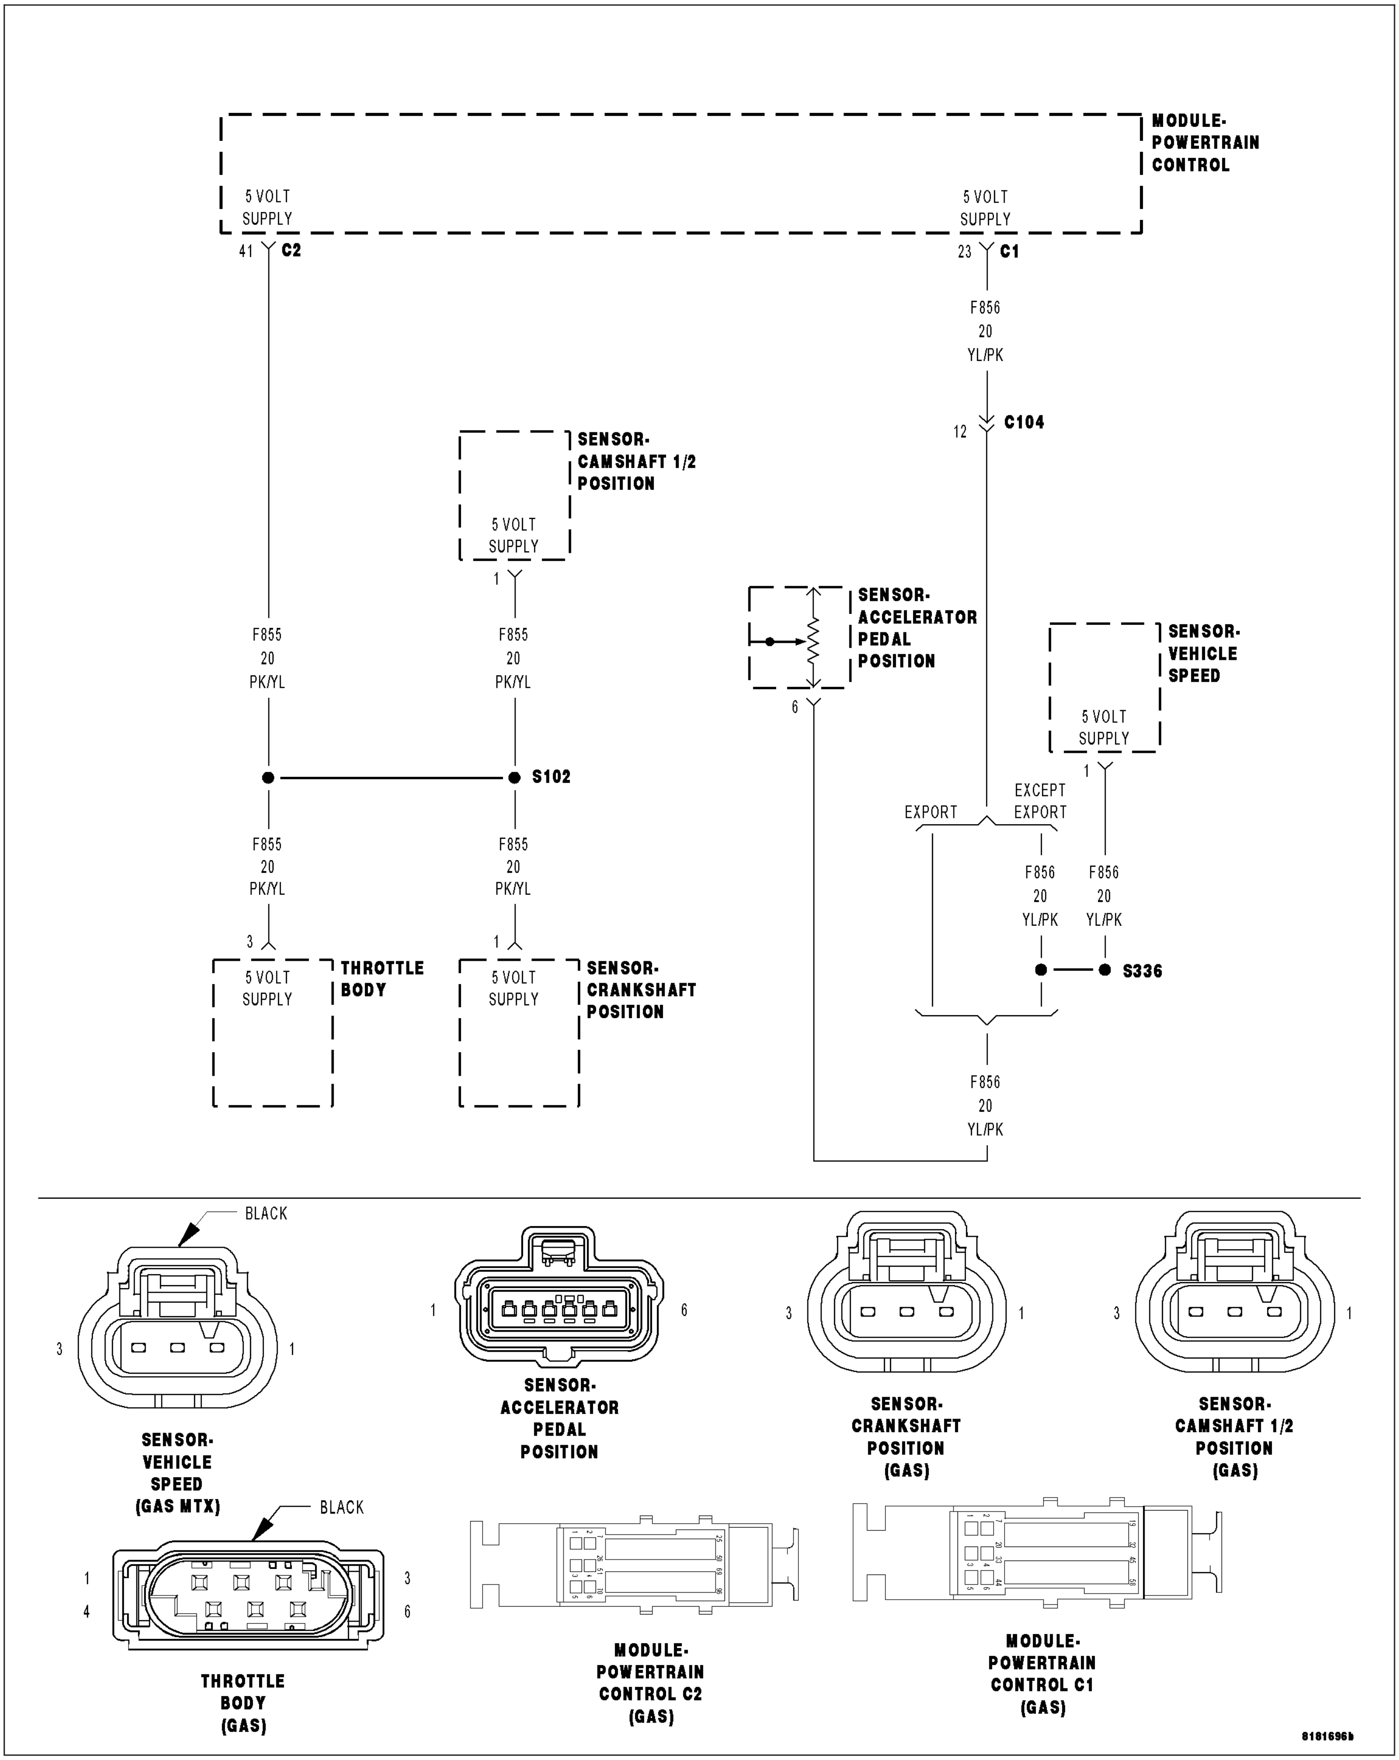
No >> Replace the Generator in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0642-SENSOR REFERENCE VOLTAGE 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects low voltage on the (F855) 5 volt supply circuit or the (F856) 5 volt supply circuit.

Possible Causes
INTERMITTENT DTC
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 2 POSITION SENSOR
CRANKSHAFT POSITION SENSOR
THROTTLE POSITION SENSOR
VEHICLE SPEED SENSOR (MTX ONLY)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

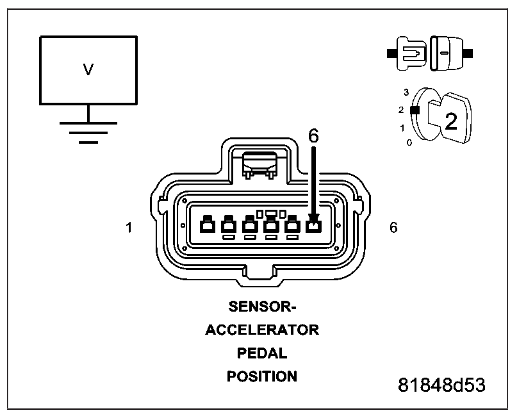
With the scan tool, clear DTCs.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



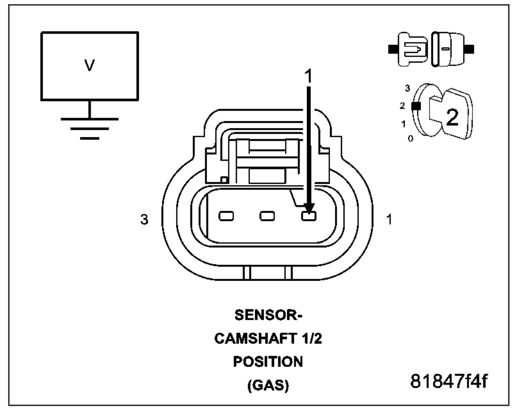
2. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the APP Sensor harness connector.



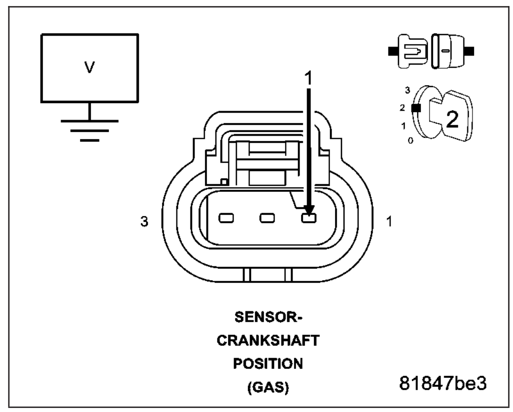
Is the voltage above 4.6 volts?

Yes >> Replace the Accelerator Pedal Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. CAMSHAFT 1/2 POSITION SENSOR

Turn the ignition off.
Disconnect the Camshaft 1/2 Position Sensor harness connector.
Turn the ignition on.
Measure the voltage of the (F855) 5 Volt Supply circuit.



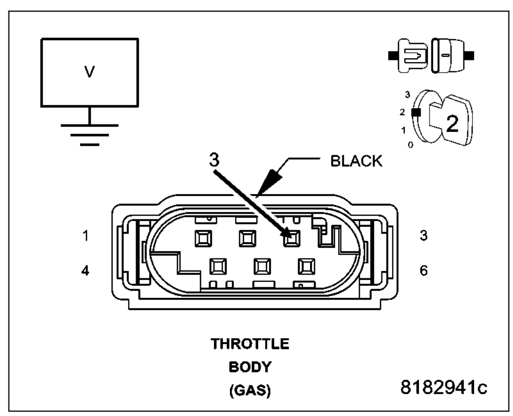
Is the voltage above 4.6 volts?

Yes >> Replace the Camshaft 1/2 Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. CRANKSHAFT POSITION SENSOR

Turn the ignition off.
Disconnect the Crankshaft Position Sensor harness connector.
Turn the ignition on.
Measure the voltage of the (F855) 5 Volt Supply circuit.



Is the voltage above 4.6 volts?

Yes >> Replace the Crankshaft Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. THROTTLE POSITION SENSOR

Turn the ignition off.
Disconnect the Throttle Body harness connector.
Turn the ignition on.
Measure the voltage of the (F855) 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes >> Replace the Throttle Body in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. VEHICLE EQUIPPED WITH MANUAL TRANSMISSION

Is the vehicle equipped with a manual transmission?

Yes >> Go to 7

No >> Go to 8

7. VEHICLE SPEED SENSOR

NOTE: Only vehicles equipped with a manual transmission will use a Vehicle Speed Sensor.

Turn the ignition off.

Disconnect the Vehicle Speed Sensor harness connector.

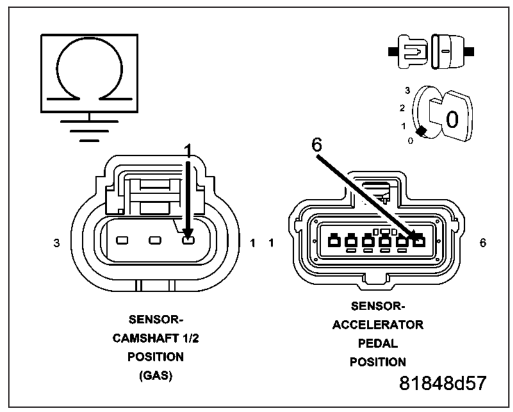
Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes >> Replace the Vehicle Speed Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 8



8. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the PCM harness connectors.

Measure the resistance between ground and the (F855) 5 Volt Supply circuit.

Measure the resistance between ground and the (F856) 5 Volt Supply circuit.

Is the resistance above 1000 ohms for both circuits?

Yes >> Go to 9

No >> Repair the 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. POWERTRAIN CONTROL MODULE (PCM)

Inspect the (F855) 5 Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the PCM harness connector.

Inspect the (F855) 5 Volt Supply circuit between the Crankshaft Position Sensor harness connector and the PCM harness connector.

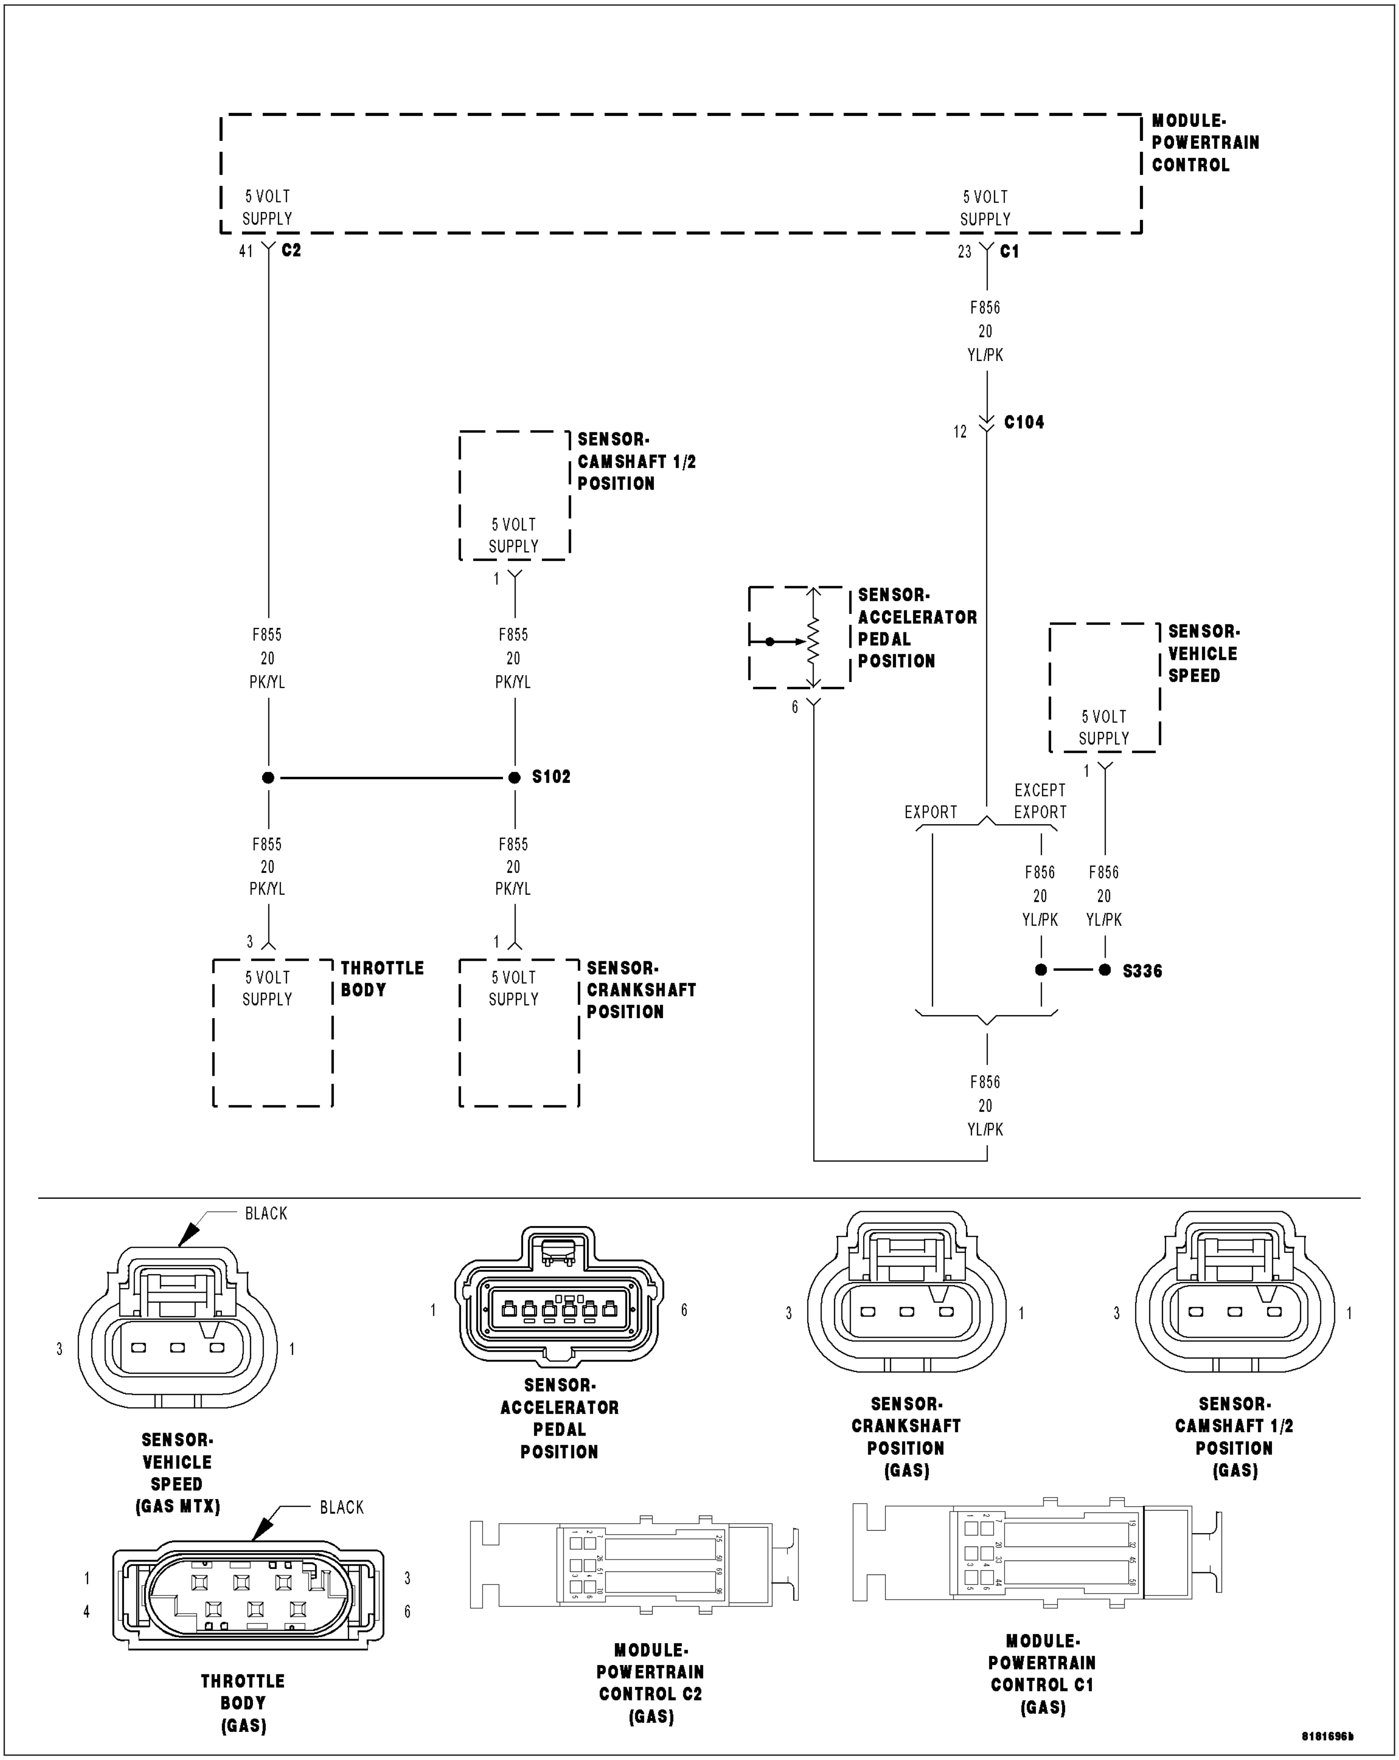
Inspect the (F855) 5 Volt Supply circuit between the Throttle Body harness connector and the PCM harness connector.

Inspect the (F856) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

If the vehicle is equipped with a manual transmission, inspect the (F856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the PCM in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0643-SENSOR REFERENCE VOLTAGE 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects a short to voltage on the (K855) 5 volt supply circuit or the (K856) 5 volt supply circuit.

Possible Causes
INTERMITTENT DTC
(K855) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, clear DTCs.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Disconnect the PCM harness connectors.

Measure the voltage on the (K856) 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (K856) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K855) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Turn the ignition on.

Measure the voltage on the (K855) 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (K855) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. POWERTRAIN CONTROL MODULE (PCM)

Turn the ignition off.

Inspect the (K855) 5 Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the PCM harness connector.

Inspect the (K855) 5 Volt Supply circuit between the Crankshaft Position Sensor harness connector and the PCM harness connector.

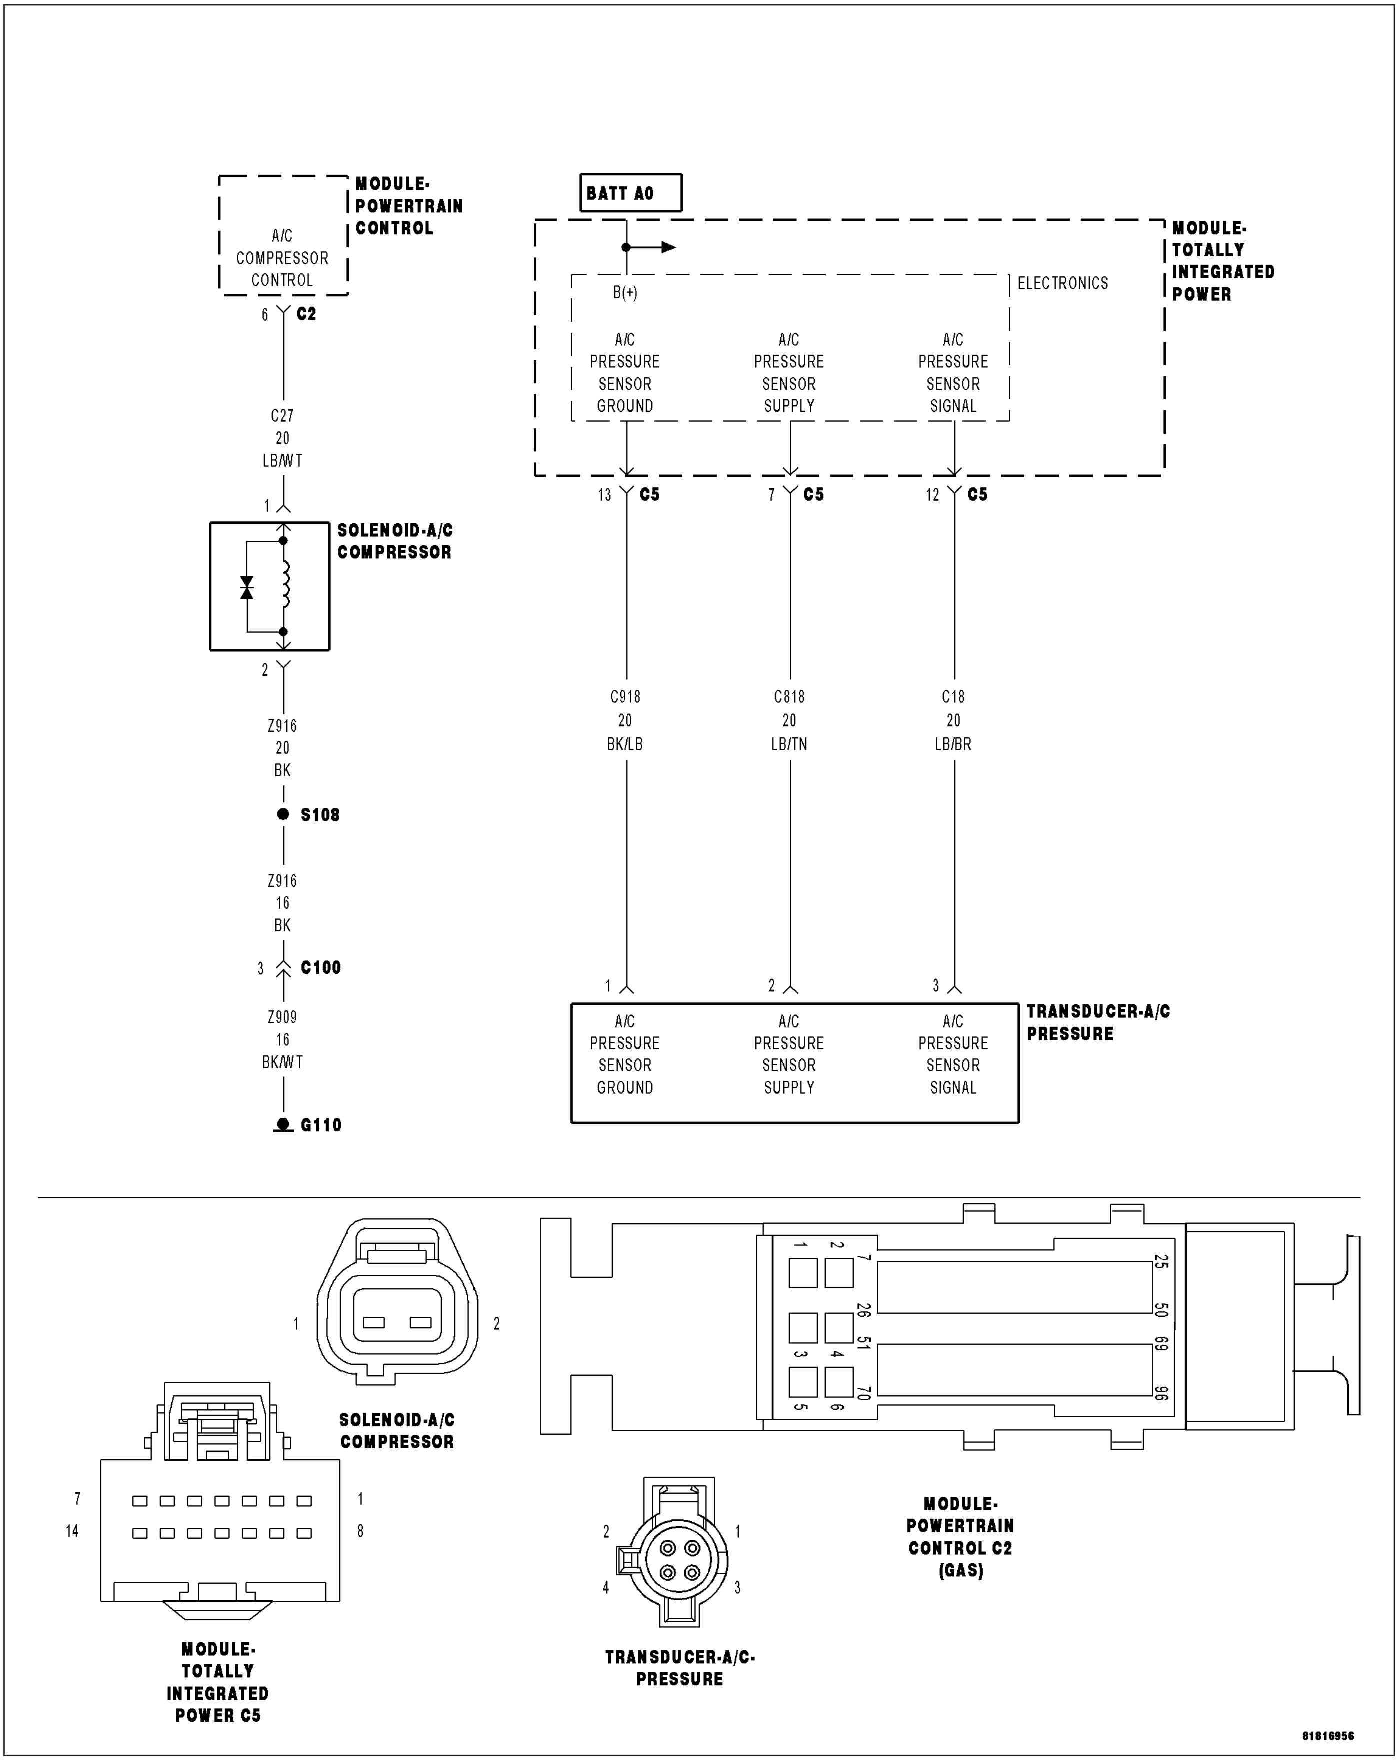
Inspect the (K855) 5 Volt Supply circuit between the Throttle Body harness connector and the PCM harness connector.

Inspect the (K856) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

If the vehicle is equipped with a manual transmission, inspect the (K856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0646-A/C CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the A/C Compressor control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND
(C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
A/C COMPRESSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

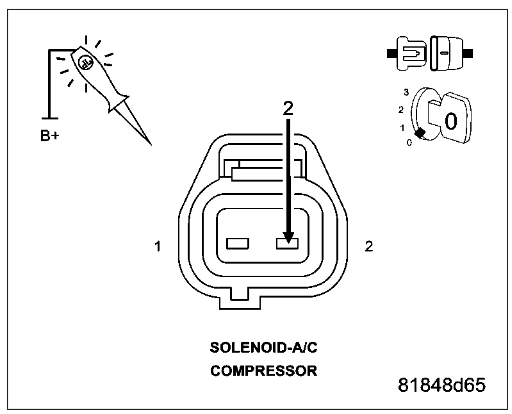
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the A/C Compressor connector.

Turn the ignition on.

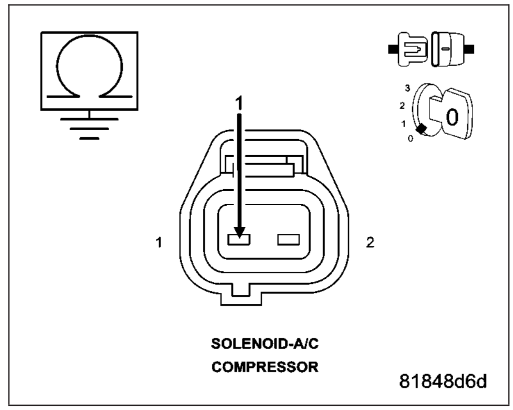
Using a 12 volt test light connected to 12 volts, check the (Z916) Ground circuit in the A/C Compressor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (Z916) Ground circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

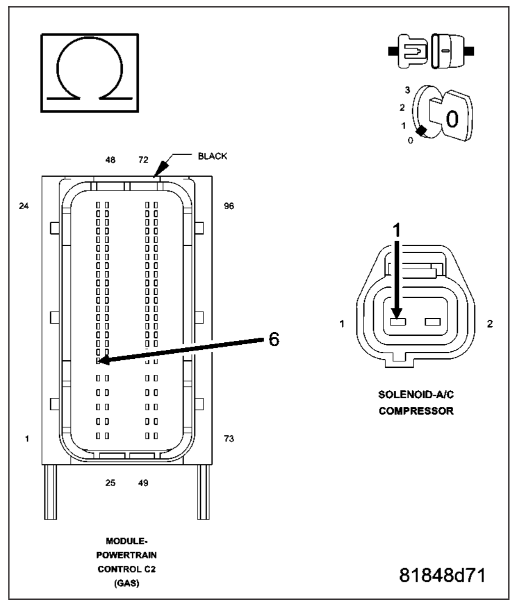
3. (C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (C27) A/C Compressor Control circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

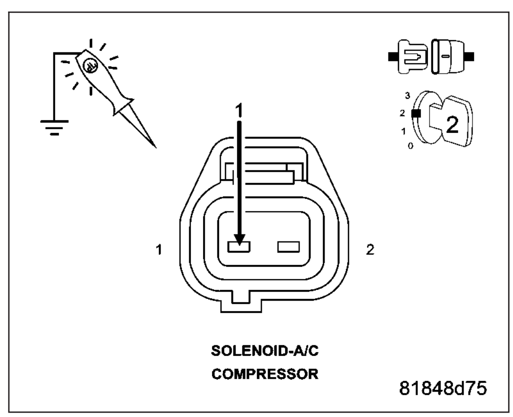
Measure the resistance of the (C27) A/C Compressor Control circuit between the A/C Compressor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (C27) A/C Compressor Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. A/C COMPRESSOR

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the A/C Compressor control to the ON position.

Using a 12 volt test light connected to ground, check the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the A/C Compressor control to the OFF position.

Using a 12 volt test light connected to ground, check the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation ON (100%) and not illuminated with the actua-

tion OFF (0%)?

Yes >> Replace the A/C Compressor in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

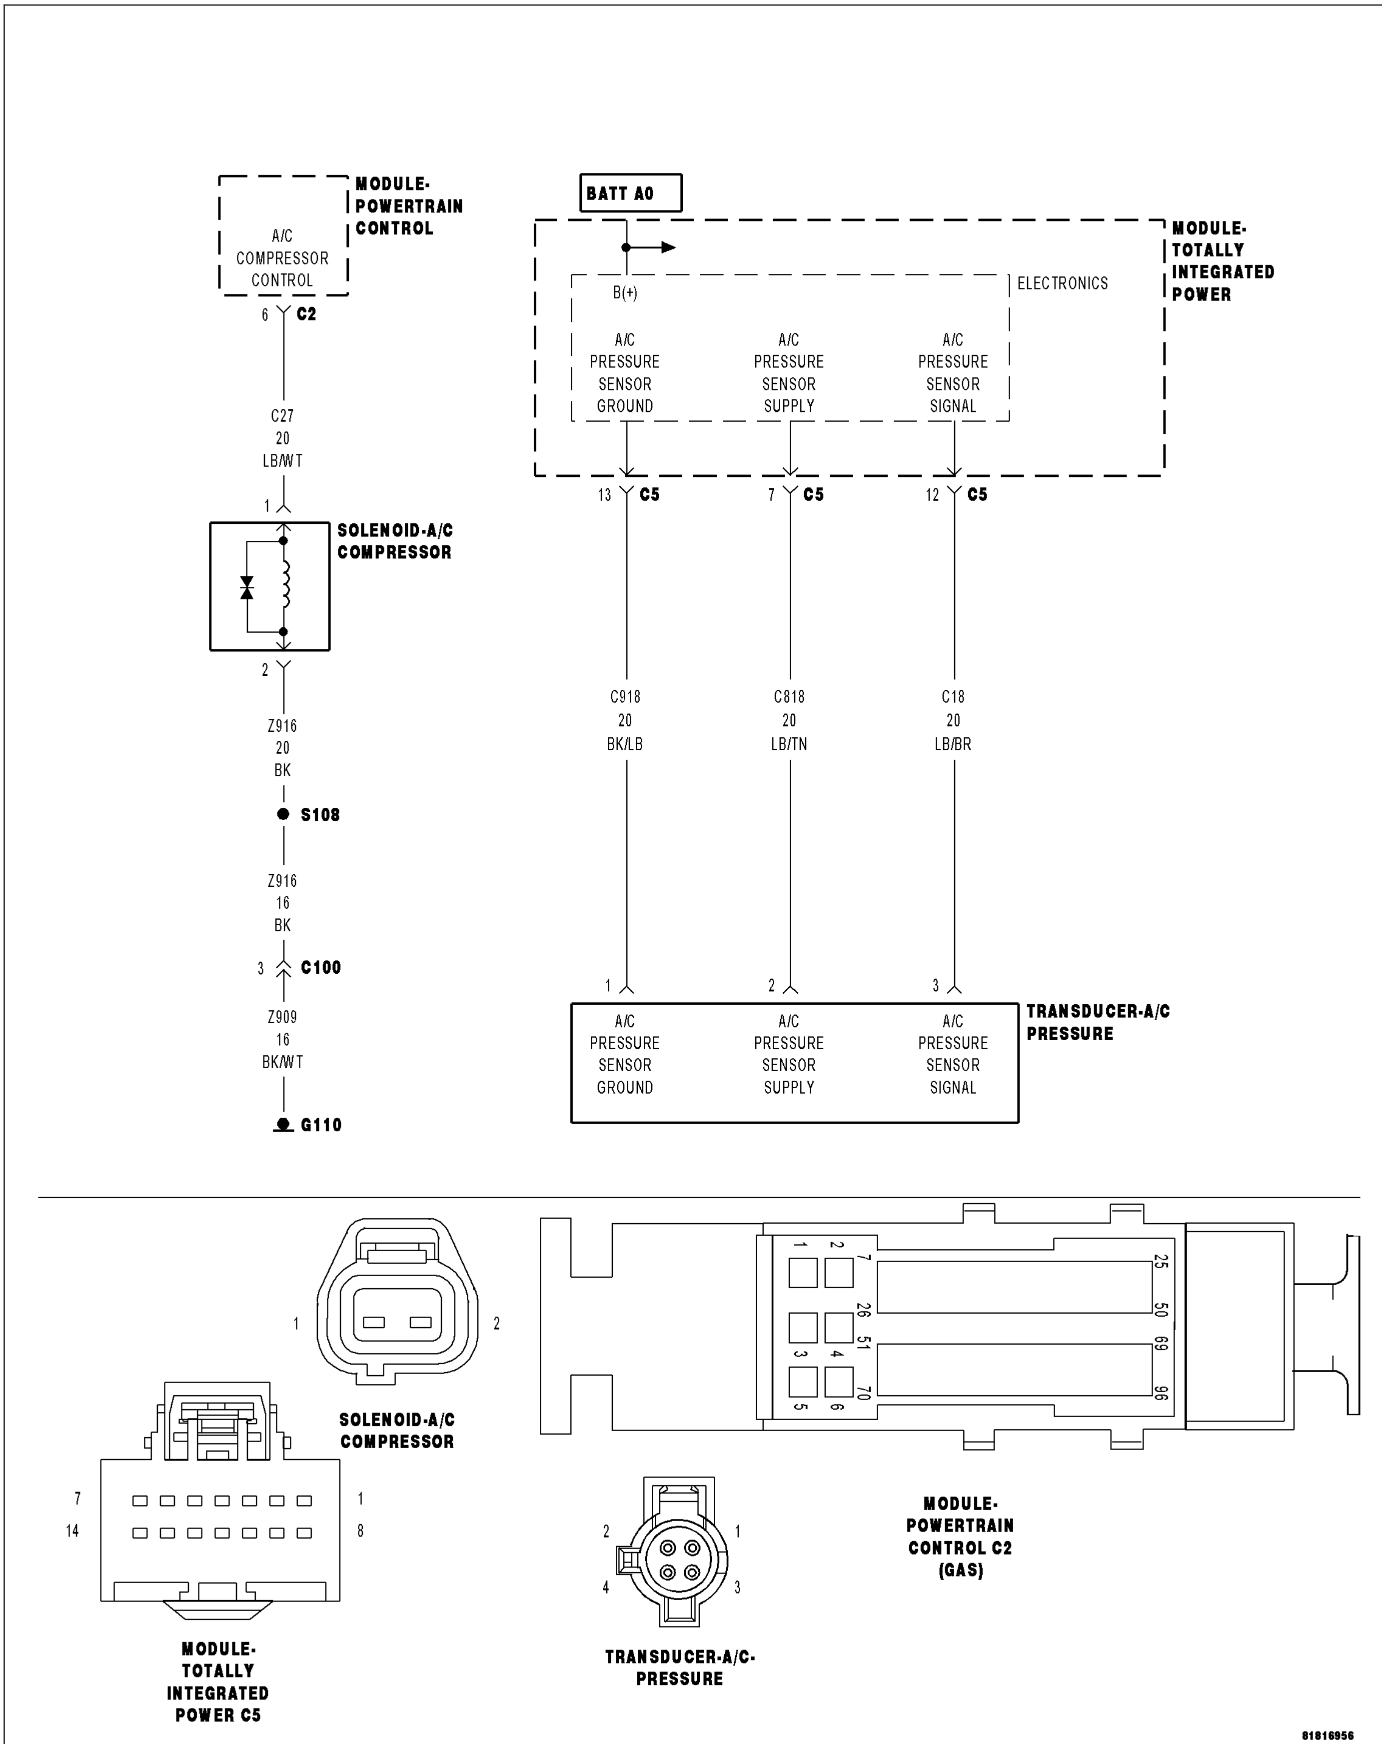
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Compressor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0647-A/C CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the A/C Compressor control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO VOLTAGE
(C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
A/C COMPRESSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

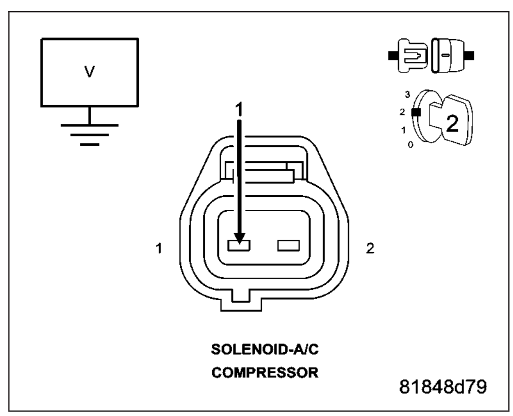
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO VOLTAGE



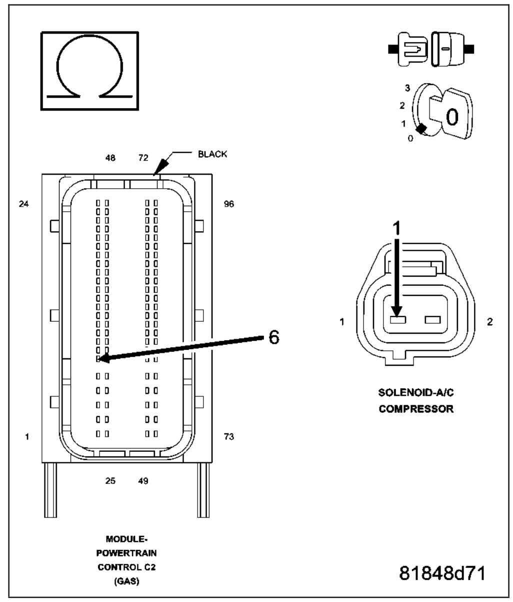
Turn the ignition off.

Disconnect the A/C Compressor connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.



Is there any voltage present?

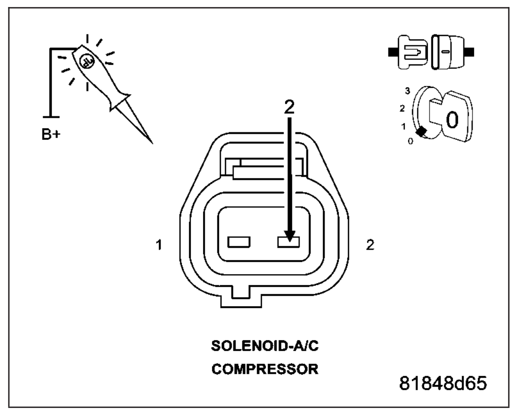
Yes >> Repair the (C27) A/C Compressor Control circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C27) A/C Compressor Control circuit between the A/C Compressor harness connector and the Powertrain Control Module (PCM) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 4

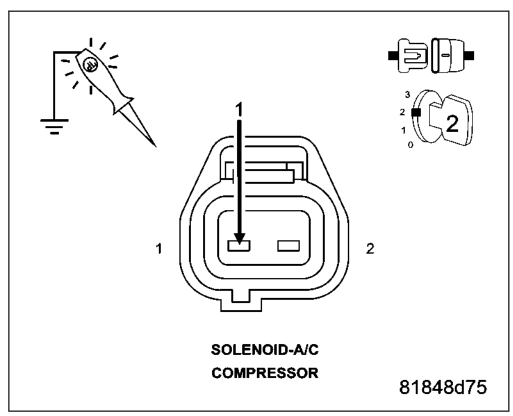
No >> Repair the (C27) A/C Compressor Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to 12 volts, check the (Z916) Ground circuit in the A/C Compressor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.



Is the test light illuminated and bright?

Yes >> Go to 5

No >> Repair the (Z916) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. A/C COMPRESSOR

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the A/C Compressor control to the ON position.

Using a 12 volt test light connected to ground, check the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the A/C Compressor control to the OFF position.

Using a 12 volt test light connected to ground, check the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuation ON (100%) and not illuminated with the actua-

tion OFF (0%)?

Yes >> Replace the A/C Compressor in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

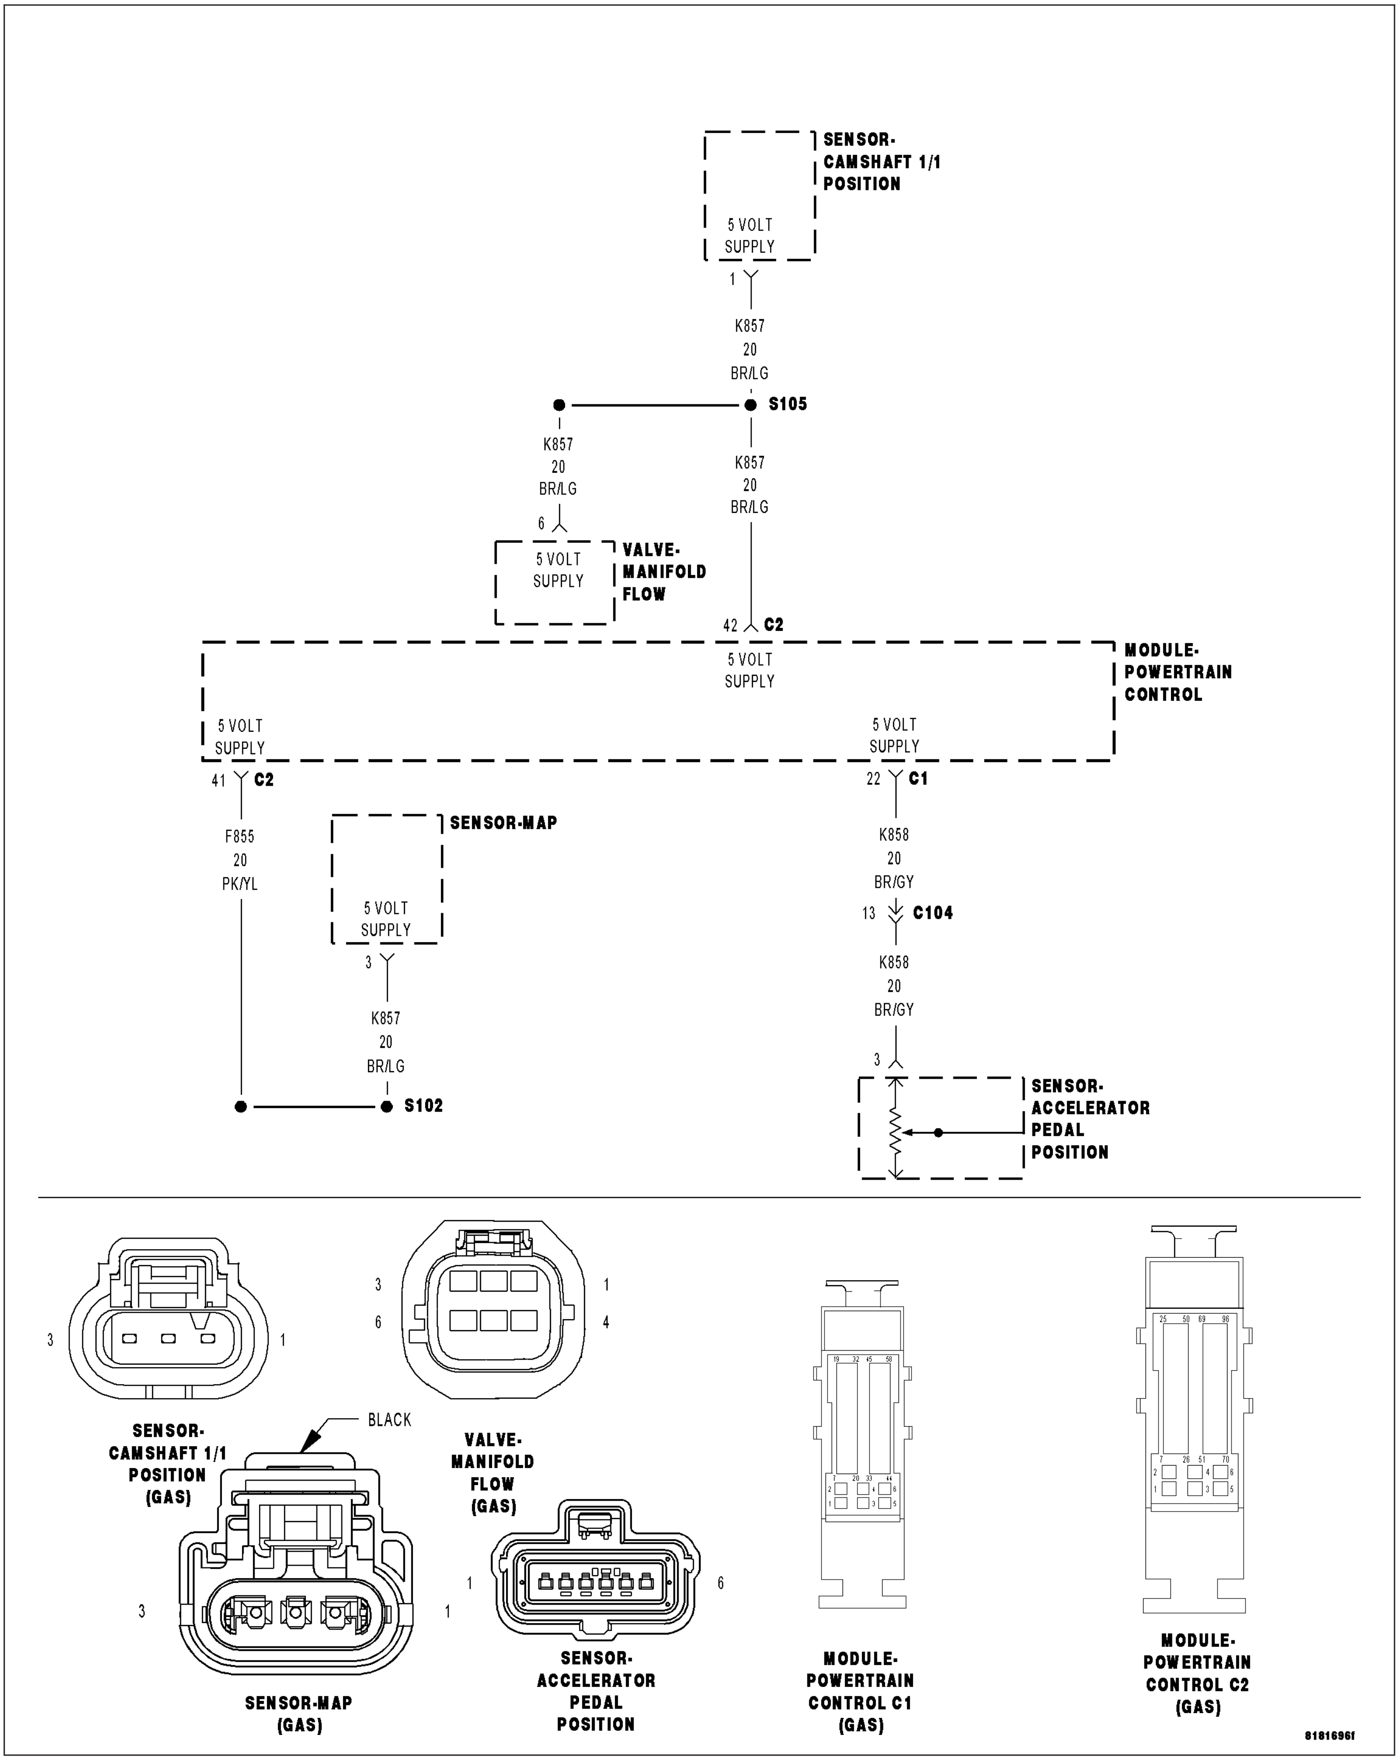
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Compressor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0652-SENSOR REFERENCE VOLTAGE 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects low voltage on the (F857) 5 volt supply circuit or the (F858) 5 volt supply circuit.

Possible Causes
INTERMITTENT DTC
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 1/1 POSITION SENSOR
MANIFOLD FLOW VALVE
MAP SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

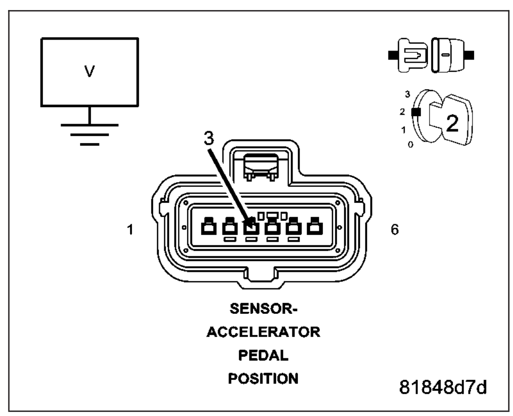
With the scan tool, clear DTCs.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Disconnect the APP Sensor harness connector.

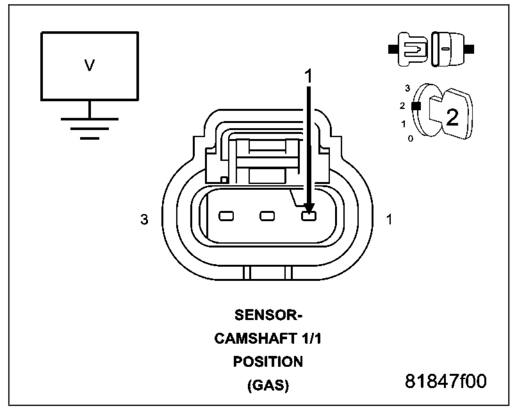
Turn the ignition on.

Measure the voltage of the (K858) 5 Volt Supply circuit in the APP Sensor harness connector.

Is the voltage above 4.6 volts?

Yes >> Replace the Accelerator Pedal Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3



3. CAMSHAFT 1/1 POSITION SENSOR

Turn the ignition off.

Disconnect the Camshaft 1/1 Position Sensor harness connector.

Turn the ignition on.

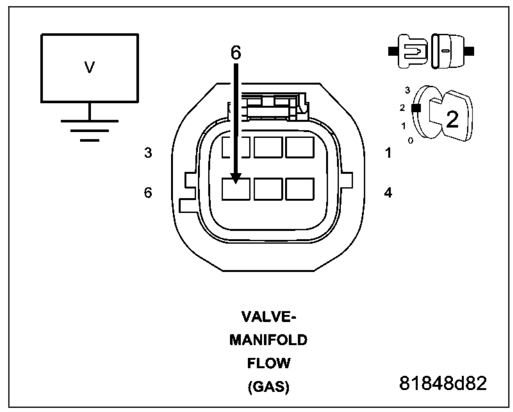
Measure the voltage of the (K857) 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes >> Replace the Camshaft 1/1 Position Sensor.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4



4. MANIFOLD FLOW VALVE

Turn the ignition off.

Disconnect the Manifold Flow Valve harness connector.

Turn the ignition on.

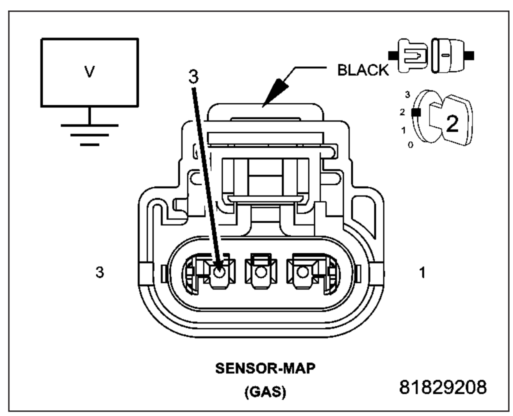
Measure the voltage of the (K857) 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes >> Replace the Manifold Flow Valve.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5



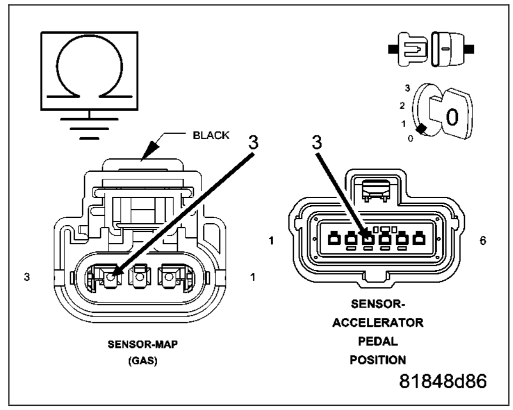
5. MAP SENSOR

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K857) 5 Volt Supply circuit.



Is the voltage above 4.6 volts?

Yes >> Replace the MAP Sensor in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the PCM harness connectors.

Measure the resistance between ground and the (K857) 5 Volt Supply circuit.

Measure the resistance between ground and the (K858) 5 Volt Supply circuit.

Is the resistance above 1000 ohms for both circuits?

Yes >> Go to 7

No >> Repair the 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. POWERTRAIN CONTROL MODULE (PCM)

Inspect the (K858) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

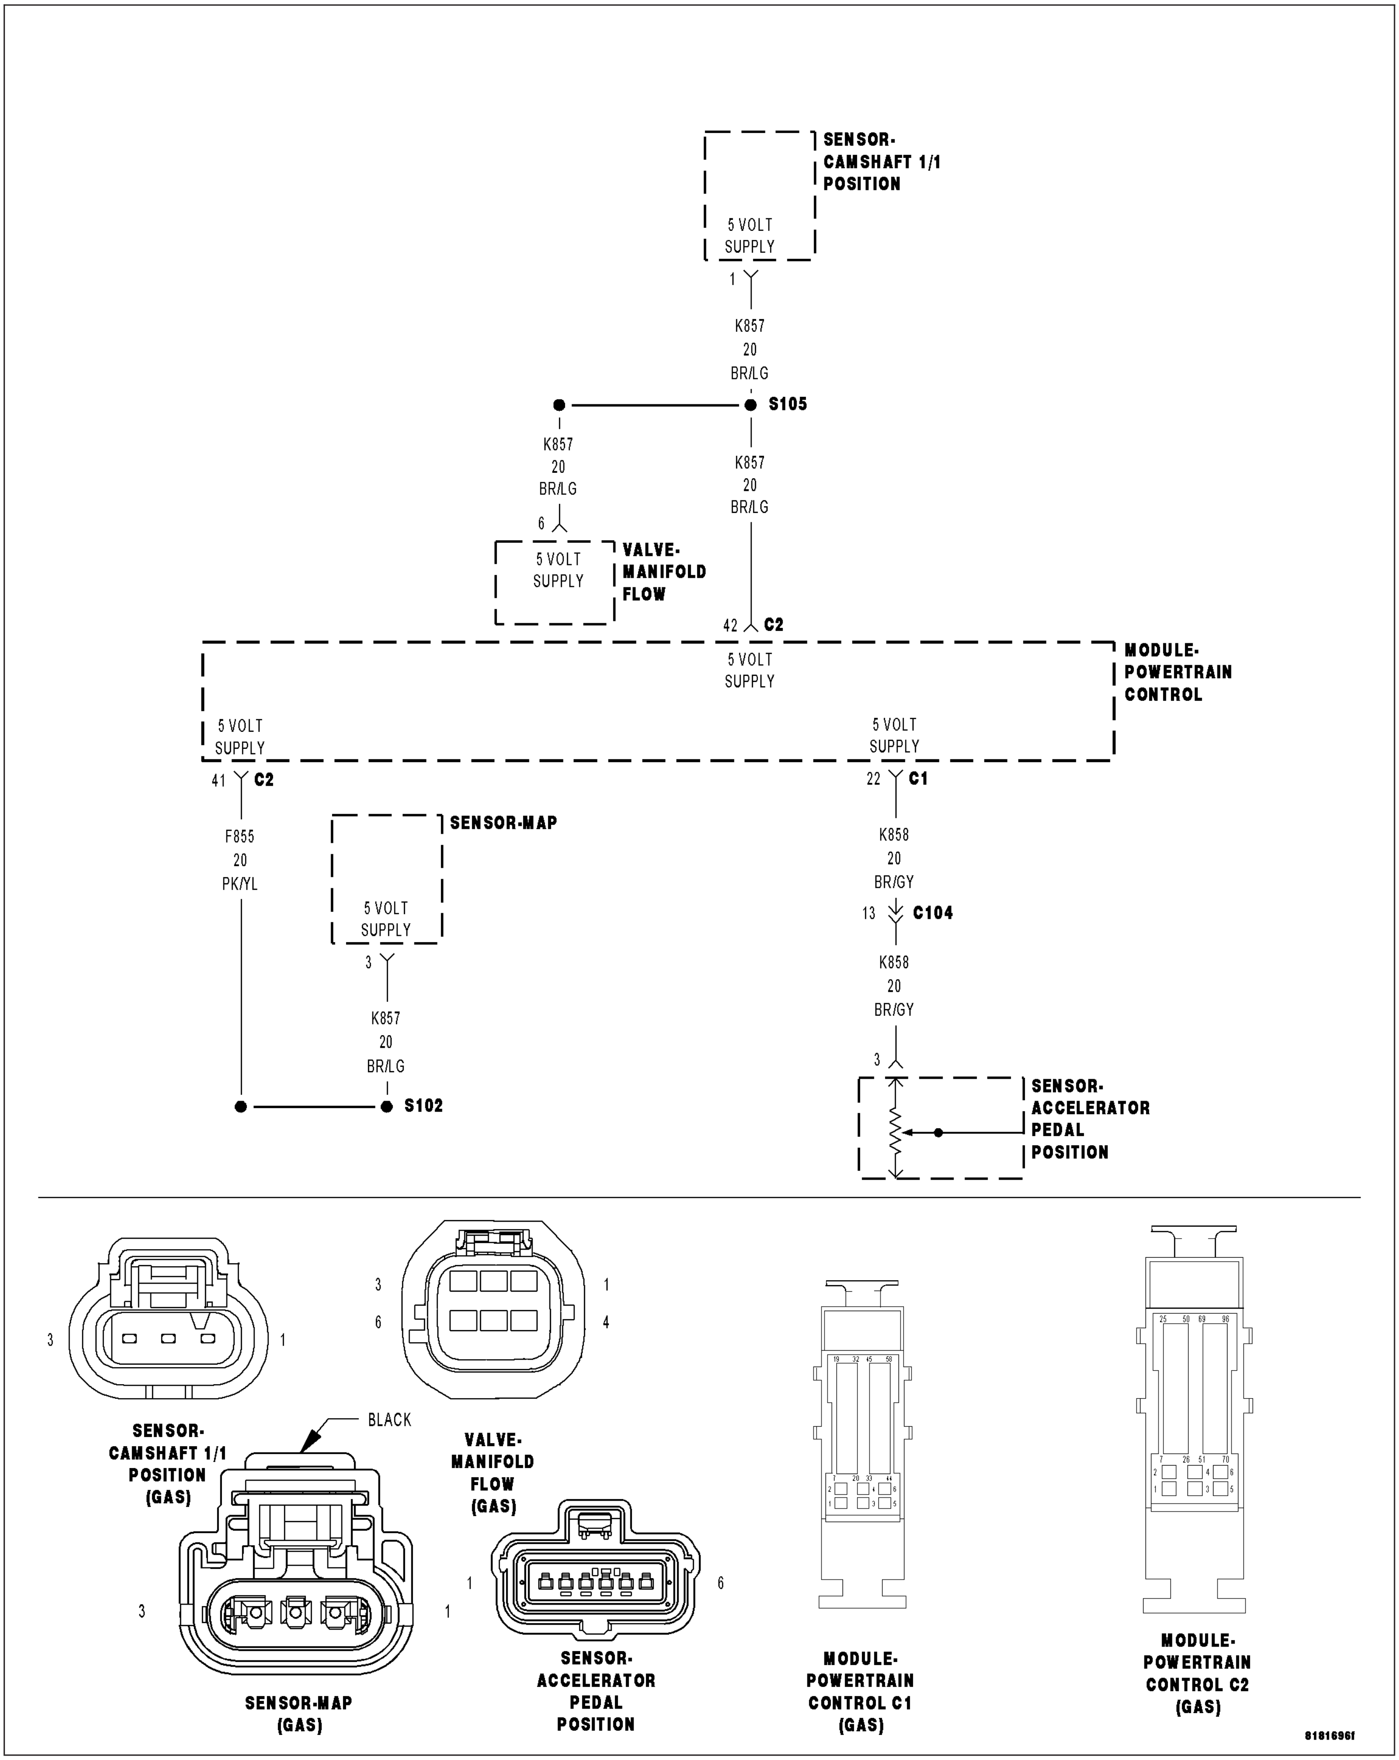
Inspect the (K857) 5 Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the PCM harness connector.

Inspect the (K857) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM harness connector.

Inspect the (K857) 5 Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the PCM in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0653-SENSOR REFERENCE VOLTAGE 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects a short to voltage on the (K857) 5 volt supply circuit or the (K858) 5 volt supply.

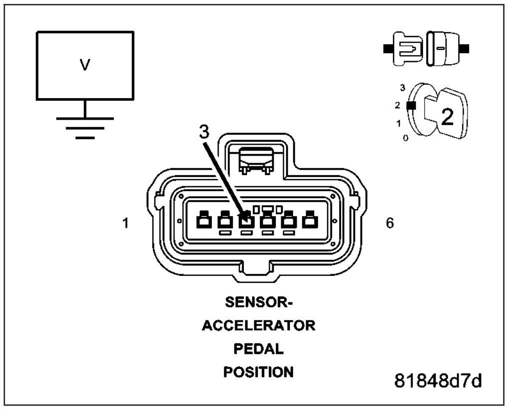
Possible Causes
INTERMITTENT DTC
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.
With the scan tool, clear DTCs.
Turn the ignition on.
With the scan tool, select View DTCs.



Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

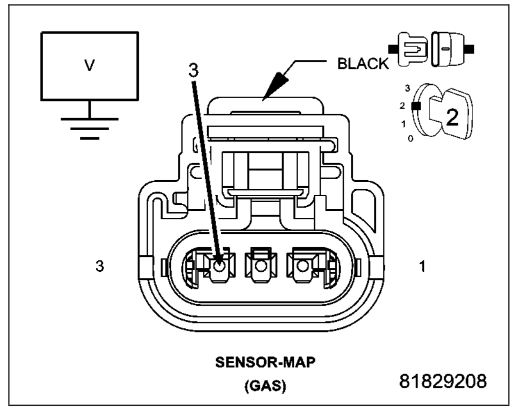
2. (K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Accelerator Pedal Position Sensor harness connector.
Disconnect the PCM harness connectors.
Measure the voltage on the (K858) 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (K858) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3



3. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Turn the ignition on.

Measure the voltage on the (K857) 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (K857) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. POWERTRAIN CONTROL MODULE (PCM)

Turn the ignition off.

Inspect the (K858) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

Inspect the (K857) 5 Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the PCM harness connector.

Inspect the (K857) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM harness connector.

Inspect the (K857) 5 Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0700-TRANSMISSION CONTROL SYSTEM (MIL REQUEST)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM receives a CAN Bus message indicating that a DTC is present in the TCM.

Possible Causes
INTERMITTENT DTC
TRANSMISSION DTC(S) PRESENT
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose and repair any other DTCs that are set in the PCM before continuing.

NOTE: This DTC will set in the PCM to indicate that a DTC is set in the TCM.

NOTE: When all repairs have been completed, clear DTCs in the PCM and TCM.

Ignition on, engine not running.

With the scan tool, select View DTCs in the PCM.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. DTCS PRESENT IN THE TRANSMISSION CONTROL MODULE (TCM)

NOTE: If the scan tool is unable to communicate with the TCM, or if there are related communication DTCs present, refer to the Communication Category and perform the appropriate diagnostic procedure.

Ignition on, engine not running.

With the scan tool, select View DTCs in the TCM.

Are there any DTCs present in the TCM?

Yes >> Refer to the Transmission Category and perform the appropriate diagnostic procedure.

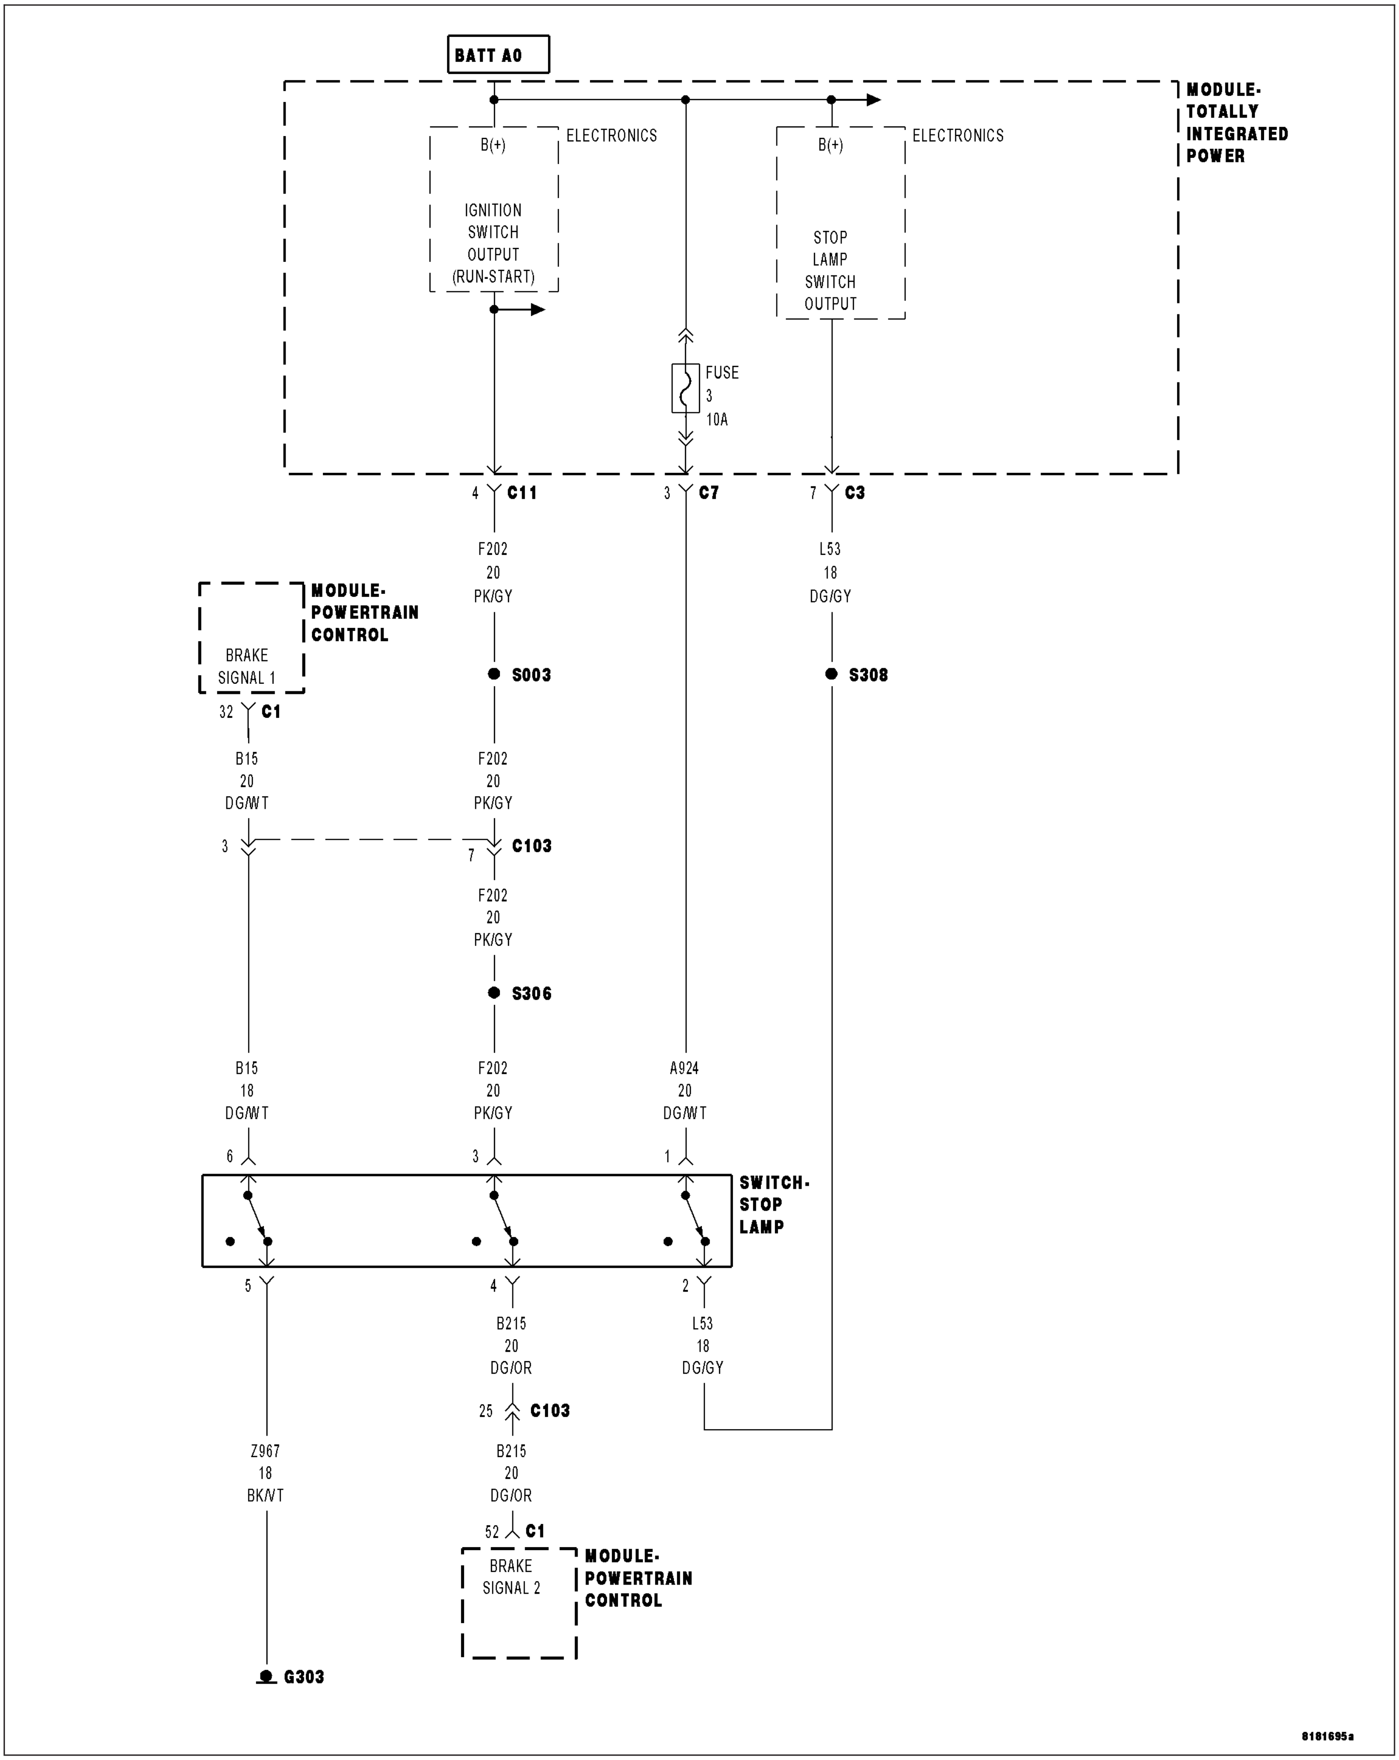
No >> Go to 3

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the TCM and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the PCM in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0703-BRAKE SWITCH 2 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the states of Brake Signal 1 and Brake Signal 2 do not match for more than 50 ms.

Possible Causes
INTERMITTENT DTC
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

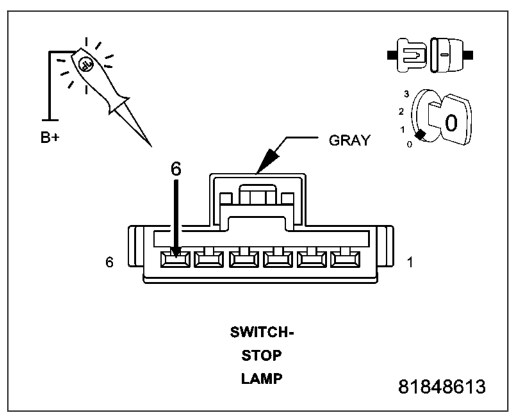
1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 2

2. (B15) BRAKE SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

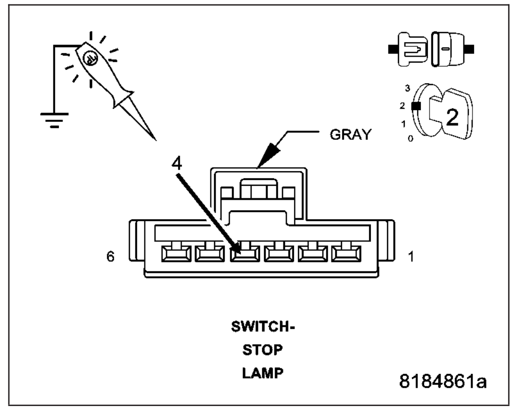
Using a 12 volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

Yes >> Go to 3.

No >> Go to 4

3. (B16) BRAKE SIGNAL 2 CIRCUIT



Turn the ignition on.

Using a 12 volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

Yes >> Go to 11

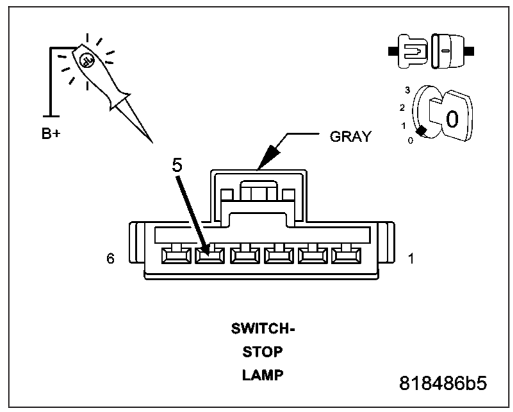
No >> Go to 7

4. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Stop Lamp Switch connector.

Using a 12 volt test light connected to 12 volts, check the (Z967) Ground circuit in the Stop Lamp Switch harness connector.



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

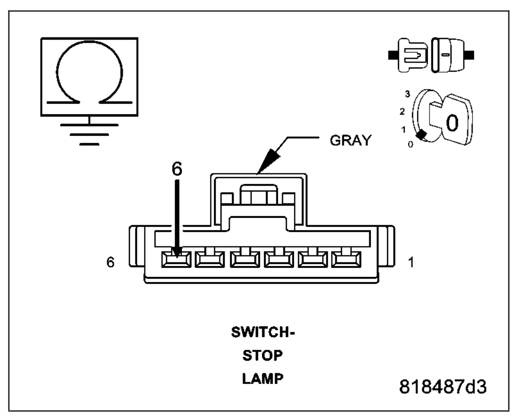
Is the test light illuminated and bright?

Yes >> Go to 5

No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

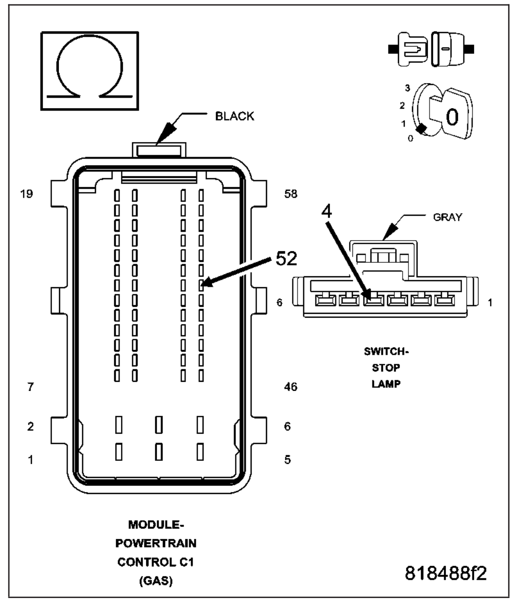
5. (B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 6



No >> Repair the (B15) Brake Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

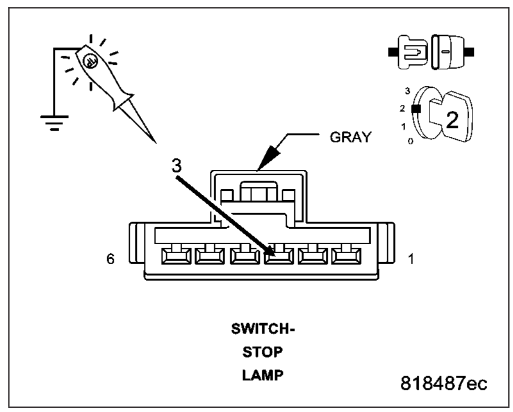
Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B15) Brake Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

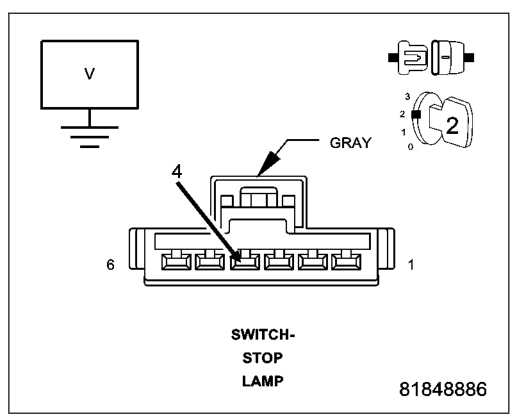
Disconnect the Stop Lamp Switch connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 8

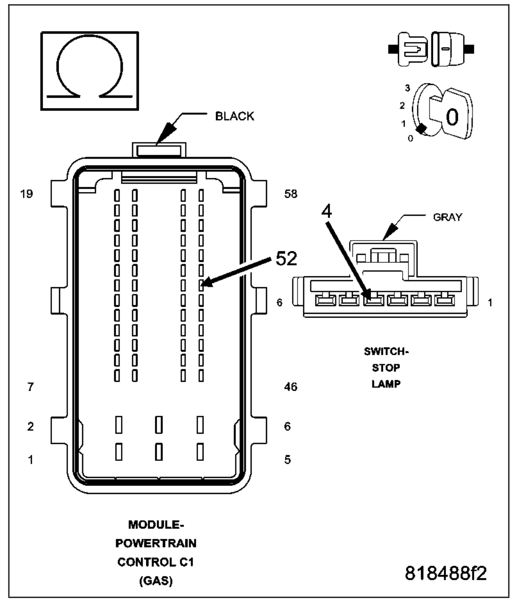
No >> Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is there any voltage present?



Yes >> Repair the (B16) Brake Signal 2 circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B16) Brake Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. STOP LAMP SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Stop Lamp Switch in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0850-PARK/NEUTRAL SWITCH PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the transmission in Park, Neutral, or Drive and not in Limp-in mode.
- **Set Condition:**
  This code will set if the PCM detects an irrational Park/Neutral switch state. Two trip fault. Three good trips to turn off the MIL.

Possible Causes
INTERMITTENT DTC
P/N SIGNAL CIRCUIT SHORTED TO VOLTAGE OR GROUND
DTCS PRESENT IN THE TRANSMISSION CONTROL MODULE (TCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, select View DTCs in the PCM.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. DTCS PRESENT IN THE TRANSMISSION CONTROL MODULE (TCM)

NOTE: If the scan tool is unable to communicate with the TCM, or if there are related communication DTCs present, refer to the Communication Category and perform the appropriate diagnostic procedure.

Ignition on, engine not running.

With the scan tool, select View DTCs in the TCM.

Are there any DTCs present in the TCM?

Yes >> Refer to the Transmission Category and perform the appropriate diagnostic procedure.

No >> Go to 3

3. POWERTRAIN CONTROL MODULE (PCM)

Inspect the P/N signal circuit for a short to ground, or a short to voltage with the shifter in Drive or Reverse. Refer to the appropriate diagnostic procedures in the Transmission category.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Transmission Range Sensor, the TCM, and the PCM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the PCM in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1115-GENERAL TEMPERATURE RATIONALITY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage greater than 10 volts.
- **Set Condition:**
  AAT, ECT, and IAT sensor inputs are compared during a cold start. After start up, the values are monitored. If one of the readings is not plausible for two consecutive trips, a DTC is stored. Three good trips turns off the MIL.

Possible Causes
SENSOR SIGNAL CIRCUIT HIGH RESISTANCE
SENSOR GROUND CIRCUIT HIGH RESISTANCE
TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, select View DTCs.

NOTE: Diagnose and repair any AAT, ECT, and IAT sensor DTCs before continuing with this test.

NOTE: Diagnose and repair P1607 PCM INTERNAL SHUTDOWN TIMER SLOW RATIONALITY or P2610 PCM INTERNAL SHUTDOWN TIMER FAST RATIONALITY if either code is set before continuing with this test.

NOTE: Using an unapproved block heater in cold temperatures may cause this DTC to set. No repair is required.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. TEMPERATURE SENSOR CIRCUIT VALUE IMPLAUSIBLE

NOTE: Allow the engine sit for 6 - 8 hours before testing.

With a scan tool, monitor the AAT, ECT, and IAT sensor values.

Start the engine.

Allow the engine to reach normal operating temperature.

Does the value for each of the sensors increase smoothly and as expected?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. TEMPERATURE SENSOR

NOTE: If it is necessary to replace the AAT sensor, be sure to drive the vehicle over 30 MPH for at least 5 minutes to update the AAT value.

Ignition on, engine not running.

Disconnect the harness connector for the sensor that had a value which did not increase smoothly and as expected.

With the scan tool, read the sensor voltage with the connected disconnected.

NOTE: The sensor voltage should be approximately 5.0 volts with the connector disconnected.

Connect a jumper wire between the sensor signal circuit and the sensor ground circuit in the harness connector.

With the scan tool, read the sensor voltage with the jumper wire in place.

NOTE: The sensor voltage should be approximately 0 volts with the jumper wire in place.

Does the sensor voltage change as described?

Yes >> Replace the sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. SENSOR SIGNAL CIRCUIT HIGH RESISTANCE

Turn the ignition off.

For the AAT sensor, disconnect the TIPM harness connector. Otherwise disconnect the PCM harness connector.

Measure the resistance of the sensor signal circuit from the sensor harness connector to the module harness connector.

Is the resistance above 5.0 ohms.

Yes >> Repair the sensor signal circuit for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. SENSOR GROUND CIRCUIT HIGH RESISTANCE

Measure the resistance of the sensor ground circuit from the sensor harness connector to the module harness connector.

Is the resistance above 5.0 ohms.

Yes >> Repair the sensor ground circuit for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

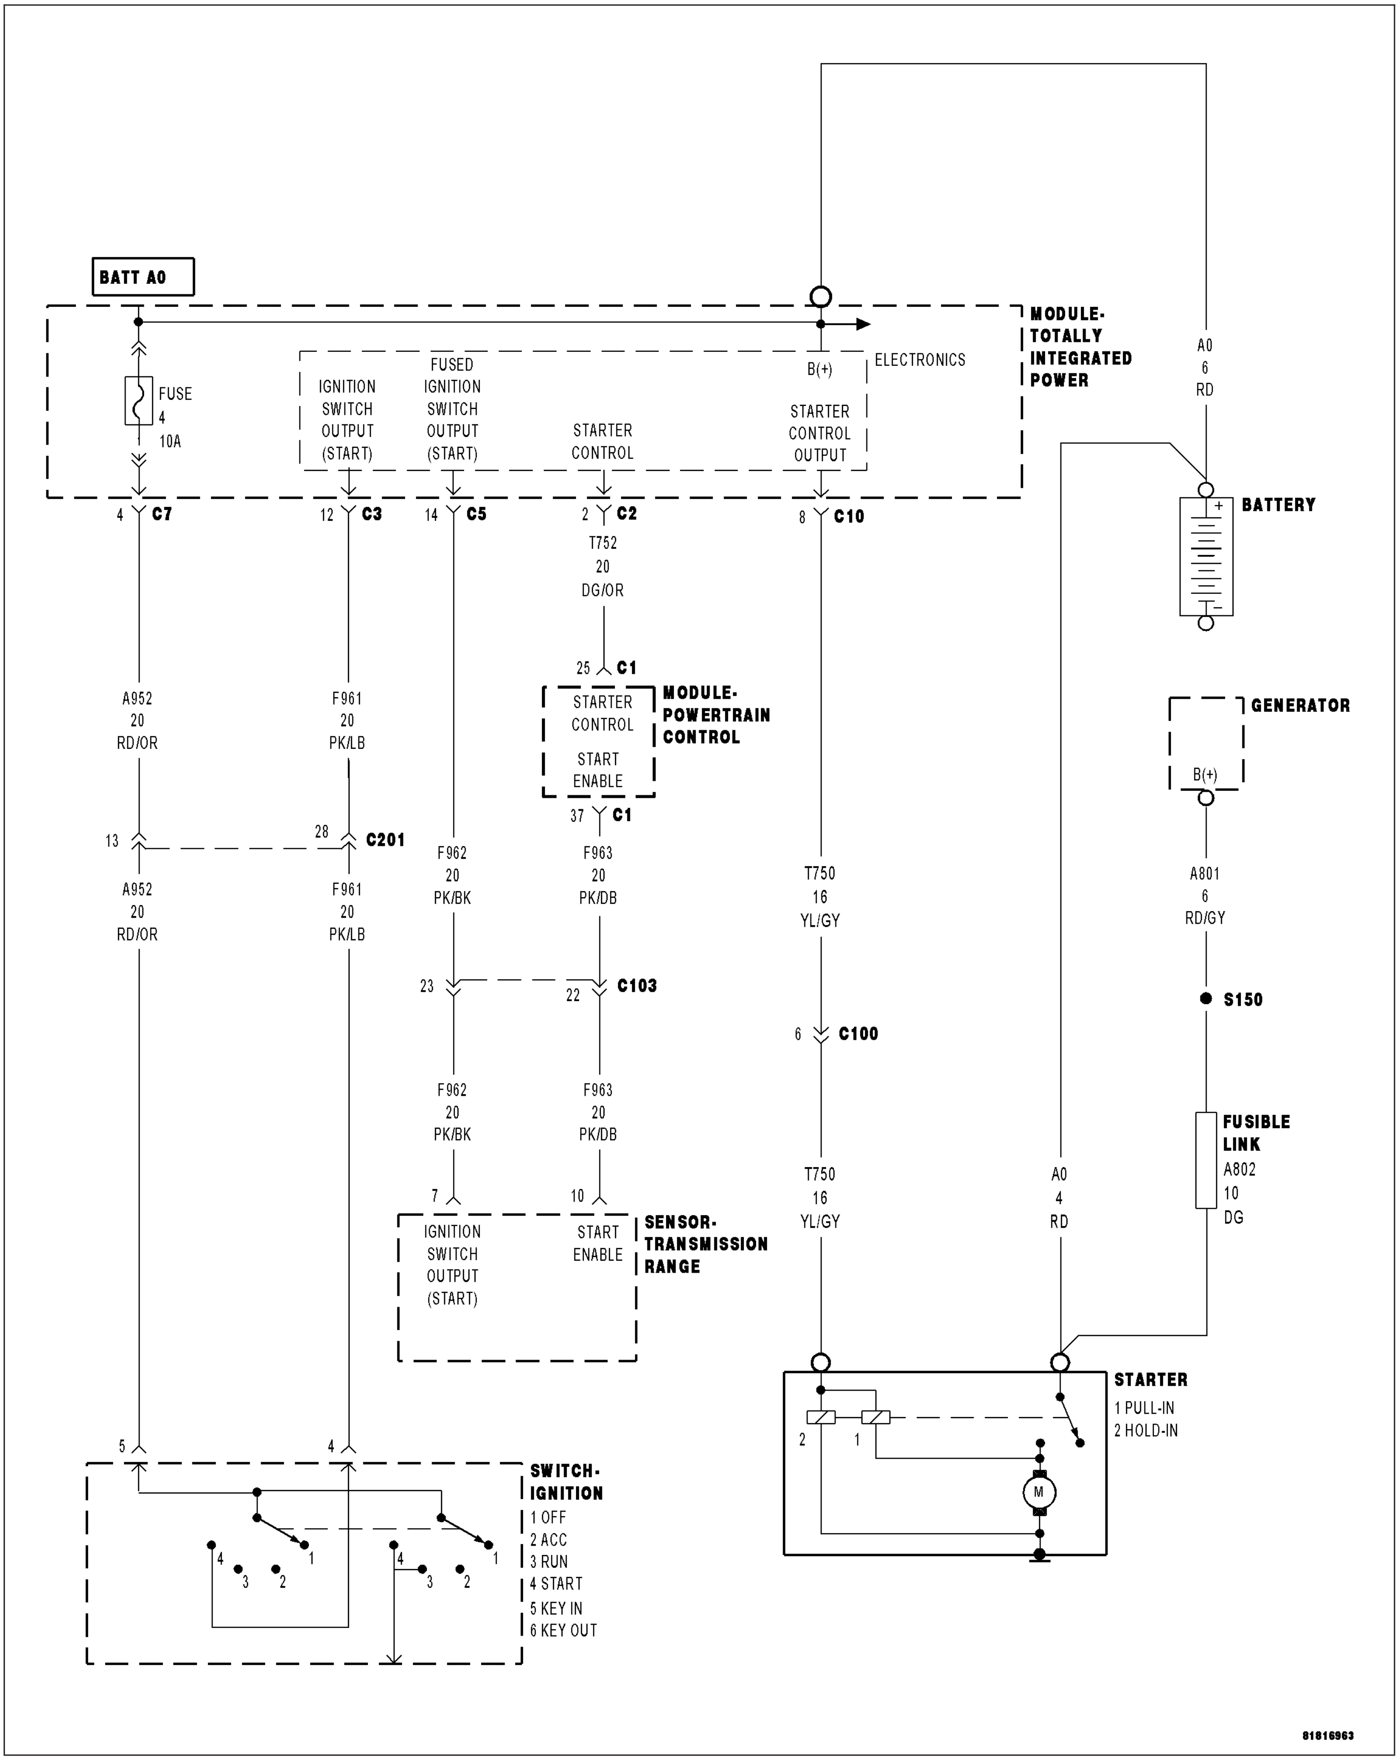
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module per Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1277-STARTER CONTROL CIRCUIT 2 LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts and Main Relay is on. TIPM requesting Starter operation.
- **Set Condition:**
  Actual Starter state is not equal to desired state. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(T750) STARTER CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
STARTER
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If P0615, P0616 or P0617 has set along with this DTC, diagnose those DTC(s) first before continuing.
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. STARTER CONTROL OUTPUT OPERATION

Turn the ignition off.

Disconnect the Starter (1-way) harness connector.

With a 12-volt test light connected to ground, probe the (T750) Starter Control Output circuit in the Starter (1-way) harness connector

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.
Crank the engine and monitor the test light.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Replace the Starter in accordance with the Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 3

3. (T750) STARTER CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Turn the ignition off

Disconnect the TIPM C10 harness connector.

Measure the resistance between ground and the (T750) Starter Control Output circuit at the TIPM C10 harness connector.

Is the resistance below 100 ohms?

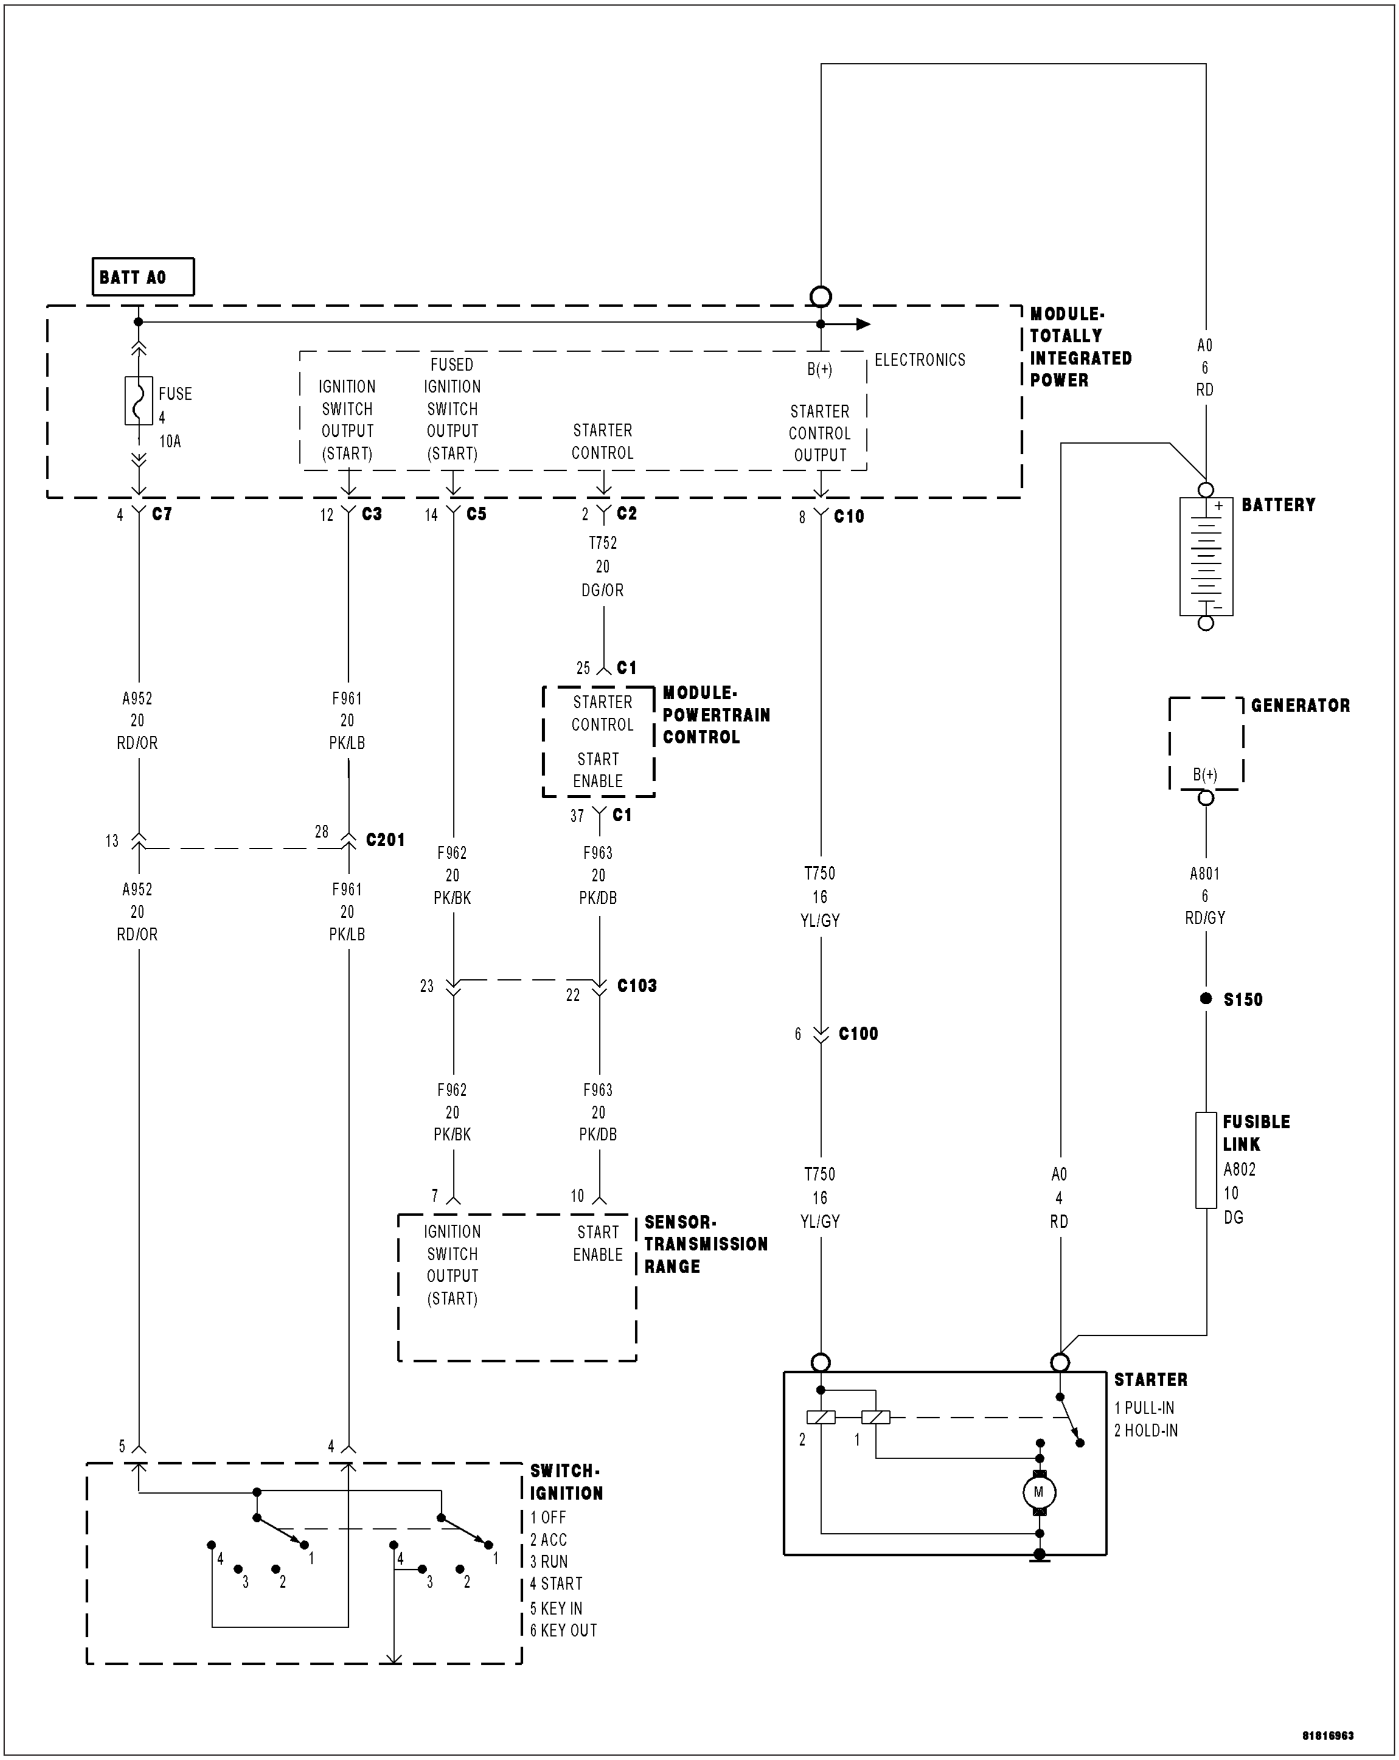
Yes >> Repair the short to ground in the (T750) Starter Control Output circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 4

4. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.



Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P1278-STARTER CONTROL CIRCUIT 2 HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts and the Main Relay on. TIPM requesting Starter operation.
- **Set Condition:**
  Actual Starter state is not equal to desired state. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(T750) STARTER CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE
STARTER MOTOR
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If P0615, P0616 or P0617 has set along with this DTC, diagnose those DTC(s) first before continuing.
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. STARTER CONTROL OUTPUT VERIFICATION

Turn the ignition off.

Disconnect TIPM C10 harness connector.

Turn the ignition on.

Measure the voltage of the (T750) Starter Control Output circuit in the TIPM C10 harness connector.

Is voltage present?

Yes >> Go To 3

No >> Go To 4

3. (T750) STARTER CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off

Disconnect the Starter (1-way) harness connector.

Turn the ignition on.

Using a voltmeter, measure the voltage of the (T750) Starter Control Output circuit in the TIPM C10 harness connector.

Is voltage present?

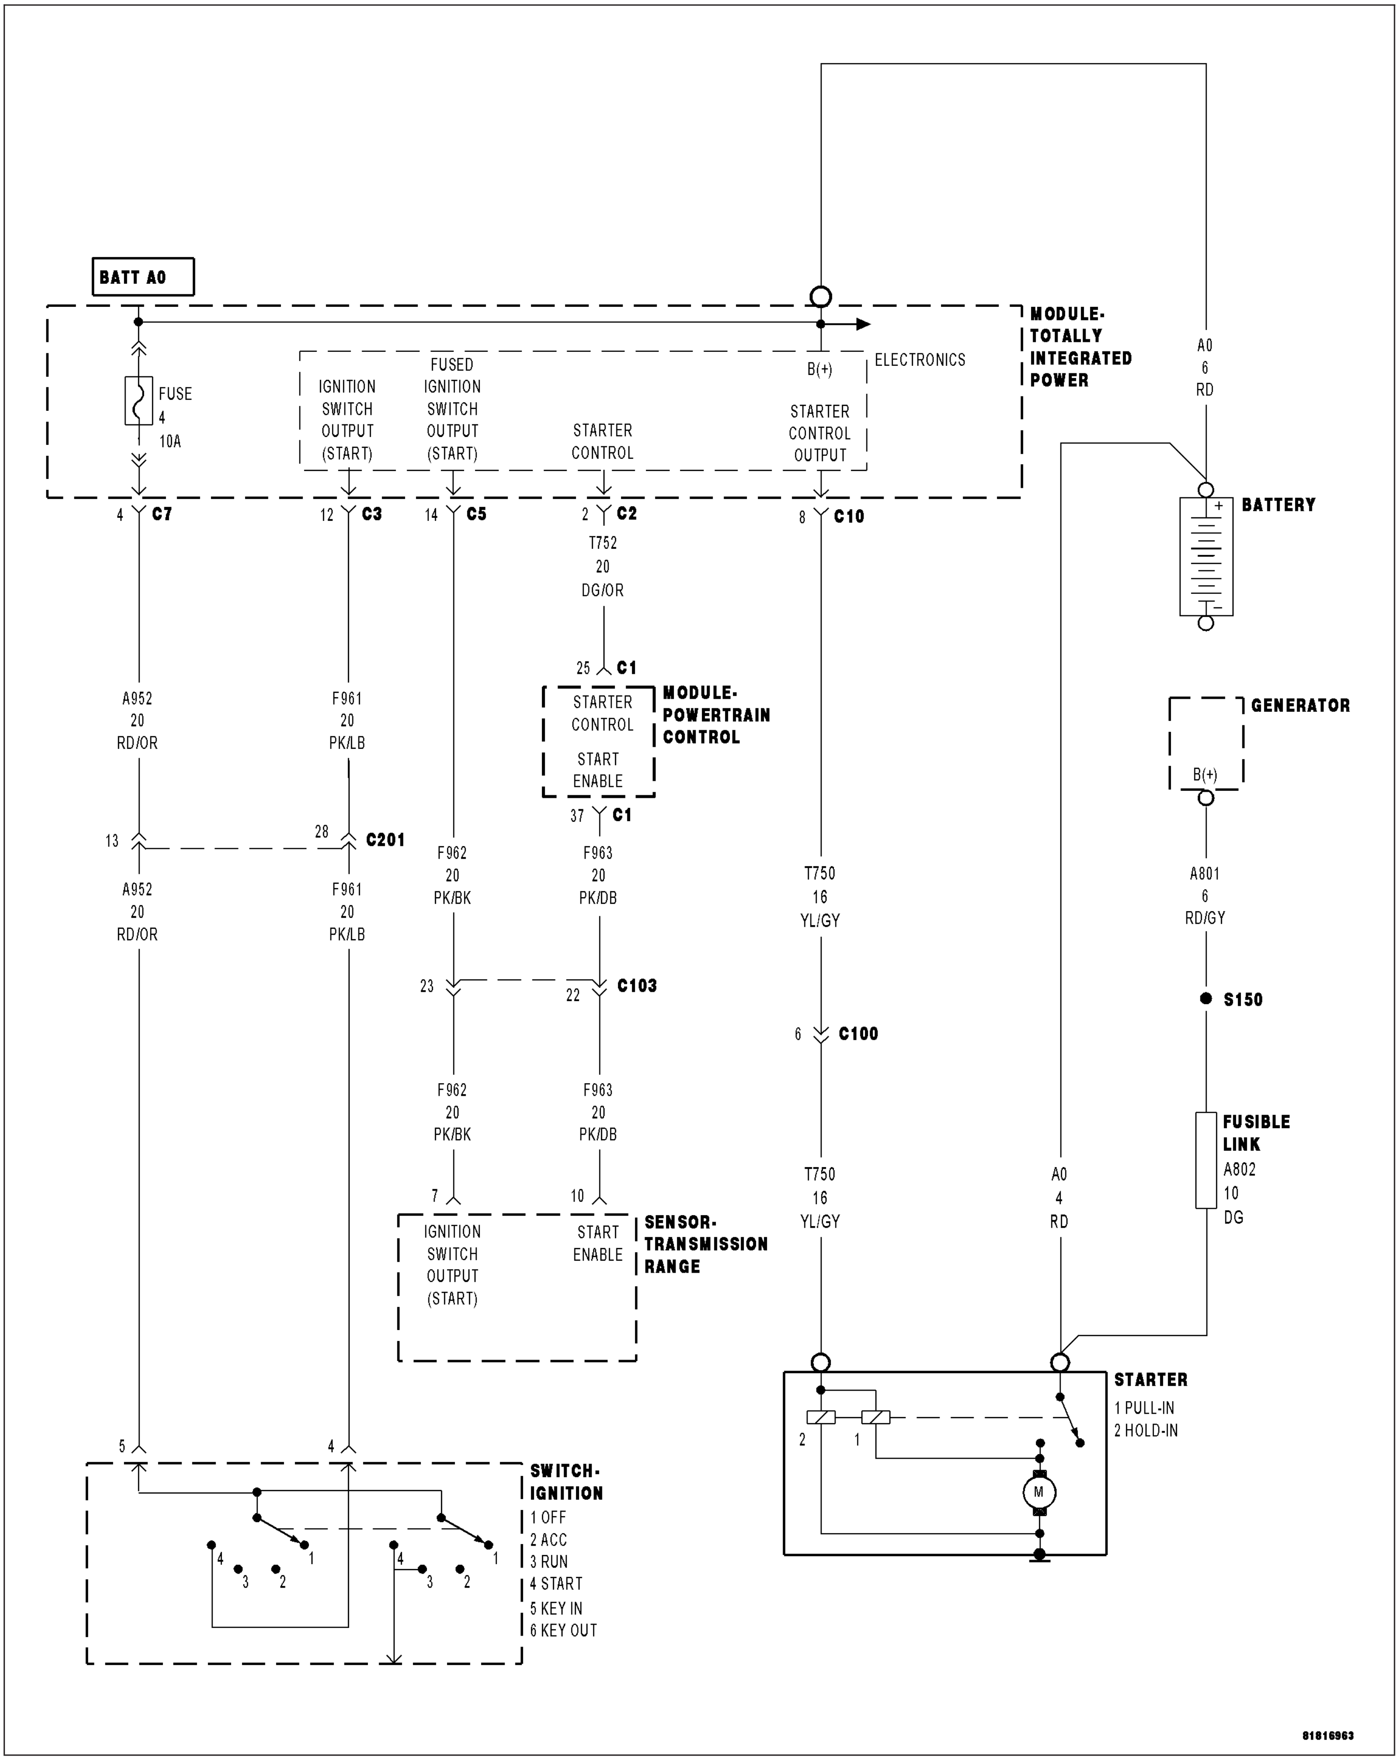
Yes >> Repair the short to battery voltage in the (T750) Starter Control Output circuit.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Starter in accordance with the Service information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.



Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P1279-STARTER CONTROL CIRCUIT 2 OPEN (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts and the Main Relay on. TIPM requesting Starter operation.
- **Set Condition:**
  Actual Starter state is not equal to desired state. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(T750) STARTER CONTROL OUTPUT CIRCUIT OPEN
STARTER
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

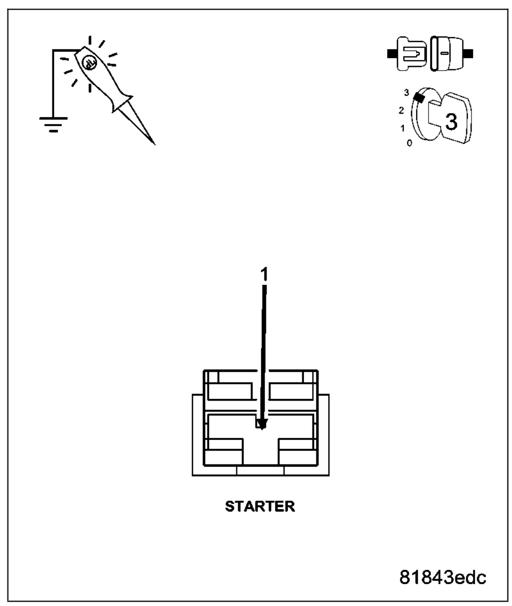
NOTE: If P0615, P0616 or P0617 has set along with this DTC, diagnose those DTC(s) first before continuing.

Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2



No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. STARTER CONTROL OUTPUT OPERATION

Turn the ignition off.

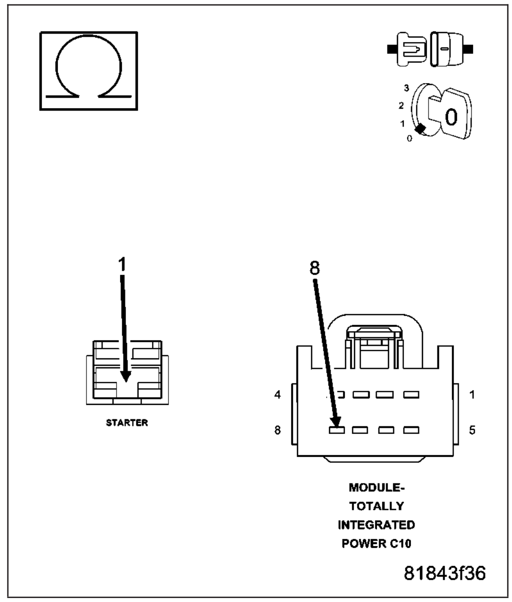
Disconnect the Starter (1-way) harness connector.

With a 12-volt test light connected to ground, probe the (T750) Starter Control Output circuit in the Starter (1-way) harness connector

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Crank the engine and monitor the test light.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly?

Yes >> Replace the Starter in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 3

3. (T750) STARTER CONTROL OUTPUT CIRCUIT OPEN

Turn the ignition off

Disconnect the TIPM 10 harness connector.

Measure the resistance of the (T750) Starter Control Output circuit between the TIPM C10 harness connector and the Starter harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the short to ground in the (T750) Starter Control Output circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

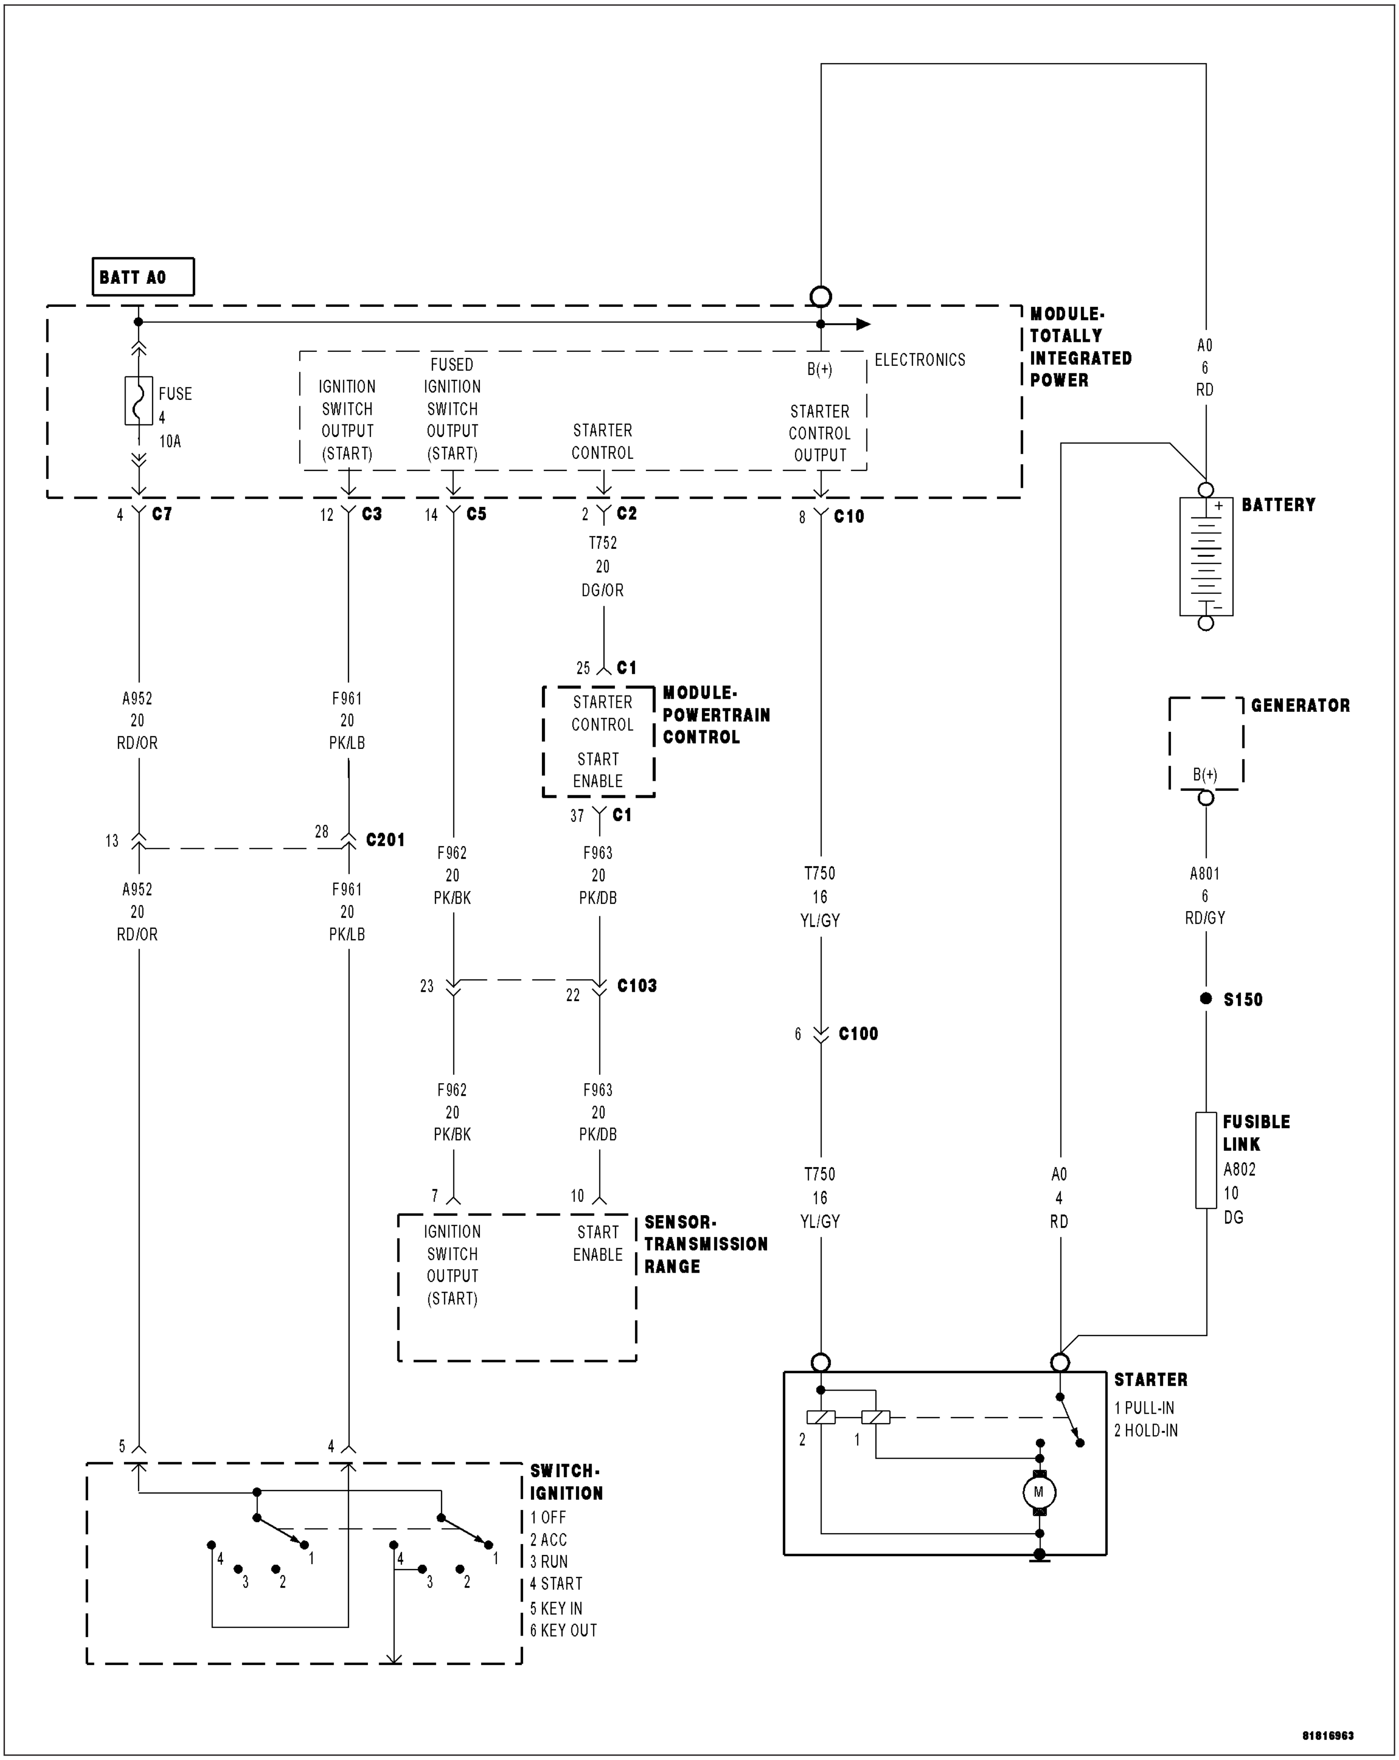
4. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P127A-STARTER CONTROL CIRCUIT 2 OVERCURRENT (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts. TIPM requesting Stater operation.
- **Set Condition:**
  An overcurrent condition is detected in the Starter control output circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
TERMINAL DAMAGE OR CORROSION
(T750) STARTER CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
STARTER
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If P0615, P0616 or P0617 has set along with this DTC, diagnose those DTC(s) first before continuing.
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VISUAL AND PHYSICAL CONNECTOR AND TERMINAL INSPECTION

NOTE: Ensure the Starter is bolted securely and is properly mounted.
Turn the ignition off.

Disconnect the TIPM C10 harness connector.

Disconnect the Starter (1-way) harness connector.

Inspect the terminal and connector condition. Check for signs of corrosion build up or damage that would compromise the terminal to controller pin connector.

NOTE: Make sure that all in-line connectors are inspected for corrosion and/or damage.
Visually inspect the wiring harness. Look for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

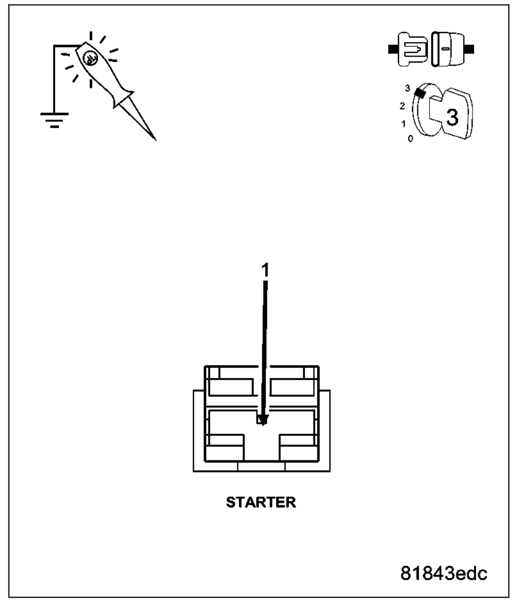
Yes >> Repair or replace as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 3

3. STARTER CONTROL OUTPUT OPERATION

Turn the ignition off.

Reconnect the TIPM C10 harness connector.



With a 12-volt test light connected to ground, probe the (T750) Starter Control Output circuit in the Starter (1-way) harness connector

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Crank the engine and monitor the test light.

NOTE: The test light should be illuminated only when cranking the engine. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly when cranking the engine and then turn off when it is not being cranked?

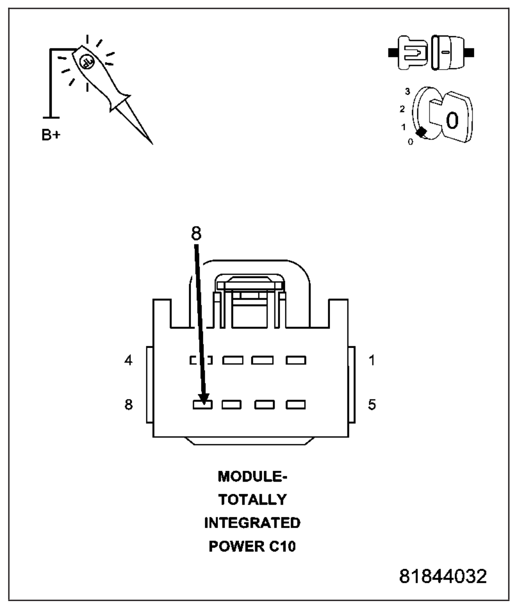
Yes >> Replace the Starter in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 4

4. (T750) STARTER CONTROL OUTPUT CIRCUIT HIGH RESISTANCE

Turn the ignition off.



Disconnect the TIPM C10 harness connector.

With a jumper wire, connect one end to the (T750) Starter Control Output circuit in the Starter harness connector and the other to a clean chassis ground.

Using a 12-volt test light to battery voltage, probe the (T750) Starter Control Output circuit in the TIPM C7 harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly.

Yes >> Go To 5

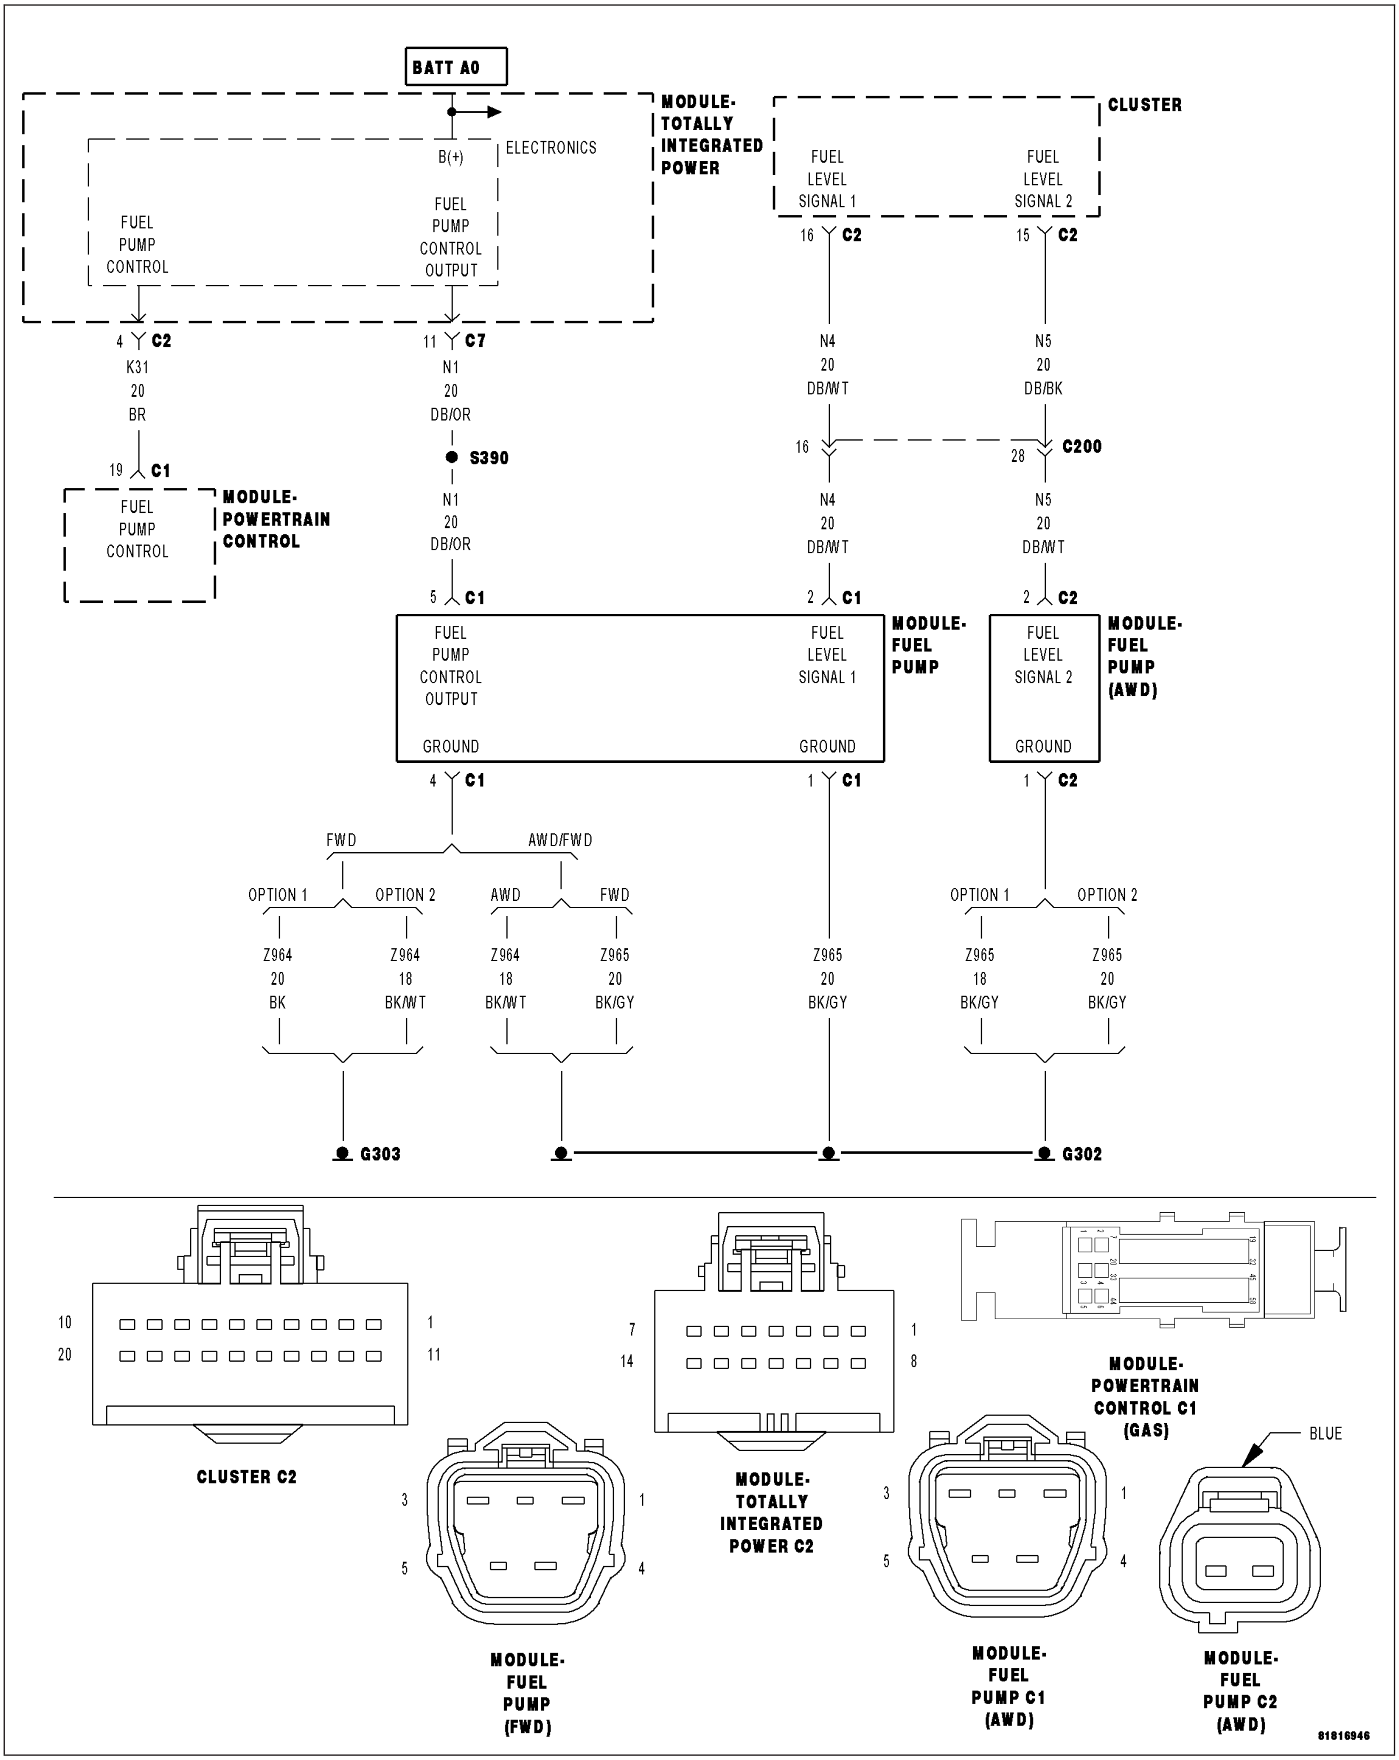
No >> Repair the high resistance in the (T750) Starter Control Output circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

5. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.



Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P127C-FUEL PUMP CONTROL CIRCUIT 2 LOW (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts and the Main Relay on. TIPM requesting Fuel Pump operation.
- **Set Condition:**
  Actual Fuel Pump state is not equal to desired state. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(N1) FUEL PUMP CONTROL OUTPUT CIRCUIT SHORTED TO GROUND
FUEL PUMP
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If P0627, P0628 or P0629 has set along with this DTC, diagnose those DTC(s) first before continuing.

Ignition on, engine not running.

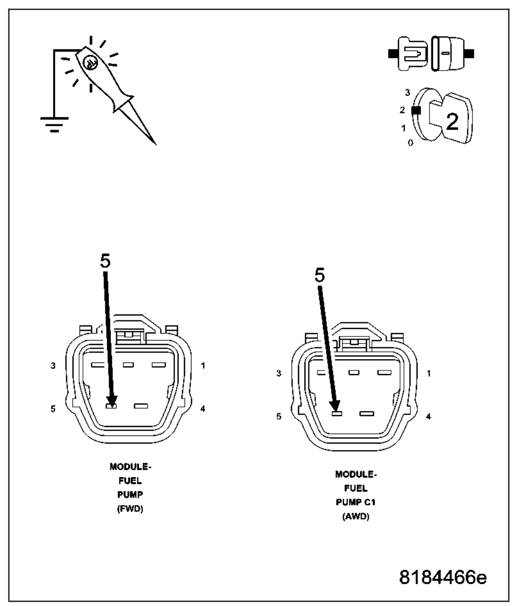
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL PUMP MODULE



Turn the ignition off.

Disconnect the Fuel Pump Module harness connector.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate the Fuel Pump.

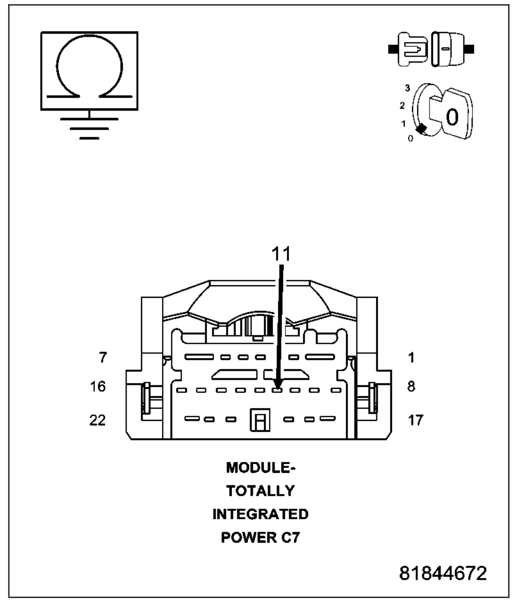
With a 12-volt test light connected to ground, probe the (N1) Fuel Pump Control Output circuit at the Fuel Pump Module harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly and flash on and off?

Yes >> Replace the Fuel Pump Module in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



No >> Go To 3

3. (N1) FUEL PUMP CONTROL OUTPUT CIRCUIT SHORTED TO GROUND

Turn the ignition off

Disconnect the TIPM C7 harness connector.

Measure the resistance between ground and the (N1) Fuel Pump Control Output circuit at the TIPM C7 harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (N1) Fuel Pump Control Output circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 4

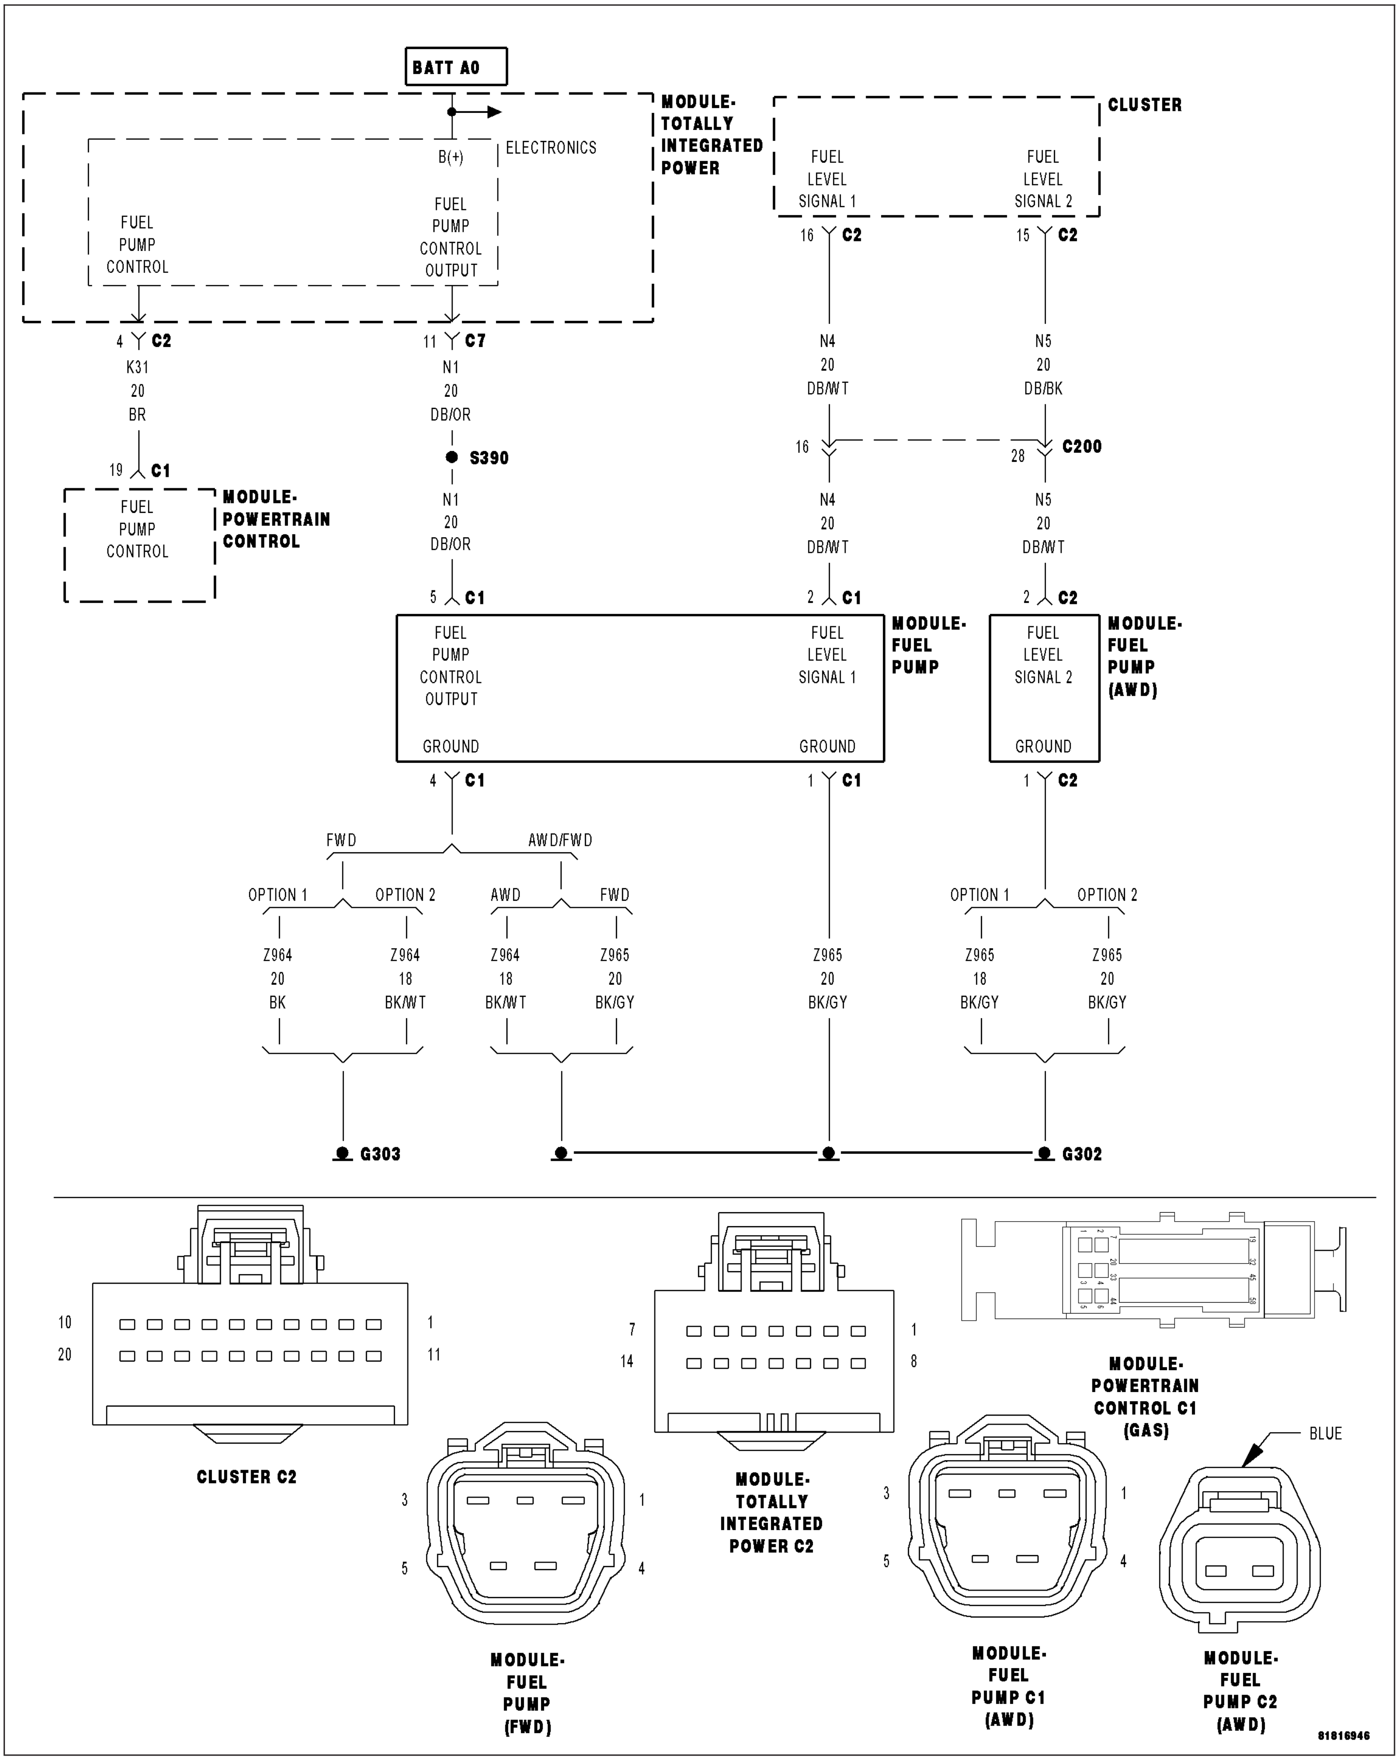
4. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P127D-FUEL PUMP CONTROL CIRCUIT 2 HIGH (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts and the Main Relay on. TIPM requesting Fuel Pump operation.
- **Set Condition:**
  Actual Fuel Pump state is not equal to desired state. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(N1) FUEL PUMP CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE
FUEL PUMP MOTOR GROUND CIRCUIT
FUEL PUMP MOTOR
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

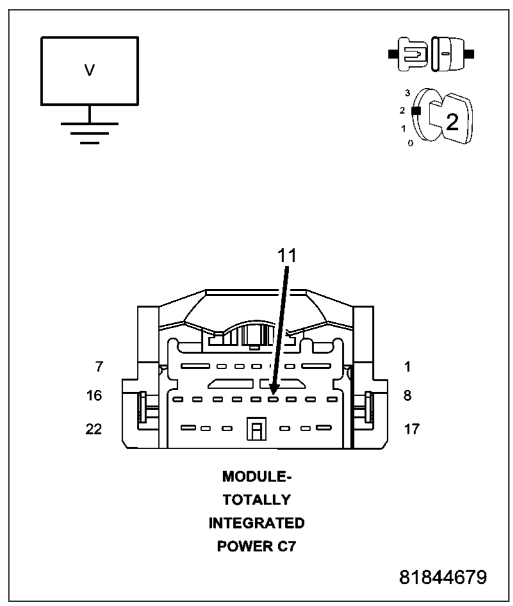
NOTE: If P0627, P0628 or P0629 has set along with this DTC, diagnose those DTC(s) first before continuing.
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



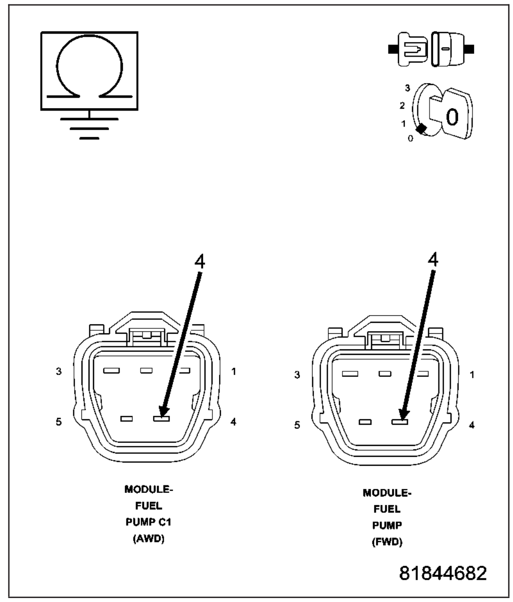
2. (N1) FUEL PUMP CONTROL OUTPUT CIRCUIT SHORTED TO BATTERY VOLTAGE

Turn the ignition off

Disconnect the C7 TIPM harness connector.

Turn the ignition on.

Using a voltmeter, measure the voltage of the (N1) Fuel Pump Control Output circuit in the C7 TIPM harness connector.



Does the voltmeter indicate voltage present?

Yes >> Repair the short to battery voltage in the (N1) Fuel Pump Control Output circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 3

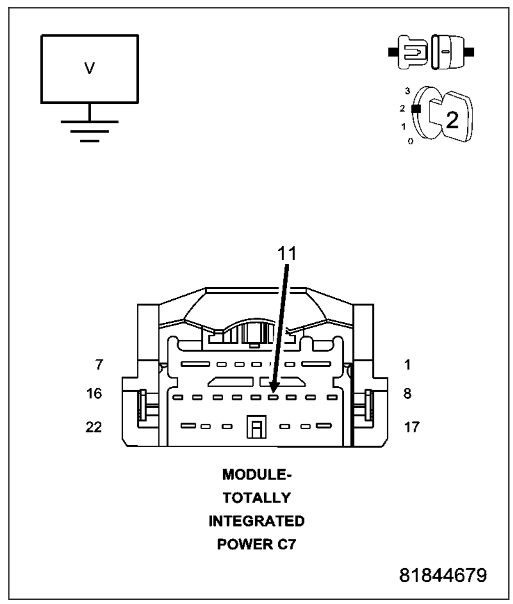
3. FUEL PUMP MOTOR GROUND CIRCUIT

Turn the ignition off.

Disconnect the Fuel Pump Module harness connector.

Using a 12-volt test light to battery voltage, probe the Fuel Pump Motor Ground circuit in the Fuel Pump Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly.

Yes >> Go To 4

No >> Repair the Fuel Pump Motor Ground circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

4. FUEL PUMP MODULE

Connect the C7 TIPM harness connectors.

Ignition on, engine not running.

Using the scan tool under the TIPM Actuators, actuate (Toggle) the Fuel Pump.

With a 12-volt test light connected to ground, probe the (N1) Fuel Pump Control Output circuit at the Fuel Pump Module harness connector.

Does the test light illuminate brightly and flash on and off?

Yes >> Replace the Fuel Pump Module in accordance with the Service Information.

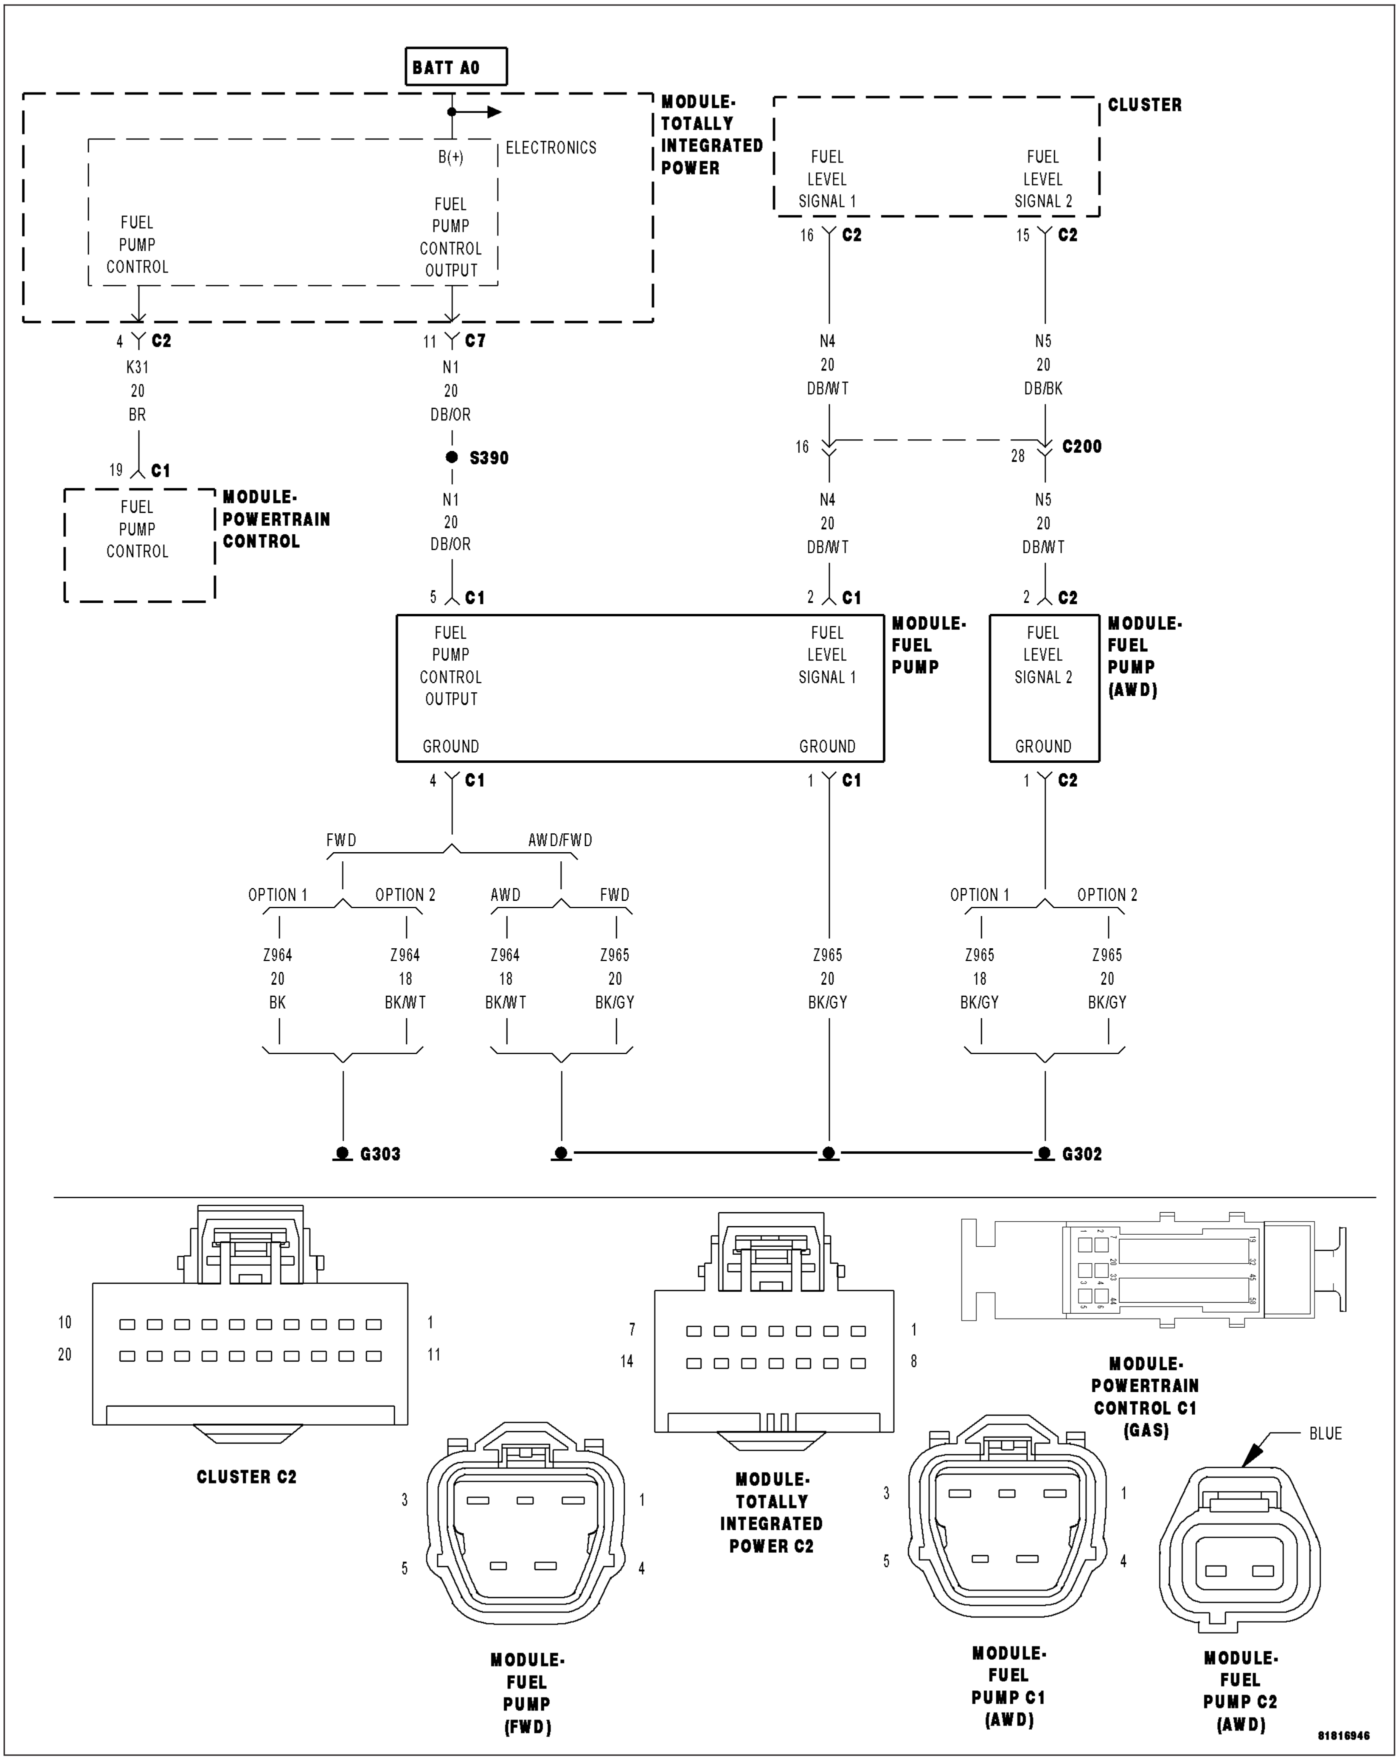
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 5

5. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.



Pay particular attention to all Power and Ground circuits.

Were any problems found?

Yes >> Repair as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P127E-FUEL PUMP CONTROL CIRCUIT 2 OPEN (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts and the Main relay is on. TIPM requesting Fuel Pump operation.
- **Set Condition:**
  Actual Fuel Pump state is not equal to desired state. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
(N1) FUEL PUMP CONTROL OUTPUT CIRCUIT OPEN
FUEL PUMP
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If P0627, P0628 or P0629 has set along with this DTC, diagnose those DTC(s) first before continuing.

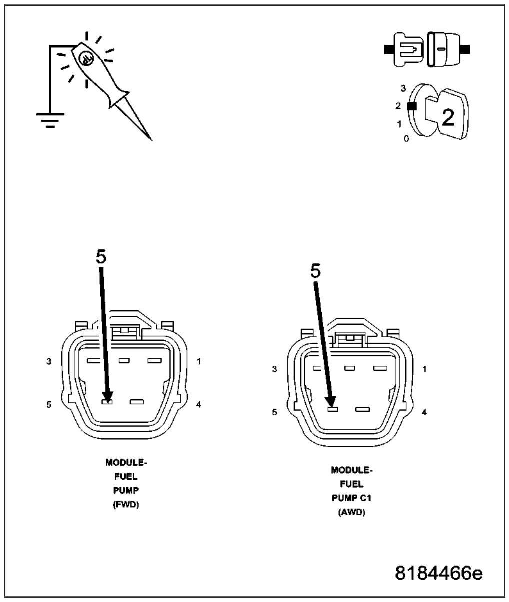
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. FUEL PUMP MODULE

Disconnect the Fuel Pump Module harness connector.

Ignition on, engine not running.

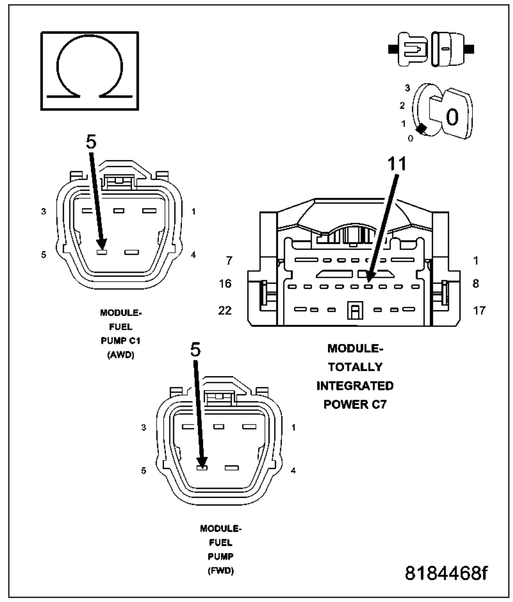
Using the scan tool under the TIPM Actuators, actuate the Fuel Pump.

With a 12-volt test light connected to ground, probe the (N1) Fuel Pump Control Output circuit at the Fuel Pump Module harness connector.

Does the test light illuminate brightly and flash on and off?

Yes >> Replace the Fuel Pump Module in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



No >> Go To 3

3. (N1) FUEL PUMP CONTROL OUTPUT CIRCUIT OPEN

Turn the ignition off

Disconnect the TIPM C7 harness connector.

Measure the resistance of the (N1) Fuel Pump Control Output circuit between the TIPM C7 harness connector and the Fuel Pump Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go To 4

No >> Repair the short to ground in the (N1) Fuel Pump Control Output circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

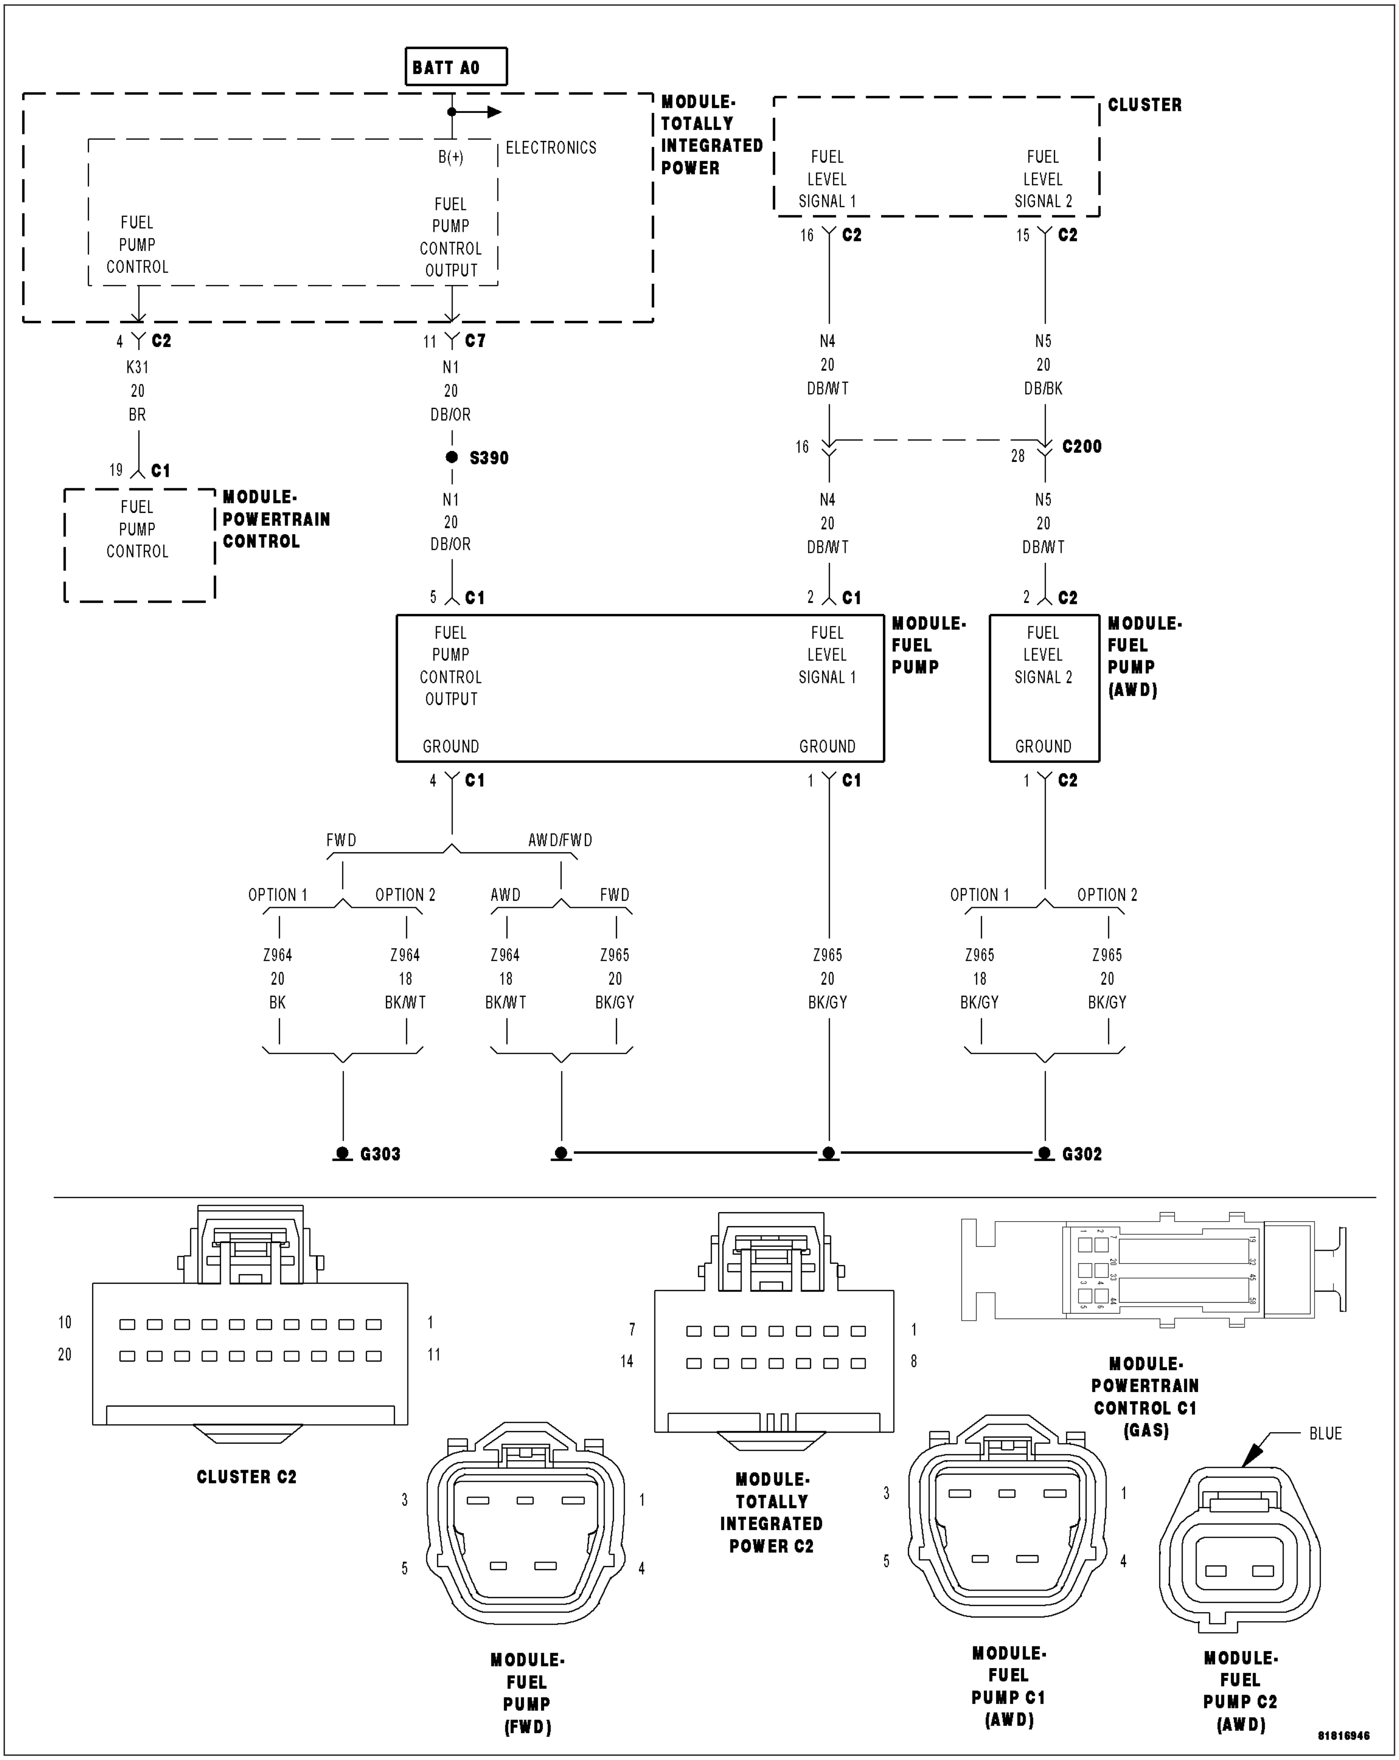
4. TOTALLY INTEGRATED POWER MODULE

NOTE: Before continuing, check the TIPM harness connector terminals for corrosion, damage, or terminal push out. Repair as necessary.

Using the schematics as a guide, inspect the wire harness and connectors.

Pay particular attention to all Power and Ground circuits.

Were any problems found?



Yes >> Repair as necessary.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P127F-FUEL PUMP CONTROL CIRCUIT 2 OVERCURRENT (TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10.4 volts. TIPM requesting fuel pump operation.
- **Set Condition:**
  An overcurrent condition is detected in the Fuel Pump control output circuit. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
TERMINAL DAMAGE OR CORROSION
(Z904) FUEL PUMP GROUND HIGH RESISTANCE
(N1) FUEL PUMP CONTROL OUTPUT CIRCUIT HIGH RESISTANCE
FUEL PUMP
TIPM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If P0627, P0628 or P0629 has set along with this DTC, diagnose those DTC(s) first before continuing.
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

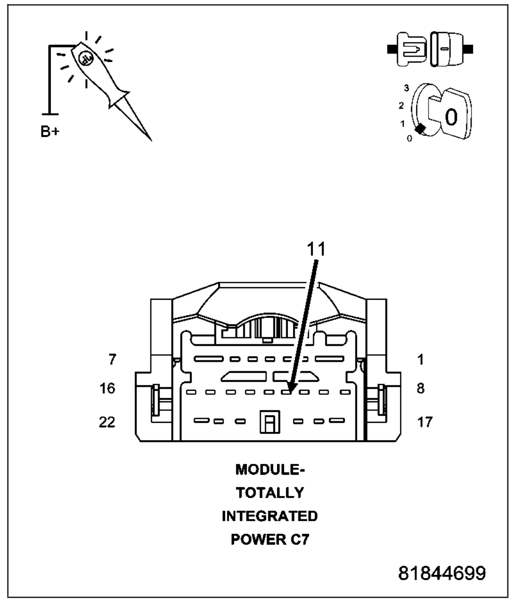
2. VISUAL AND PHYSICAL CONNECTOR AND TERMINAL INSPECTION

Turn the ignition off.

Disconnect the TIPM C7 harness connector.

Disconnect the Fuel Pump harness connector.

Inspect the terminal and connector condition. Check for signs of corrosion build up or damage the would compromise the terminal to controller pin connector.



NOTE: Make sure that all in-line connectors are inspected for corrosion and/or damage.
Visually inspect the wiring harness. Look for any chafed, pierced, pinched or partially broken wires hidden in the wire insulation.

Were any of the above conditions found?

Yes >> Repair or replace as necessary.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

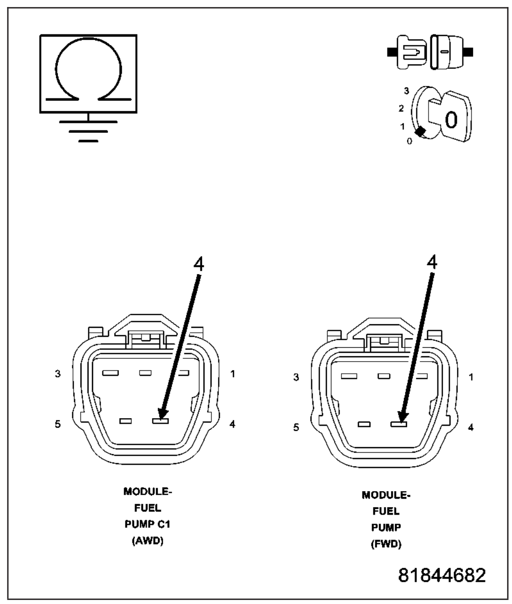
No >> Go To 3

3. (N1) FUEL PUMP CONTROL OUTPUT CIRCUIT HIGH RESISTANCE

With a jumper wire, connect one end to the (N1) Fuel Pump Control Output circuit in the Fuel Pump harness connector and the other to a clean chassis ground.

Using a 12-volt test light to battery voltage, probe the (N1) Fuel Pump Control Output circuit in the TIPM C7 harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly.

Yes >> Go To 4

No >> Repair the high resistance in the (N1) Fuel Pump Control Output circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE).

4. FUEL PUMP GROUND CIRCUIT

Using a 12-volt test light to battery voltage, probe the Fuel Pump Ground circuit in the Fuel Pump harness connector.

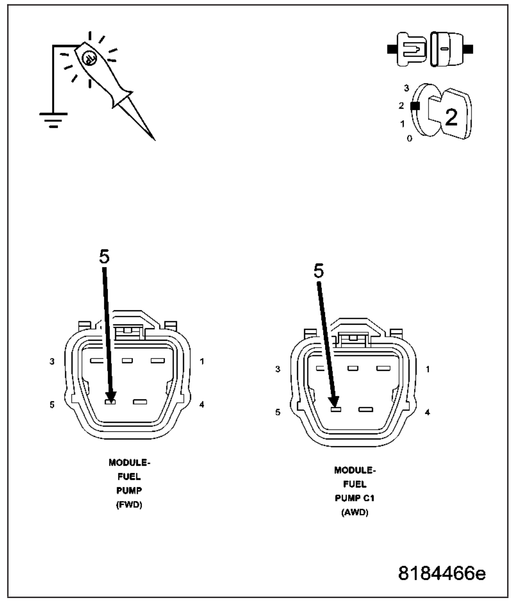
NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly.

Yes >> Go To 5

No >> Repair the excessive resistance in the (Z904) Fuel Pump Ground circuit.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)



5. FUEL PUMP CONTROL OUTPUT FROM TIPM

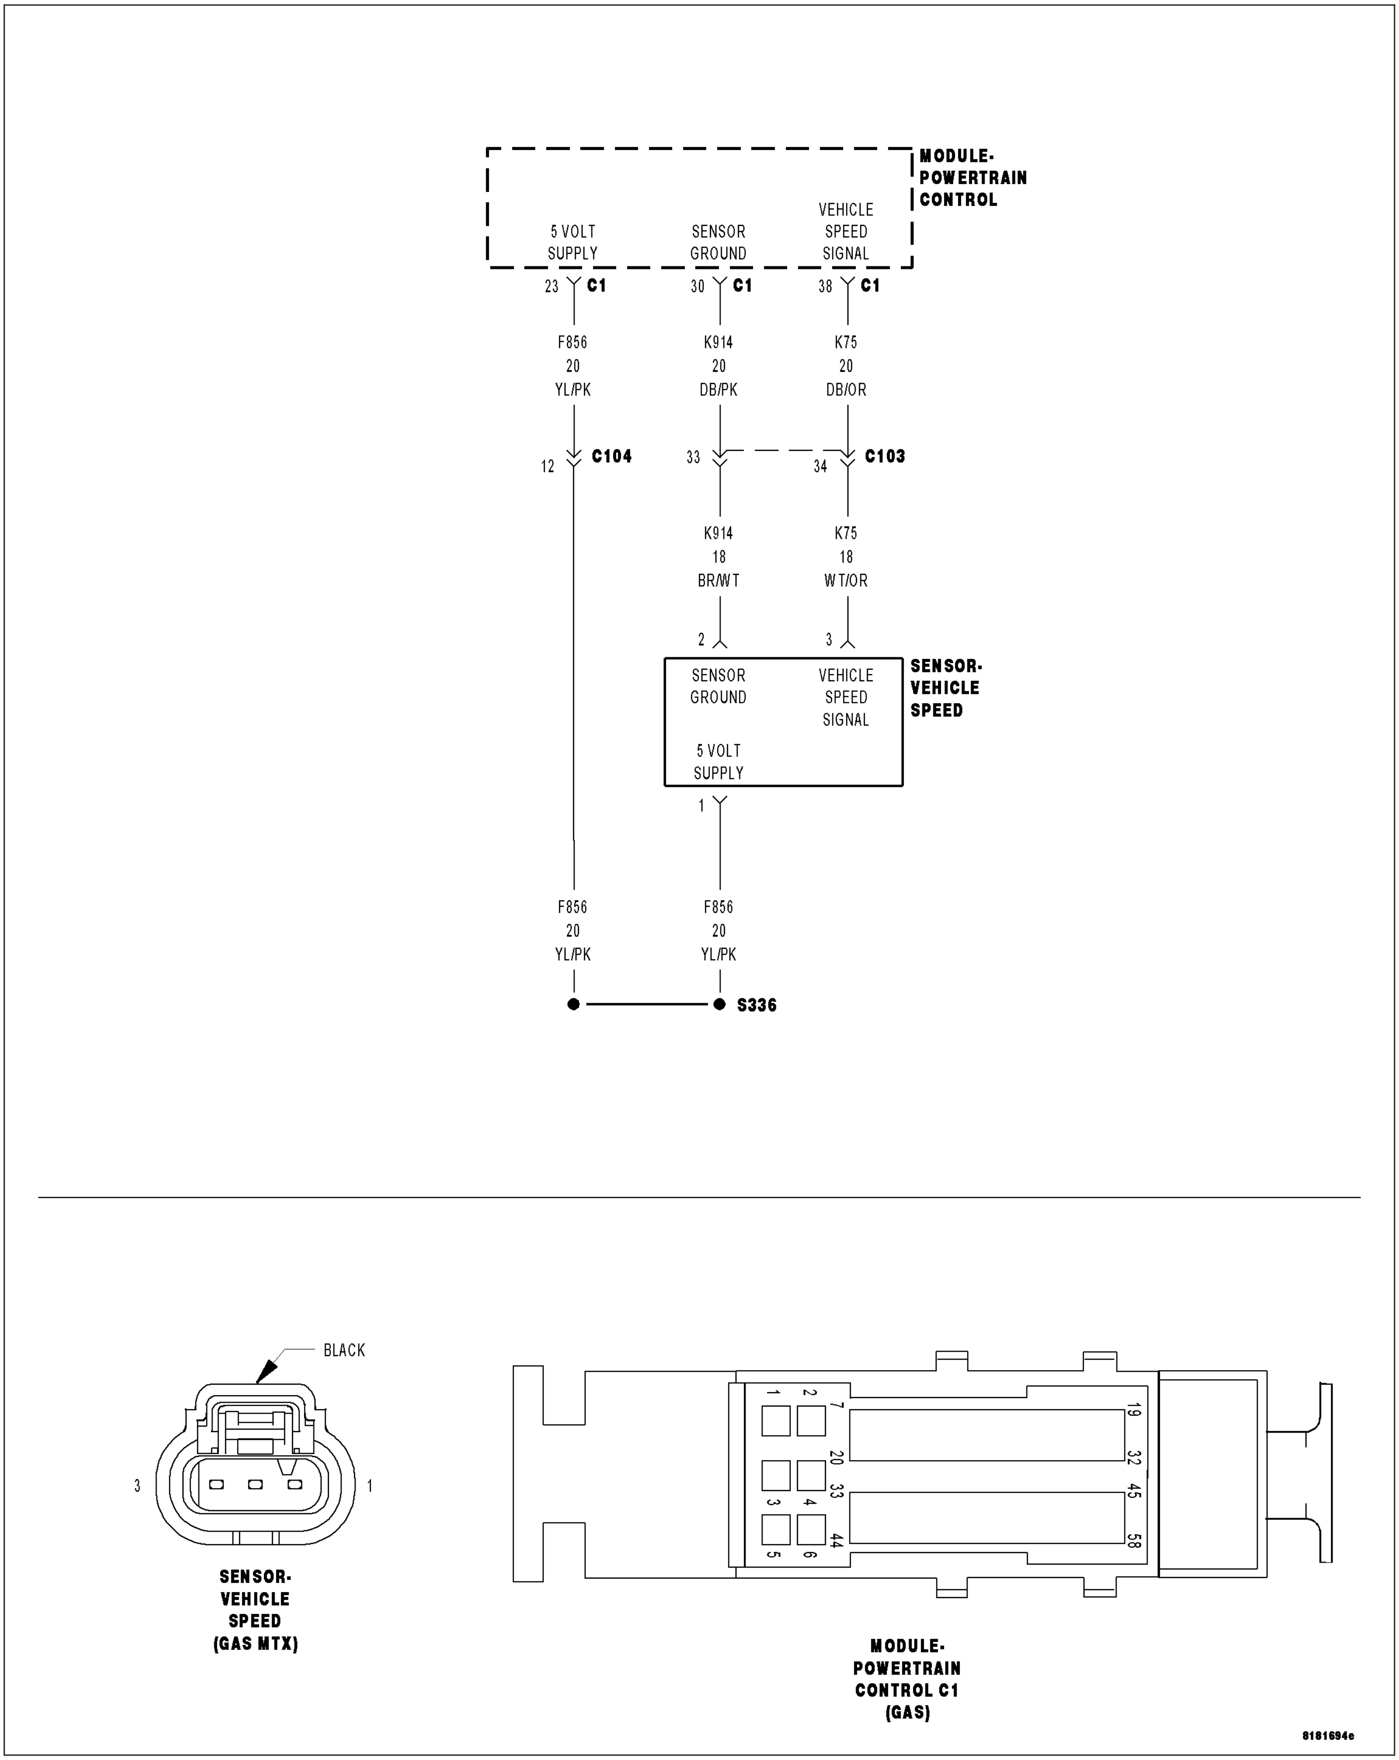
Reconnect the TIPM C7 harness connector.

Ignition on, engine not running.

With a scan tool in the TIPM Actuators, actuate the Fuel Pump.

Using the 12-volt test light connected to ground, probe the (N1) Fuel Pump Control Output circuit in the Fuel Pump harness connector.

Does the test light illuminate brightly?



Yes >> Replace the Fuel Pump.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Replace the TIPM in accordance with the Service Information.

Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P1501-VEHICLE SPEED SENSOR 1/2 CORRELATION — DRIVE WHEELS

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects an implausible voltage on the Vehicle Speed Sensor circuit.

Possible Causes
INTERMITTENT DTC
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
VEHICLE SPEED SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start the engine.

Allow the engine to reach normal operating temperature.

NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active Vehicle Speed Sensor DTCs in the Totally Integrated Power Module. Any bus, communication, or VSS DTCs in the TIPM must be properly diagnosed before continuing.

NOTE: This code may set after a hard acceleration on loose gravel, during other off road driving conditions, or by any condition that causes a wheel speed difference between the front and rear wheels.

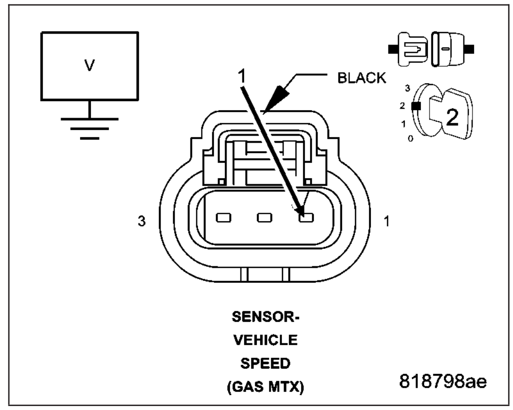
NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



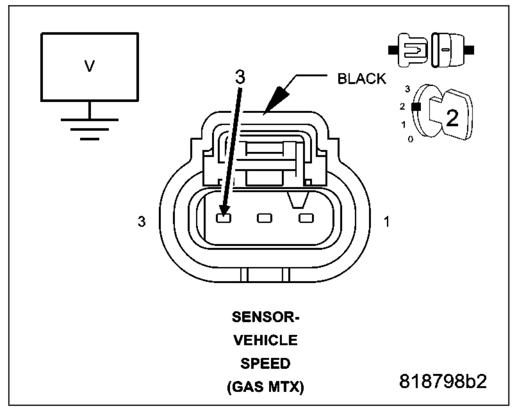
2. (F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Vehicle Speed Sensor connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.



Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 3

No >> Go to 7

3. (K75) VEHICLE SPEED SIGNAL CIRCUIT VOLTAGE

Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 4

No >> Go to 11

4. (K914) SENSOR GROUND CIRCUIT TEST

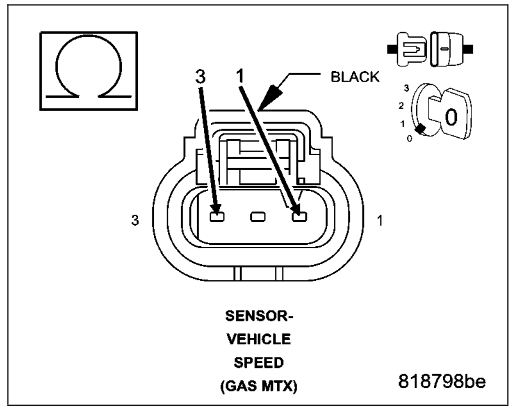
Turn the ignition off.

Using a 12 volt test light connected to 12 volts, check the (K914) Sensor Ground in the Vehicle Speed Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 5



No >> Go to 15

5. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K75) VEHICLE SPEED SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K75) Vehicle Speed Signal circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. VEHICLE SPEED SENSOR

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

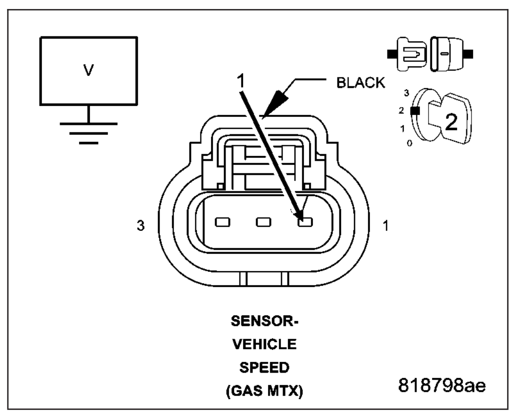
Look for broken, bent, pushed out or corroded terminals.

Inspect the Vehicle Speed Sensor for any condition that would result in an incorrect signal, such as damage, corrosion, or contamination.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Vehicle Speed Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

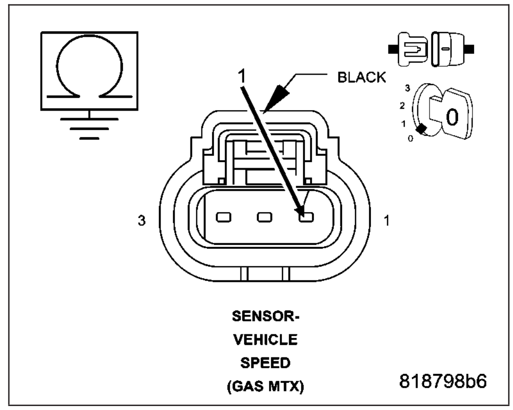
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

Is there any voltage present?



Yes >> Repair the (F856) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

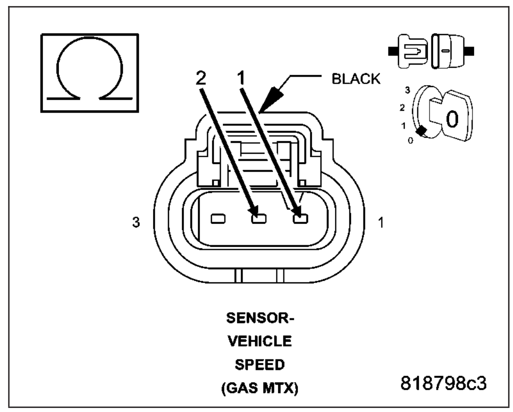
No >> Go to 8

8. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Vehicle Speed Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 9

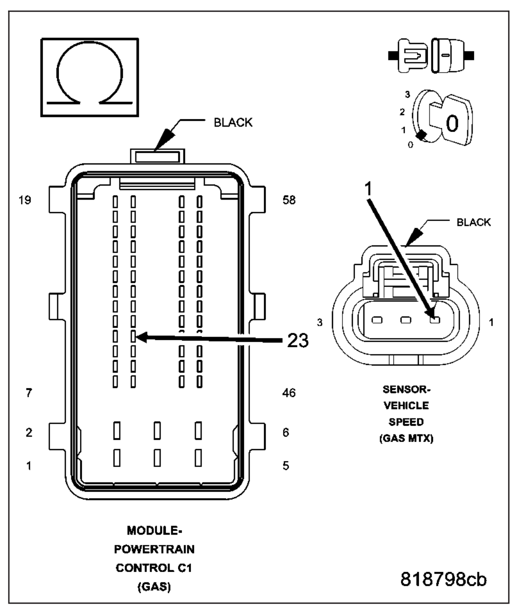
No >> Repair the (F856) 5 Volt Supply circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K914) SENSOR GROUND CIRCUIT

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 10

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K914) Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

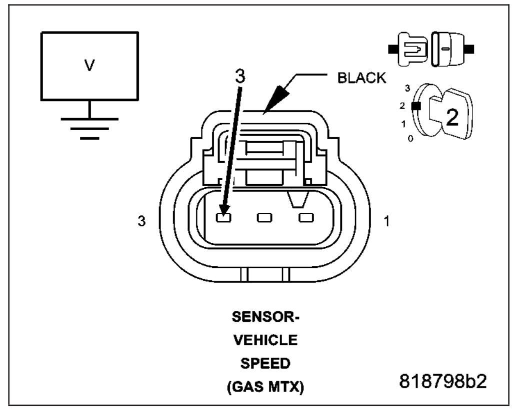
Measure the resistance of the (F856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



11. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO VOLTAGE

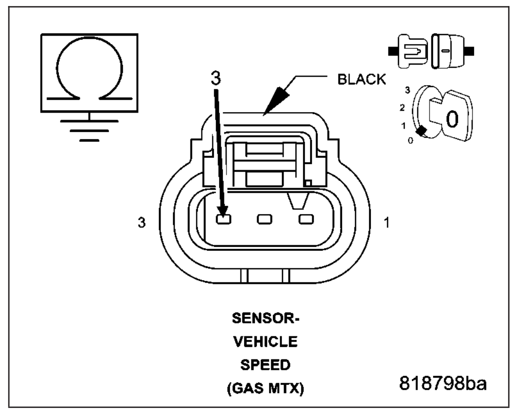
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.

Is there any voltage present?



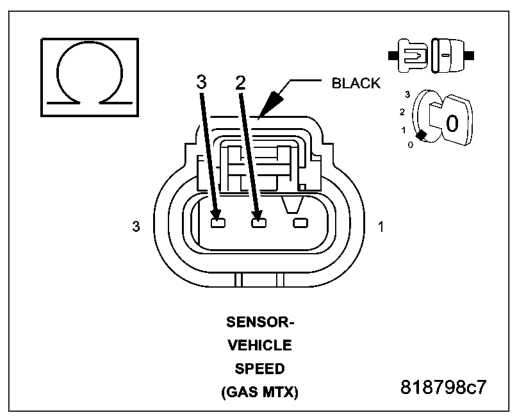
Yes >> Repair the (K75) Vehicle Speed Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 12

12. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K75) Vehicle Speed Signal circuit in the Vehicle Speed Sensor harness connector.



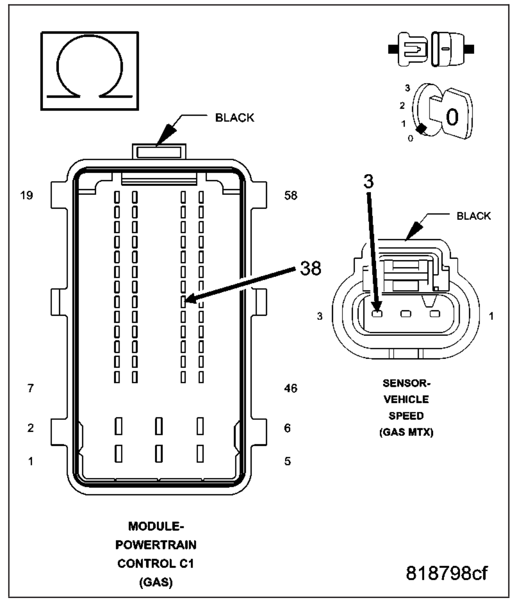
Is the resistance above 100 ohms?

Yes >> Go to 13

No >> Repair the (K75) Vehicle Speed Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. (K75) VEHICLE SPEED SIGNAL CIRCUIT SHORTED TO (K914) SENSOR GROUND CIRCUIT

Measure the resistance between the (K75) Vehicle Speed Signal circuit and the (K914) Sensor Ground circuit in the Vehicle Speed Sensor harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 14

No >> Repair the (K75) Vehicle Speed Signal circuit for a short to the (K914) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

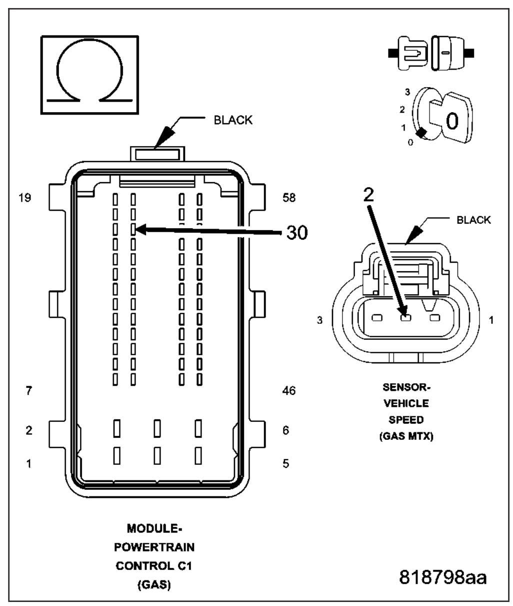
14. (K75) VEHICLE SPEED SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K75) Vehicle Speed Signal circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (K75) Vehicle Speed Signal circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

15. (K914) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance of the (K914) Sensor Ground circuit between the Vehicle Speed Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

16. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Vehicle Speed Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1502-VEHICLE SPEED SENSOR 1/2 CORRELATION — NON-DRIVE WHEELS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running, transmission not neutral, brakes not applied, and engine RPM greater than 1500.
- **Set Condition:**
  This code will set if the PCM receives an implausible vehicle speed signal from the TIPM Module.

Possible Causes
ACTIVE BUS OR COMMUNICATION DTCS
DIFFERENCE IN TIRE CIRCUMFERENCE
WHEEL SPEED SENSOR, WIRING, CONNECTORS, OR HARDWARE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

NOTE: Check for any Bus Communication DTCs. If no Bus or Communication DTCs are set, check for active Vehicle Speed Sensor DTCs in the Totally Integrated Power Module. Any bus, communication, or VSS DTCs in the TIPM must be properly diagnosed before continuing.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VISUAL INSPECTION

NOTE: This code may set after a hard acceleration on loose gravel, during other off road driving conditions, or by any condition that causes a wheel speed difference between the front and rear wheels.

Perform a thorough inspection of the rear Wheel Speed Sensor, wiring, connector, attaching hardware, and tone wheel.

Check tire pressure of all the tires.

Check tire wear on all the tires.

Ask the customer what the road and driving conditions were like when the fault set.

Were any problems found?

Yes >> Repair as necessary. If the code set during a front OR rear wheel spin condition, no repair may be necessary. Perform a thorough road test to verify proper operation.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors related to this circuit.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1513-STARTER REQUEST SWITCH STUCK

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects voltage on the (F963) Start Enable circuit for a specified time after the engine is running.

Possible Causes
INTERMITTENT DTC
(F963) START ENABLE CIRCUIT SHORTED TO VOLTAGE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: This DTC can set by holding the ignition switch in the start position after the engine starts.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F963) START ENABLE CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (F963) Start Enable circuit in the Powertrain Control Module (PCM) harness connector.

Is there any voltage present?

Yes >> Repair the (F963) Start Enable circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. POWERTRAIN CONTROL MODULE (PCM)

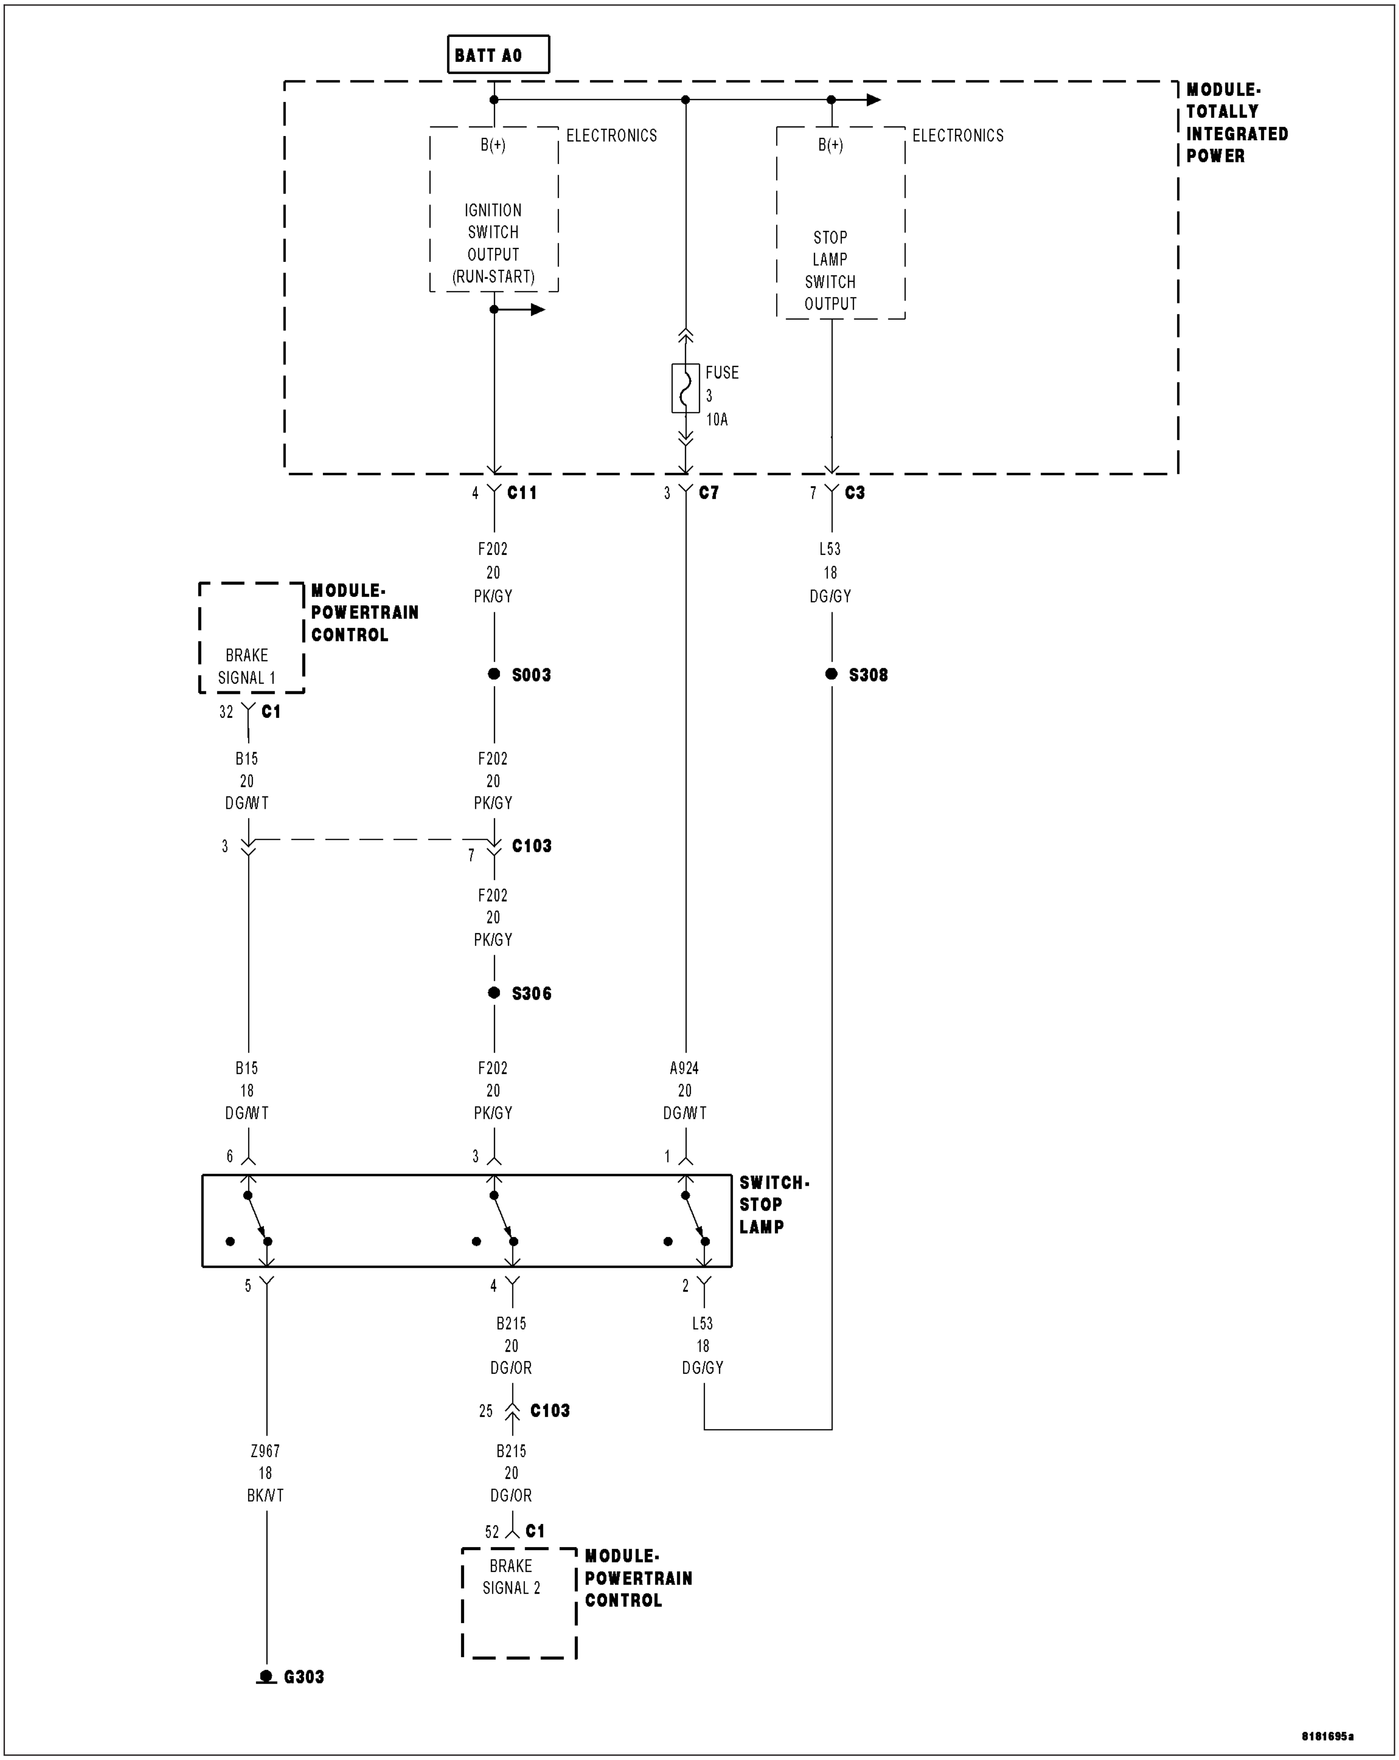
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the ignition switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1572-BRAKE PEDAL STUCK ON

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the state of brake switch does not change as expected.

Possible Causes
INTERMITTENT DTC
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

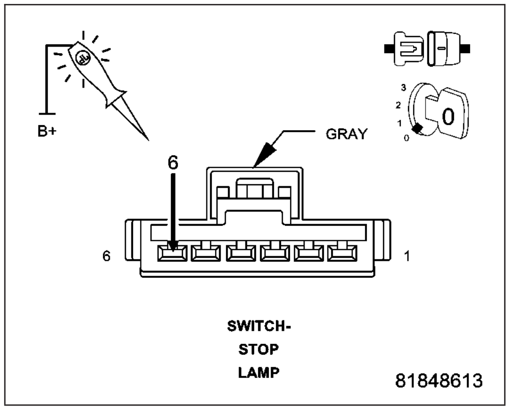
1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 2

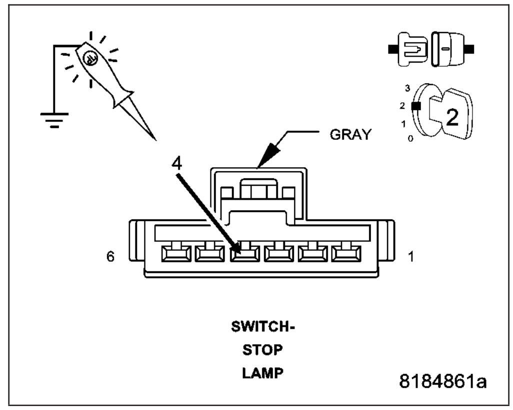
2. (B15) BRAKE SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?



Yes >> Go to 3.

No >> Go to 4

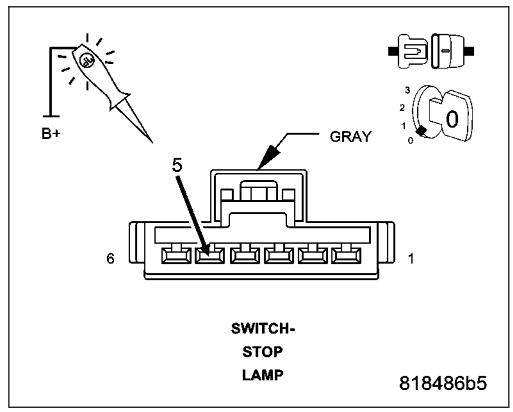
3. (B16) BRAKE SIGNAL 2 CIRCUIT

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

Yes >> Go to 11



No >> Go to 7

4. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

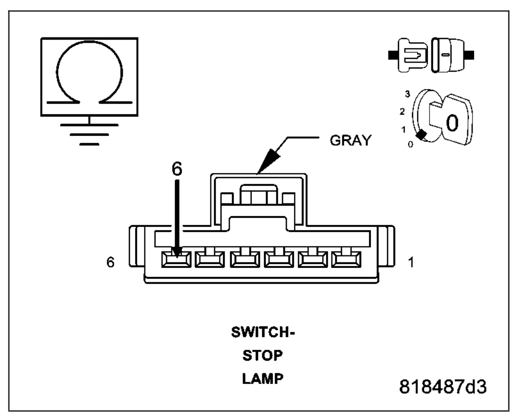
Turn the ignition off.

Disconnect the Stop Lamp Switch connector.

Using a 12 volt test light connected to 12 volts, check the (Z967) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 5

No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

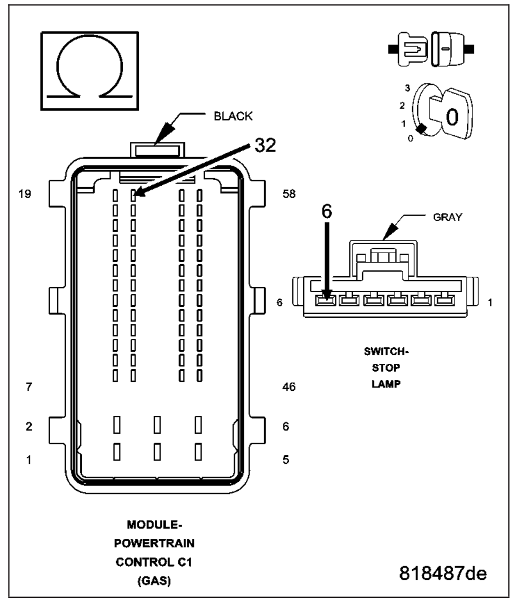
Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (B15) Brake Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B15) Brake Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

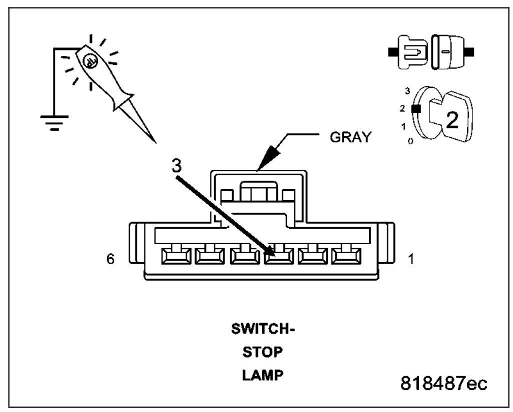
7. (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Stop Lamp Switch connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.



NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

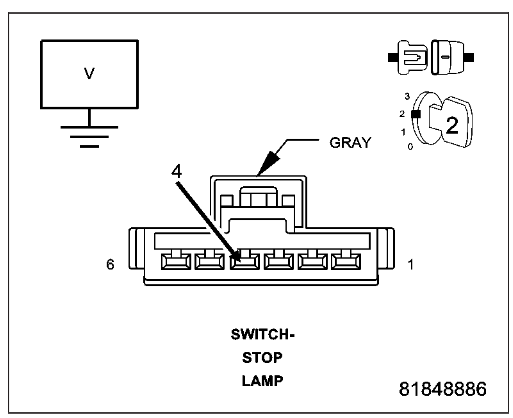
Is the test light illuminated and bright?

Yes >> Go to 8

No >> Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

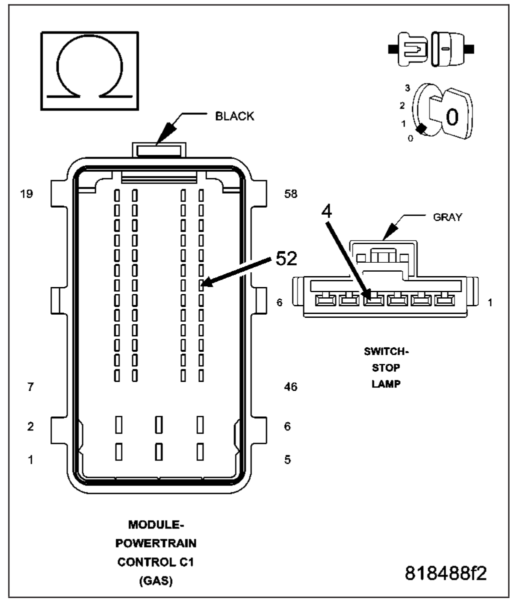
8. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE



Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is there any voltage present?

Yes >> Repair the (B16) Brake Signal 2 circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B16) Brake Signal 2 circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. STOP LAMP SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

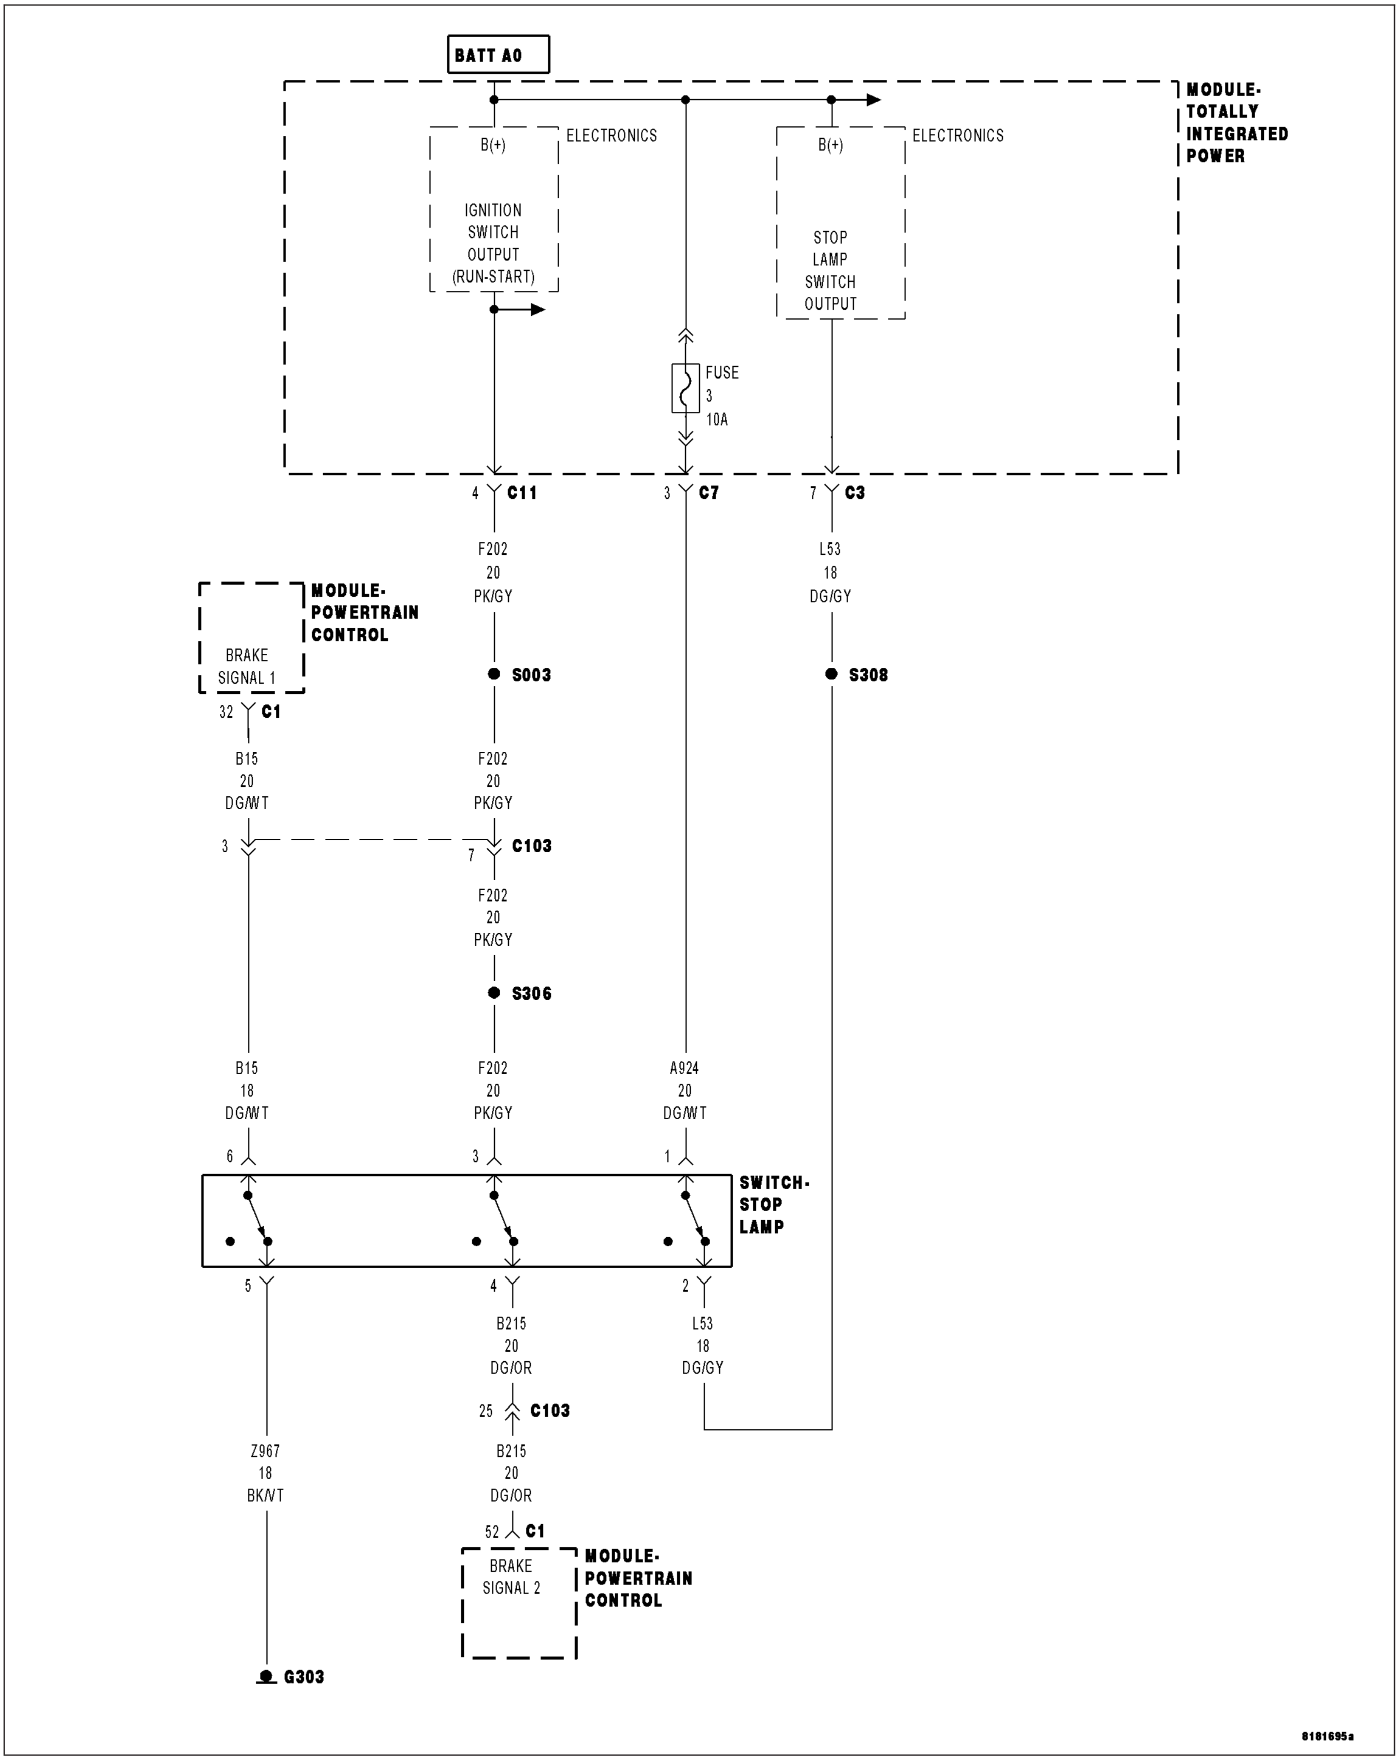
No >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1573-BRAKE PEDAL STUCK OFF

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the state of Brake Signal 2 does not change as expected.

Possible Causes
INTERMITTENT DTC
(B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND
(B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
STOP LAMP SWITCH
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

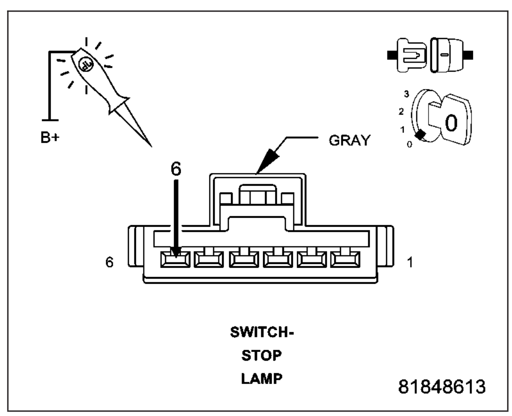
1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, monitor the states of Brake Signal 1 and Brake Signal 2 while pressing and releasing the brake pedal several times.

Do the states change from Pressed when the pedal is pressed to Not Pressed when the pedal is released?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 2

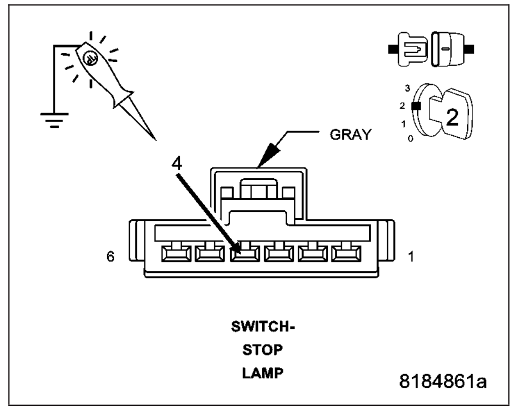
2. (B15) BRAKE SIGNAL 1 CIRCUIT

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (B15) Brake Signal 1 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?



Yes >> Go to 3.

No >> Go to 4

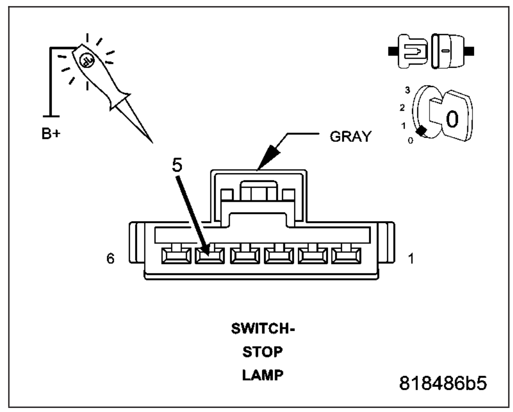
3. (B16) BRAKE SIGNAL 2 CIRCUIT

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (B16) Brake Signal 2 circuit in the Powertrain Control Module (PCM) harness connector while pressing and releasing the brake pedal several times.

Does the test light change from illuminated when the pedal is pressed to not illuminated when the pedal is released?

Yes >> Go to 11



No >> Go to 7

4. (Z967) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

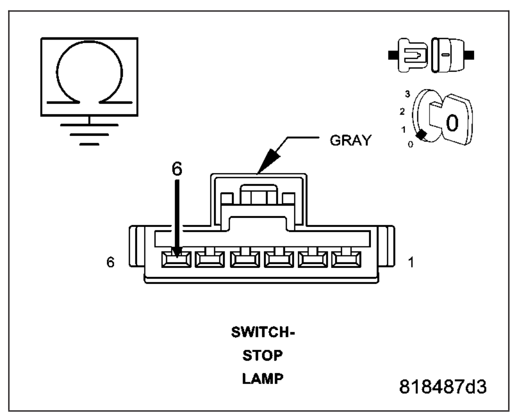
Turn the ignition off.

Disconnect the Stop Lamp Switch connector.

Using a 12 volt test light connected to 12 volts, check the (Z967) Ground circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 5

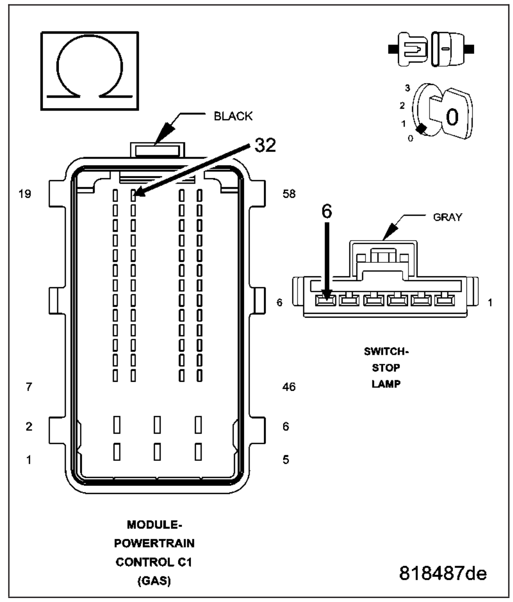
No >> Repair the (Z967) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (B15) BRAKE SIGNAL 1 CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (B15) Brake Signal 1 circuit in the Stop Lamp Switch harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 6

No >> Repair the (B15) Brake Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (B15) BRAKE SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

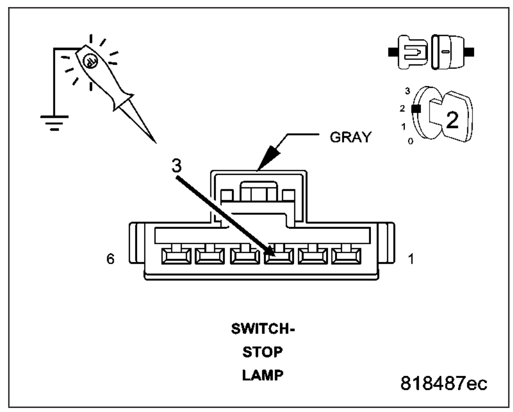
Measure the resistance of the (B15) Brake Signal 1 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B15) Brake Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



7. (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

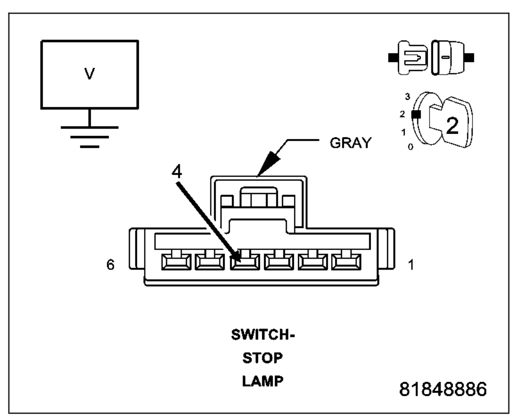
Disconnect the Stop Lamp Switch connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit in the Stop Lamp Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?



Yes >> Go to 8

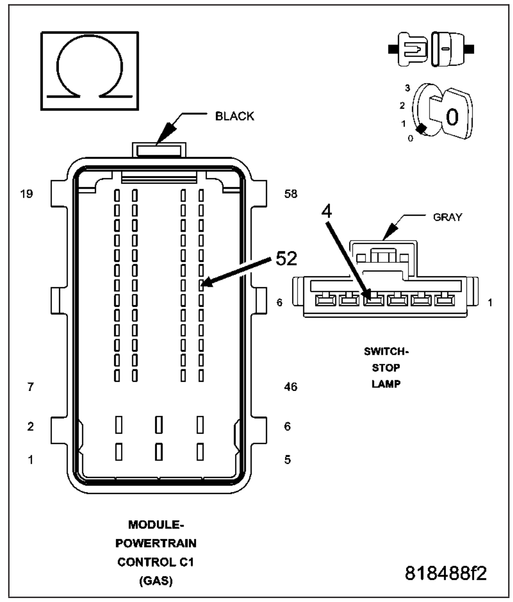
No >> Repair the (F202) Fused Ignition Switch Output (Run-Start) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (B16) BRAKE SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (B16) Brake Signal 2 circuit in the Stop Lamp Switch harness connector.

Is there any voltage present?



Yes >> Repair the (B16) Brake Signal 2 circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (B16) BRAKE SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (B16) Brake Signal 2 circuit between the Stop Lamp Switch harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (B16) Brake Signal 2 circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. STOP LAMP SWITCH

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Stop Lamp Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Stop Lamp Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1593-SPEED CONTROL SWITCH 1/2 STUCK

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The ECM detects that the (V71) S/C Signal 1 voltage does not match the (V72) S/C Signal 2 voltage.

Possible Causes
INTERMITTENT DTC
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND
(V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT
(V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLOCKSPRING
SPEED CONTROL SWITCH
STEERING CONTROL MODULE (SCM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. SPEED CONTROL SWITCH

Turn the ignition off.

Remove the Speed Control Switch in accordance with the Service Information.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2 voltages.

NOTE: The voltages should be above 4.8 volts with the Speed Control Switch connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Speed Control Switch harness connector.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. CLOCKSPRING

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C5 harness connector.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2 voltages.

NOTE: The voltages should be above 4.8 volts with the Steering Control Module (SCM) C5 connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit at the Steering Control Module (SCM) C5 connector, not at the harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit at the Steering Control Module (SCM) C5 connector, not at the harness connector.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Clockspring in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. STEERING CONTROL MODULE (SCM)

Turn the ignition off.

Disconnect the Steering Control Module (SCM) C2 connector.

Turn the ignition on.

With a scan tool, read the (V71) S/C Signal 1 and (V72) S/C Signal 2 voltages.

NOTE: The voltages should be above 4.8 volts with the connector disconnected.

Connect a jumper wire between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

With a scan tool, read the (V71) S/C Signal 1 voltage.

NOTE: The (V71) S/C Signal 1 voltage should be below .2 volts with the jumper wire in place.

Connect a jumper wire between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

With a scan tool, read the (V72) S/C Signal 2 voltage.

NOTE: The (V72) S/C Signal 2 voltage should be below .2 volts with the jumper wire in place.

Are the Speed Control voltages displayed as described?

Yes >> Replace the Steering Control Module (SCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) C2 harness connector.

Is there any voltage present?

Yes >> Repair the (V71) S/C Signal 1 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) C2 harness connector.

Is there any voltage present?

Yes >> Repair the (V72) S/C Signal 2 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

7. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (V71) S/C Signal 1 circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 8

No >> Repair the (V71) S/C Signal 1 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (V72) S/C Signal 2 circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 9

No >> Repair the (V72) S/C Signal 2 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (V71) S/C SIGNAL 1 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V71) S/C Signal 1 circuit and the (V937) S/C Switch Ground circuit in the C2 Steering Control Module (SCM) harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 10

No >> Repair the (V71) S/C Signal 1 circuit for a short to the Steering Control Module (SCM) circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (V72) S/C SIGNAL 2 CIRCUIT SHORTED TO THE (V937) S/C SWITCH GROUND CIRCUIT

Measure the resistance between the (V72) S/C Signal 2 circuit and the (V937) S/C Switch Ground circuit in the Steering Control Module (SCM) C2 harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 11

No >> Repair the (V72) S/C Signal 2 circuit for a short to the (V937) S/C Switch Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. (V71) S/C SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V71) S/C Signal 1 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 12

No >> Repair the (V71) S/C Signal 1 circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

12. (V72) S/C SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V72) S/C Signal 2 circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 13

No >> Repair the (V72) S/C Signal 2 circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. (V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (V937) S/C Switch Ground circuit between the Steering Control Module (SCM) C2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 14

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

14. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1602–PCM NOT PROGRAMMED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and battery voltage greater than 10 volts.
- **Set Condition:**
  The PCM has not been programmed.

Possible Causes
PCM NOT PROGRAMMED
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. PCM NOT PROGRAMMED

Ignition on, engine not running.

Program the PCM in accordance with the Service Information.

Start the engine.

Allow the engine to reach normal operating temperature.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace and program the Powertrain Control Module per Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> The PCM has been successfully programmed. Test is complete.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1607-PCM INTERNAL SHUTDOWN TIMER SLOW RATIONALITY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage greater than 10 volts.
- **Set Condition:**
  An internal PCM failure has been detected. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
PENDING TEMPERATURE SENSOR DTCS
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(A931) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. PENDING TEMPERATURE SENSOR DTCS

Turn the ignition on.

NOTE: If any temperature sensor DTCs are present, allow the vehicle to cool completely before proceeding with this test.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Are there any pending Engine Coolant Temperature sensor, Ambient Air Temperature sensor, or general temperature DTCs?

Yes >> Diagnose and repair any temperature sensor DTCs and retest.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 2

2. PCM IGNITION CIRCUITS OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the PCM harness connector.

With a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit.

With a 12-volt test light connected to ground, check the (A931) Fused B+ circuit.

Check the circuits with the ignition switch in the OFF, ON, and START positions.

NOTE: The test light should be illuminated and bright with the ignition switch in the ON and START positions. Compare the brightness to that of a direct connection to the battery.

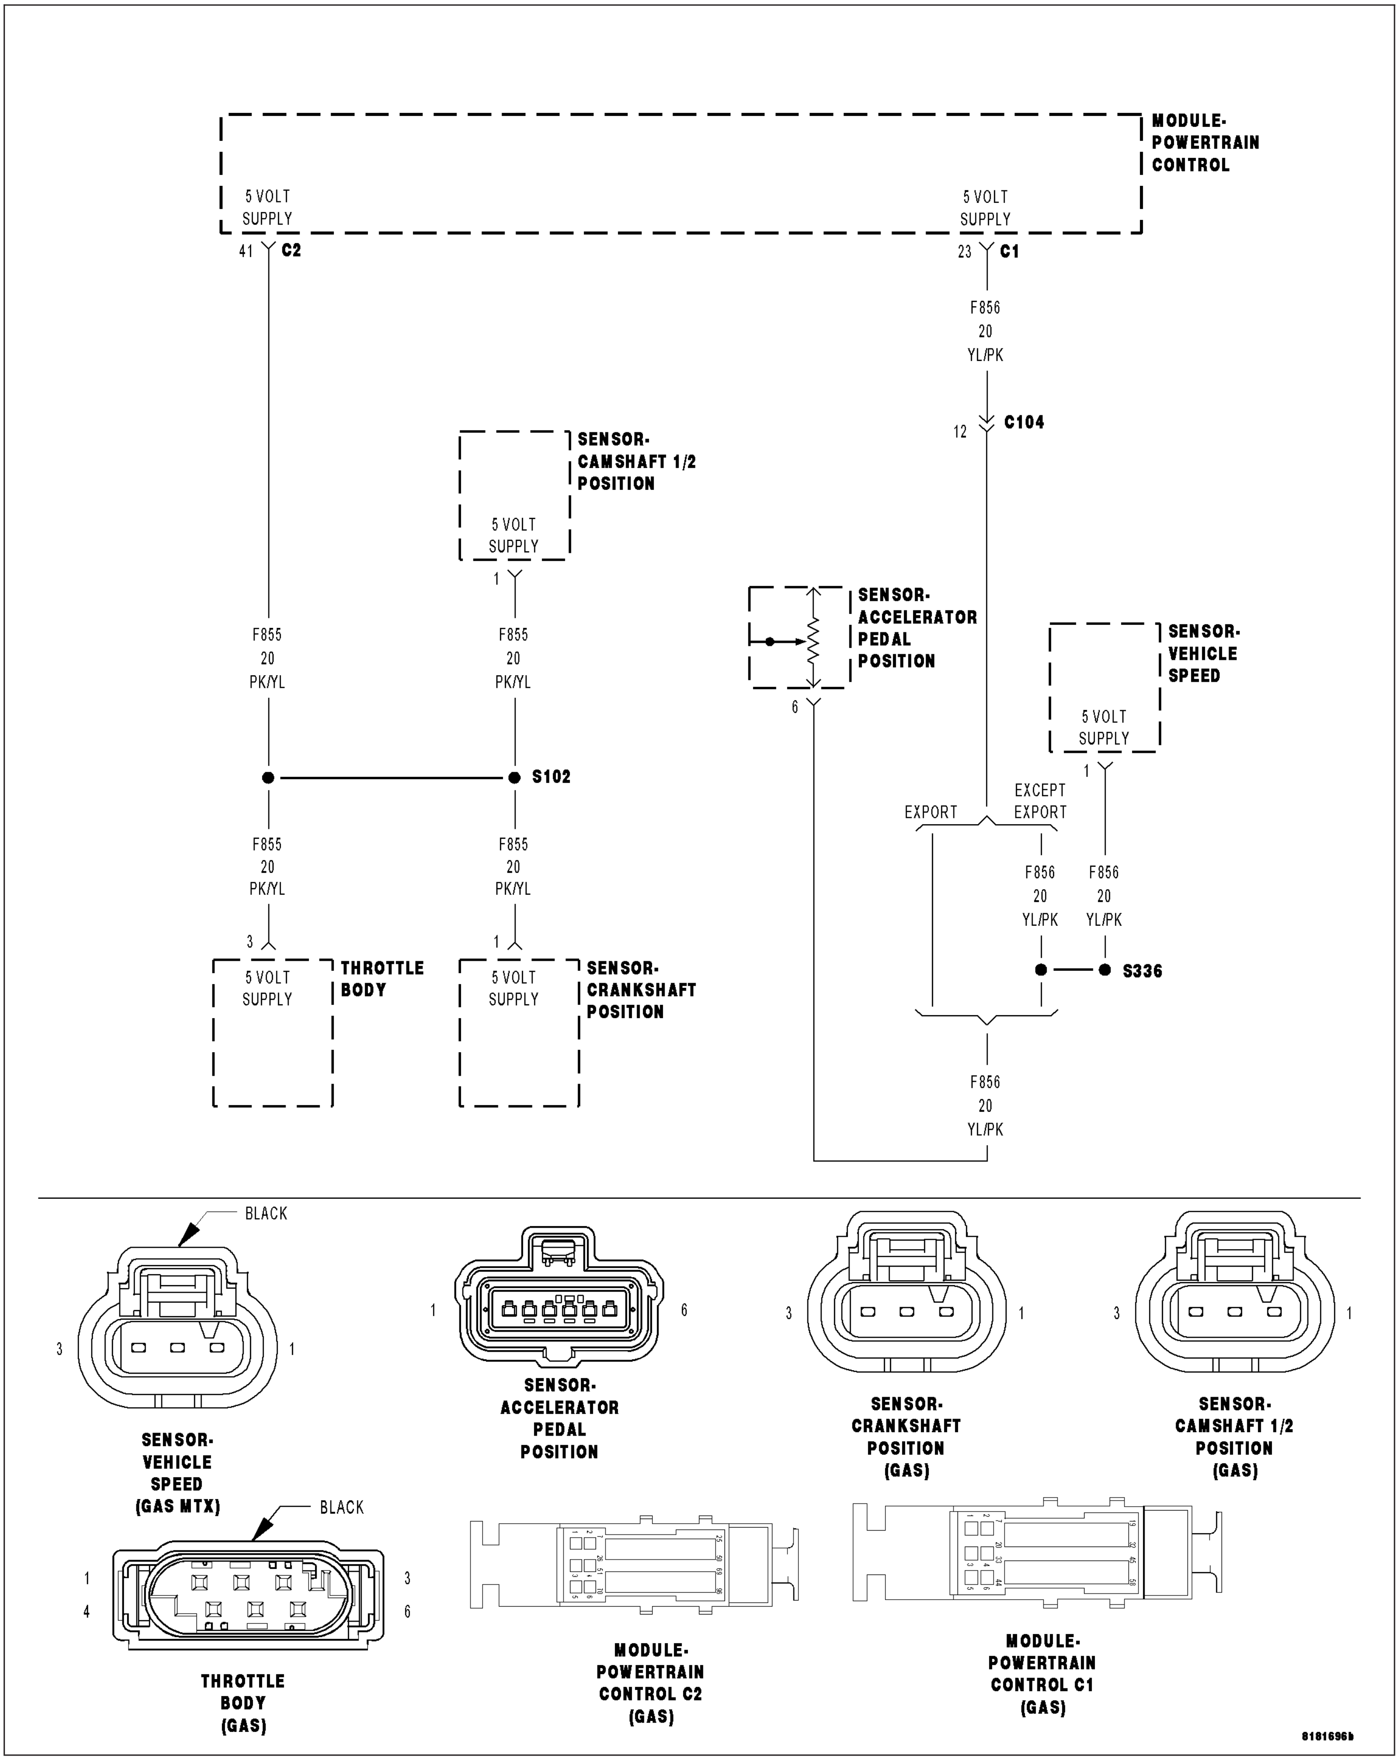
Wiggle test the circuits while checking with the test light to check the circuit for an intermittent problem.

Does the test light illuminate, or not illuminate, as expected in each of the ignition switch positions?

Yes >> Go to 3

No >> Repair the circuit(s) as necessary. If an open fuse is found, inspect the circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. POWERTRAIN CONTROL MODULE (PCM)



Using the wiring diagram/schematic as a guide, inspect Powertrain Control Module power and ground circuits.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Monitor the scan tool data and wiggle test the wiring and connectors.
Look for the any data to change or for the DTC to reset during the wiggle test.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1618-SENSOR REFERENCE VOLTAGE 1 CIRCUIT ERRATIC

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects an excessive voltage variation on the (F855) 5 volt supply circuit or the (F856) 5 volt supply circuit.

Possible Causes
INTERMITTENT DTC
5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 2 POSITION SENSOR
THROTTLE POSITION SENSOR
CRANKSHAFT POSITION SENSOR
VEHICLE SPEED SENSOR (MTX ONLY)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, clear DTCs.

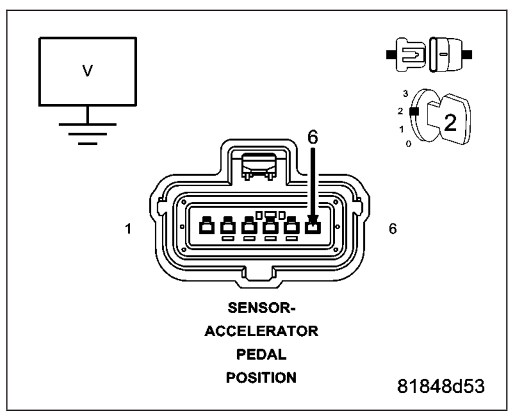
Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit.

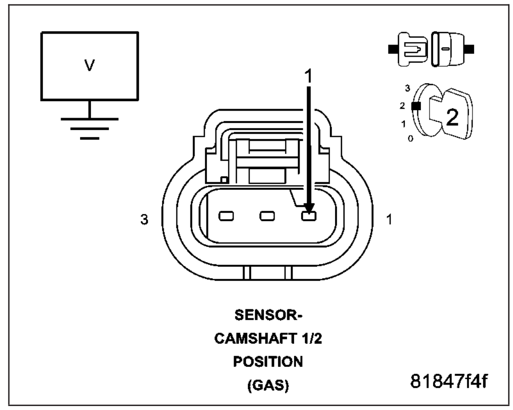
Select the appropriate response from the list below:

Voltage more than 5.2 volts
Repair the (F856) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Voltage between 4.8 and 5.2 volts
Go to 3

Voltage below 4.8 volts
Go to 4

3. ACCELERATOR PEDAL POSITION SENSOR



Turn the ignition off.

Connect the APP Sensor harness connector.

Disconnect the Camshaft 1/2 Position Sensor harness connector.

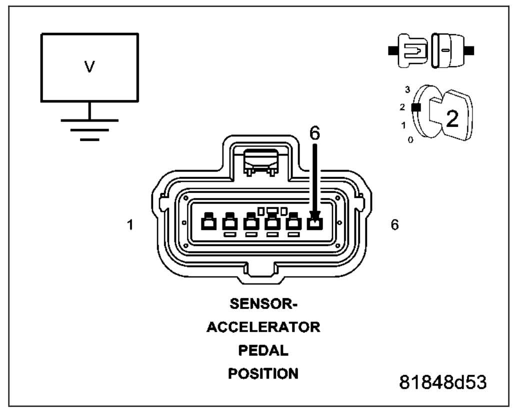
Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Camshaft 1/2 Position Sensor harness connector.

Is the voltage below 4.8 volts?

Yes >> Replace the Accelerator Pedal Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 11



4. CAMSHAFT 1/2 POSITION SENSOR

Turn the ignition off.

Disconnect the Camshaft 1/2 Position Sensor harness connector.

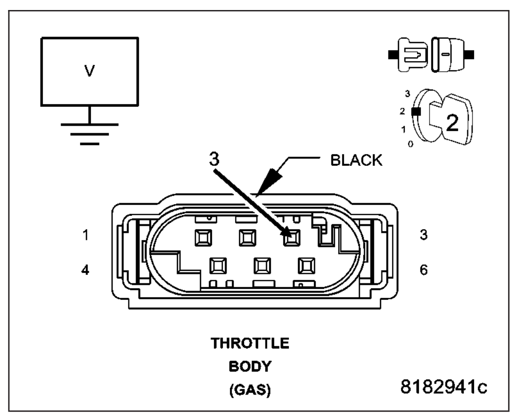
Turn the ignition on.

Measure the voltage of the (F855) 5 Volt Supply circuit in the APP Sensor harness connector.

Is the voltage above 4.8 volts?

Yes >> Replace the Camshaft 1/2 Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5



5. THROTTLE POSITION SENSOR

Turn the ignition off.

Disconnect the Throttle Body harness connector.

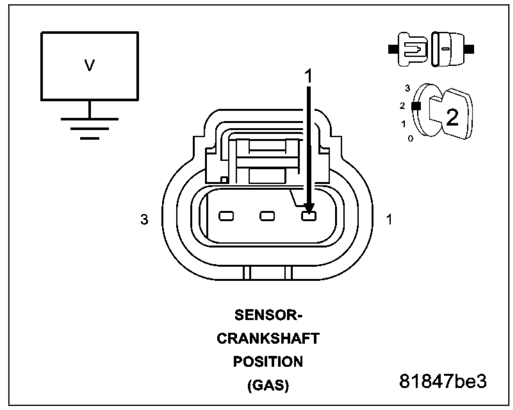
Turn the ignition on.

Measure the voltage of the (F855) 5 Volt Supply circuit.

Is the voltage above 4.8 volts?

Yes >> Replace the Throttle Body in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6



6. CRANKSHAFT POSITION SENSOR

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F855) 5 Volt Supply circuit.

Is the voltage above 4.8 volts?

Yes >> Replace the Crankshaft Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 7

7. VEHICLE EQUIPPED WITH MANUAL TRANSMISSION

NOTE: Only vehicles equipped with a manual transmission use a Vehicle Speed Sensor.

Is the vehicle equipped with a manual transmission?

Yes >> Go to 8

No >> Go to 9

8. VEHICLE SPEED SENSOR

NOTE: Only vehicles equipped with a manual transmission use a Vehicle Speed Sensor.

Turn the ignition off.

Disconnect the Vehicle Speed Sensor harness connector.

Turn the ignition on.

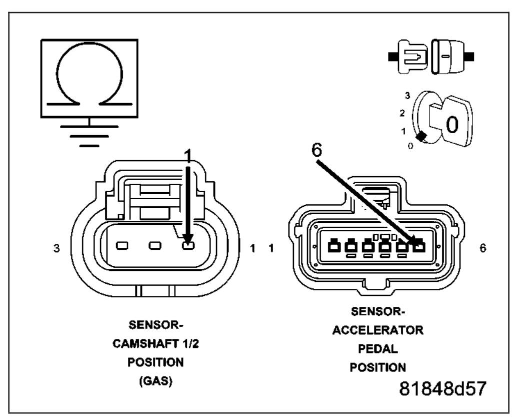
Measure the voltage of the (F856) 5 Volt Supply circuit.

Is the voltage above 4.8 volts?

Yes >> Replace the Vehicle Speed Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

9. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND



NOTE: All sensors connected to the (F855) 5 volt supply circuit and the (F856) 5 volt supply circuit must be disconnected.

Turn the ignition off.

Disconnect the PCM harness connectors.

Measure the resistance between ground and the (F855) 5 Volt Supply circuit.

Measure the resistance between ground and the (F856) 5 Volt Supply circuit.

Is the resistance above 1000 ohms for both circuits?

Yes >> Go to 10

No >> Repair the 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. 5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

NOTE: All sensors connected to the (F855) 5 volt supply circuit and the (F856) 5 volt supply circuit must be disconnected.

Turn the ignition off.

Measure the resistance of the (F855) 5 Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the PCM harness connector.

Measure the resistance of the (F855) 5 Volt Supply circuit between the Crankshaft Position Sensor harness connector and the PCM harness connector.

Measure the resistance of the (F855) 5 Volt Supply circuit between the Throttle Body harness connector and the PCM harness connector.

Measure the resistance of the (F856) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

If the vehicle is equipped with a manual transmission, measure the resistance of the (K856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.

Is the resistance below 5.0 ohms for all of the circuits?

Yes >> Go to 11

No >> Repair the 5 Volt Supply circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

11. POWERTRAIN CONTROL MODULE (PCM)

Inspect the (F855) 5 Volt Supply circuit between the Camshaft 1/2 Position Sensor harness connector and the PCM harness connector.

Inspect the (F855) 5 Volt Supply circuit between the Crankshaft Position Sensor harness connector and the PCM harness connector.

Inspect the (F855) 5 Volt Supply circuit between the Throttle Body harness connector and the PCM harness connector.

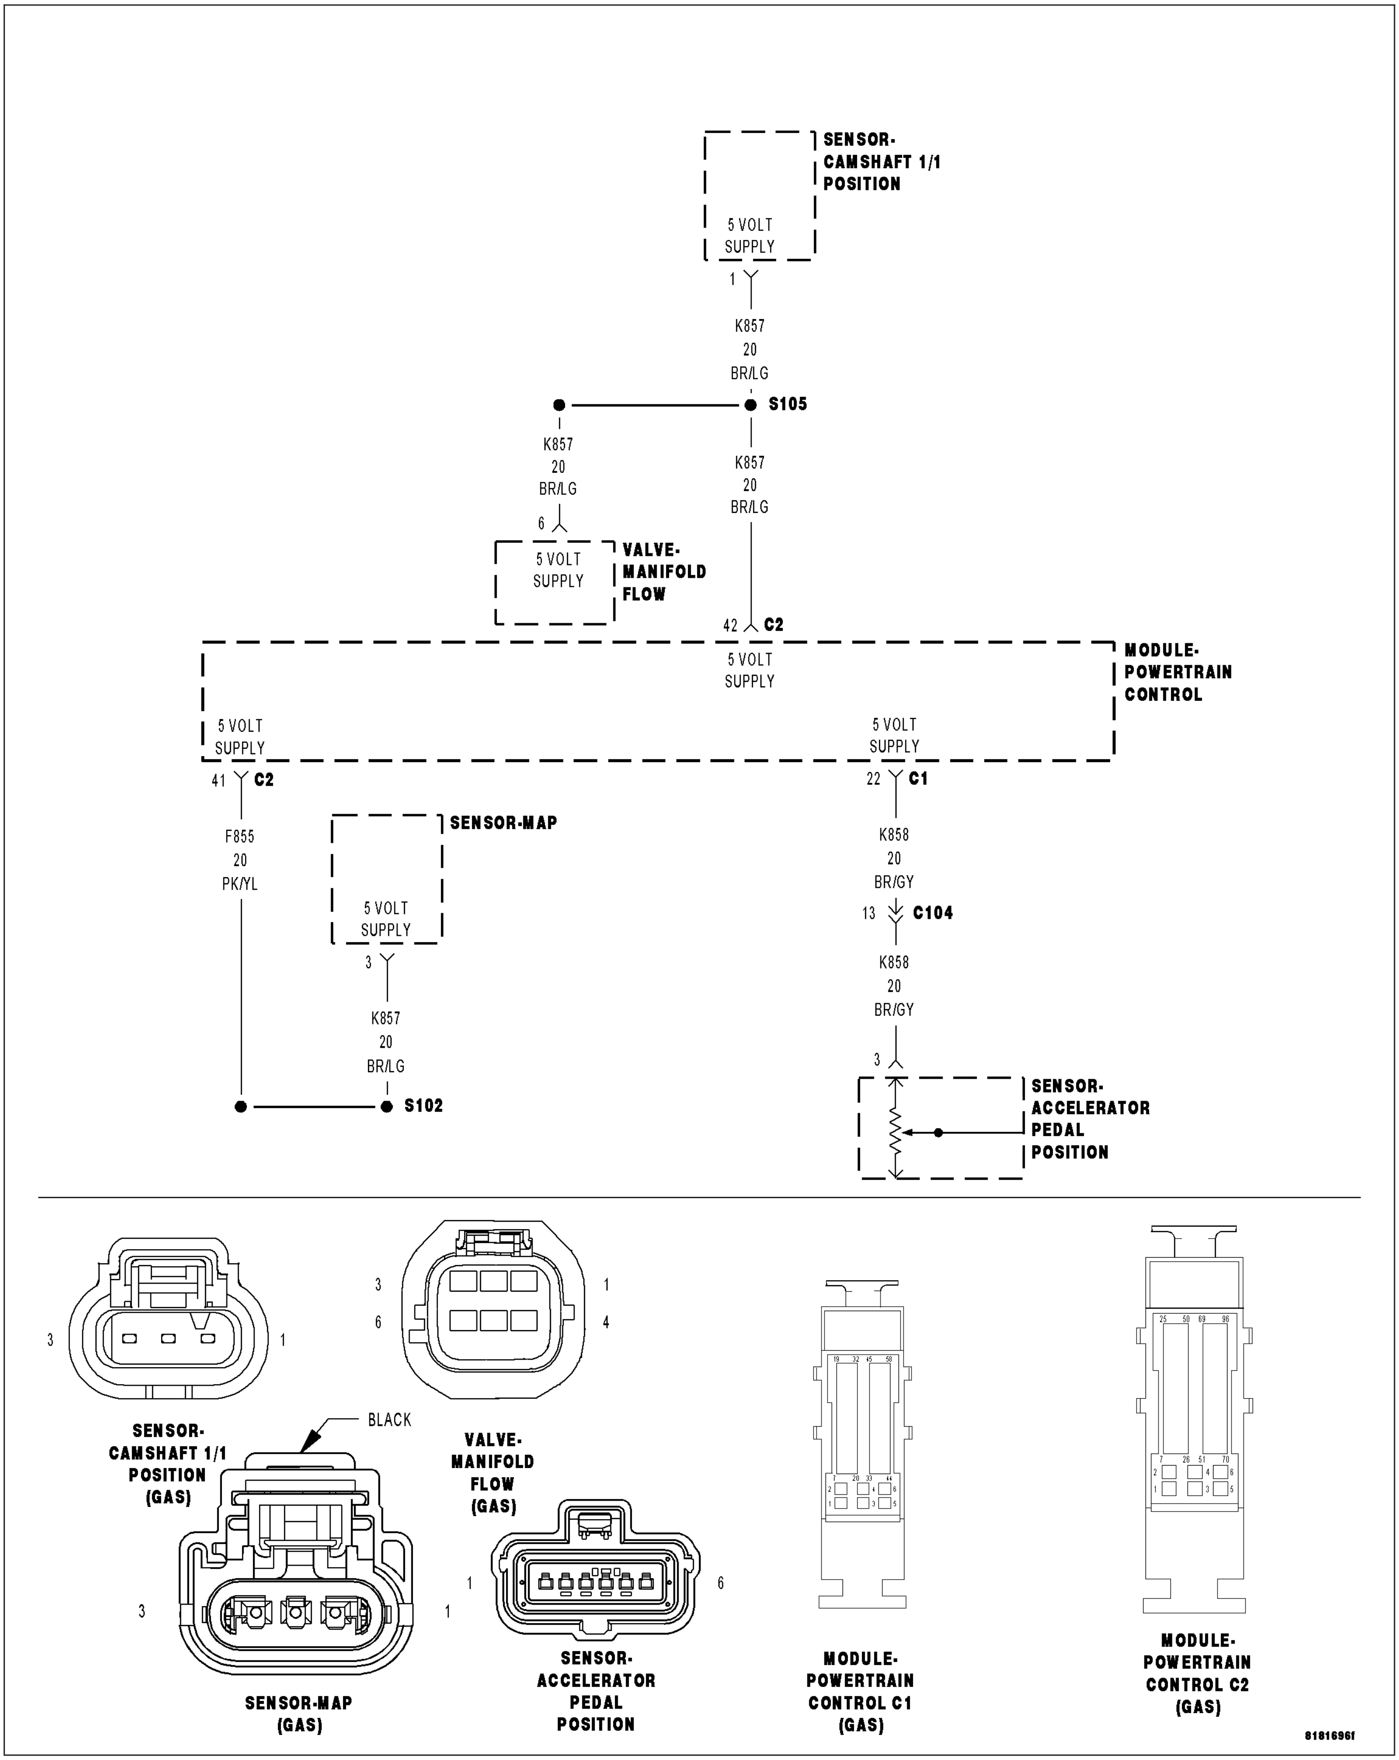
Inspect the (F856) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

If the vehicle is equipped with a manual transmission, inspect the (K856) 5 Volt Supply circuit between the Vehicle Speed Sensor harness connector and the PCM harness connector.

Inspect all PCM power and ground circuits.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the PCM in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P1628-SENSOR REFERENCE VOLTAGE CIRCUIT ERRATIC

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects an excessive voltage variation on the (K857) 5 volt supply circuit or the (K858) 5 volt supply circuit.

Possible Causes
INTERMITTENT DTC
5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
CAMSHAFT 1/1 POSITION SENSOR
MAP SENSOR
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Turn the ignition on.

With the scan tool, clear DTCs.

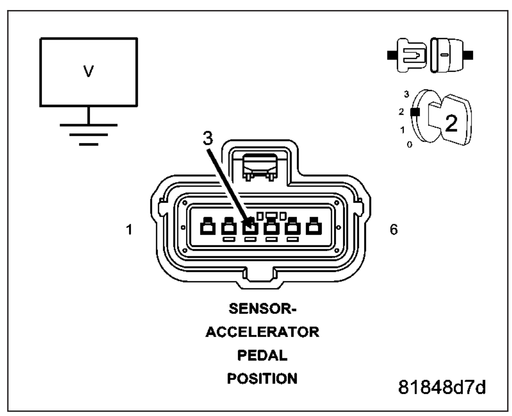
Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K858) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K858) 5 Volt Supply circuit in the APP Sensor harness connector.

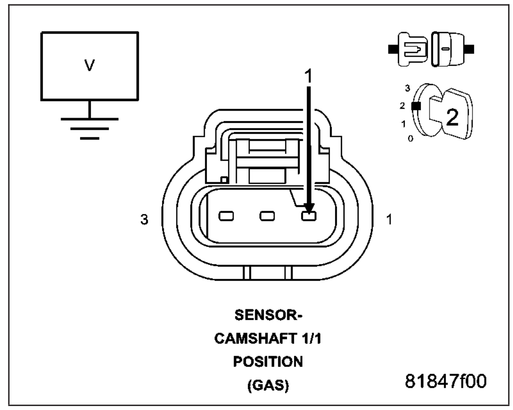
Select the appropriate response from the list below:

Voltage above 5.2 volts
Repair the (K858) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Voltage between 4.8 and 5.2 volts
Go to 3

Voltage below 4.8 volts
Go to 4

3. ACCELERATOR PEDAL POSITION SENSOR



Turn the ignition off.

Connect the APP Sensor harness connector.

Disconnect the Camshaft 1/1 Position Sensor harness connector.

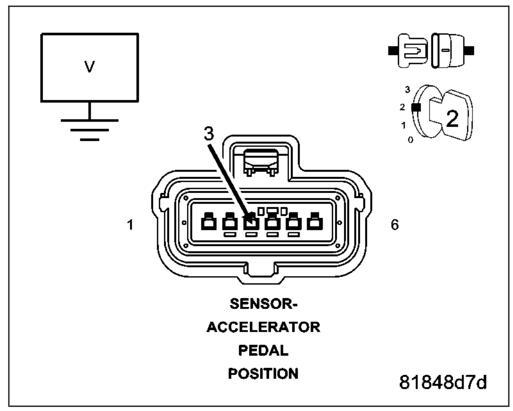
Turn the ignition on.

Measure the voltage of the (K857) 5 Volt Supply circuit in the Camshaft 1/1 Position Sensor harness connector.

Is the voltage below 4.8 volts?

Yes >> Replace the Accelerator Pedal Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9



4. CAMSHAFT 1/1 POSITION SENSOR

Turn the ignition off.

Disconnect the Camshaft 1/1 Position Sensor harness connector.

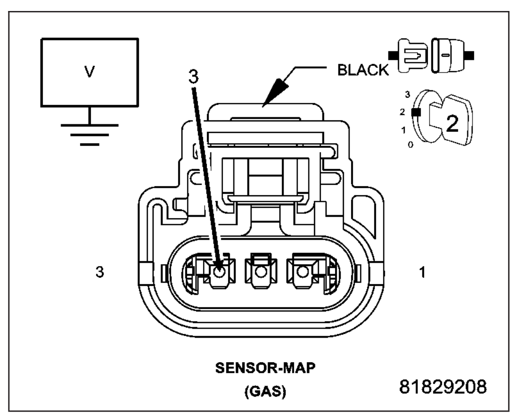
Turn the ignition on.

Measure the voltage of the (K858) 5 Volt Supply circuit in the APP Sensor harness connector.

Is the voltage above 4.8 volts?

Yes >> Replace the Camshaft 1/1 Position Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5



5. MAP SENSOR

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K858) 5 Volt Supply circuit.

Is the voltage above 4.8 volts?

Yes >> Replace the MAP Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

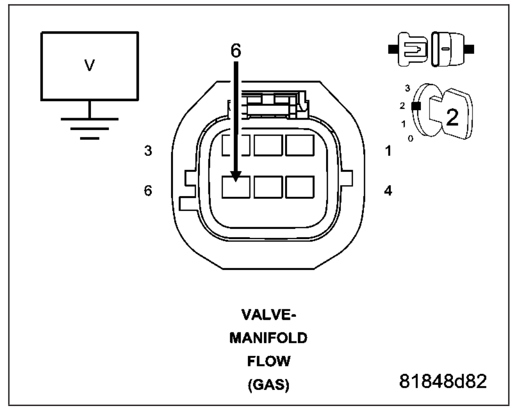
No >> Go to 6

6. MANIFOLD FLOW VALVE

Turn the ignition off.

Disconnect the Manifold Flow Valve harness connector.

Turn the ignition on.



Measure the voltage of the (K857) 5 Volt Supply circuit.

Is the voltage above 4.8 volts?

Yes >> Replace the Manifold Flow Valve in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 7

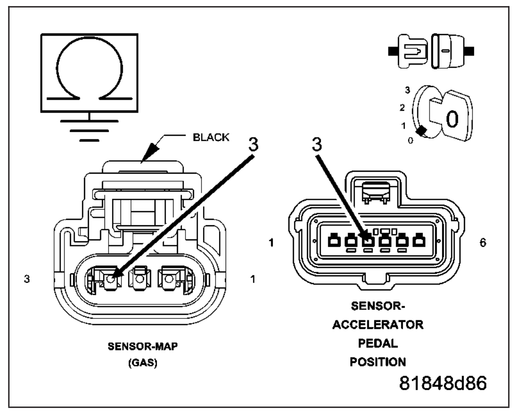
7. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

NOTE: All sensors connected to the (K857) 5 volt supply circuit and the (K858) 5 volt supply circuit must be disconnected.

Turn the ignition off.

Disconnect the PCM harness connectors.

Measure the resistance between ground and the (K857) 5 Volt Supply circuit.



Measure the resistance between ground and the (K858) 5 Volt Supply circuit.

Is the resistance above 1000 ohms for both circuits?

Yes >> Go to 8

No >> Repair the 5 Volt Supply circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. 5-VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

NOTE: All sensors connected to the (K857) 5 volt supply circuit and the (K858) 5 volt supply circuit must be disconnected.

Turn the ignition off.

Measure the resistance of the (K857) 5 Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the PCM harness connector.

Measure the resistance of the (K857) 5 Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector.

Measure the resistance of the (K857) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM harness connector.

Measure the resistance of the (K858) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

Is the resistance below 5.0 ohms for all of the circuits?

Yes >> Go to 9

No >> Repair the 5 Volt Supply circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. POWERTRAIN CONTROL MODULE (PCM)

Inspect the (K857) 5 Volt Supply circuit between the Camshaft 1/1 Position Sensor harness connector and the PCM harness connector.

Inspect the (K857) 5 Volt Supply circuit between the MAP Sensor harness connector and the PCM harness connector.

Inspect the (K857) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the PCM harness connector.

Inspect the (K858) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the PCM harness connector.

Inspect all PCM power and ground circuits.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the PCM in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P1696-EEPROM MEMORY WRITE DENIED/INVALID

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Continuously with the ignition on.
- **Set Condition:**
  An attempt to program/write to the internal EEPROM failed. Also checks at powerdown. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. SCAN TOOL DISPLAYS A WRITE FAILURE

With a scan tool, perform the SRI Memory Test.

Does scan tool display Write Failure?

Yes >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 2

2. SCAN TOOL DISPLAYS A WRITE REFUSED

With the a scan tool, perform the SRI Memory Test.

Does the scan tool display Write Refused?

Yes >> Go To 3

No >> Go To 4

3. PCM REFUSED 2ND TEST

With a scan tool, perform the SRI Memory Test a third time.

NOTE: Retest the SRI Memory two more times.

Does the scan tool display Write Refused again?

Yes >> Replace and program the Powertrain Control Module per Service Information.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Test Complete.

4. SCAN TOOL DISPLAYS SRI MILEAGE INVALID

With a scan tool, perform the SRI Memory Test.

Does the scan tool display SRI Mileage Invalid?

Yes >> Update the mileage and retest the SRI Memory.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

No >> Go To 5

5. COMPARE SRI MILEAGE WITH ODOMETER

Compare the SRI Mileage stored with the Instrument Panel Odometer.

Is the mileage within the specified range displayed on the scan tool?

Yes >> Test Complete.

No >> Update the mileage and retest the SRI Memory.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

P1697–EMR (SRI) MILEAGE NOT STORED

For a complete wiring diagram **Refer to Section 8W**.

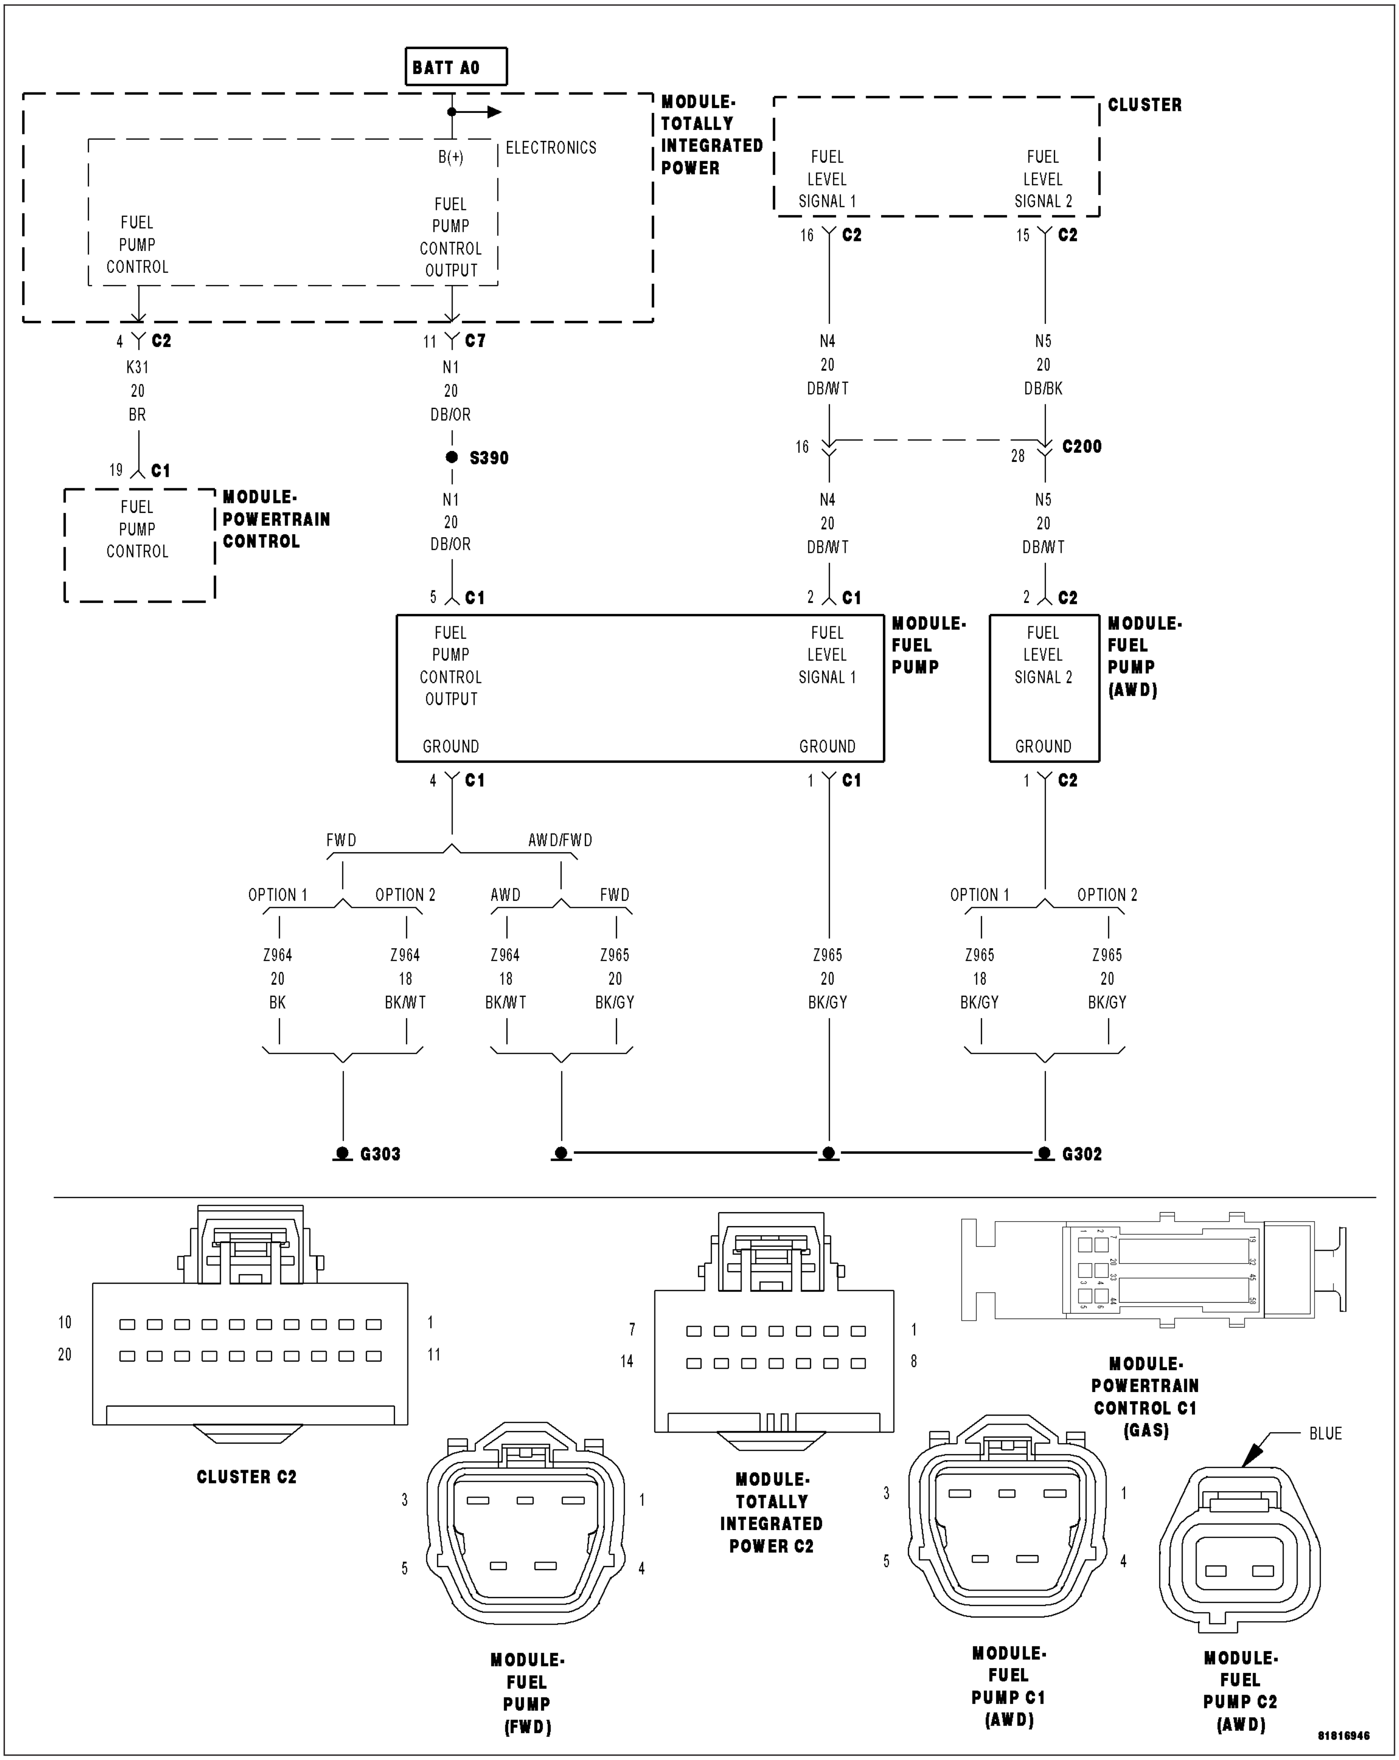
- **When Monitored:**
  Ignition on and battery voltage greater than 10 volts.
- **Set Condition:**
  The SRI Mileage has not been programmed into the PCM.

Possible Causes
SRI MILEAGE NOT PROGRAMMED INTO THE PCM
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. SRI MILEAGE NOT PROGRAMMED INTO THE PCM



Ignition on, engine not running.
With the scan tool, attempt to program the SRI mileage into the PCM.
With the scan tool, clear DTCs in the PCM.
Start the engine.
Allow the engine to reach normal operating temperature.
With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace and program the Powertrain Control Module in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> The SRI mileage has been successfully programmed into the PCM. Test is complete.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1861-SIPHON LINE DISCONNECTED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition key on.
- **Set Condition:**
  PCM compares the primary tank level with the secondary tank level. If the PCM detects the primary side is lower than the secondary side by a calibrated amount the DTC will set.

Possible Causes
DTC IS ACTIVE
FUEL TANK DAMAGE
FUEL LEVEL SIGNAL CIRCUIT SHORTED TO GROUND
FUEL LEVEL SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT OPEN OF HIGH RESISTANCE
INTERNAL DAMAGE TO FUEL TANK OR SIPHON HOSE
FUEL LEVEL SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose any Fuel Level DTCs before proceeding with this test.

NOTE: The following test must be performed on both Fuel Level Sensors.

Inspect the Fuel Pump Module harness connectors for any corrosion or damage.

Ignition on, engine not running.

With the scan tool, select View DTCs. Record the related Freeze Frame data.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL TANK INSPECTION

Inspect both sides of the Fuel Tank for any damage that may restrict the Fuel Level Sensor float.

Were any problems found?

Yes >> Replace the Fuel Tank as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. FUEL LEVEL SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Fuel Pump Module harness connector.

Measure the resistance between ground and each Fuel Level Signal circuit at the Fuel Pump Module harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the Fuel Level Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. FUEL LEVEL SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Disconnect the Cluster harness connector.

Measure the resistance of each Fuel Level Signal circuit from the Fuel Pump Module harness connector to the Cluster harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the Fuel Level Signal circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance between ground and the (Z965) Ground circuit in the Fuel Pump Module harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 6

No >> Repair the (Z965) Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. FUEL TANK AND SIPHON HOSE INSPECTION

WARNING: The fuel system is under a constant pressure even with the engine off. Before opening the fuel system, the fuel pressure must be released in accordance with the service information. Failure to follow these instructions can result in personal injury or death.

Inspect the following components.

- Siphon hose for restrictions or being disconnected.
- Siphon Inlet and Outlet tube on the Fuel Modules for restrictions.
- Fuel Pump Inlet Strainers for restrictions.
- Fuel Tank for any obstructions or deformities.
- Fuel Pump Module Float arm for damage.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Fuel Level Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2004-INTAKE MANIFOLD RUNNER CONTROL STUCK OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running, when the valve closes, below a calibrated RPM, depending upon pedal position.
- **Set Condition:**
  The PCM detects that the position feedback of the Manifold Flow Valve Position Sensor is not within range of the adapted value learned during in-plant initialization or after a non volatile memory reset (adaptive memory clear).

Possible Causes
INTERMITTENT DTC
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K857) 5 VOLT SUPPLY CIRCUIT
(K857) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
INTAKE MANIFOLD
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, clear DTCs.

Start the engine and allow it to reach operating temperature.

NOTE: It may be necessary to test drive the vehicle to get this DTC to reset.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K857) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Manifold Flow Valve connector.

Turn the ignition on.

Measure the voltage of the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 7

No >> Go to 3

3. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

Is there any voltage present?

Yes >> Repair the (K857) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 5

No >> Repair the (K857) 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K857) 5 Volt Supply circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (K857) 5 Volt Supply circuit for a short to the (K900) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (K857) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K857) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (K857) 5 Volt Supply circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K602) MFV SIGNAL CIRCUIT VOLTAGE

Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 12

No >> Go to 8

8. (K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Is there any voltage present?

Yes >> Repair the (K602) MFV Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 10

No >> Repair the (K602) MFV Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K602) MFV Signal circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 11

No >> Repair the (K602) MFV Signal circuit for a short to the (K900) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. (K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (K602) MFV Signal circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

12. (K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K900) Sensor Ground circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 13

No >> Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. (K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K857) 5 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K602) MFV Signal circuit and the (K857) 5 Volt Supply in the Manifold Flow Valve harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (K602) MFV Signal circuit for a short to the (K857) 5 Volt Supply circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 14

14. (Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to 12 volts, check the (Z916) Ground circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 15

No >> Repair the (Z916) Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

15. MANIFOLD FLOW VALVE

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Remove the Manifold Flow Valve.

Inspect the return spring and the valve blade assembly for debris stuck in the path or for frozen/seized blades.

NOTE: Manifold Flow Valve over travel or under travel can cause this DTC to set.

NOTE: If the Manifold Flow Valve blades are seized in the intake manifold, the manifold will have to be replaced.

NOTE: If the Manifold Flow Valve is replaced, a non volatile memory reset must be performed to learn the new port flap adaptive values.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Manifold Flow Valve in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

16. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2006-INTAKE MANIFOLD RUNNER CONTROL STUCK CLOSED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running, when the valve opens, below a calibrated RPM depending upon pedal position.
- **Set Condition:**
  The PCM detects that the position feedback of the Manifold Flow Valve Position Sensor is not within range of the adapted value learned during in-plant initialization or after a non volatile memory reset (adaptive memory clear).

Possible Causes
INTERMITTENT DTC
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K857) 5 VOLT SUPPLY CIRCUIT
(K857) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
INTAKE MANIFOLD
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, clear DTCs.

Start the engine and allow it to reach operating temperature.

NOTE: It may be necessary to test drive the vehicle to get this DTC to reset.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K857) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.
Disconnect the Manifold Flow Valve connector.
Turn the ignition on.
Measure the voltage of the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 7

No >> Go to 3

3. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Powertrain Control Module (PCM) connector.
Turn the ignition on.
Measure the voltage of the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

Is there any voltage present?

Yes >> Repair the (K857) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 5

No >> Repair the (K857) 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K857) 5 Volt Supply circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (K857) 5 Volt Supply circuit for a short to the (K900) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (K857) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K857) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (K857) 5 Volt Supply circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K602) MFV SIGNAL CIRCUIT VOLTAGE

Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 12

No >> Go to 8

8. (K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Is there any voltage present?

Yes >> Repair the (K602) MFV Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 10

No >> Repair the (K602) MFV Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K602) MFV Signal circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 11

No >> Repair the (K602) MFV Signal circuit for a short to the (K900) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. (K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 16

No >> Repair the (K602) MFV Signal circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

12. (K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K900) Sensor Ground circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 13

No >> Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

13. (K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K857) 5 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K602) MFV Signal circuit and the (K857) 5 Volt Supply in the Manifold Flow Valve harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (K602) MFV Signal circuit for a short to the (K857) 5 Volt Supply circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 14

14. (Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to 12 volts, check the (Z916) Ground circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 15

No >> Repair the (Z916) Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

15. MANIFOLD FLOW VALVE

Turn the ignition off.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Remove the Manifold Flow Valve.

Inspect the return spring and the valve blade assembly for debris stuck in the path or for frozen/seized blades.

NOTE: Manifold Flow Valve over travel or under travel can cause this DTC to set.

NOTE: If the Manifold Flow Valve blades are seized in the intake manifold, the manifold will have to be replaced.

NOTE: If the Manifold Flow Valve is replaced, a non volatile memory reset must be performed to learn the new port flap adaptive values.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

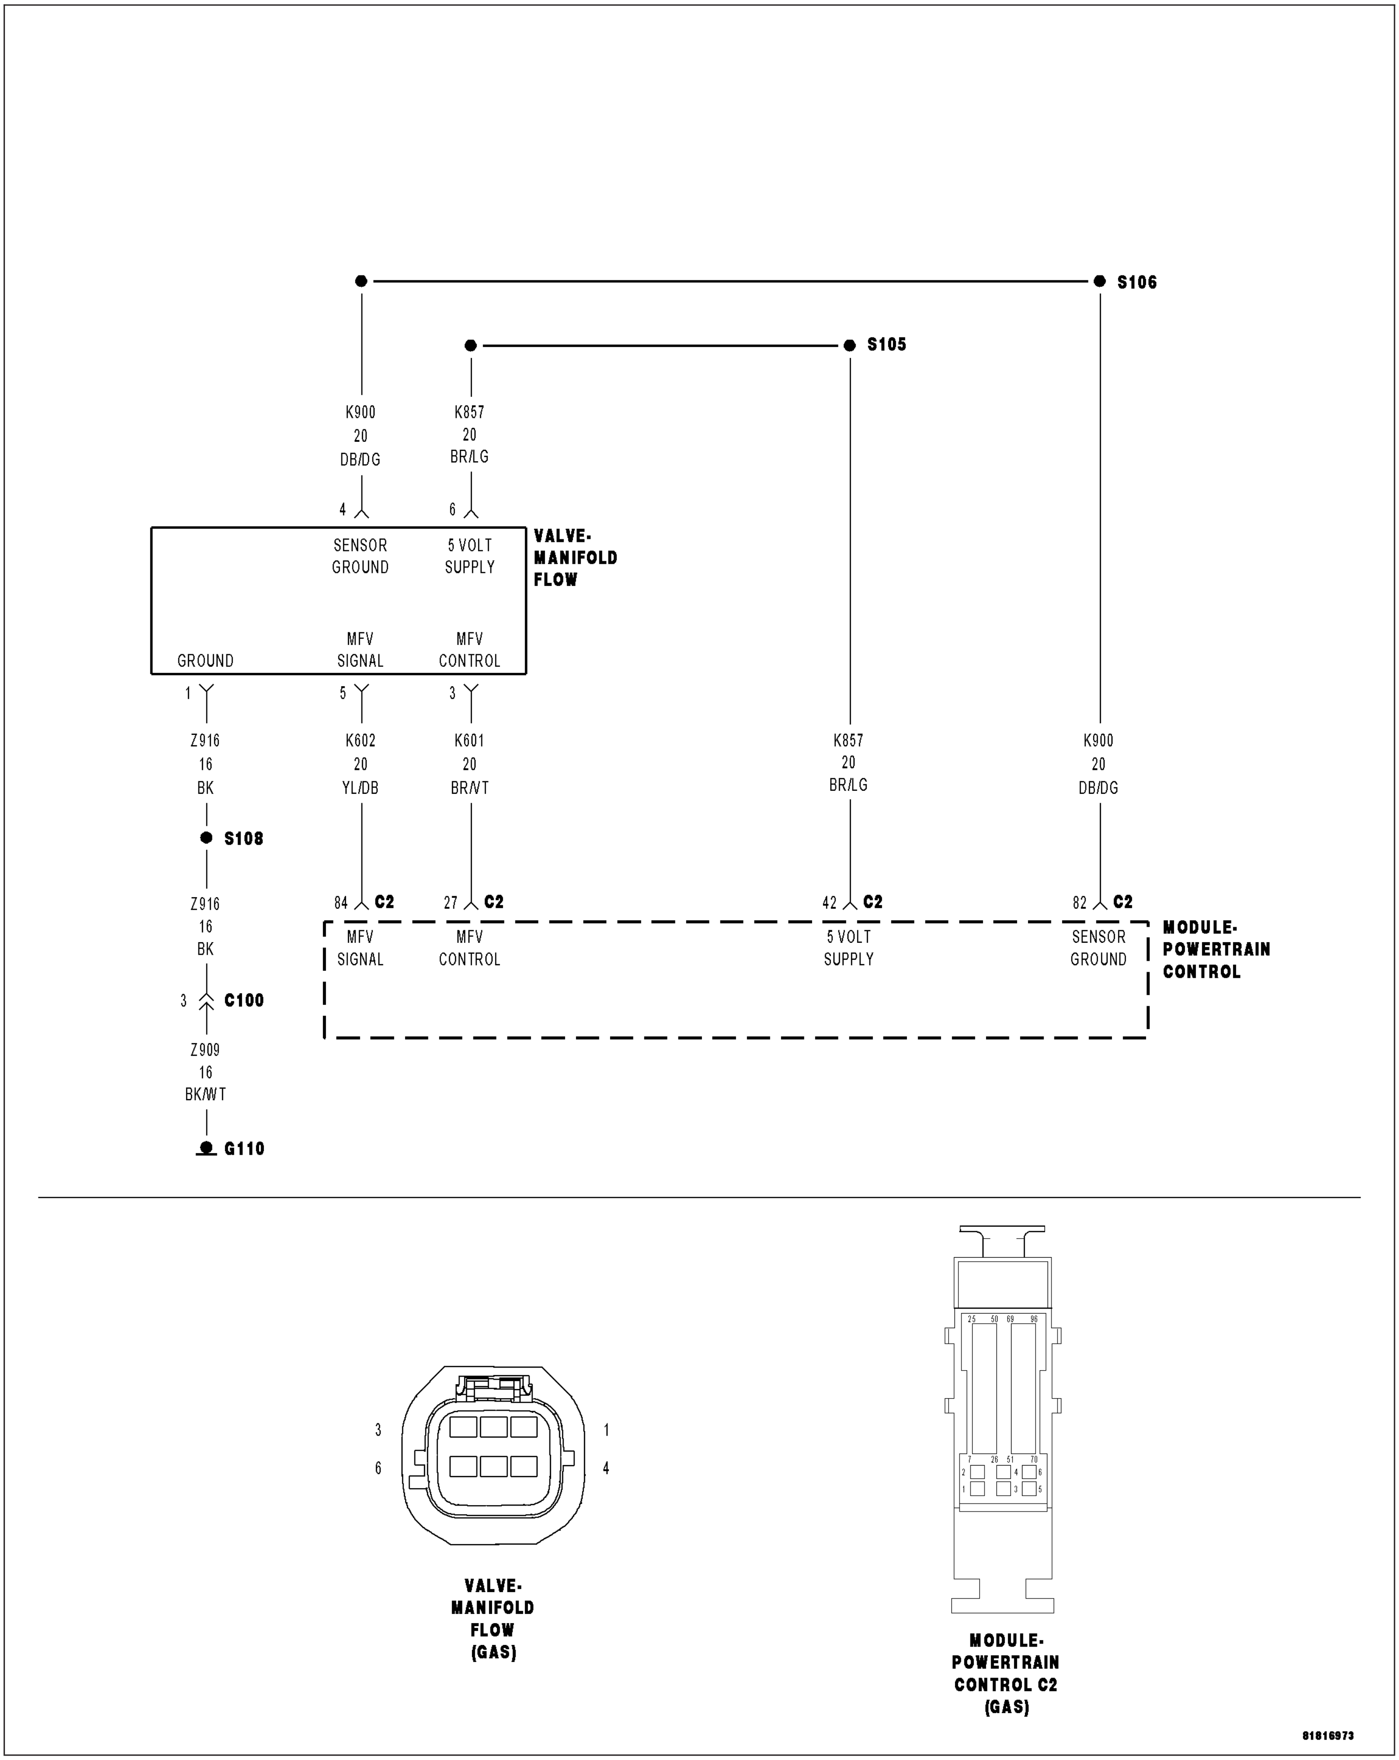
No >> Replace the Manifold Flow Valve in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

16. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2009-INTAKE MANIFOLD RUNNER (SWIRL) CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the Manifold Flow Valve control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K601) MFV CONTROL CIRCUIT SHORTED TO GROUND
(K601) MFV CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

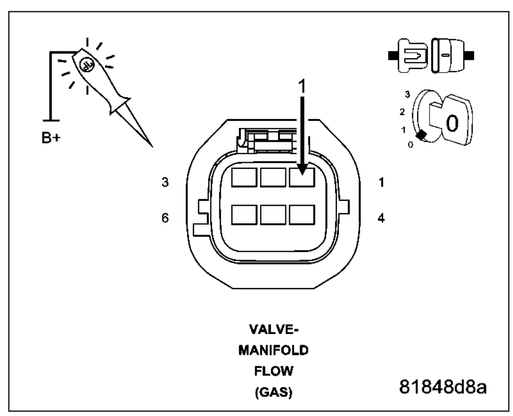
Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2



No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (Z916) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Manifold Flow Valve connector.

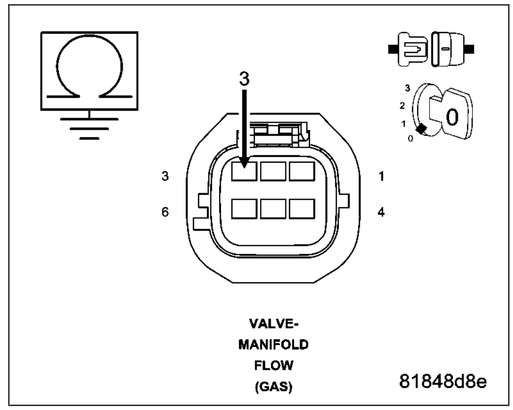
Using a 12 volt test light connected to 12 volts, check the (Z916) Ground circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (Z916) Ground circuit for an open circuit or high resistance.



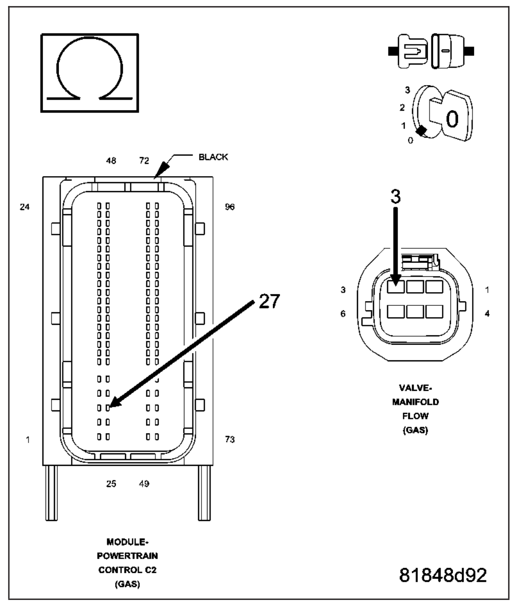
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K601) MFV CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K601) MFV Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

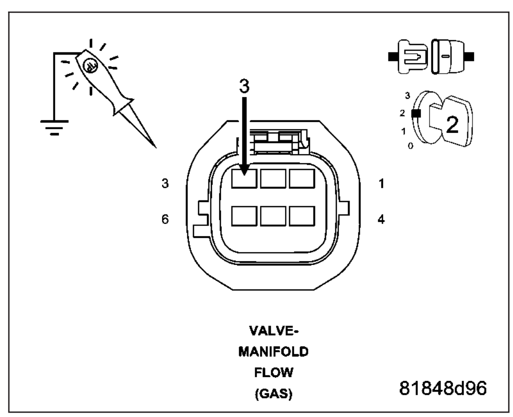
4. (K601) MFV CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K601) MFV Control circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K601) MFV Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. MANIFOLD FLOW VALVE

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Manifold Flow Valve control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright with the control actuated ON (100%). Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Manifold Flow Valve control to OFF (0%).

Using a 12 volt test light connected to 12 ground, check the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should not be illuminated with the control actuated OFF (0%).

Is the test light illuminated and bright with the control actuated ON and not illuminated with the control

actuated OFF?

Yes >> Replace the Manifold Flow Valve in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

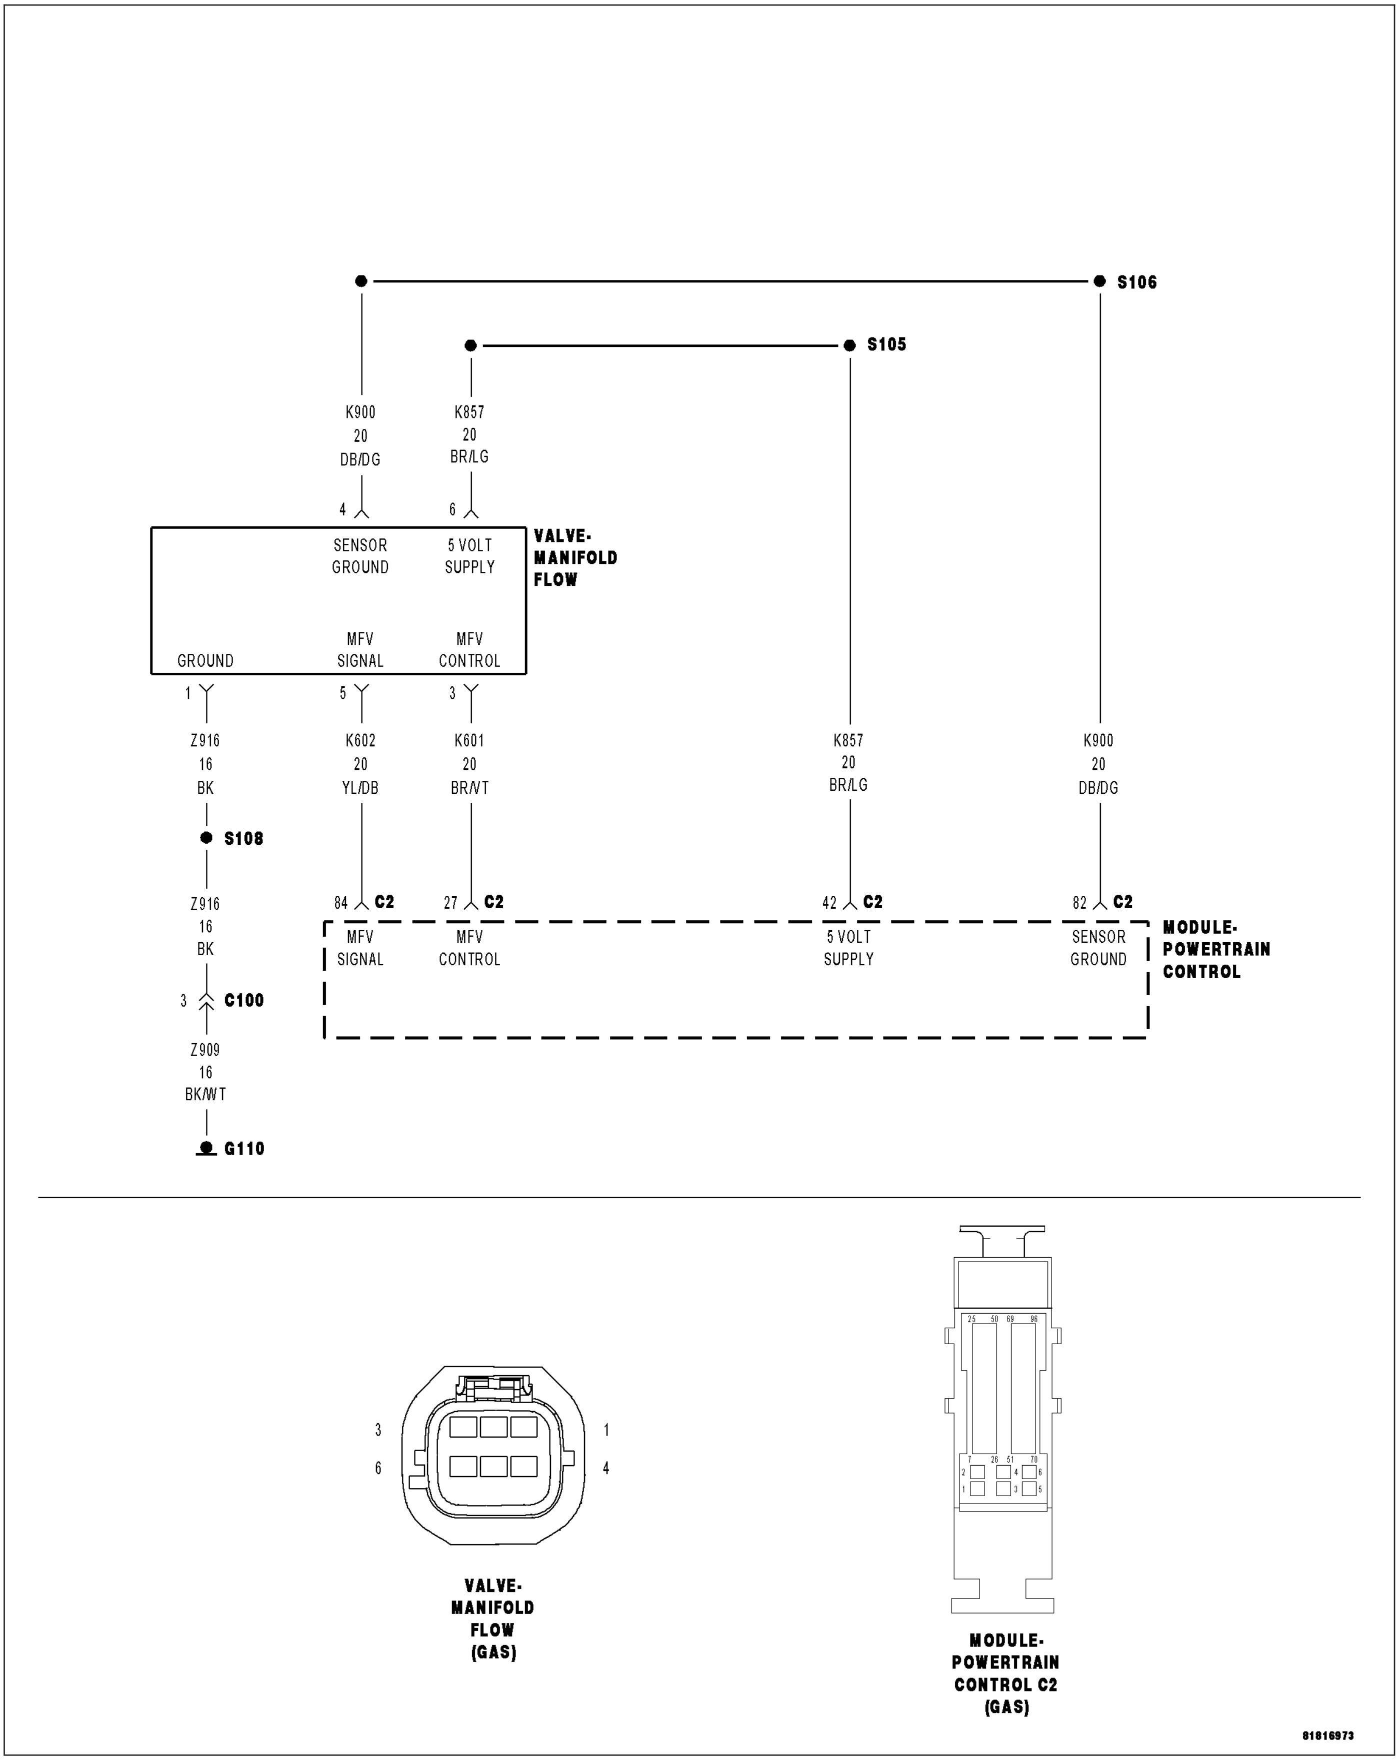
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2010-INTAKE MANIFOLD RUNNER (SWIRL) CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the Manifold Flow Valve control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K601) MFV CONTROL CIRCUIT SHORTED TO VOLTAGE
(K601) MFV CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

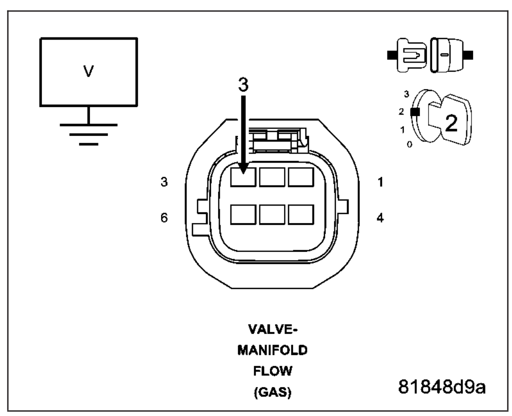
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K601) MFV CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

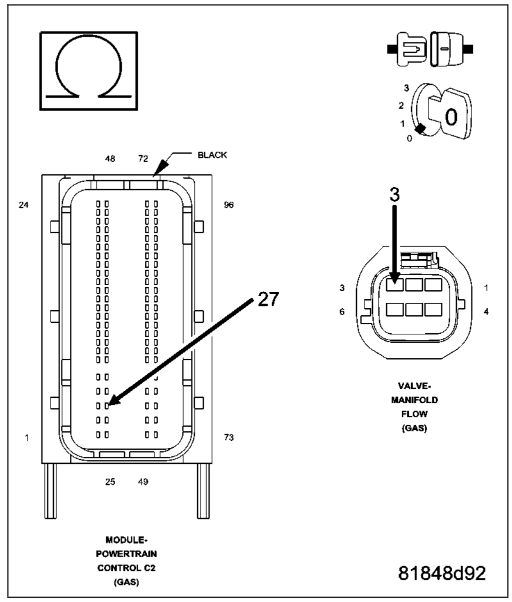
Disconnect the Manifold Flow Valve connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

Is there any voltage present?



Yes >> Repair the (K601) MFV Control circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K601) MFV CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

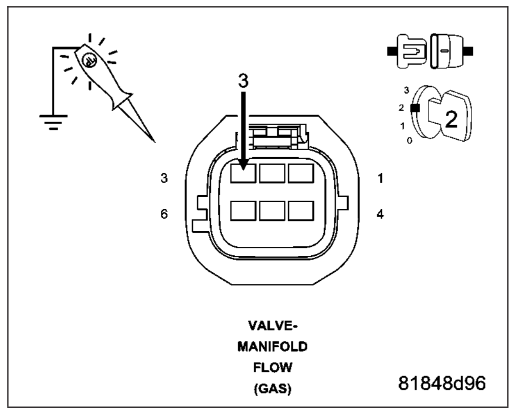
Measure the resistance of the (K601) MFV Control circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (K601) MFV Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



4. MANIFOLD FLOW VALVE

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Manifold Flow Valve control to the ON (100%) position.

Using a 12 volt test light connected to ground, check the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Manifold Flow Valve control to the OFF (0%) position.

Using a 12 volt test light connected to ground, check the (K601) MFV Control circuit in the Manifold Flow Valve harness connector.

NOTE: The test light should not be illuminated.

Is the test light illuminated and bright with the actuator ON (100%) and not illuminated with the actuator OFF (0%)?

Yes >> Replace the Manifold Flow Valve in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

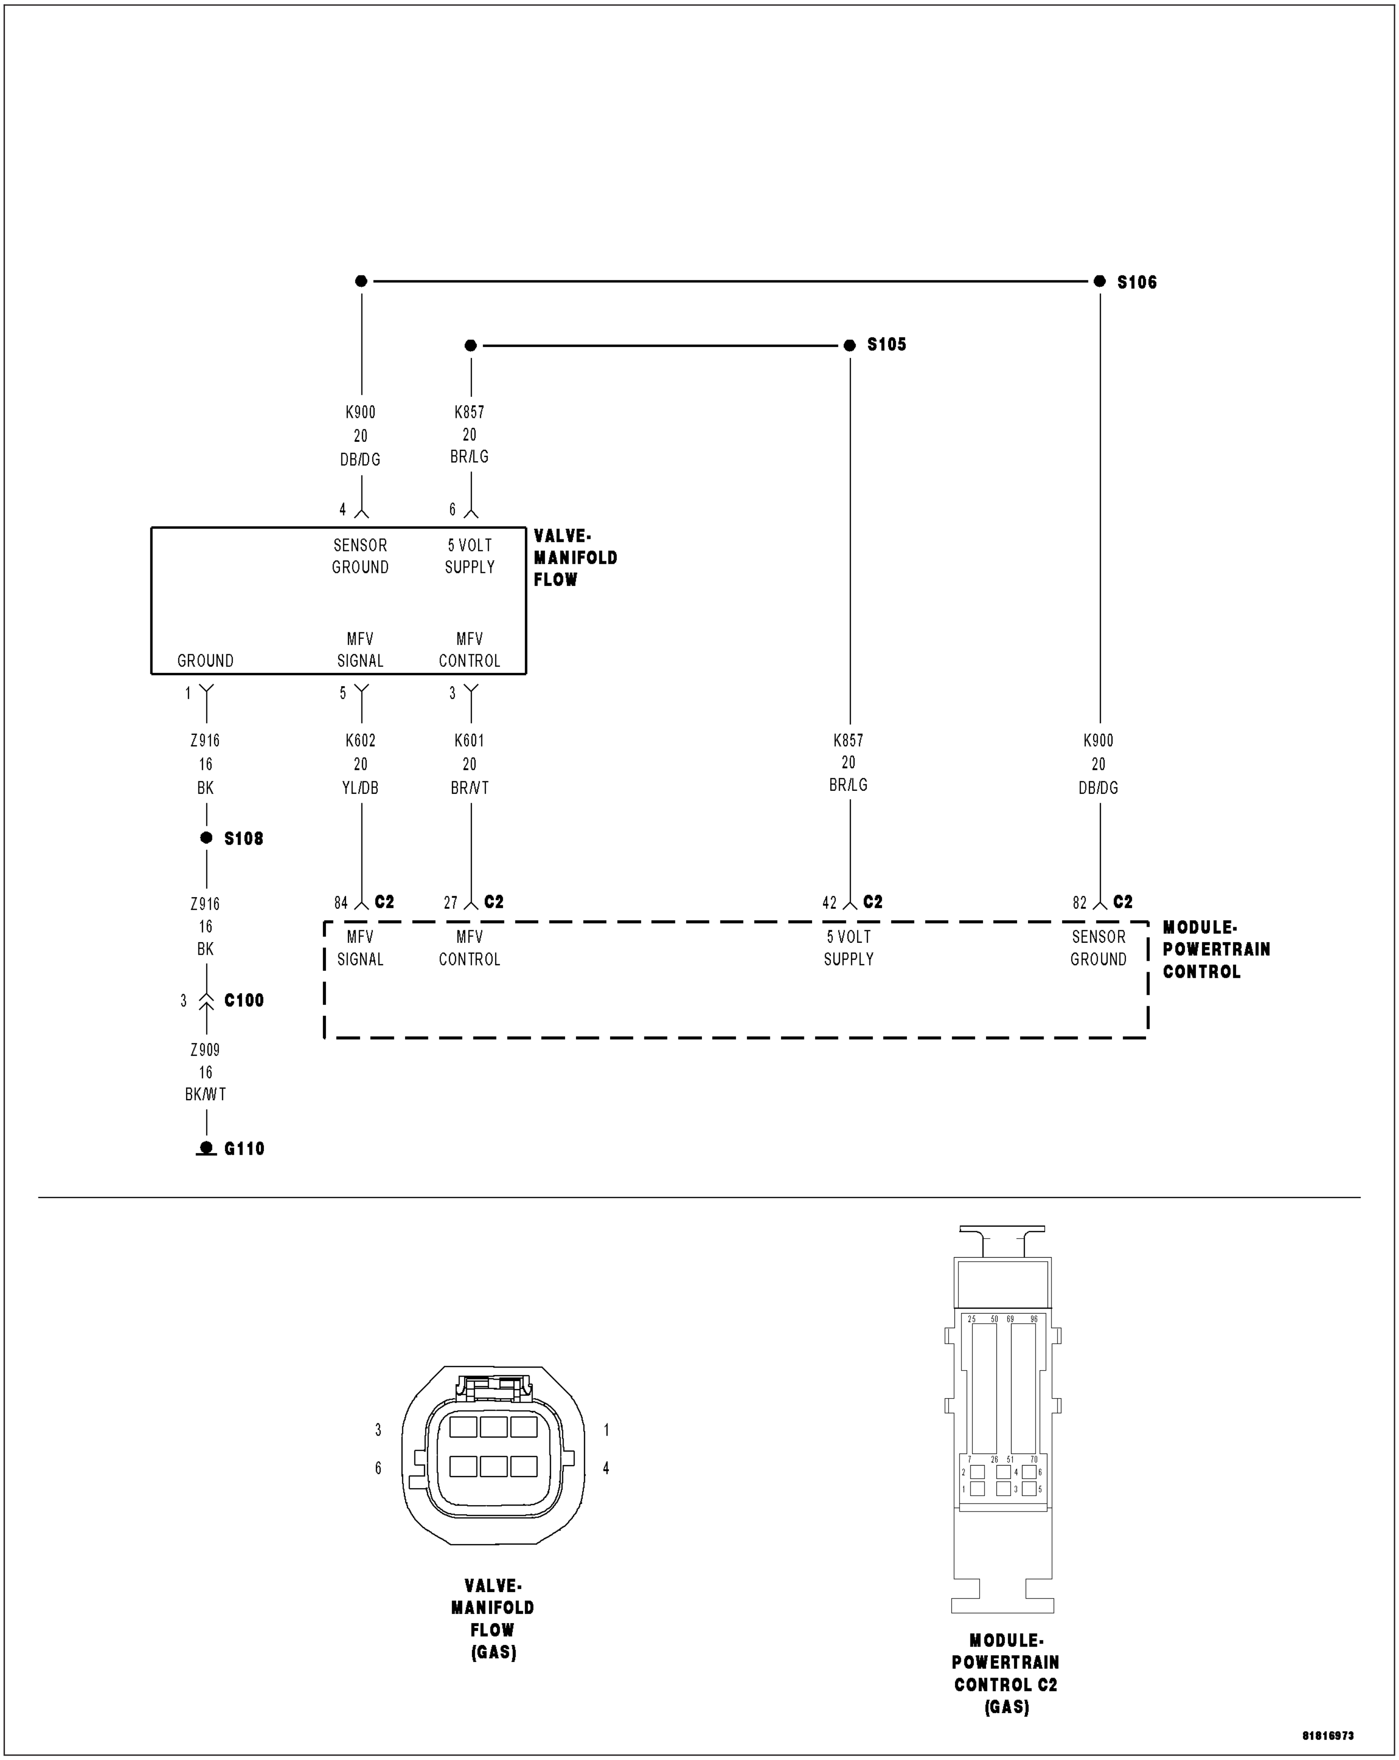
No >> Go to 5

5. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2016-INTAKE MANIFOLD RUNNER POSITION SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K602) MFV Signal circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT
(K857) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

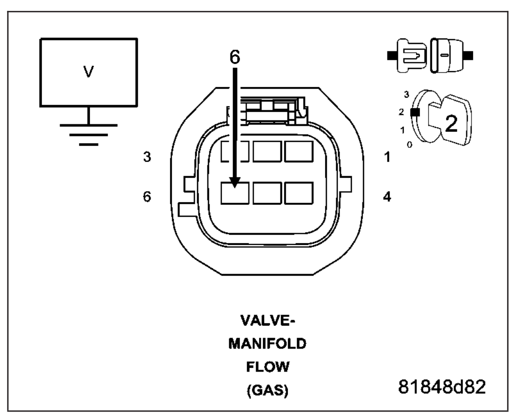
NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K857) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

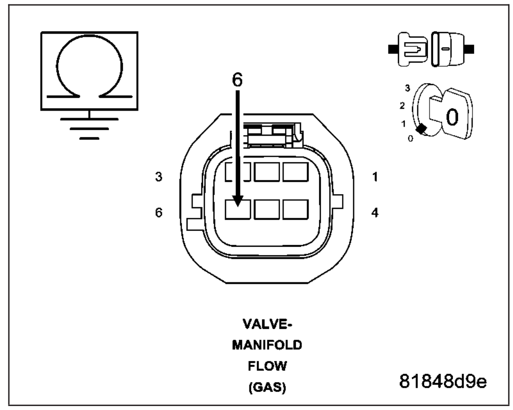
Disconnect the Manifold Flow Valve connector.

Turn the ignition on.

Measure the voltage of the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.

Is the voltage above 4.5 volts?

Yes >> Go to 6



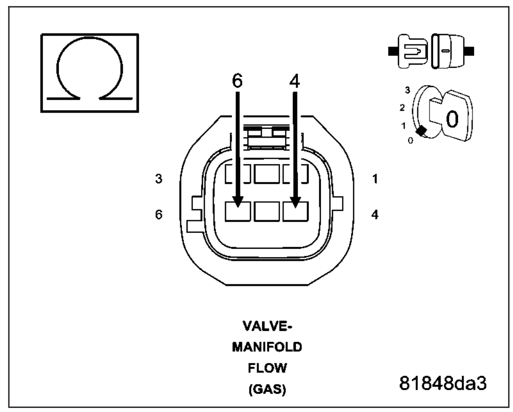
No >> Go to 3

3. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition on.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.



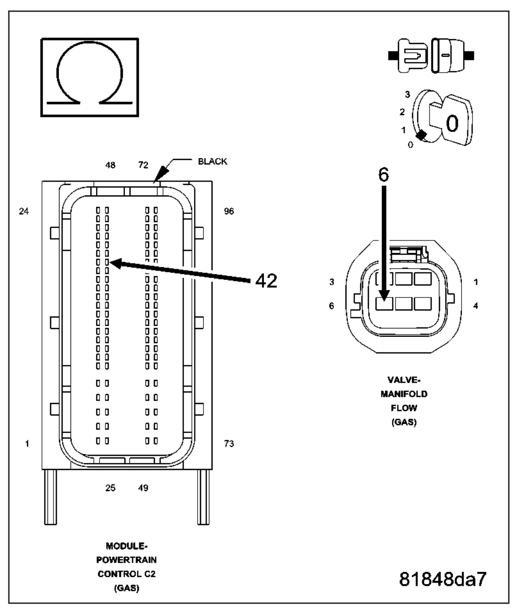
Is the resistance above 1000 ohms?

Yes >> Go to 4

No >> Repair the (K857) 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K857) 5 Volt Supply circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 5

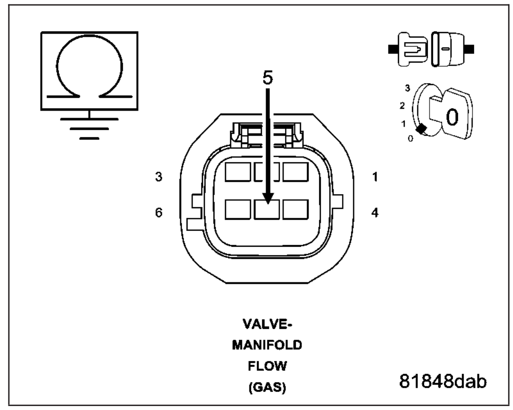
No >> Repair the (K857) 5 Volt Supply circuit for a short to the (K900) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K857) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K857) 5 Volt Supply circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10



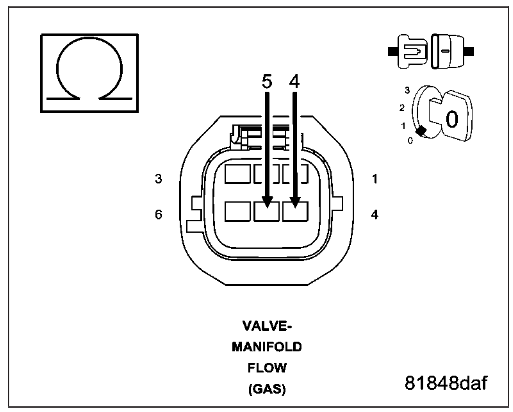
No >> Repair the (K857) 5 Volt Supply circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (K602) MFV SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.



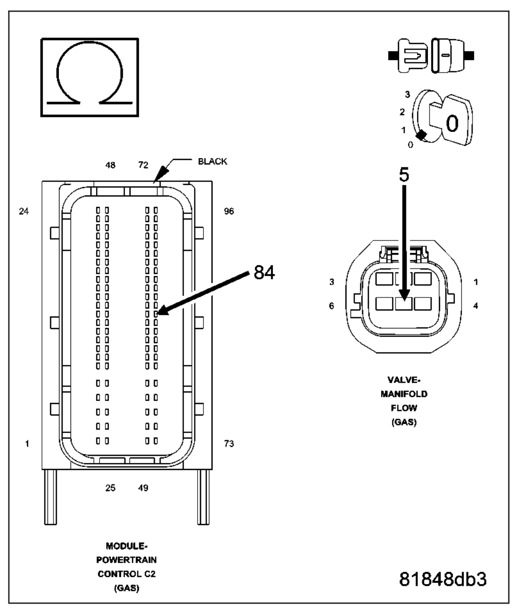
Is the resistance above 100 ohms?

Yes >> Go to 7

No >> Repair the (K602) MFV Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K602) MFV SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND CIRCUIT

Measure the resistance between the (K602) MFV Signal circuit and the (K900) Sensor Ground circuit in the Manifold Flow Valve harness connector.



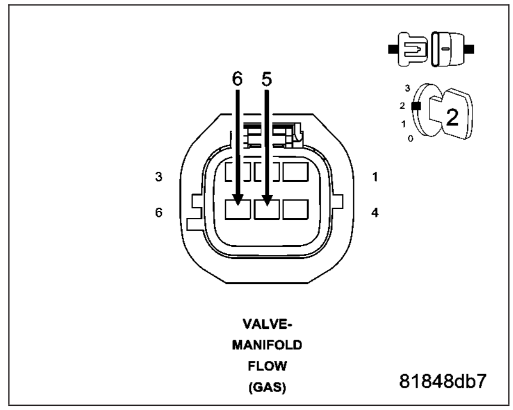
Is the resistance above 100 ohms?

Yes >> Go to 8

No >> Repair the (K602) MFV Signal circuit for a short to the (K900) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K602) MFV Signal circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 9

No >> Repair the (K602) MFV Signal circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. MANIFOLD FLOW VALVE

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (K857) 5 Volt Supply circuit and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Turn the ignition on.

With the scan tool, read the Manifold Flow Valve signal voltage.

Is the voltage above 4.5 volts with the jumper wire in place?

Yes >> Replace the Manifold Flow Valve in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 10

10. POWERTRAIN CONTROL MODULE (PCM)

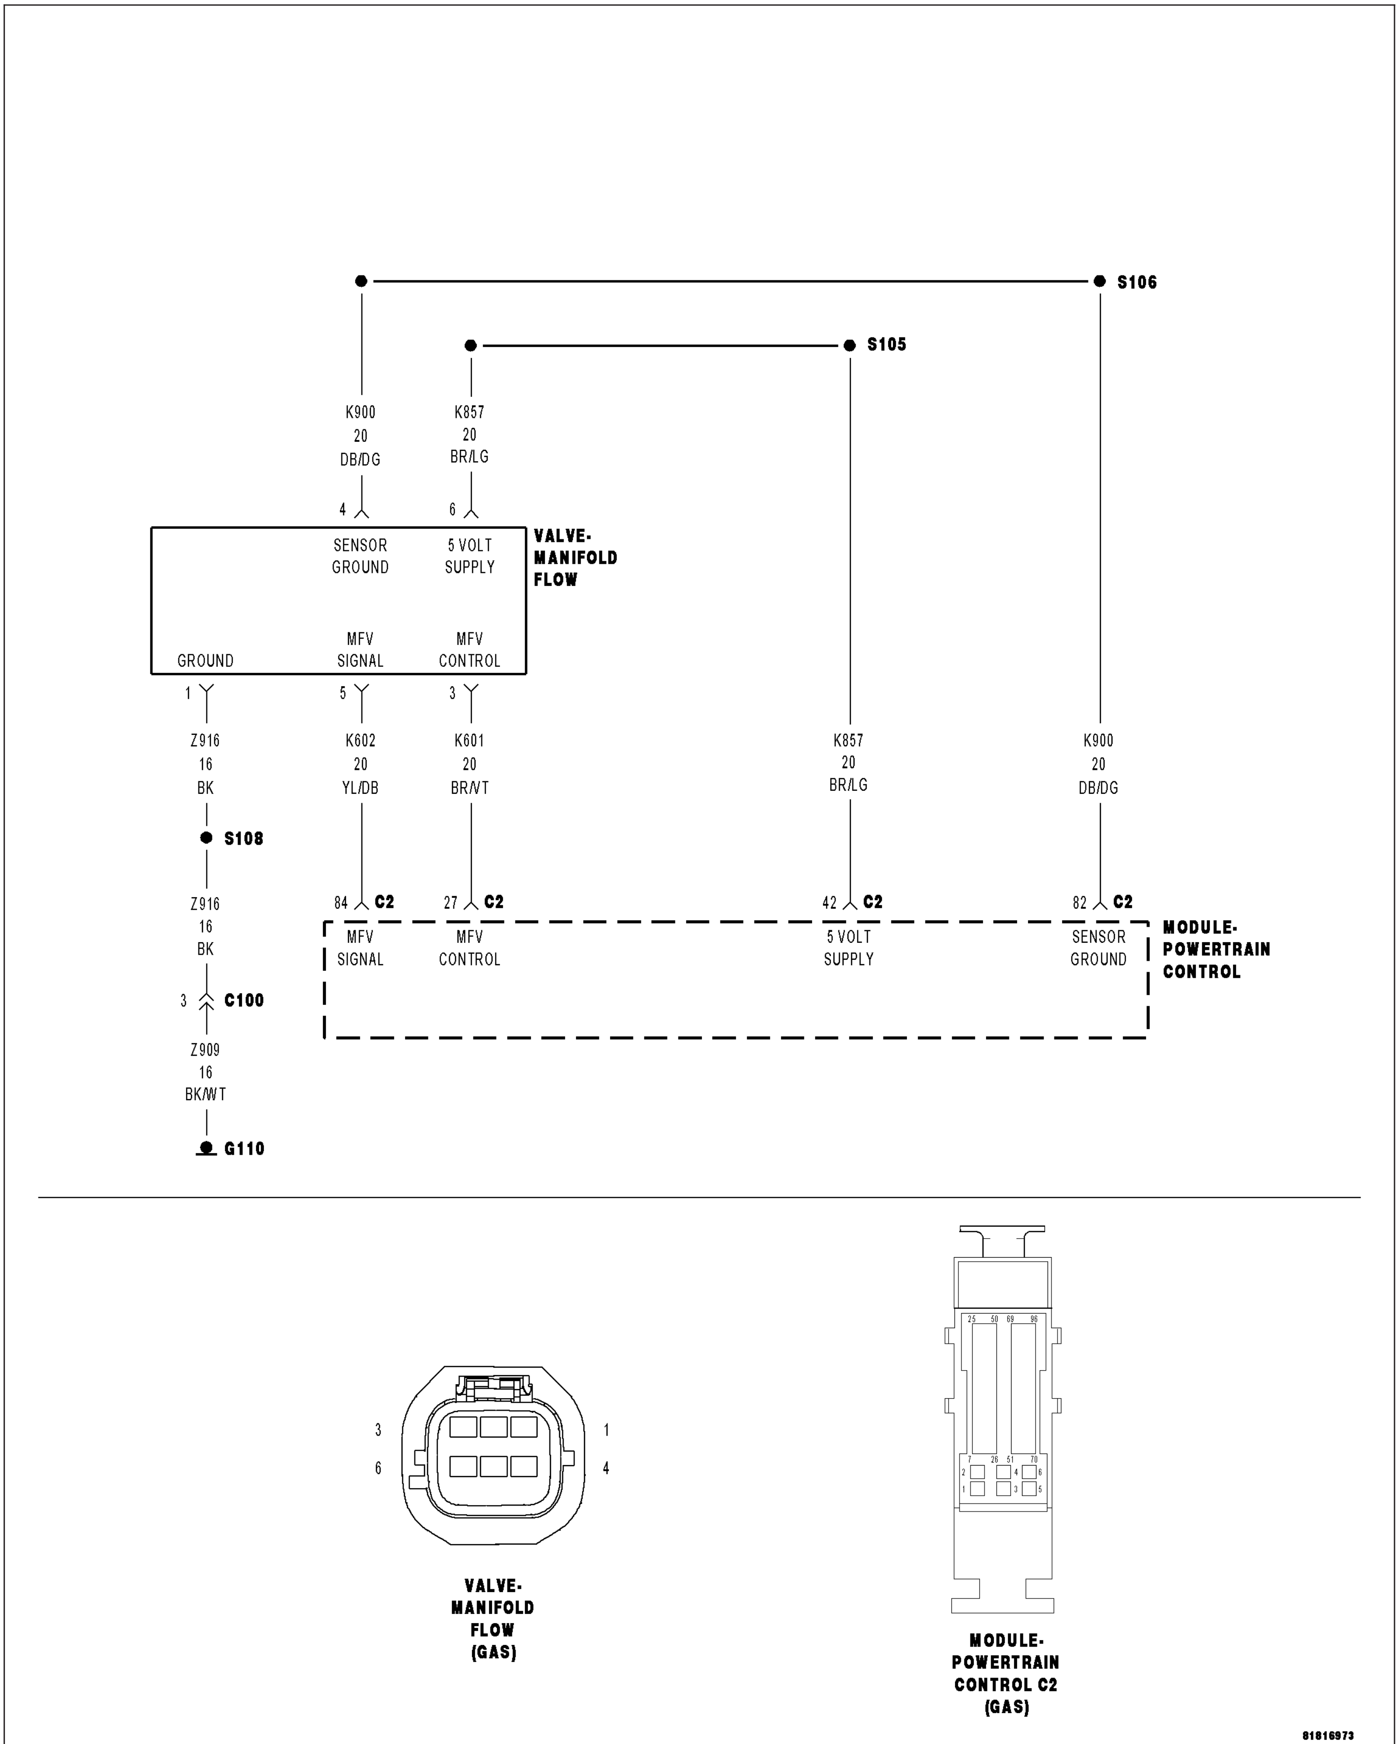
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2017-INTAKE MANIFOLD RUNNER POSITION SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K602) MFV Signal circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K857) 5 VOLT SUPPLY CIRCUIT
(K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MANIFOLD FLOW VALVE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

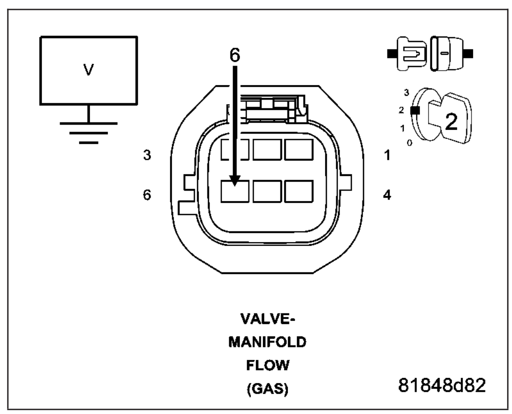
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K857) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE



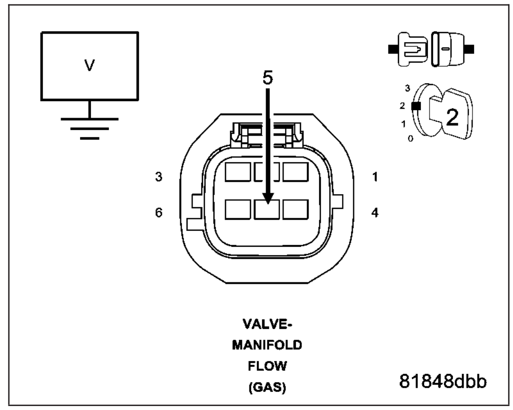
Turn the ignition off.

Disconnect the Manifold Flow Valve connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K857) 5 Volt Supply circuit in the Manifold Flow Valve harness connector.



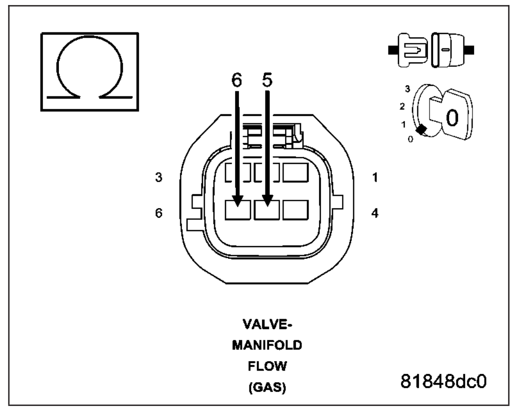
Is there any voltage present?

Yes >> Repair the (K857) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K602) MFV SIGNAL CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.



Is there any voltage present?

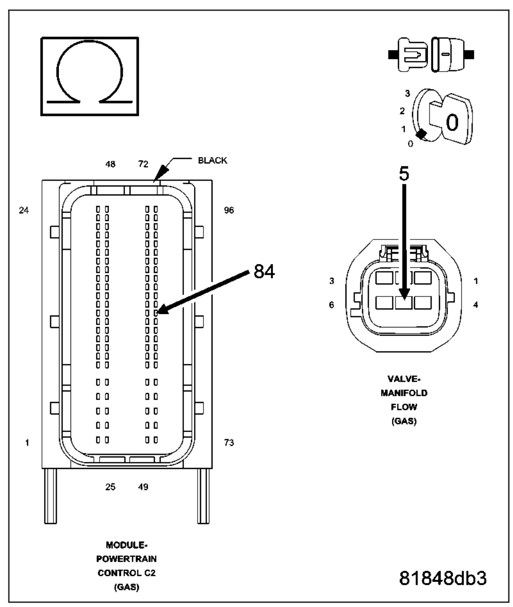
Yes >> Repair the (K602) MFV Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K602) MFV SIGNAL CIRCUIT SHORTED TO THE (K857) 5 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K602) MFV Signal circuit and the (K857) 5 Volt Supply in the Manifold Flow Valve harness connector.

Is the resistance below 100 ohms?



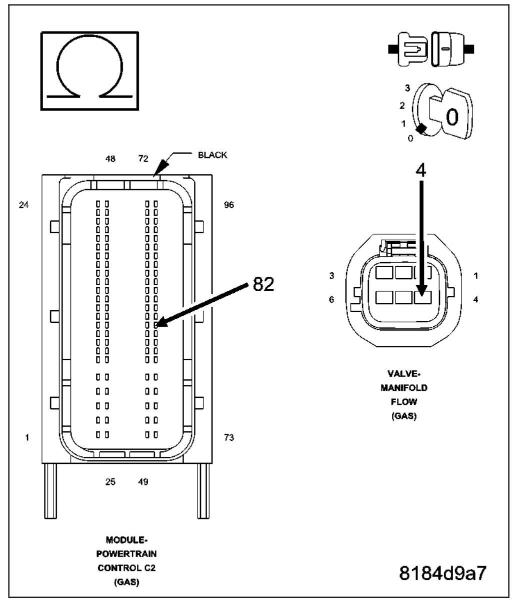
Yes >> Repair the (K602) MFV Signal circuit for a short to the (K857) 5 Volt Supply circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (K602) MFV SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K602) MFV Signal between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 6

No >> Repair the (K602) MFV Signal for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (K900) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

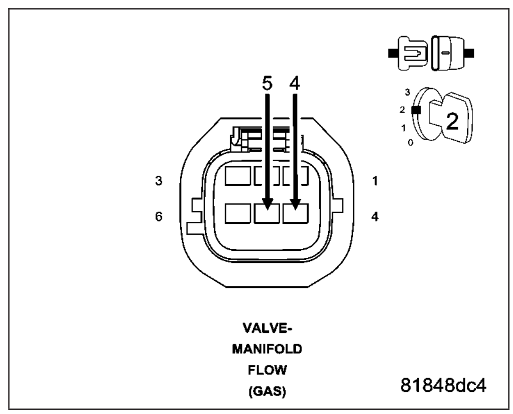
Measure the resistance of the (K900) Sensor Ground circuit between the Manifold Flow Valve harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (K900) Sensor Ground circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. MANIFOLD FLOW VALVE



Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (K900) Sensor Ground circuit and the (K602) MFV Signal circuit in the Manifold Flow Valve harness connector.

Turn the ignition on.

With the scan tool, read the Manifold Flow Valve signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Manifold Flow Valve in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. POWERTRAIN CONTROL MODULE (PCM)

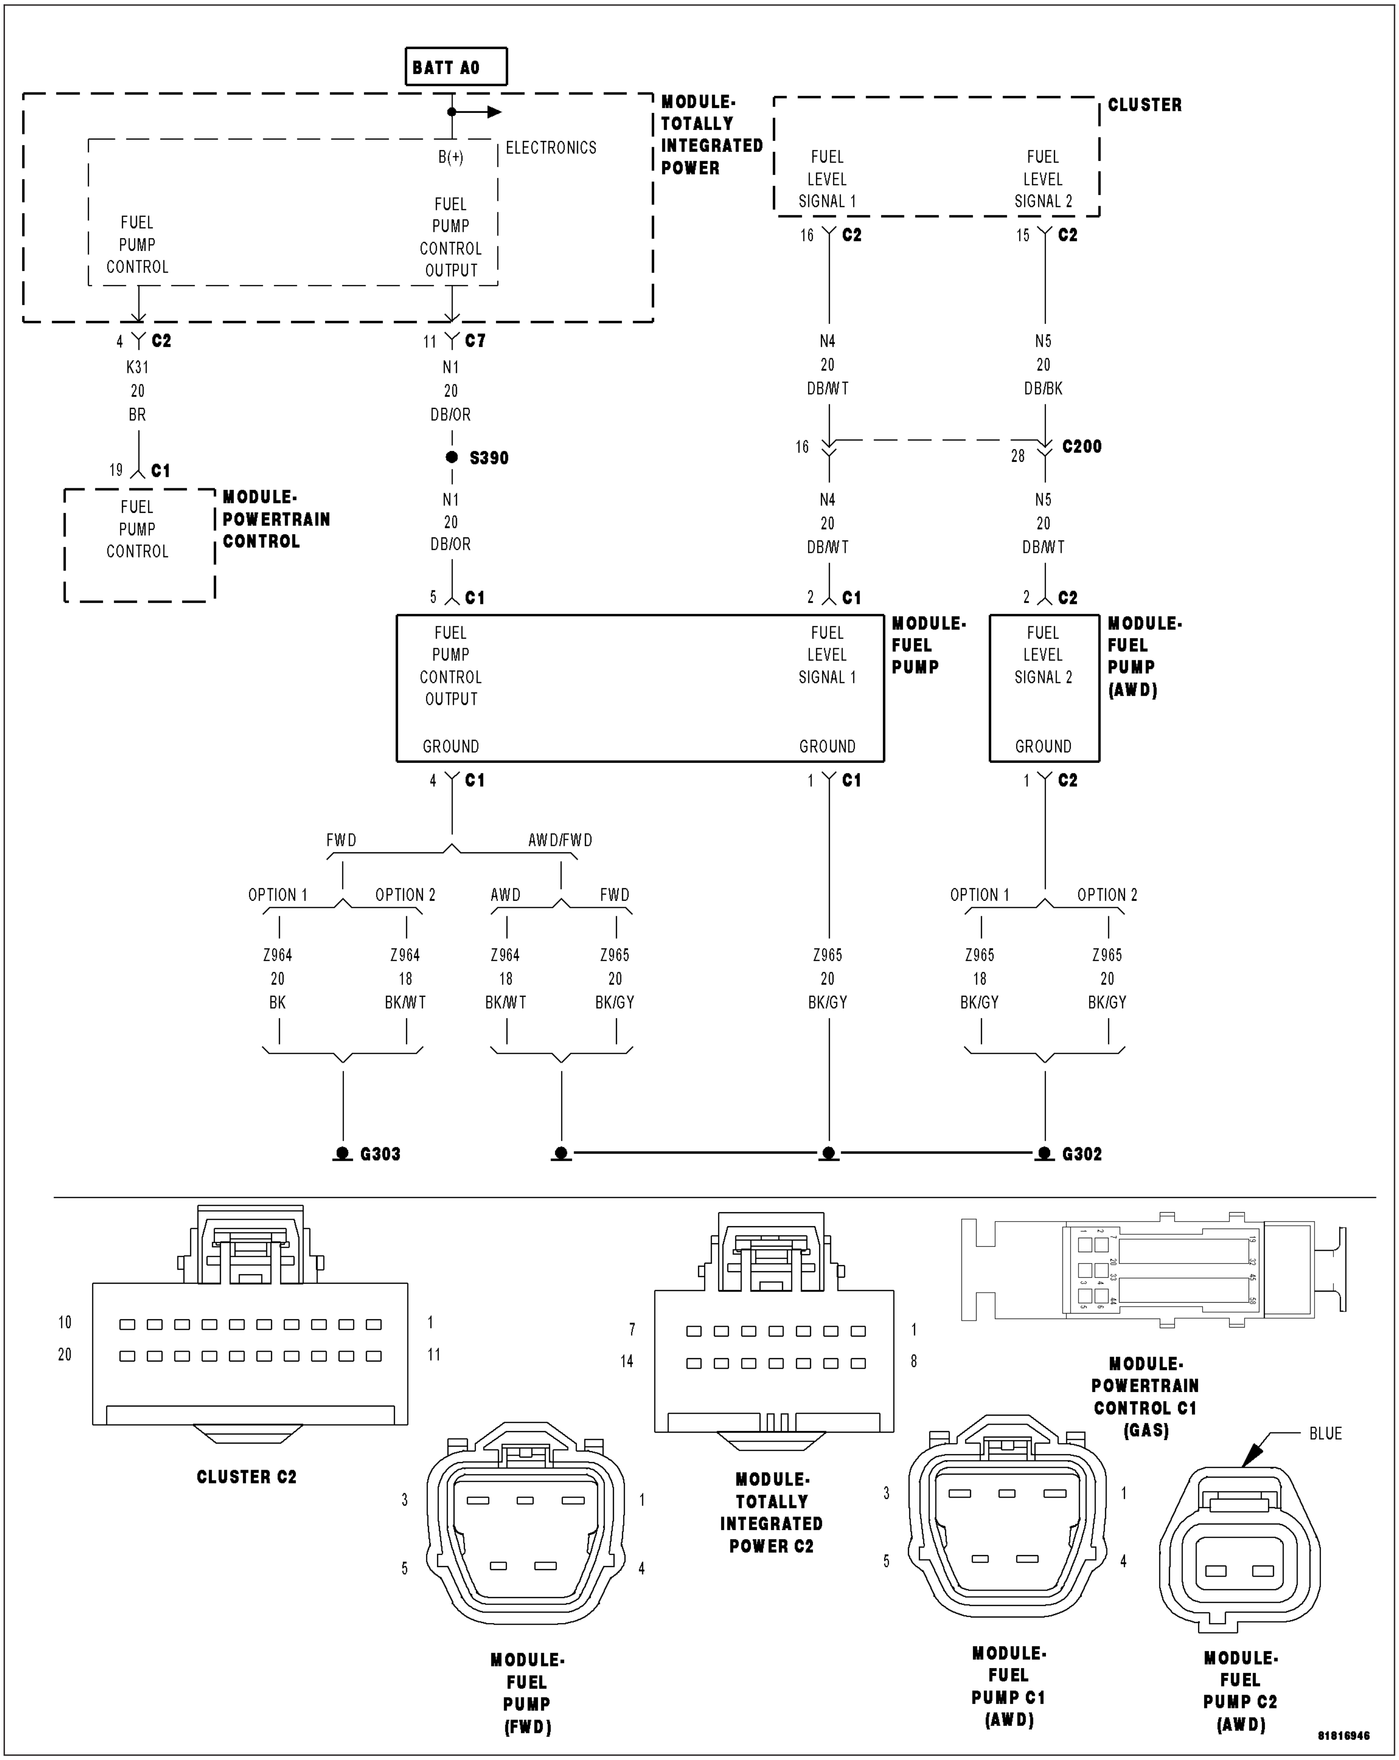
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Manifold Flow Valve and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2066-FUEL LEVEL SENSOR 2 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The PCM detects that the Fuel Level Sensor circuit voltage is implausible.

Possible Causes
INTERMITTENT DTC
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO GROUND
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO THE (Z965) GROUND CIRCUIT
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

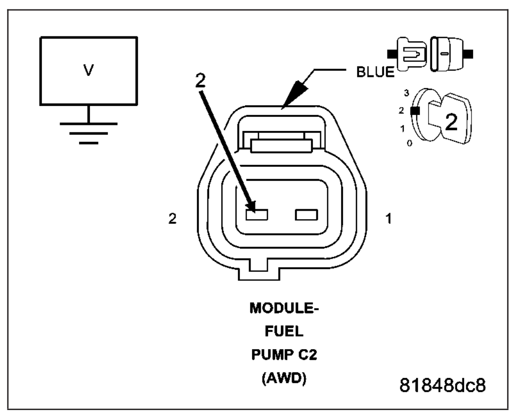
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Fuel Level Sensor connector.

Disconnect the Instrument Cluster (CCN) connector.

Turn the ignition on.

Measure the voltage of the (N5) Fuel Level Signal 2 circuit in the Fuel Level Sensor harness connector.

Is there any voltage present?

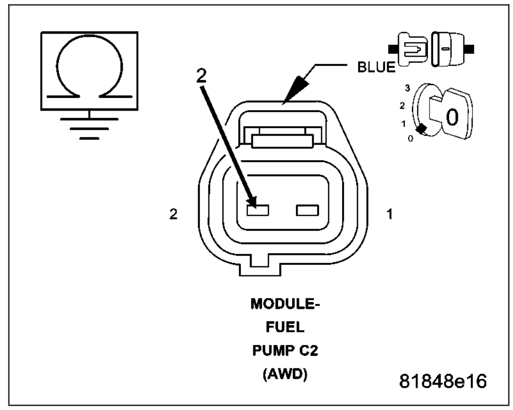
Yes >> Repair the (N5) Fuel Level Signal 2 circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.



Measure the resistance between ground and the (N5) Fuel Level Signal 2 circuit in the Fuel Level Sensor harness connector.

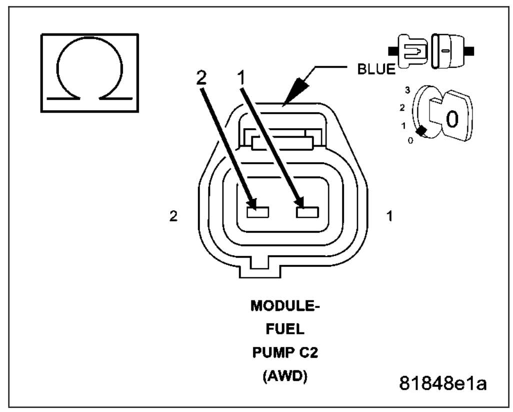
Is the resistance above 100 ohms?

Yes >> Go to 4

No >> Repair the (N5) Fuel Level Signal 2 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO THE (Z965) GROUND CIRCUIT



Measure the resistance between the (N5) Fuel Level Signal 2 circuit and the (Z965) Ground circuit in the Fuel Level Sensor harness connector.

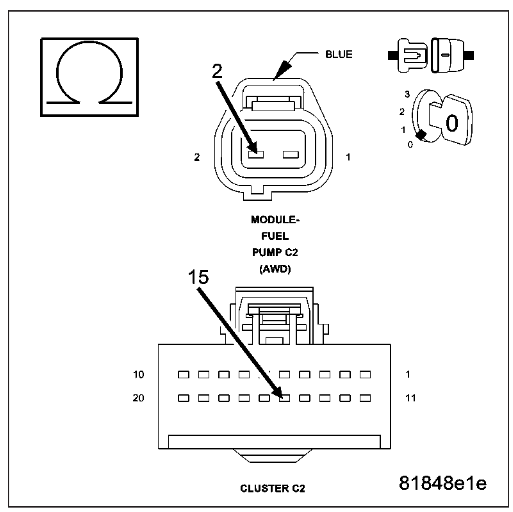
Is the resistance above 100 ohms?

Yes >> Go to 5

No >> Repair the (N5) Fuel Level Signal 2 circuit for a short to the (Z965) Ground circuit.

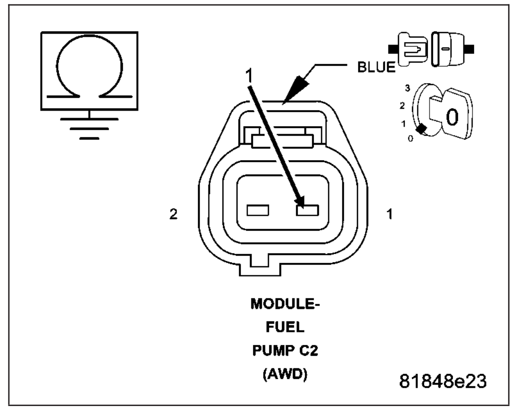
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (N5) FUEL LEVEL SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (N5) Fuel Level Signal 2 circuit between the Fuel Level Sensor harness connector and the Instrument Cluster (CCN) harness connector.

Is the resistance below 5.0 ohms?

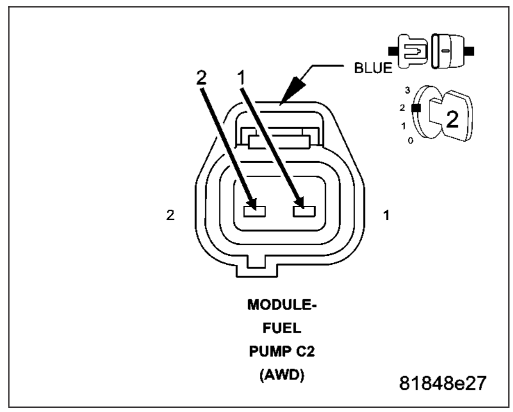


Yes >> Go to 6

No >> Repair the (N5) Fuel Level Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance between ground and the (Z965) Ground circuit in the Fuel Level Sensor harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (Z965) Ground for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. FUEL LEVEL SENSOR

Turn the ignition off.

Connect the Instrument Cluster (CCN) connector.

Connect a jumper wire between the (Z965) Ground circuit and the (N5) Fuel Level Signal 2 circuit in the Fuel Level Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Fuel Level Sensor 2 signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Fuel Level Sensor in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

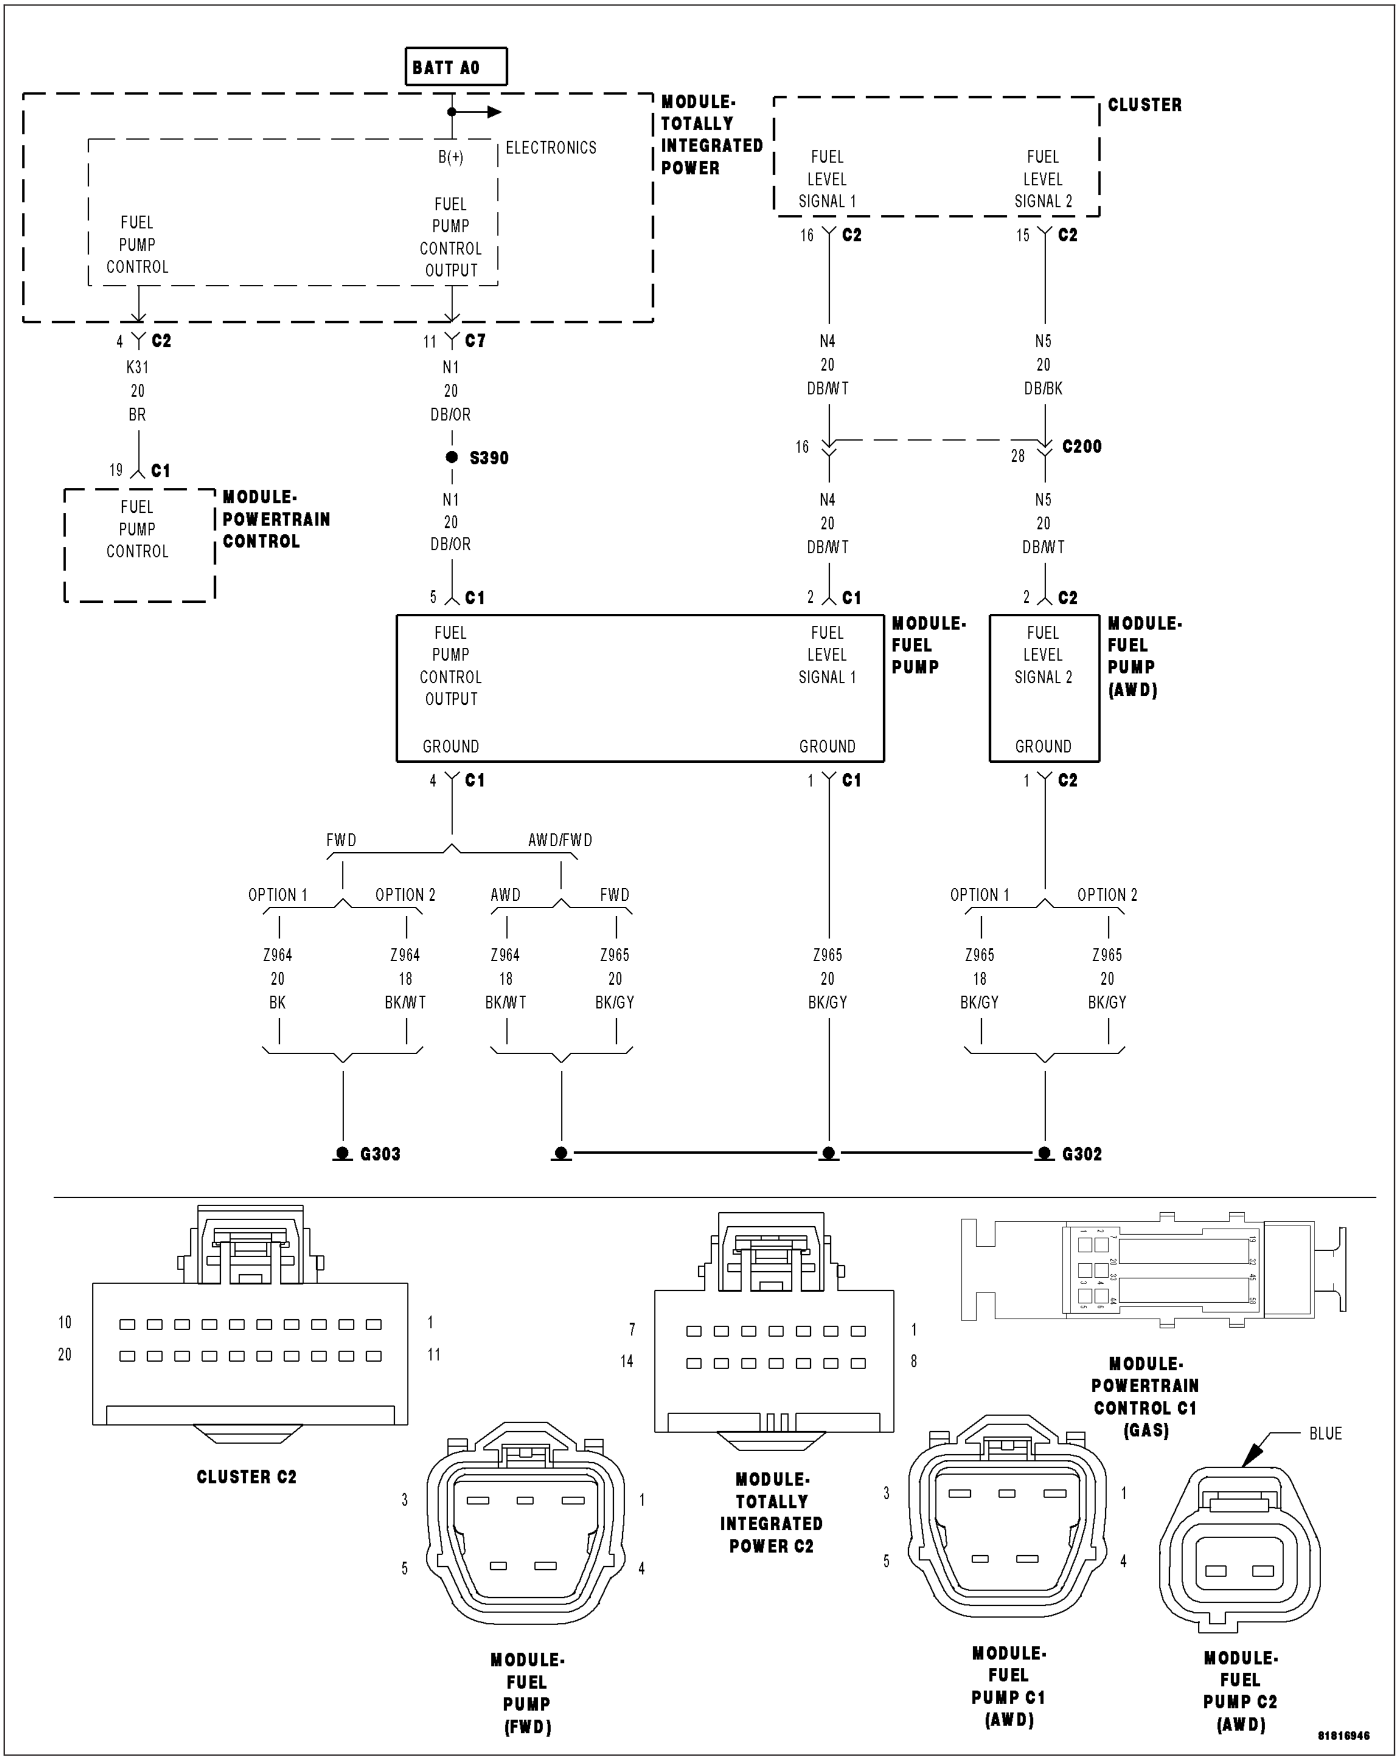
No >> Go to 8

8. INSTRUMENT CLUSTER (CCN)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Instrument Cluster (CCN) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2067-FUEL LEVEL SENSOR 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the Fuel Level Sensor circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO GROUND
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

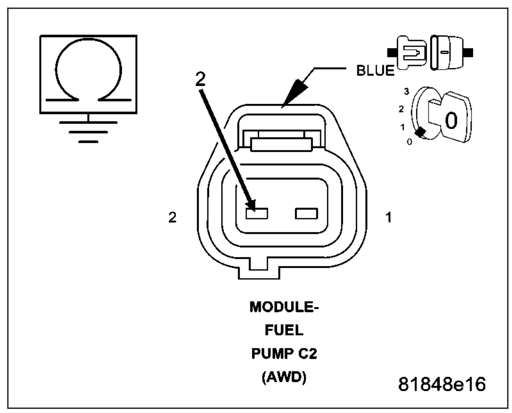
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



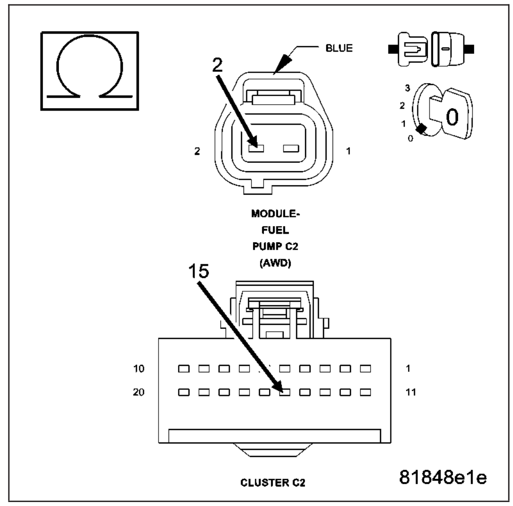
2. (N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Fuel Level Sensor connector.

Disconnect the Instrument Cluster (CCN) connector.

Measure the resistance between ground and the (N5) Fuel Level Signal 2 circuit in the Fuel Level Sensor harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 3

No >> Repair the (N5) Fuel Level Signal 2 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (N5) FUEL LEVEL SIGNAL 2 CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (N5) Fuel Level Signal 2 circuit between the Fuel Level Sensor harness connector and the Instrument Cluster (CCN) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 4

No >> Repair the (N5) Fuel Level Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. FUEL LEVEL SENSOR

Turn the ignition off.

Connect the Instrument Cluster (CCN) connector.

Turn the ignition on.

With the scan tool, read the Fuel Level Sensor 2 signal voltage.

Is the voltage above 4.5 volts with the Fuel Level Sensor harness disconnected?

Yes >> Replace the Fuel Level Sensor in accordance with the service information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. INSTRUMENT CLUSTER (CCN)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).

Look for any chafed, pierced, pinched, or partially broken wires.

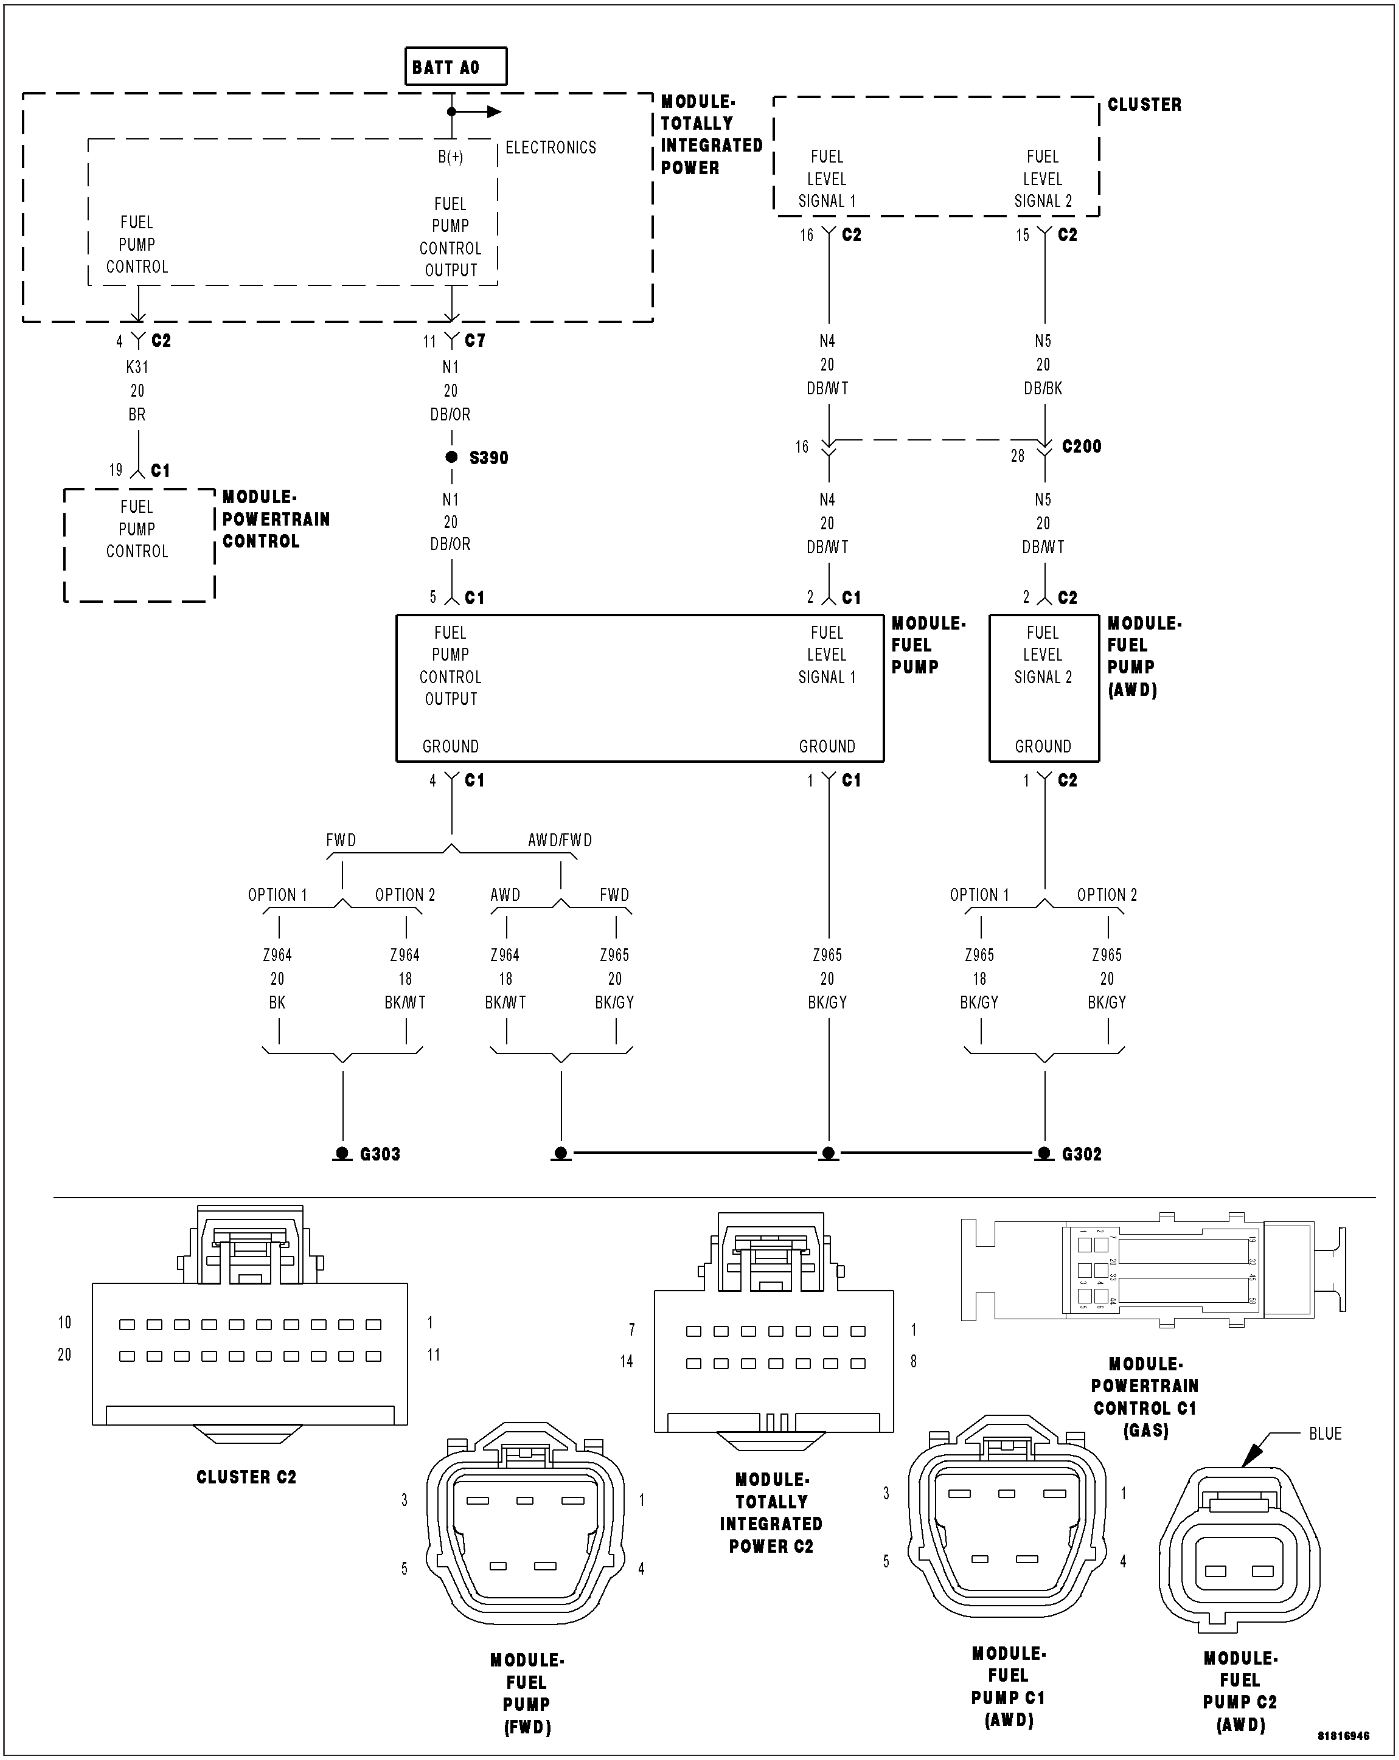
Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Instrument Cluster (CCN) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2068-FUEL LEVEL SENSOR 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (N5) Fuel Level Signal 2 circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(N5) FUEL LEVEL SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL LEVEL SENSOR
INSTRUMENT CLUSTER (CCN)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

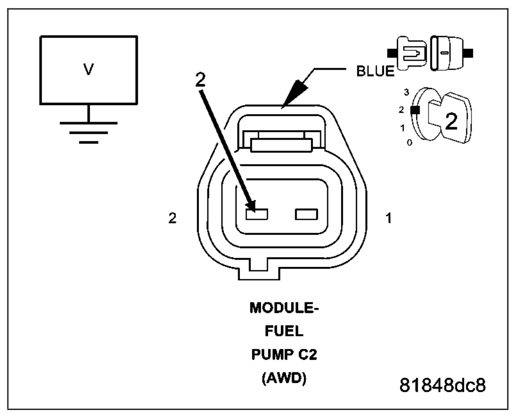
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (N5) FUEL LEVEL SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

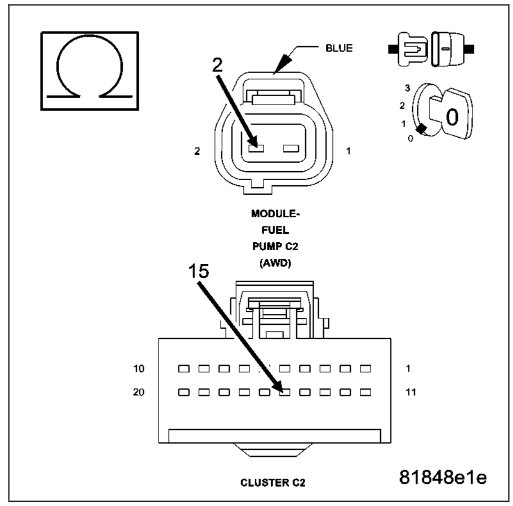
Disconnect the Fuel Level Sensor connector.

Disconnect the Instrument Cluster (CCN) connector.

Turn the ignition on.

Measure the voltage of the (N5) Fuel Level Signal 2 circuit in the Fuel Level Sensor harness connector.

Is there any voltage present?



Yes >> Repair the (N5) Fuel Level Signal 2 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

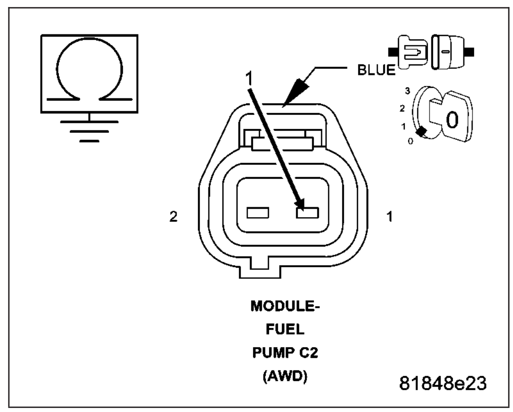
No >> Go to 3

3. (N5) FUEL LEVEL SIGNAL 2 OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (N5) Fuel Level Signal 2 circuit between the Fuel Level Sensor harness connector and the Instrument Cluster (CCN) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 4

No >> Repair the (N5) Fuel Level Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (Z965) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance between ground and the (Z965) Ground circuit at the Fuel Level Sensor harness connector.

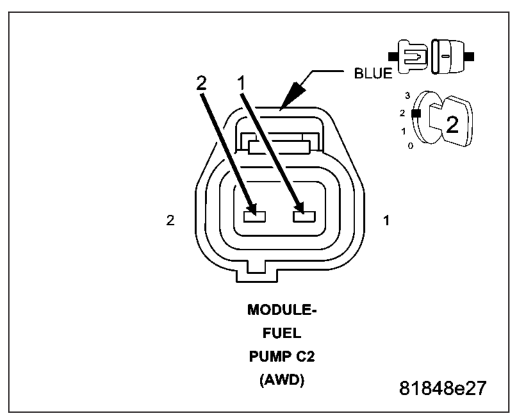
Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (Z965) Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL LEVEL SENSOR



Turn the ignition off.

Connect the Instrument Cluster (CCN) connector.

Connect a jumper wire between the (N5) Fuel Level Signal 2 circuit and the (Z965) Ground in the Fuel Level Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Fuel Level Sensor 2 signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Fuel Level Sensor in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. INSTRUMENT CLUSTER (CCN)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Level Sensor and the Instrument Cluster (CCN).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Instrument Cluster (CCN) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2072-ELECTRONIC THROTTLE CONTROL SYSTEM - ICE BLOCKAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the throttle plate is stuck during extremely cold ambient temperature operation. The PCM will initiate a throttle de-icing procedure, and if the throttle blade still doesn't move, this DTC will set. The MIL will not illuminate. The vehicle will be in Limp home condition, limiting rpm and vehicle speed.

Possible Causes
THROTTLE PLATE OBSTRUCTION

Diagnostic Test

1. THROTTLE BODY INSPECTION

Ignition on, engine not running.

With a scan tool, select View DTCs. Record the related Freeze Frame data.

NOTE: Diagnose any other DTCs before continuing.

NOTE: This DTC will set in extreme cold ambient temperatures when the PCM detects that the throttle plate is stuck. By the time the vehicle is serviced, the condition may be corrected.

Turn the ignition off.

Remove the air cleaner assembly.

Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

Were any problems found?

Yes >> Repair as necessary. It the throttle blade is frozen, allow the throttle body to thaw naturally in a warm location.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test complete.

P2074-MAP/TPS CORRELATION - HIGH AIRFLOW/VACUUM LEAK DETECTED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  During all drive modes
- **Set Condition:**
  With engine vacuum below 1.5″ Hg, engine RPM greater than 2000 RPM, and a closed throttle. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5 Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VACUUM LEAK

NOTE: This code is enabled on engines equipped with a plastic intake manifold to limit engine operation if a large vacuum leak should occur.

NOTE: A large vacuum leak is the most probable cause of this DTC.

Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.

Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.

Inspect the MAP Sensor and Throttle Body for proper installation.

Inspect the engine for any mechanical conditions that can cause low engine vacuum.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. MAP SENSOR OPERATION

Start the engine.

With a scan tool, monitor the MAP Sensor voltage.

Snap the throttle.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

Yes >> Go to 5

No >> Go to 4

4. MAP SENSOR

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the MAP Sensor circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the MAP Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. THROTTLE FOLLOWER TEST

Ignition on, engine not running.

With a scan tool, perform the Throttle Follower Test and monitor the TP Sensor 1 and TP Sensor 2 voltages.

Slowly press the throttle pedal down.

The voltage for TP Sensor 1 should start at approximately 0.3 volts and increase to above 4.7 volts.

The voltage for TP Sensor 2 should start at approximately 4.7 volts and decrease to approximately 0.3 volts.

Is the voltage within the range specified for each sensor?

Yes >> Go to 7

No >> Go to 6

6. THROTTLE BODY

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the Throttle Body circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

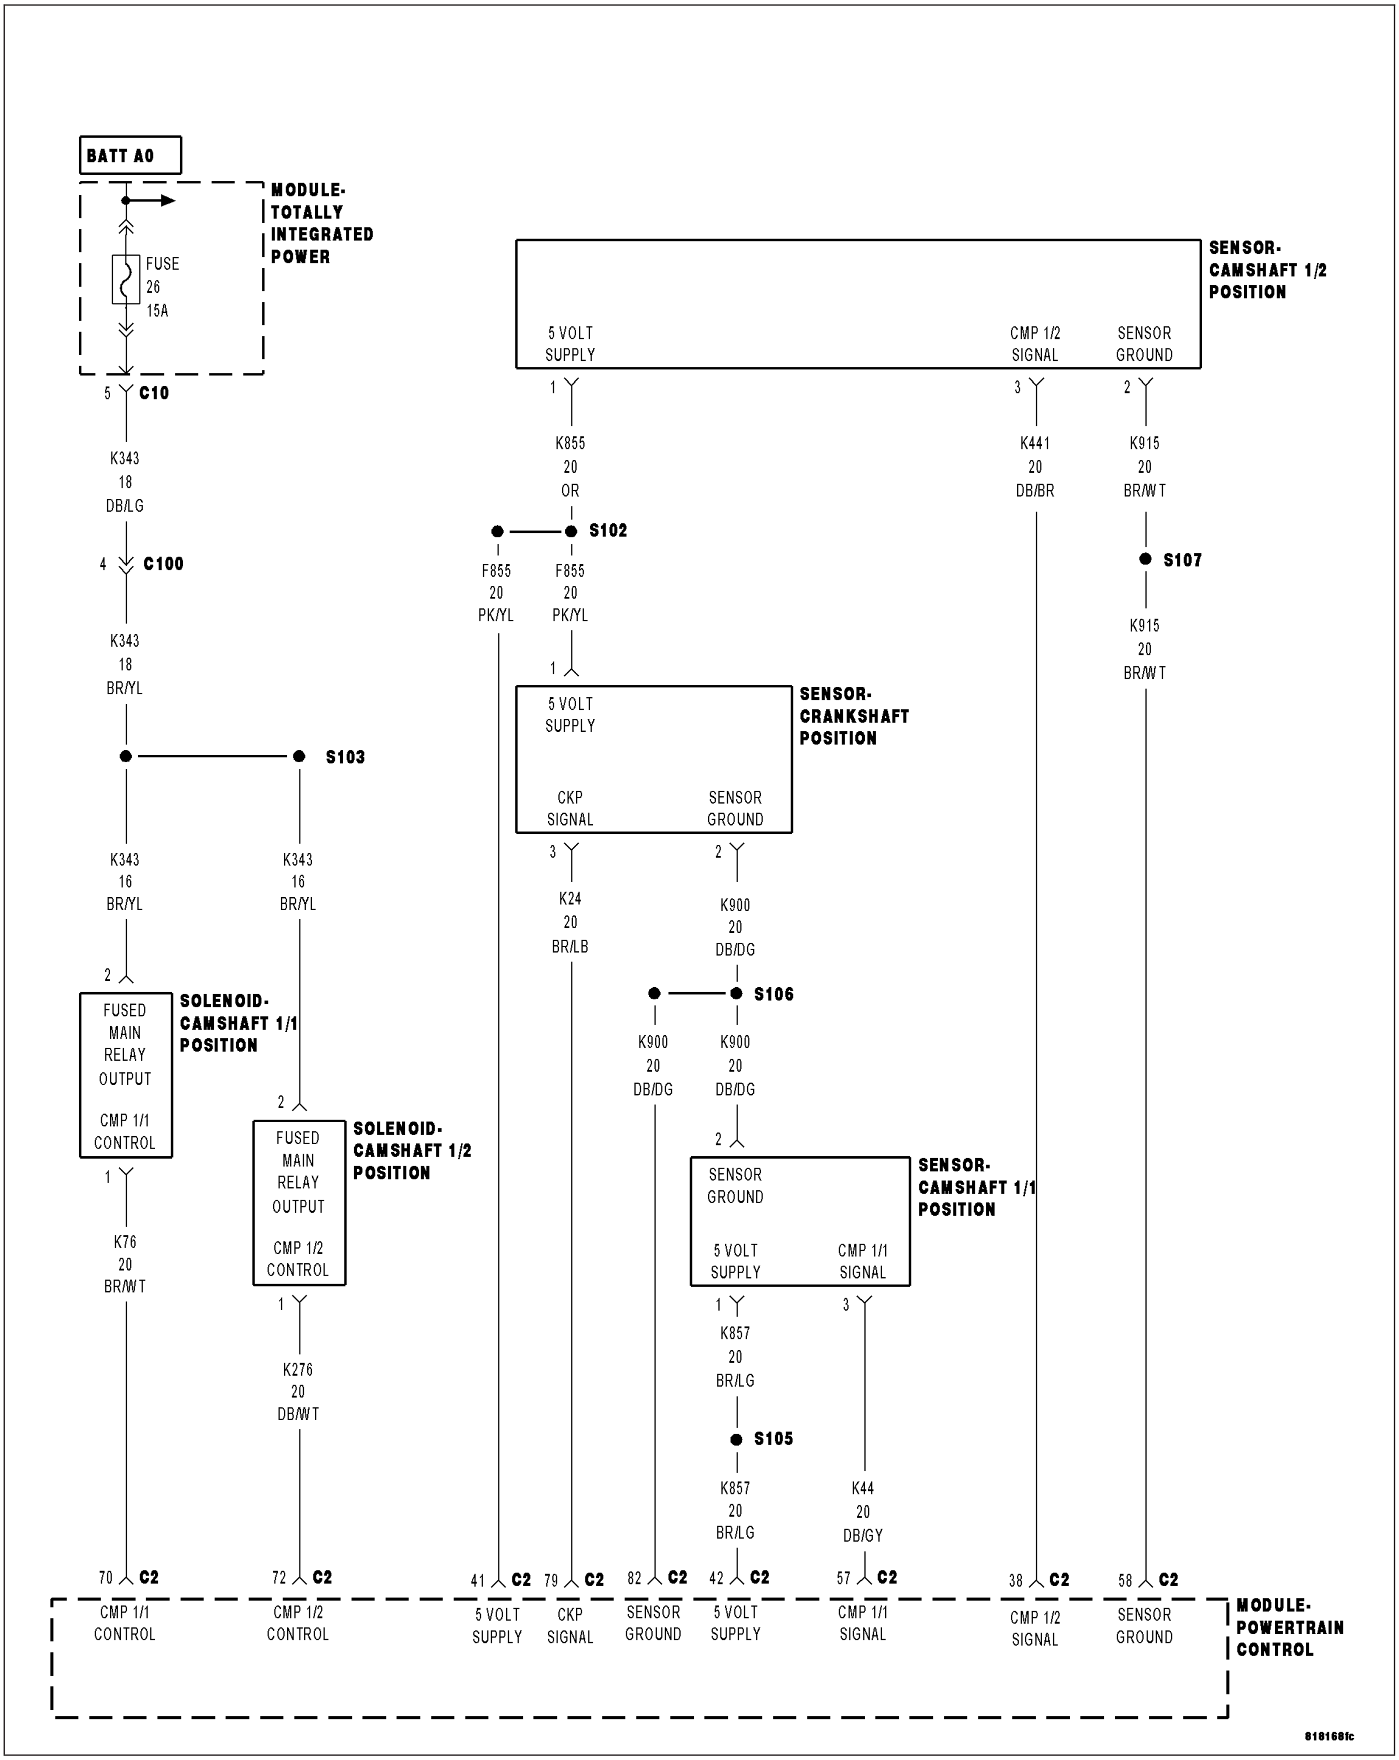
No >> Replace the Throttle Body in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2088-BANK 1 CAMSHAFT 1 POSITION ACTUATOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K76) CMP 1/1 Control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K76) CMP 1/1 CONTROL CIRCUIT SHORTED TO GROUND
(K76) CMP 1/1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
CAMSHAFT 1/1 POSITION SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

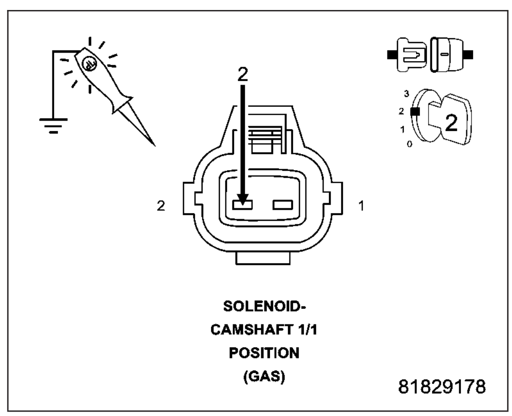
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Camshaft 1/1 Position Solenoid harness connector.

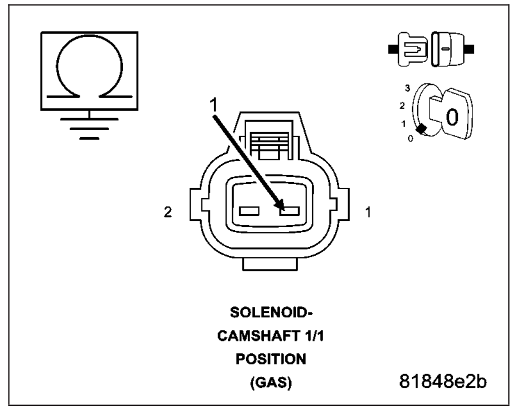
Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K343) Fused Main Relay Output circuit in the Camshaft 1/1 Position Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3



No >> Repair the (K343) Fused Main Relay Output circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

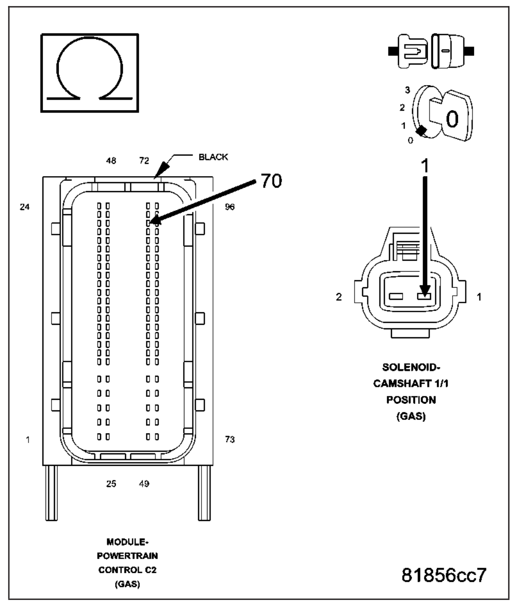
3. (K76) CMP 1/1 CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K76) CMP 1/1 Control circuit in the Camshaft 1/1 Position Solenoid harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (K76) CMP 1/1 Control circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K76) CMP 1/1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

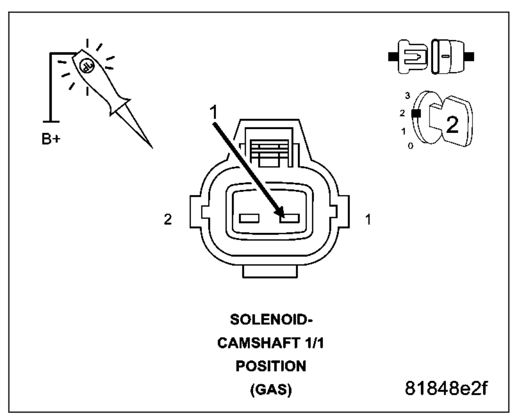
Measure the resistance of the (K76) CMP 1/1 Control circuit between the Camshaft 1/1 Position Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K76) CMP 1/1 Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. CAMSHAFT 1/1 POSITION SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Camshaft 1/1 Position Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to 12 volts, check the (K76) CMP 1/1 Control circuit in the Camshaft 1/1 Position Solenoid harness connector.

NOTE: The test light should be illuminated and bright with the control actuated ON (100%). Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Camshaft 1/1 Position Solenoid control to OFF (0%).

Using a 12 volt test light connected to 12 volts, check the (K76) CMP 1/1 Control circuit in the Camshaft 1/1 Position Solenoid harness connector.

NOTE: The test light should not be illuminated with the control actuated OFF (0%).

Is the test light illuminated and bright with the control actuated ON and not illuminated with the control

actuated OFF?

Yes >> Replace the Camshaft 1/1 Position Solenoid in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

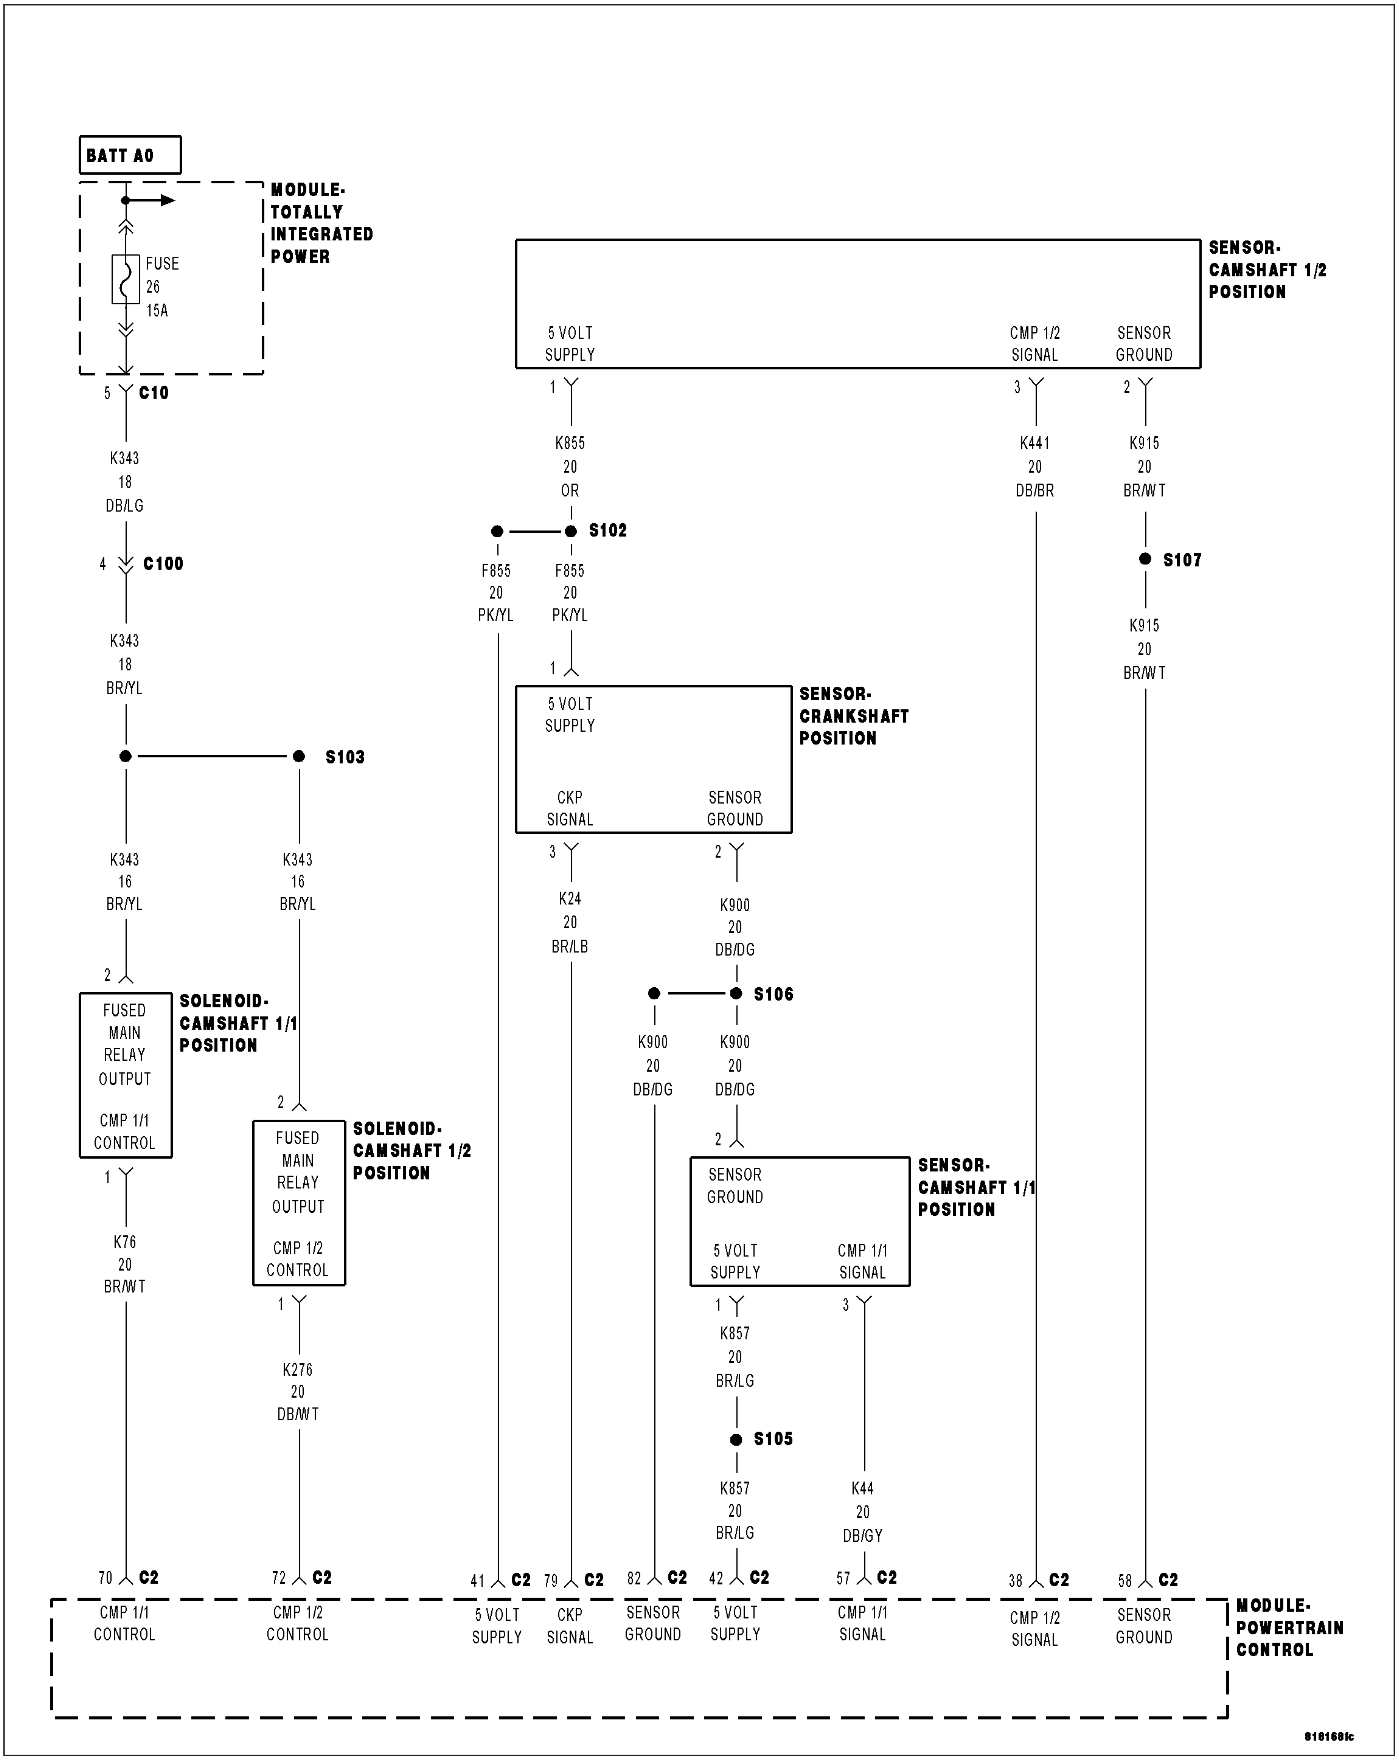
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/1 Position Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2089-BANK 1 CAMSHAFT 1 POSITION ACTUATOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects that the (K76) CMP 1/1 Control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K76) CMP 1/1 CONTROL CIRCUIT SHORTED TO VOLTAGE
(K76) CMP 1/1 CONTROL CIRCUIT SHORTED TO THE (K343) FUSED MAIN RELAY OUTPUT CIRCUIT
(K76) CMP 1/1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
CAMSHAFT 1/1 POSITION SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

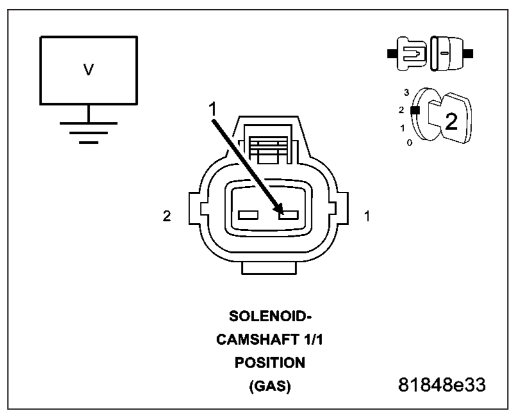
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K76) CMP 1/1 CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

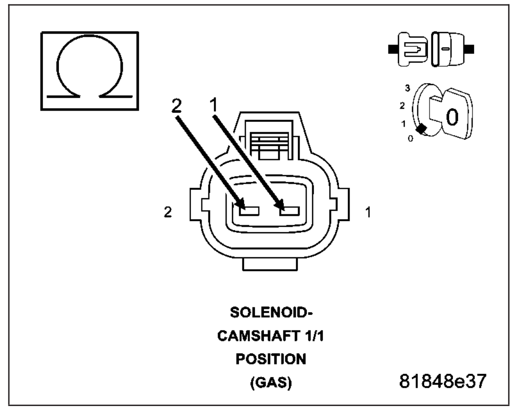
Disconnect the Camshaft 1/1 Position Solenoid connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K76) CMP 1/1 Control circuit in the Camshaft 1/1 Position Solenoid harness connector.

Is there any voltage present?



Yes >> Repair the (K76) CMP 1/1 Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

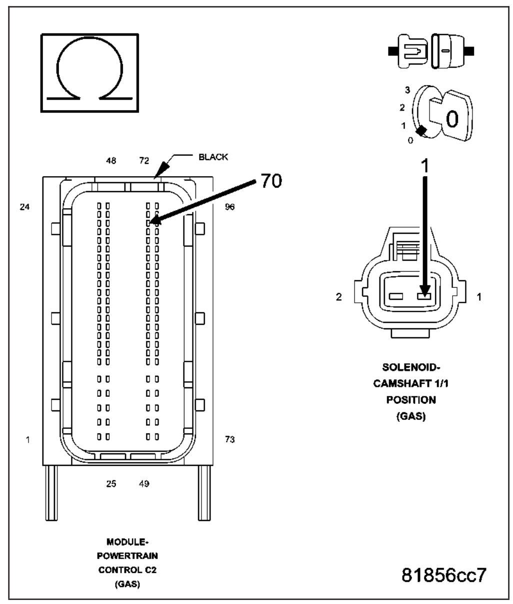
No >> Go to 3

3. (K76) CMP 1/1 CONTROL CIRCUIT SHORTED TO THE (K343) FUSED MAIN RELAY OUTPUT CIRCUIT

Turn the ignition off.

Measure the resistance between the (K76) CMP 1/1 Control circuit and the (K343) Fused Main Relay Output circuit in the Camshaft 1/1 Position Solenoid harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 4

No >> Repair the (K76) CMP 1/1 Control circuit for a short to the (K343) Fused Main Relay Output circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K76) CMP 1/1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

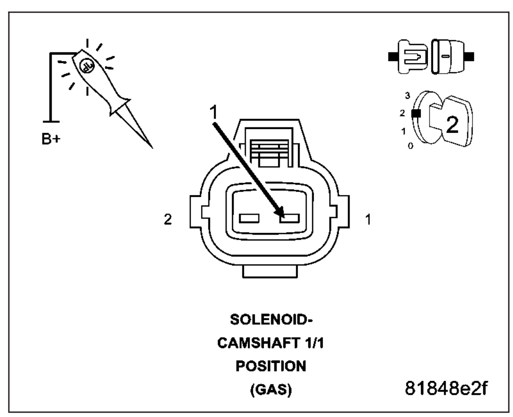
Measure the resistance of the (K76) CMP 1/1 Control circuit between the Camshaft 1/1 Position Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K76) CMP 1/1 Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. CAMSHAFT 1/1 POSITION SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Camshaft 1/1 Position Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to 12 volts, check the (K76) CMP 1/1 Control circuit in the Camshaft 1/1 Position Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Replace the Camshaft 1/1 Position Solenoid in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

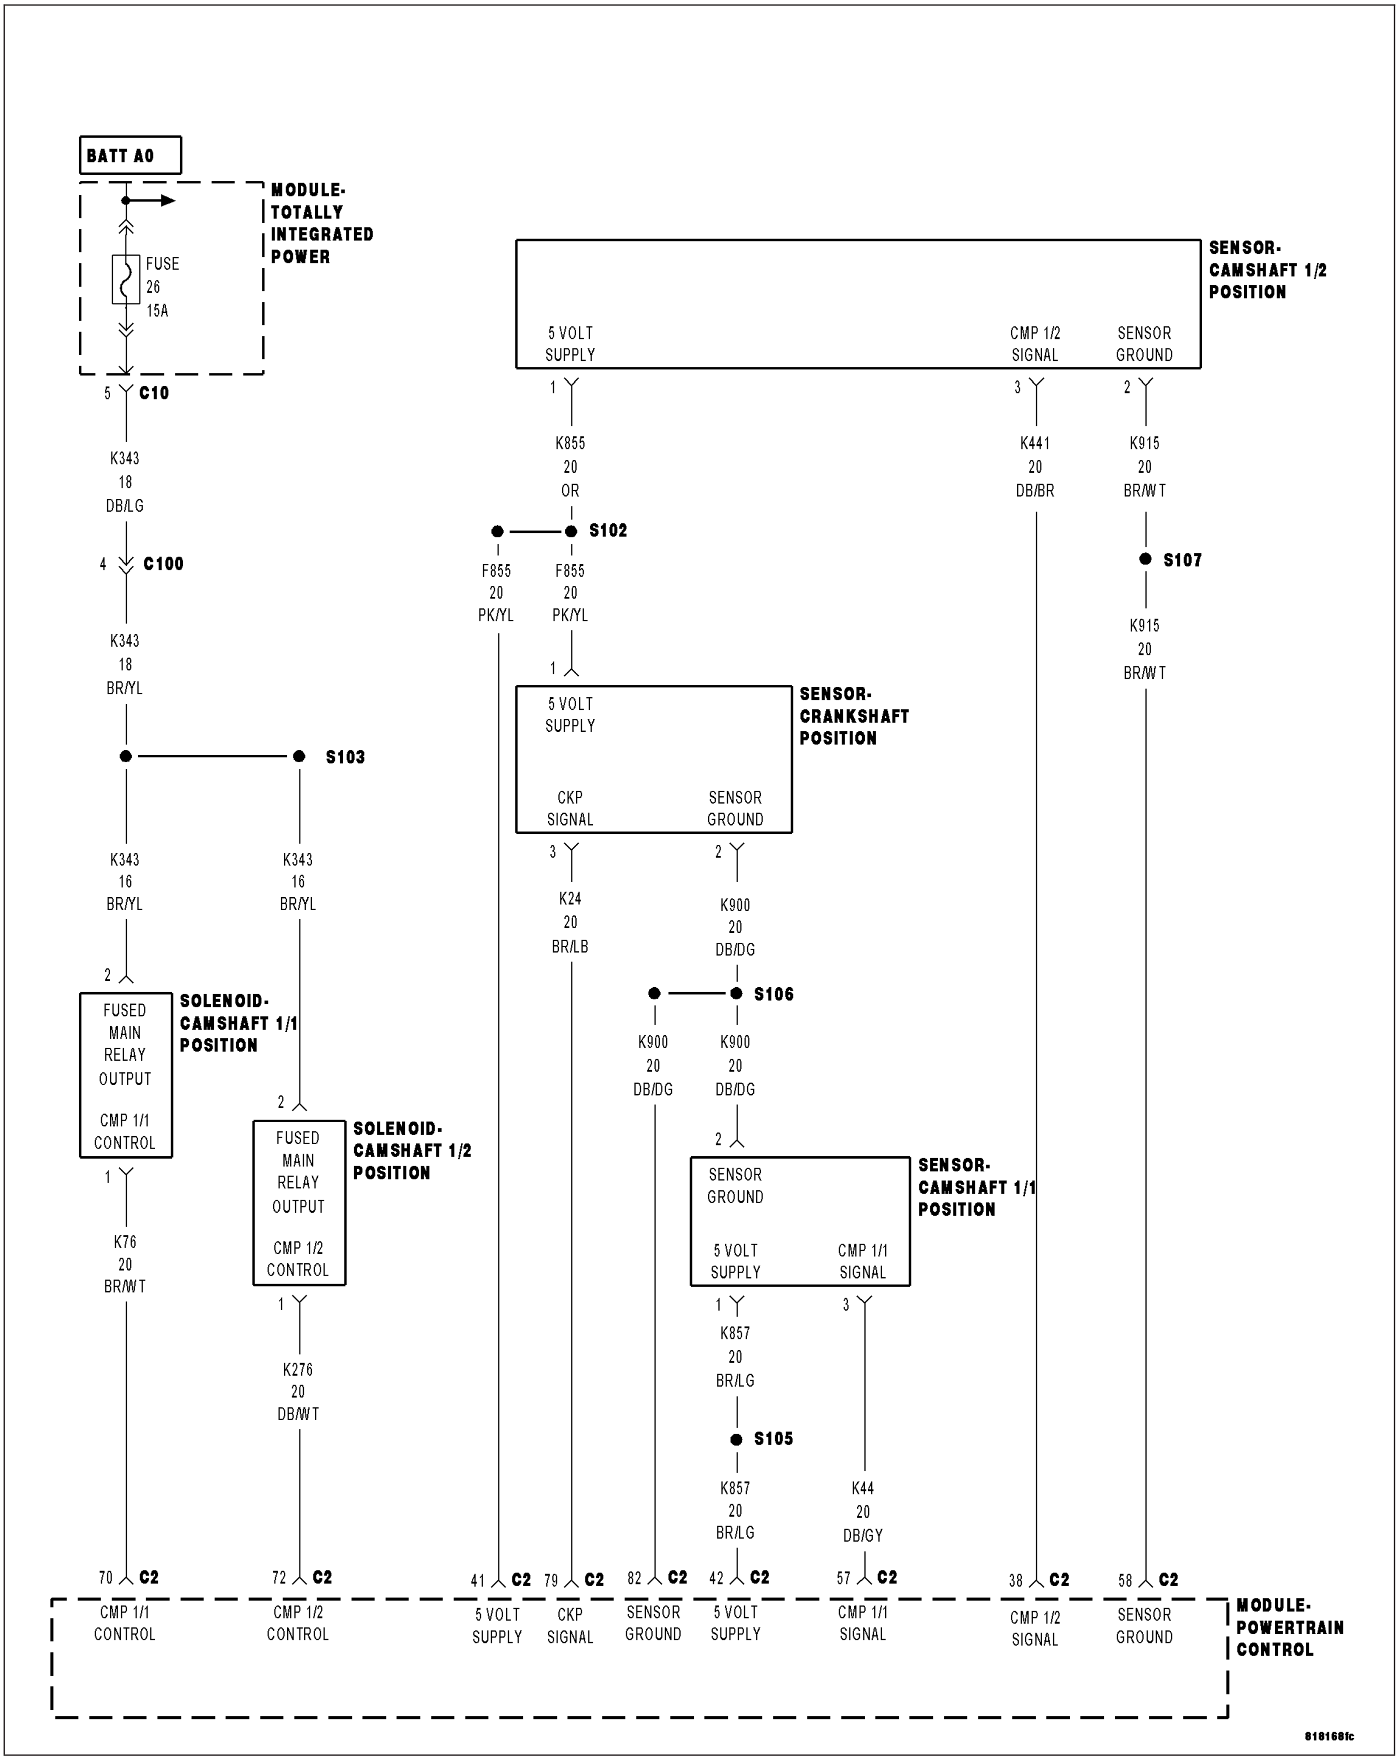
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/1 Position Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2090-BANK 1 CAMSHAFT 2 POSITION ACTUATOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K276) CMP 1/2 Control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K276) CMP 1/2 CONTROL CIRCUIT SHORTED TO GROUND
(K276) CMP 1/2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
CAMSHAFT 1/2 POSITION SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

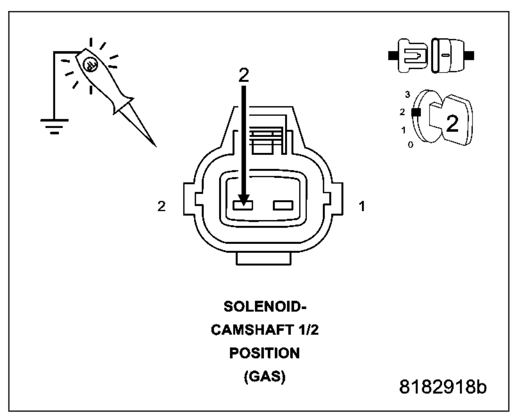
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Camshaft 1/2 Position Solenoid harness connector.

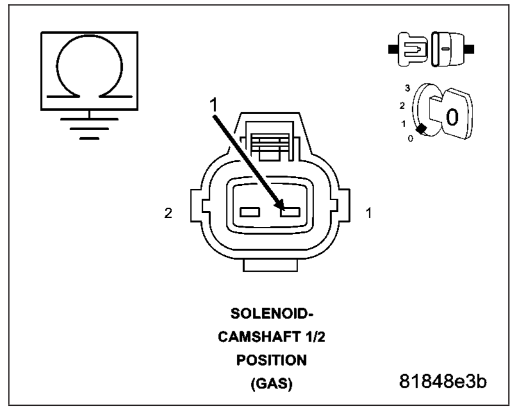
Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K343) Fused Main Relay Output circuit in the Camshaft 1/2 Position Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3



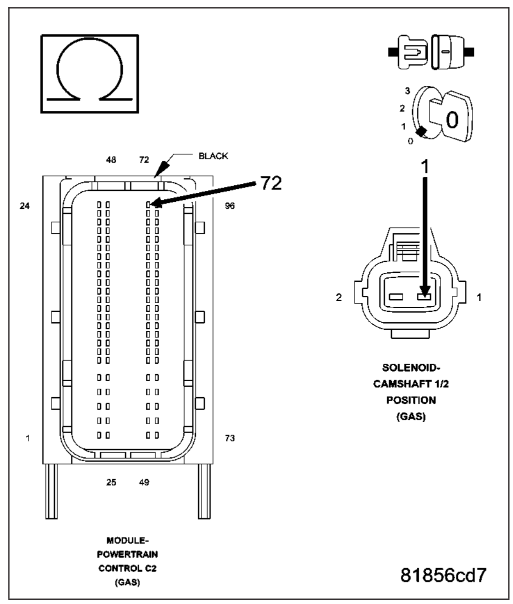
No >> Repair the (K343) Fused Main Relay Output circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K276) CMP 1/2 CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K276) CMP 1/2 Control circuit in the Camshaft 1/2 Position Solenoid harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K276) CMP 1/2 Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

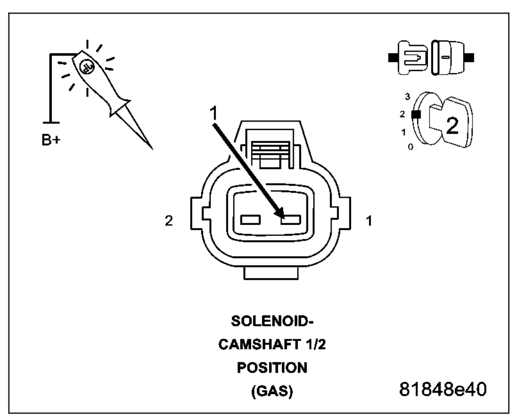
4. (K276) CMP 1/2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K276) CMP 1/2 Control circuit between the Camshaft 1/2 Position Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K276) CMP 1/2 Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. CAMSHAFT 1/2 POSITION SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Camshaft 1/2 Position Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to 12 volts, check the (K276) CMP 1/2 Control circuit in the Camshaft 1/2 Position Solenoid harness connector.

NOTE: The test light should be illuminated and bright with the control actuated ON (100%). Compare the brightness to that of a direct connection to the battery.

With the scan tool, actuate the Camshaft 1/2 Position Solenoid control to OFF (0%).

Using a 12 volt test light connected to 12 volts, check the (K276) CMP 1/2 Control circuit in the Camshaft 1/2 Position Solenoid harness connector.

NOTE: The test light should not be illuminated with the control actuated OFF (0%).

Is the test light illuminated and bright with the control actuated ON and not illuminated with the control

actuated OFF?

Yes >> Replace the Camshaft 1/2 Position Solenoid in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

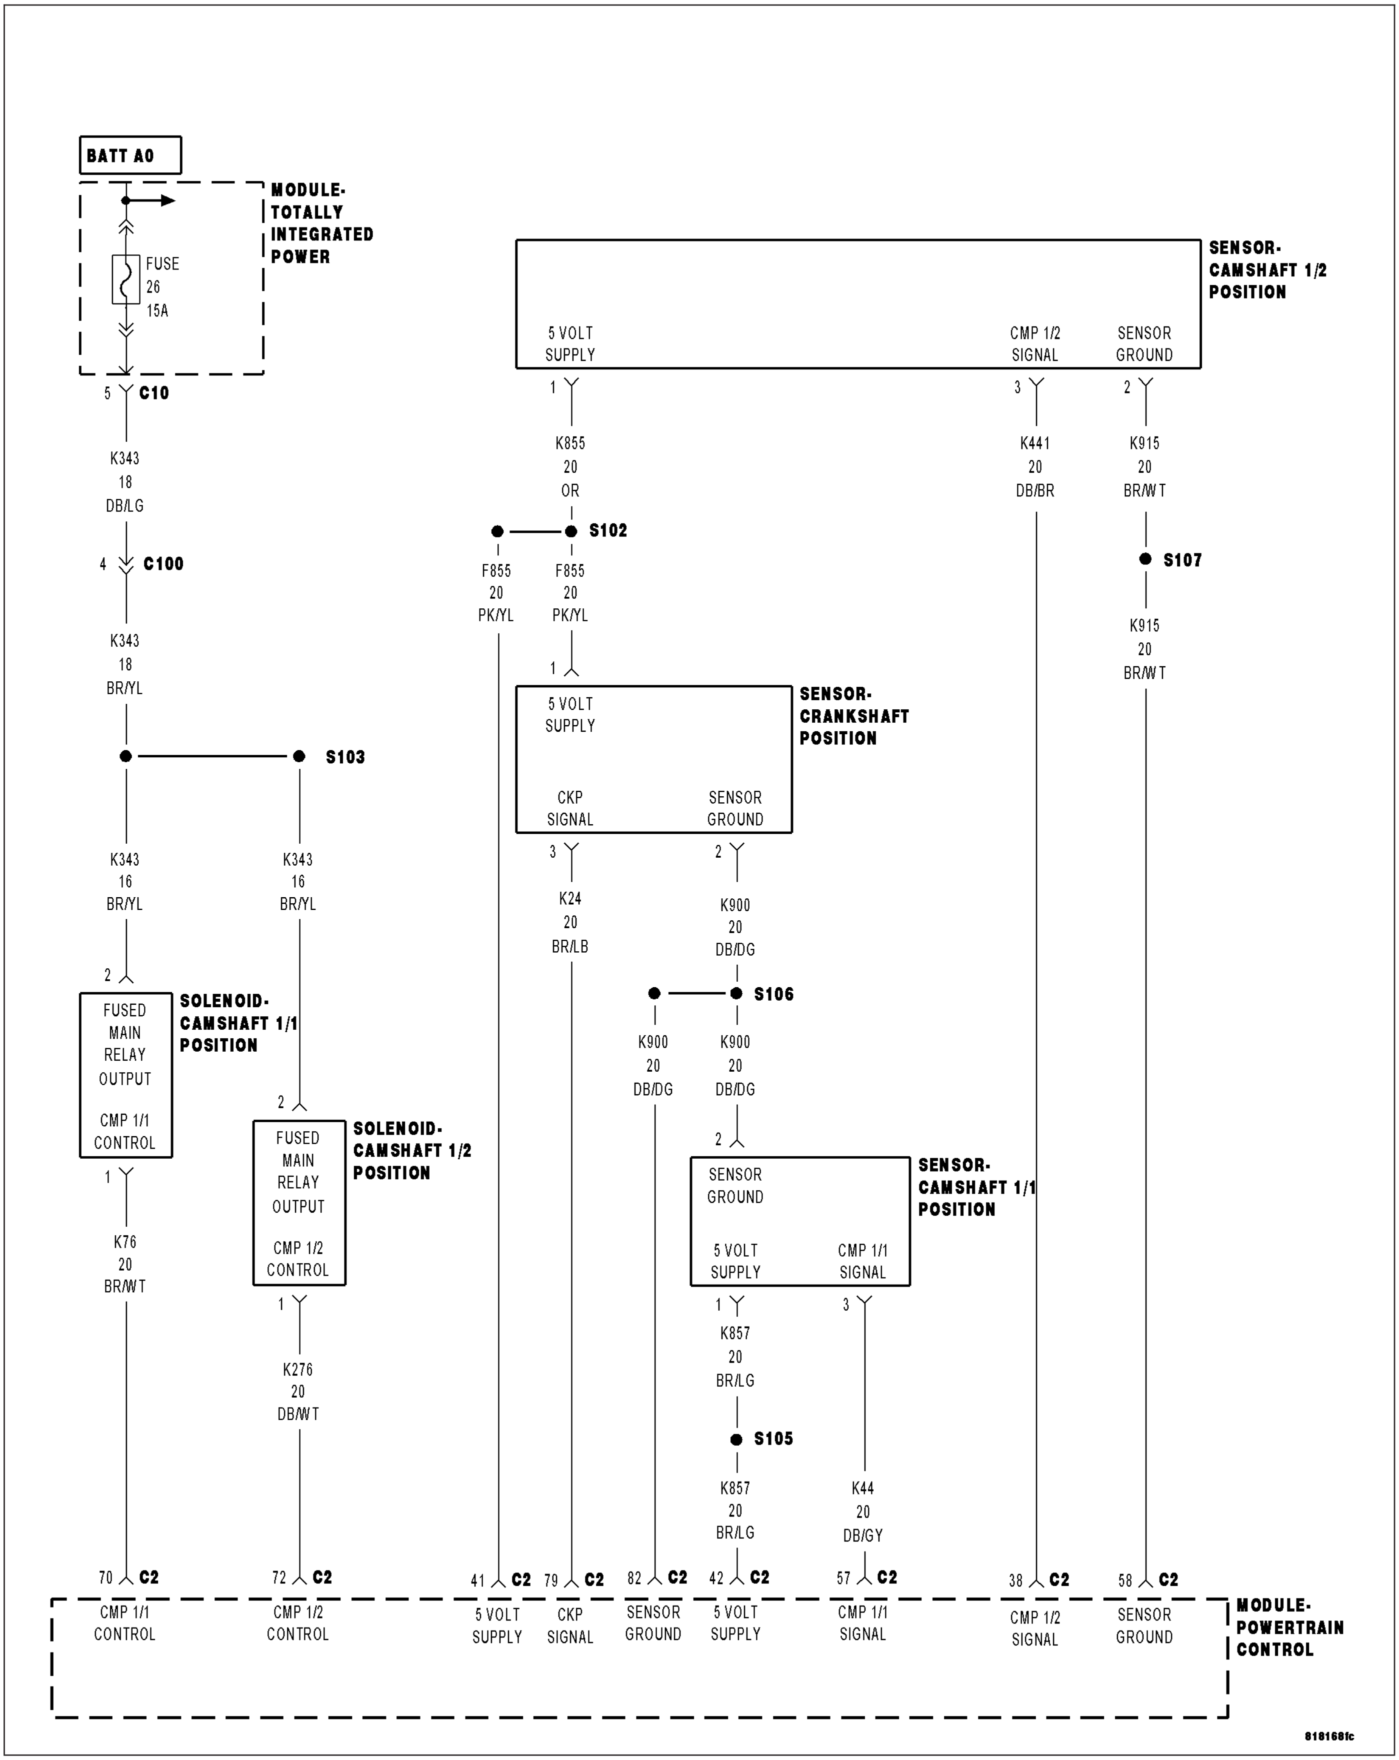
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/2 Position Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2091-BANK 1 CAMSHAFT 2 POSITION ACTUATOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects that the (K276) CMP 1/2 Control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K276) CMP 1/2 CONTROL CIRCUIT SHORTED TO VOLTAGE
(K276) CMP 1/2 CONTROL CIRCUIT SHORTED TO THE (K343) FUSED MAIN RELAY OUTPUT CIRCUIT
(K276) CMP 1/2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
CAMSHAFT 1/2 POSITION SOLENOID
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

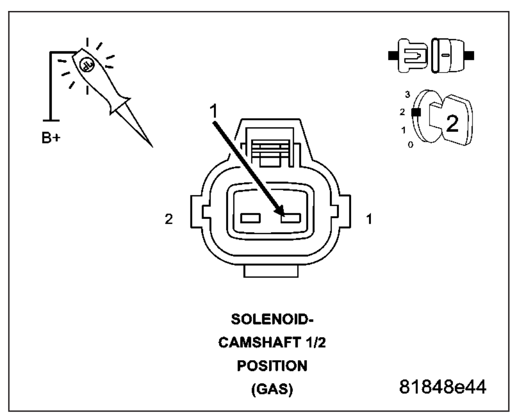
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K276) CMP 1/2 CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Camshaft 1/2 Position Solenoid connector.

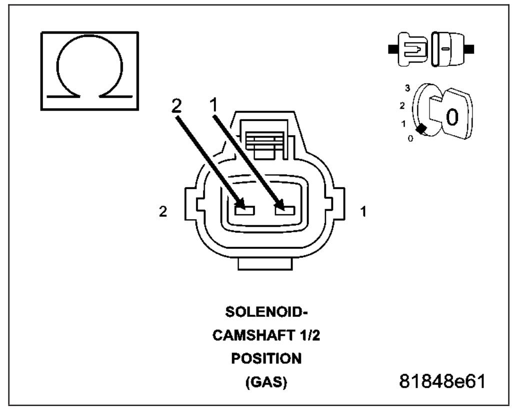
Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K276) CMP 1/2 Control circuit in the Camshaft 1/2 Position Solenoid harness connector.

Is there any voltage present?

Yes >> Repair the (K276) CMP 1/2 Control circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

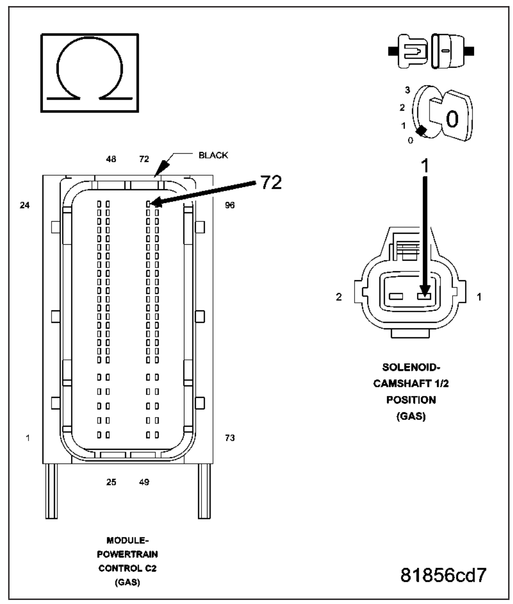
No >> Go to 3

3. (K276) CMP 1/2 CONTROL CIRCUIT SHORTED TO THE (K343) FUSED MAIN RELAY OUTPUT CIRCUIT

Turn the ignition off.

Measure the resistance between the (K276) CMP 1/2 Control circuit and the (K343) Fused Main Relay Output circuit in the Camshaft 1/2 Position Solenoid harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 4

No >> Repair the (K276) CMP 1/2 Control circuit for a short to the (K343) Fused Main Relay Output circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K276) CMP 1/2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

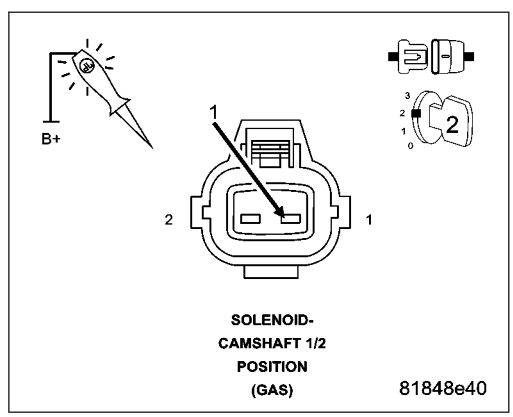
Measure the resistance of the (K276) CMP 1/2 Control circuit between the Camshaft 1/2 Position Solenoid harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K276) CMP 1/2 Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. CAMSHAFT 1/2 POSITION SOLENOID

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, actuate the Camshaft 1/2 Position Solenoid control to the ON (100%) position.

Using a 12 volt test light connected to 12 volts, check the (K276) CMP 1/2 Control circuit in the Camshaft 1/2 Position Solenoid harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Replace the Camshaft 1/2 Position Solenoid in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

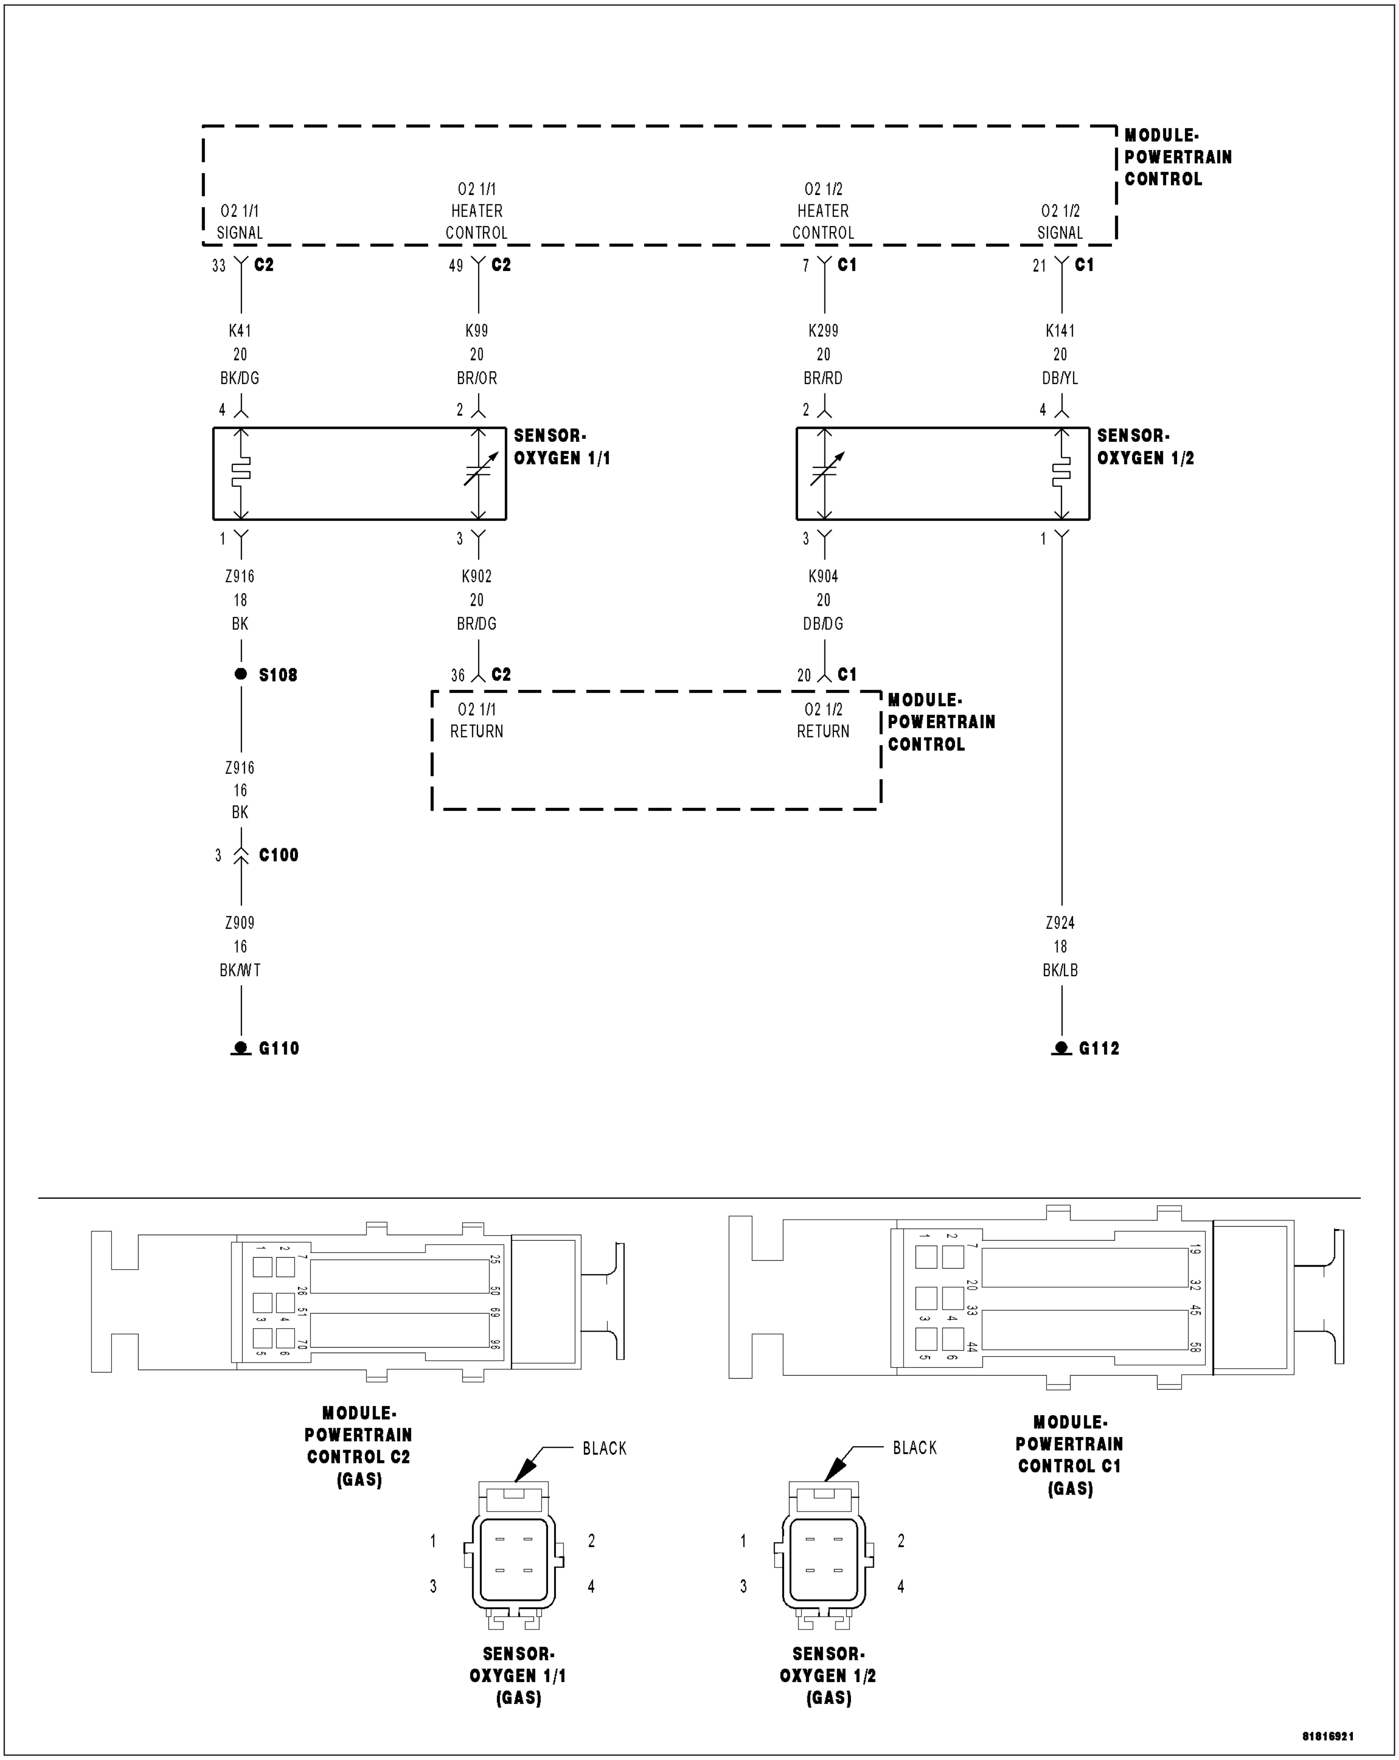
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Camshaft 1/2 Position Solenoid and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2096-DOWNSTREAM FUEL TRIM SYSTEM 1 LEAN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Monitored constantly when the upstream and downstream O2 sensors are operating in closed loop.
- **Set Condition:**
  The purpose of the diagnostic for this DTC is to determine if the upstream O2 sensor has become biased due to an exhaust leak, sensor contamination, or some other extreme condition. The downstream O2 sensor is considered to be protected from extreme conditions by the catalyst. The downstream O2 sensor feedback control is used to diagnose whether the upstream O2 sensor has become biased. The value of the downstream fuel trim is monitored and compared for rich and lean conditions. Every time the value exceeds the calculated threshold, a timer increments. If the fail timer exceeds the fail threshold, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

Possible Causes
INTERMITTENT DTC
EXHAUST LEAK
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K904) O2 1/2 RETURN CIRCUIT SHORTED TO VOLTAGE
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO THE (K904) O2 1/2 RETURN CIRCUIT
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO GROUND
(K904) O2 1/2 RETURN CIRCUIT SHORTED TO GROUND
(K141) O2 1/2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K904) O2 1/2 RETURN CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR 1/2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EXHAUST LEAK

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false 1/1 O2 Sensor failure

Turn the ignition off.

Inspect the exhaust system for leaks between the engine and the 1/1 Oxygen Sensor.

Perform a leak test with Miller Tool #8404A Evaporative Emissions Leak Detector (EELD), even if an audible leak is not heard. Pay particular attention to the exhaust manifold to head surface, exhaust pipe to manifold connection, and the O2 sensor boss for leaks.

Connect the SMOKE supply tip (black hose) to the exhaust cone adapter (if equipped) and place it into the tail pipe.

Set the smoke/air control switch to SMOKE.

Press the remote smoke/air start button.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the exhaust system path and look for a leak, indicated by exiting smoke.

If a leak is concealed from view, release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

Were any exhaust leaks found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 2

2. DTC IS ACTIVE

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

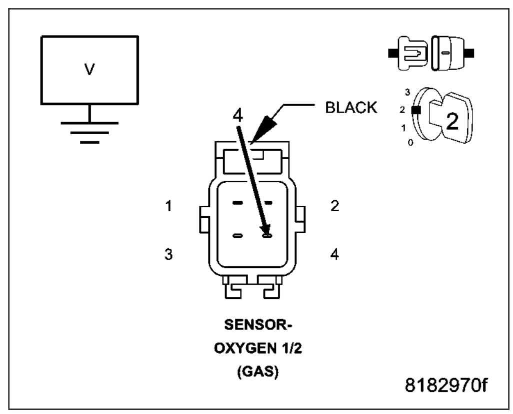
Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 3



No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Start the engine and allow it to idle.

Disconnect the Oxygen Sensor 1/2 harness connector.

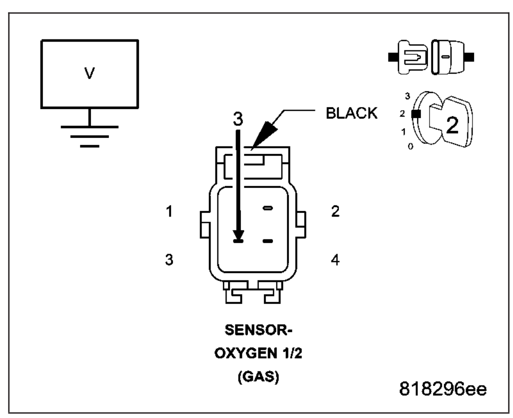
Measure the voltage on the (K141) O2 1/2 Signal circuit in the Oxygen Sensor 1/2 harness connector.

NOTE: Measure the voltage in reference to ground, not the (K904) O2 1/2 Return circuit.

Is the voltage above 5.2 volts?

Yes >> Repair the (K141) O2 1/2 Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4



4. (K904) O2 1/2 RETURN CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) harness connector.

Turn the ignition on.

Measure the voltage on the (K904) O2 1/2 Return circuit in the Oxygen Sensor 1/2 harness connector.

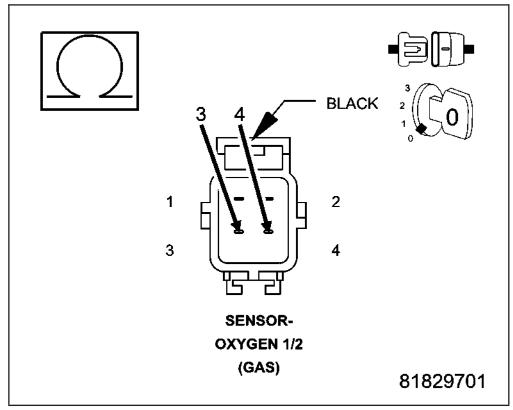
Is there any voltage present?

Yes >> Repair the (K904) O2 1/2 Return circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO THE (K904) O2 1/2 RETURN CIRCUIT

Turn the ignition off.



Measure the resistance between the (K141) O2 1/2 Signal circuit and the (K904) O2 1/2 Return circuit the Oxygen Sensor 1/2 harness connector.

Is the resistance below 100.0 ohms?

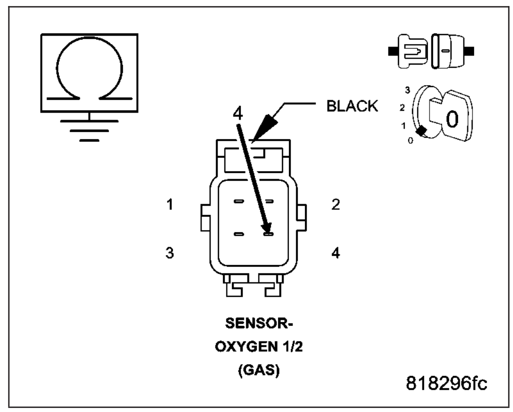
Yes >> Repair the (K141) O2 1/2 Signal circuit for a short to the (K904) O2 1/2 Return.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.



Measure the resistance between ground and the (K141) O2 1/2 Signal circuit in the Oxygen Sensor 1/2 harness connector.

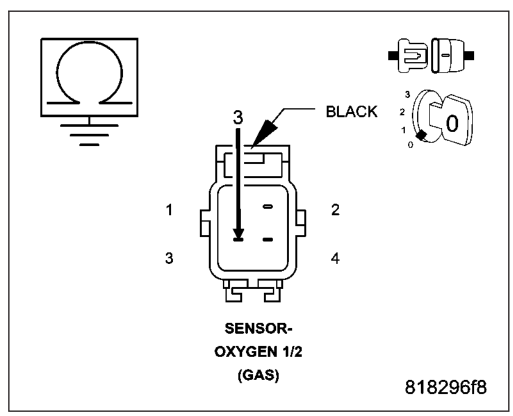
Is the resistance below 100 ohms?

Yes >> Repair the (K141) O2 1/2 Signal circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

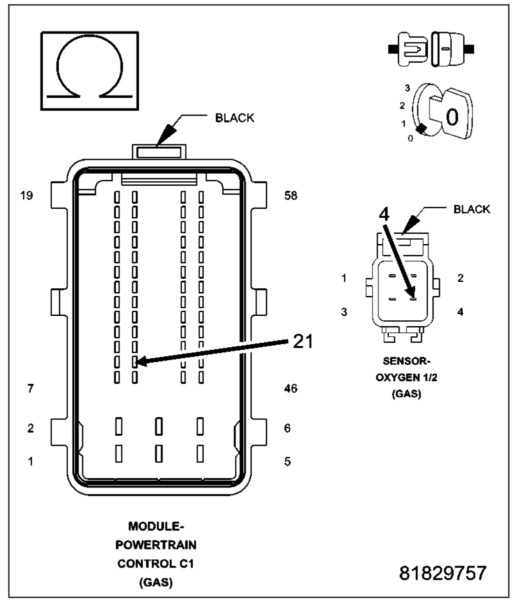
7. (K904) O2 1/2 RETURN CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K904) O2 1/2 Return circuit in the Oxygen Sensor 1/2 harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (K904) O2 1/2 Return circuit for a short to ground.



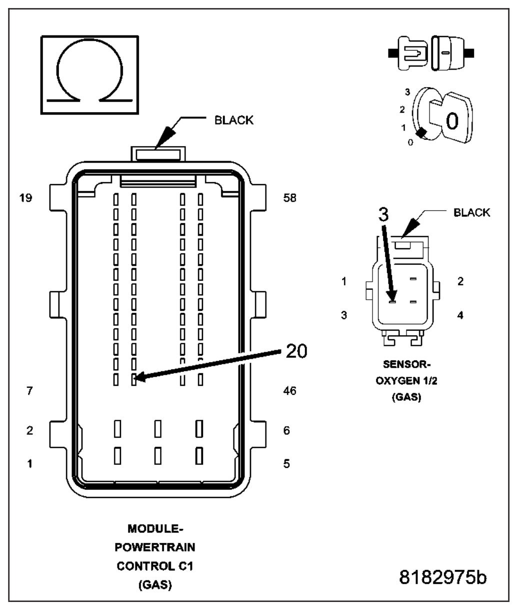
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. (K141) O2 1/2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K141) O2 1/2 Signal circuit between the Oxygen Sensor 1/2 harness connector to the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 9

No >> Repair the (K141) O2 1/2 Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (K904) O2 1/2 RETURN CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K904) O2 1/2 Return circuit between the Oxygen Sensor 1/2 harness connector to the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (K904) O2 1/2 Return circuit for an open circuit or high resistance.

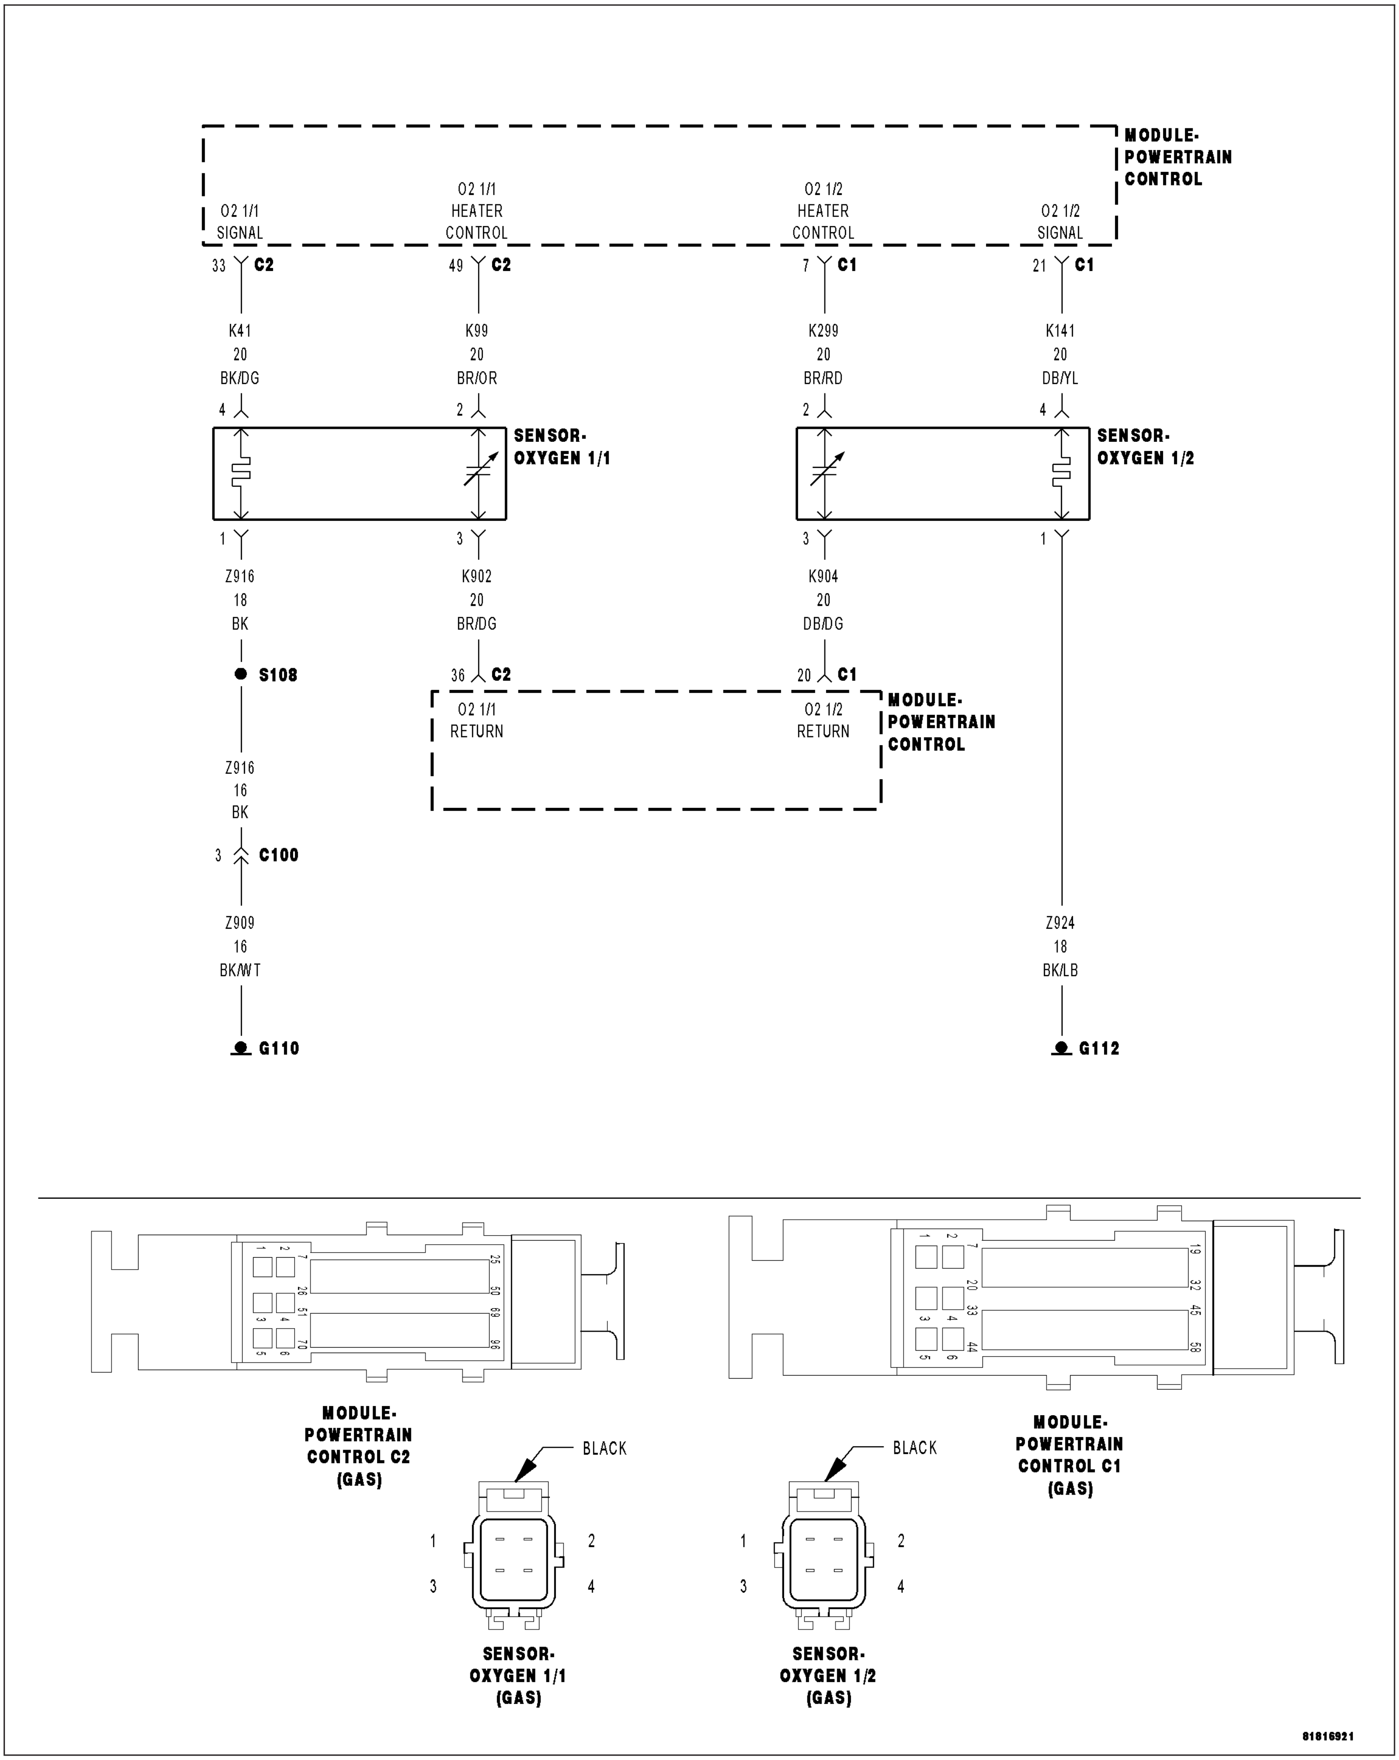
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. OXYGEN SENSOR 1/2

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Oxygen Sensor 1/2 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2097-DOWNSTREAM FUEL TRIM SYSTEM 1 RICH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Monitored constantly when the upstream and downstream O2 sensors are operating in closed loop.
- **Set Condition:**
  The purpose of the diagnostic for this DTC is to determine if the upstream O2 sensor has become biased due to an exhaust leak, sensor contamination, or some other extreme condition. The downstream O2 sensor is considered to be protected from extreme conditions by the catalyst. The downstream O2 sensor feedback control is used to diagnose whether the upstream O2 sensor has become biased. The value of the downstream fuel trim is monitored and compared for rich and lean conditions. Every time the value exceeds the calculated threshold, a timer increments. If the fail timer exceeds the fail threshold, the test fails and the diagnostic stops running for that trip. If the test fails on consecutive trips, a DTC is set.

Possible Causes
INTERMITTENT DTC
EXHAUST LEAK
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K904) O2 1/2 RETURN CIRCUIT SHORTED TO VOLTAGE
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO THE (K904) O2 1/2 RETURN CIRCUIT
(K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO GROUND
(K904) O2 1/2 RETURN CIRCUIT SHORTED TO GROUND
(K141) O2 1/2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K904) O2 1/2 RETURN CIRCUIT OPEN OR HIGH RESISTANCE
OXYGEN SENSOR 1/2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. EXHAUST LEAK

NOTE: A thorough exhaust leak test must be completed before removing an O2 Sensor or any other part from the exhaust system. Do not remove any parts before an exhaust leak check has been completed.

NOTE: An exhaust leak may cause downstream fuel adaptives to rail out, resulting in a false 1/1 O2 Sensor failure

Turn the ignition off.

Inspect the exhaust system for leaks between the engine and the 1/1 Oxygen Sensor.

Perform a leak test with Miller Tool #8404A Evaporative Emissions Leak Detector (EELD), even if an audible leak is not heard. Pay particular attention to the exhaust manifold to head surface, exhaust pipe to manifold connection, and the O2 sensor boss for leaks.

Connect the SMOKE supply tip (black hose) to the exhaust cone adapter (if equipped) and place it into the tail pipe.

Set the smoke/air control switch to SMOKE.

Press the remote smoke/air start button.

While still holding the remote smoke/air start button, use the white light (#8404-CLL) to follow the exhaust system path and look for a leak, indicated by exiting smoke.

If a leak is concealed from view, release the remote smoke/air start button, and use the ultraviolet (UV) black light #8404-UVL and the yellow goggles 8404-20 to look for residual traces of dye that is left behind by the smoke.

The exiting smoke deposits a residual fluid that is either bright green or bright yellow in color when viewed with a UV light.

Were any exhaust leaks found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 2

2. DTC IS ACTIVE

NOTE: Check for contaminants that may have damaged the O2 Sensor: contaminated fuel, unapproved silicone, oil and coolant.

NOTE: It may be necessary to test drive the vehicle within the DTC monitoring conditions in order for this DTC to set.

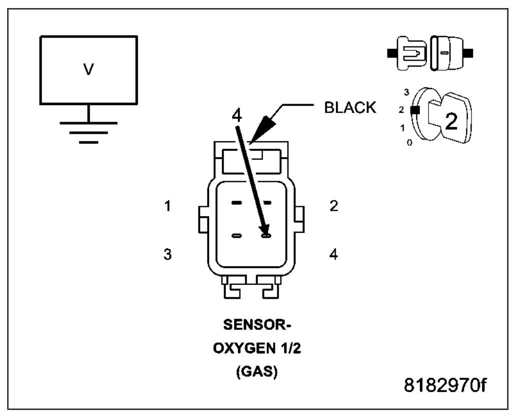
Start the engine and allow it to reach operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 3



No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Start the engine and allow it to idle.

Disconnect the Oxygen Sensor 1/2 harness connector.

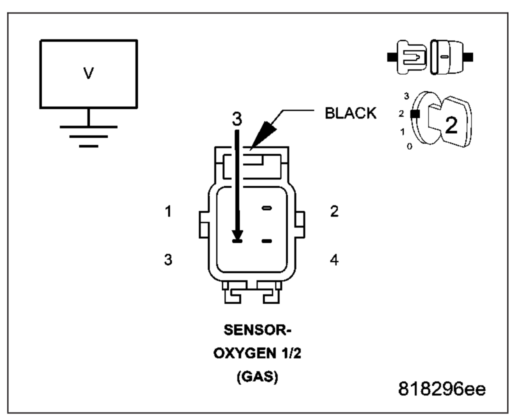
Measure the voltage on the (K141) O2 1/2 Signal circuit in the Oxygen Sensor 1/2 harness connector.

NOTE: Measure the voltage in reference to ground, not the (K904) O2 1/2 Return circuit.

Is the voltage above 5.2 volts?

Yes >> Repair the (K141) O2 1/2 Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4



4. (K904) O2 1/2 RETURN CIRCUIT SHORTED TO VOLTAGE

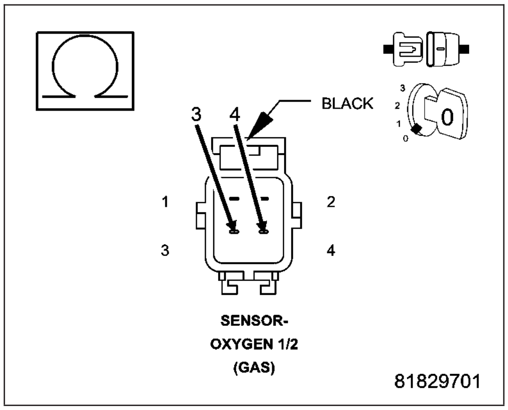
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) harness connector.

Turn the ignition on.

Measure the voltage on the (K904) O2 1/2 Return circuit in the Oxygen Sensor 1/2 harness connector.

Is there any voltage present?



Yes >> Repair the (K904) O2 1/2 Return circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

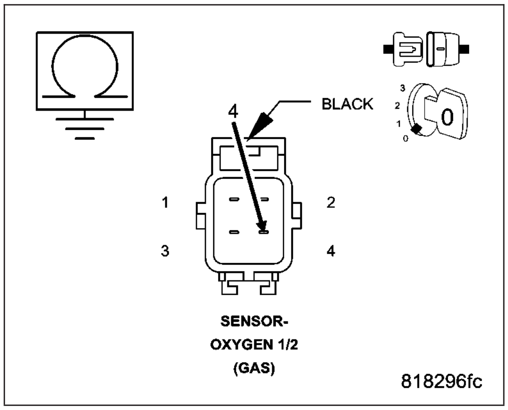
5. (K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO THE (K904) O2 1/2 RETURN CIRCUIT

Turn the ignition off.

Measure the resistance between the (K141) O2 1/2 Signal circuit and the (K904) O2 1/2 Return circuit the Oxygen Sensor 1/2 harness connector.

Is the resistance below 100.0 ohms?

Yes >> Repair the (K141) O2 1/2 Signal circuit for a short to the (K904) O2 1/2 Return.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

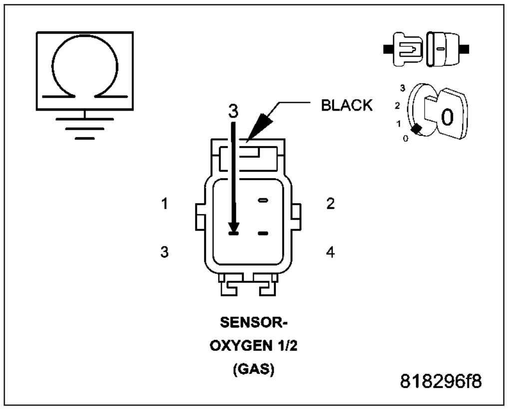
No >> Go to 6

6. (K141) O2 1/2 SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K141) O2 1/2 Signal circuit in the Oxygen Sensor 1/2 harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (K141) O2 1/2 Signal circuit for a short to ground.

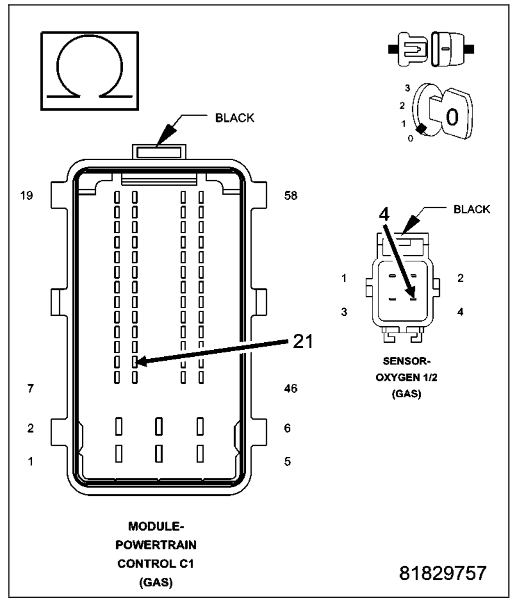
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

7. (K904) O2 1/2 RETURN CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K904) O2 1/2 Return circuit in the Oxygen Sensor 1/2 harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (K904) O2 1/2 Return circuit for a short to ground.

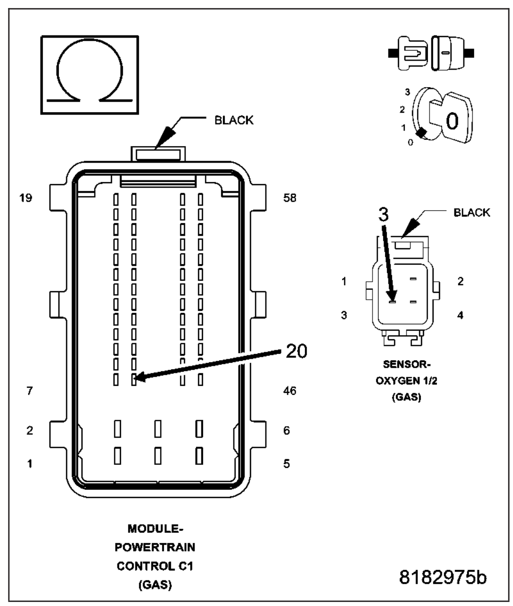
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. (K141) O2 1/2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K141) O2 1/2 Signal circuit between the Oxygen Sensor 1/2 harness connector to the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 9

No >> Repair the (K141) O2 1/2 Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (K904) O2 1/2 RETURN CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K904) O2 1/2 Return circuit between the Oxygen Sensor 1/2 harness connector to the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (K904) O2 1/2 Return circuit for an open circuit or high resistance.

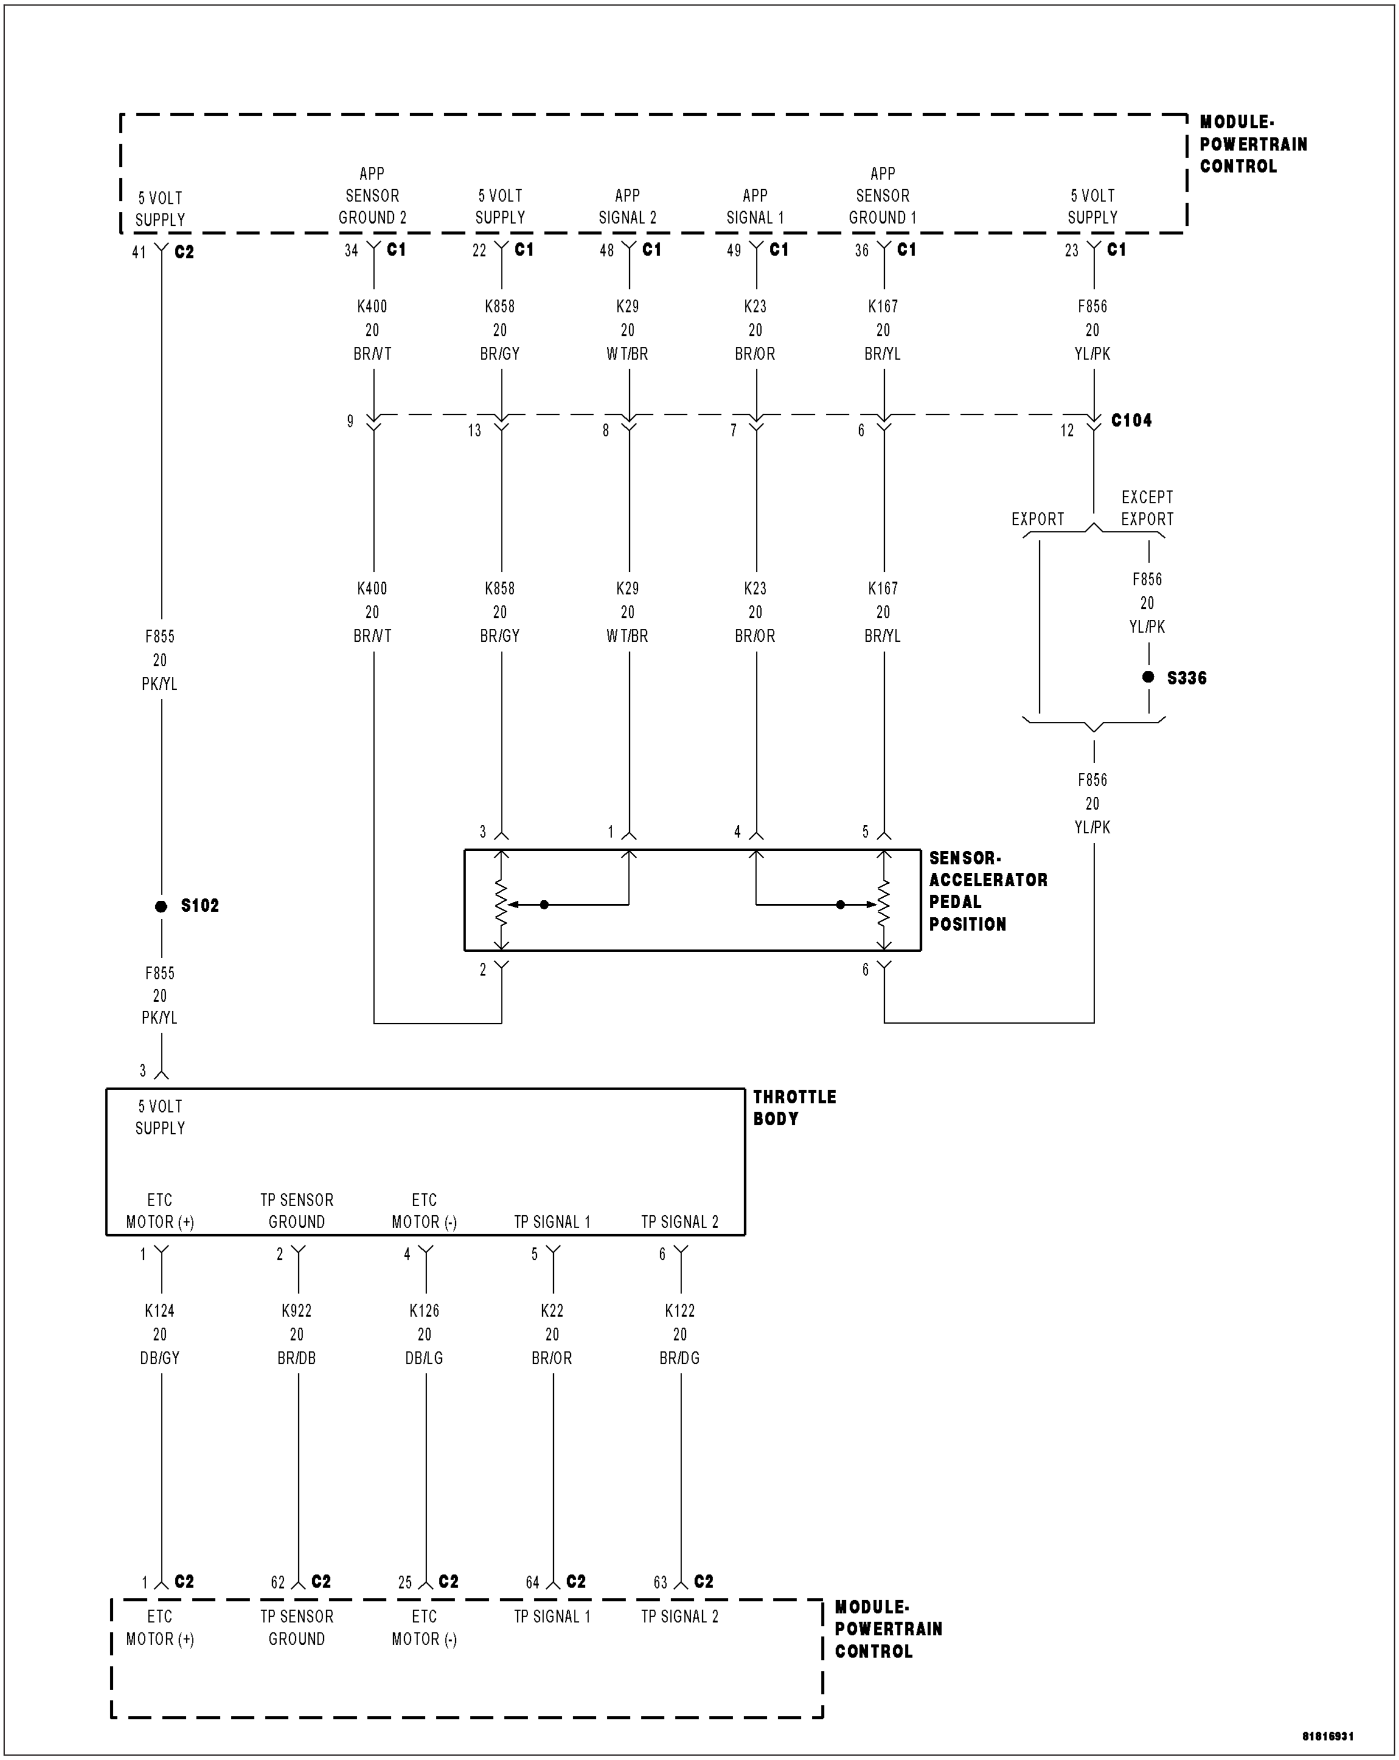
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. OXYGEN SENSOR 1/2

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Oxygen Sensor 1/2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Oxygen Sensor 1/2 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2100-ELECTRONIC THROTTLE CONTROL MOTOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and the ETC Motor not in Limp Home mode.
- **Set Condition:**
  When the PCM detects an internal error or short between the ETC Motor (-) and ETC Motor (+) circuits in the ETC Motor Driver. One trip fault. ETC light is flashing.

Possible Causes
INTERMITTENT DTC
LOW BATTERY VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
ETC MOTOR/THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.

NOTE: Low battery voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to determine the ambient temperature when the DTC set.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the air cleaner assembly.

Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

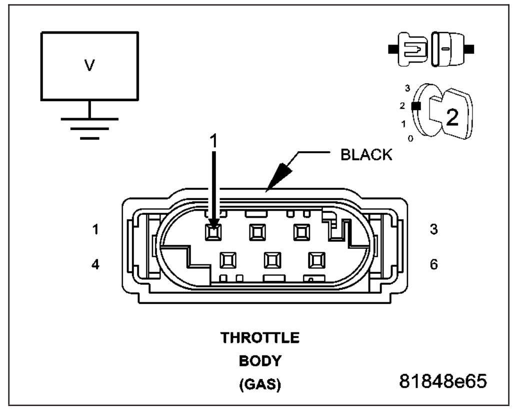
Were any problems found?

Yes >> Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

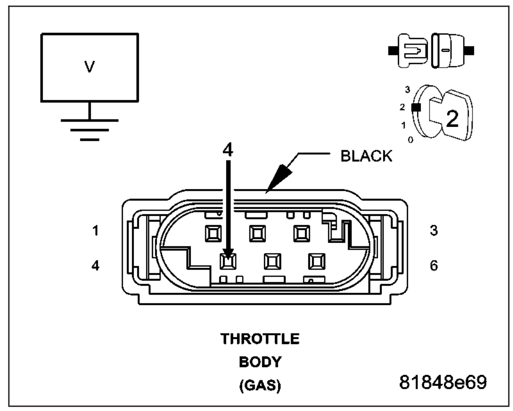
Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connectors.

Turn the ignition on.

Measure the voltage of the (K124) ETC Motor (+) circuit.

Is there any voltage present?



Yes >> Repair the (K124) ETC Motor (+) circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

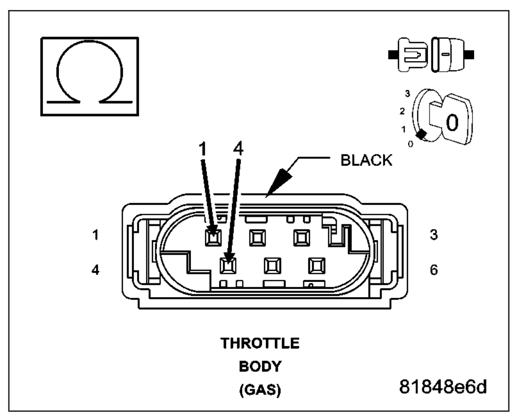
No >> Go to 4

4. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K126) ETC Motor (-) circuit.

Is there any voltage present?

Yes >> Repair the (K126) ETC Motor (-) circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT

Turn the ignition off.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

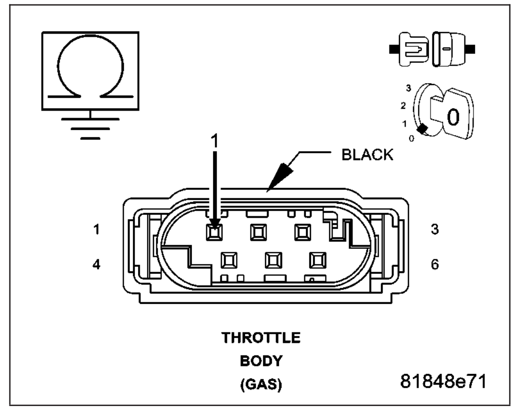
Is the resistance below 100 ohms?

Yes >> Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

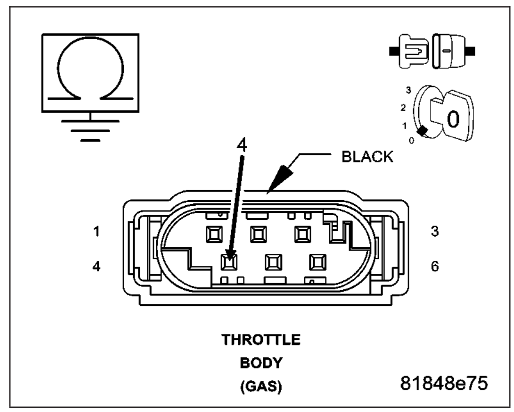
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K124) ETC Motor (+) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

7. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

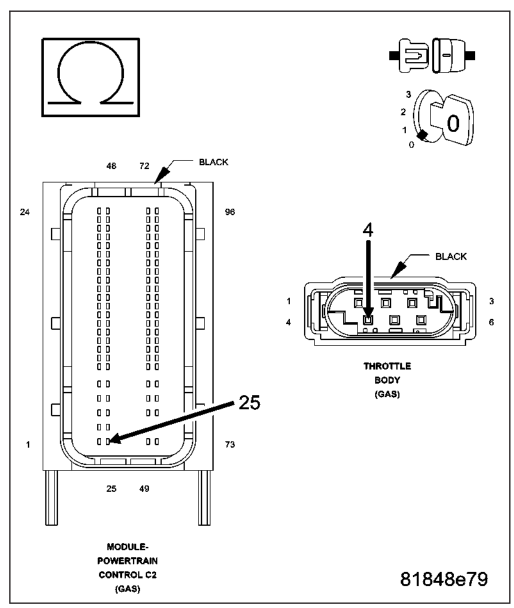
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K126) ETC Motor (-) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

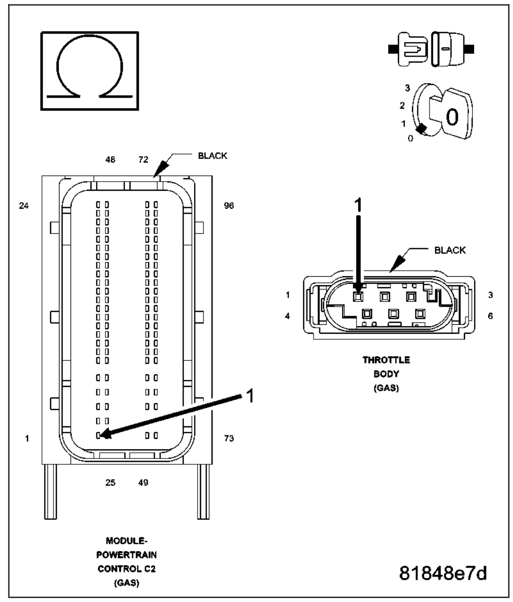
8. (K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K126) ETC Motor (-) circuit.

Is the resistance below 5.0 ohms?

Yes >> Go to 9



No >> Repair the (K126) ETC Motor (-) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K124) ETC Motor (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (K124) ETC Motor (+) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. ETC MOTOR

Reconnect the Throttle Body harness connector.

NOTE: Measure the resistance at the PCM harness connector to avoid damaging throttle body connector terminals.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes >> Go to 11

No >> Replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module per Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2101-ELECTRONIC THROTTLE CONTROL MOTOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running, ETC motor not in limp home mode, and TPS adaptation complete.
- **Set Condition:**
  The PCM detects too large of an error between the actual position of the throttle plate and the desired set point. One trip fault. The DTC will set within 5 seconds. Three good trips to turn off the MIL ETC light is flashing.

Possible Causes
INTERMITTENT DTC
LOW SYSTEM VOLTAGE
THROTTLE BODY ASSEMBLY

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.

NOTE: Low system voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to determine the ambient temperature when the DTC set.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. THROTTLE PLATE STICKING OR OBSTRUCTED

Turn the ignition off.

Remove the air cleaner assembly.

Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

Were any problems found?

Yes >> Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC Relearn function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. THROTTLE PLATE NOT WITHIN DESIRED POSITION

Start the engine and allow it to reach normal operating temperature.

With a scan tool, monitor the Actual Throttle Position and Desired Throttle Position.

Is the Actual Throttle Position within 2° degrees of the Desired Throttle Position?

Yes >> Go to 4

No >> Replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC Relearn function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. ELECTRONIC THROTTLE CONTROL MOTOR

Ignition on, engine not running.

With a scan tool, actuate the Electronic Throttle Control Motor and observe the movement of the throttle blade.

NOTE: It may be necessary to use a mirror to see the throttle blade.

NOTE: Make sure the motion of the throttle blade is smooth and that it opens and closes.

Did the ETC motor operate properly?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC Relearn function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2107-ELECTRONIC THROTTLE CONTROL MODULE PROCESSOR

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  Internal PCM failure. Module will attempt to reset, so you will be able to hear the throttle relearning. If the condition is continuous, the vehicle may not be drivable. One trip fault. ETC light is flashing.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

Test drive the vehicle for 10 miles on a flat road surface.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2108-ELECTRONIC THROTTLE CONTROL MODULE PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  Internal PCM failure. Vehicle may exhibit an extended cranking condition, limited performance, and a rough idle. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
INTERMITTENT DTC
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any other DTCs are set, they must be diagnosed and repaired before continuing this test.

NOTE: An engine vacuum leak may cause this DTC to set. Thoroughly inspect the engine for a vacuum leak before continuing with this test. Repair as necessary.

NOTE: An intermittent loss of power to the PCM without performing an ETC Relearn procedure may cause this DTC to set.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition on.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Verify the Powertrain Control Module (PCM) is at the latest calibration (flash level). If necessary, update the Powertrain Control Module (PCM) in accordance with the Service Information.

Start the engine and allow it to reach operating temperature.

Increase engine speed by pressing the accelerator pedal. Do not exceed 3500 rpm.

Test drive the vehicle for 10 miles on a flat road surface.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

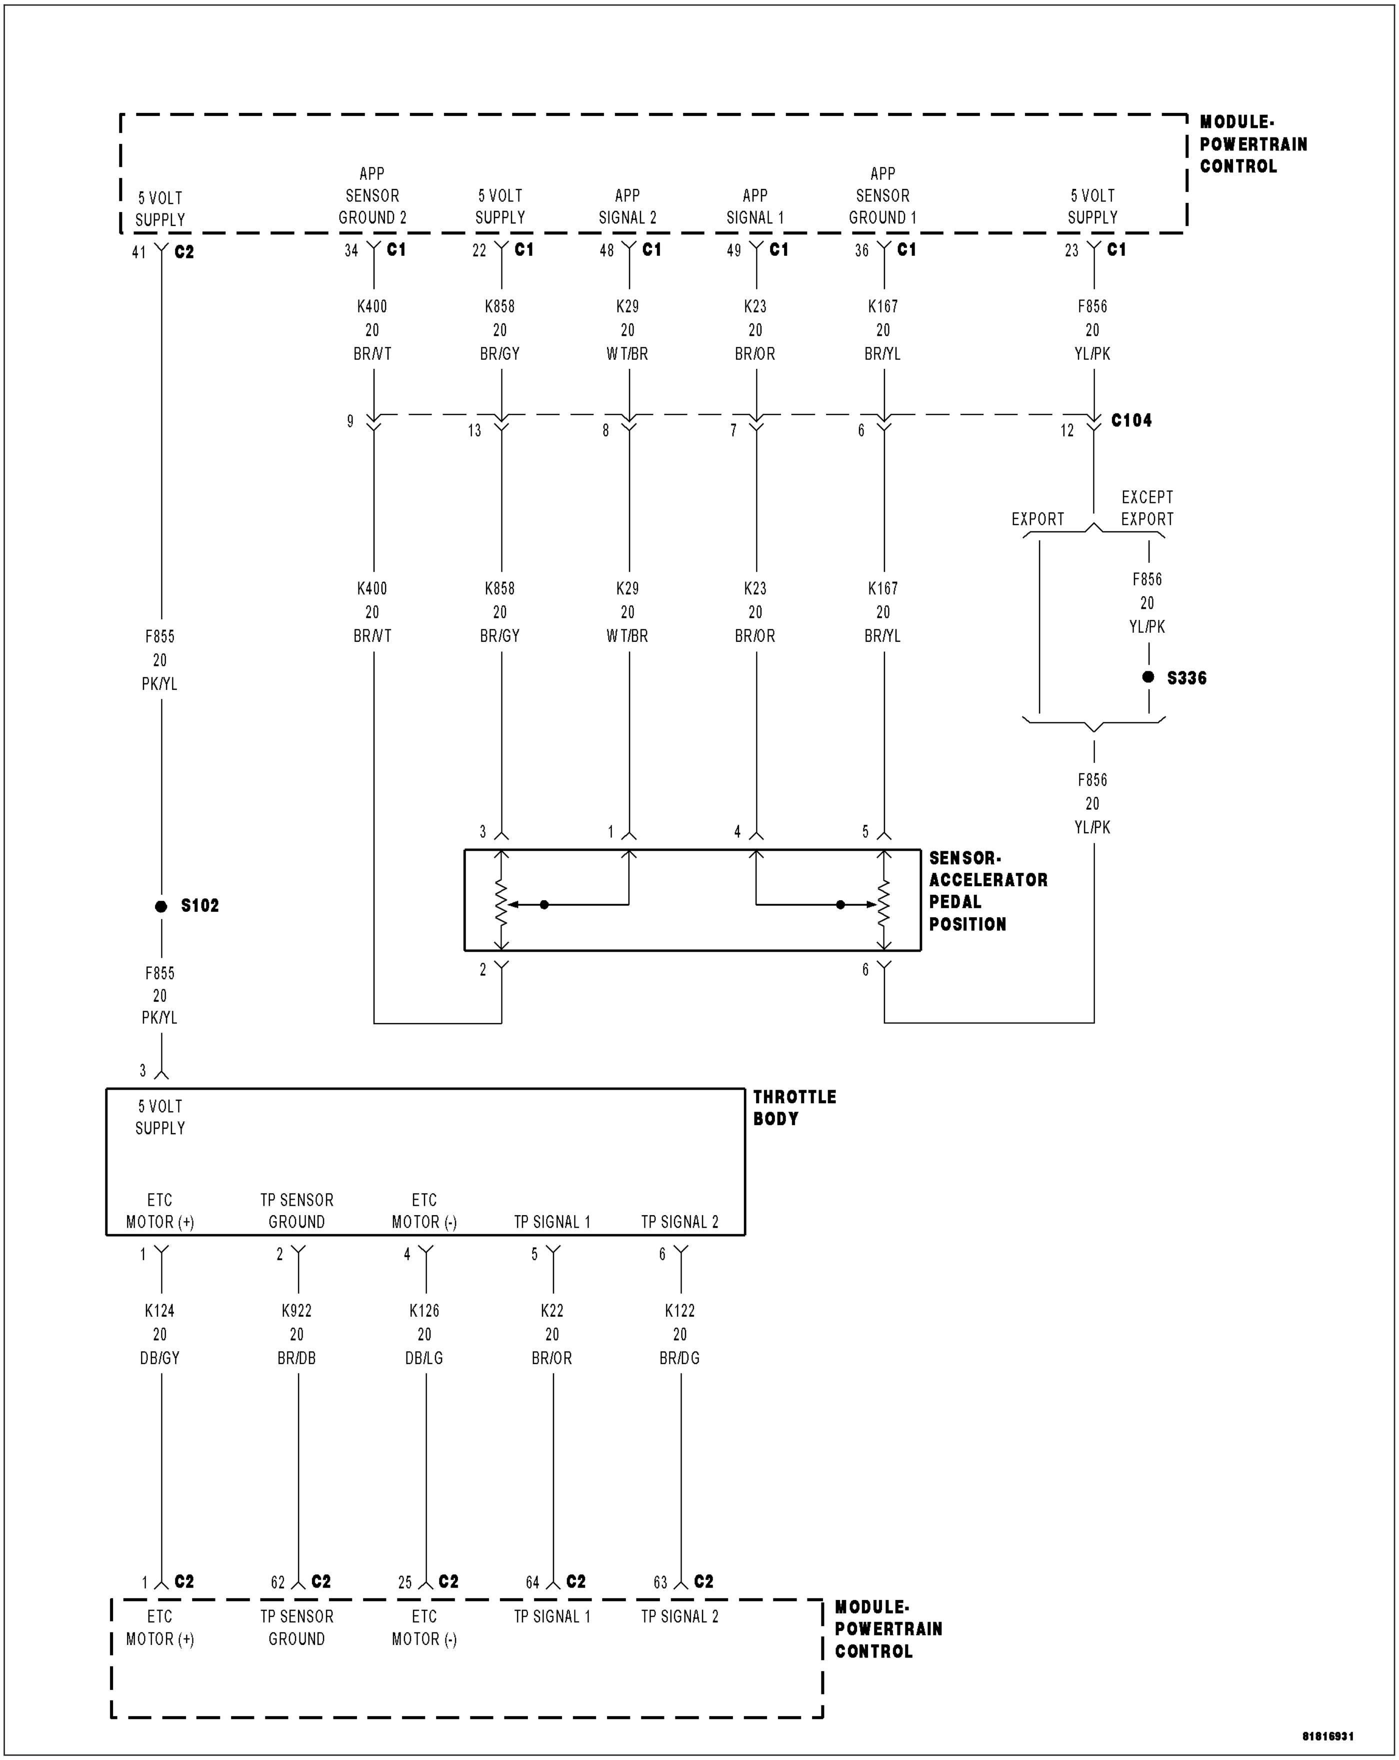
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2110-ELECTRONIC THROTTLE CONTROL - FORCED LIMITED RPM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and ETC motor is working.
- **Set Condition:**
  When the PCM requests to limit engine speed if PWM is too high for 20.5 seconds and before P2118 sets. One trip fault and the code will set within 5 seconds. ETC light is illuminated.

Possible Causes
THROTTLE PLATE STUCK OR OBSTRUCTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC POSITIVE CIRCUIT SHORTED TO GROUND
(K126) ETC NEGATIVE CIRCUIT SHORTED TO GROUND
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
ETC MOTOR
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.

NOTE: Low battery voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to determine the ambient temperature when the DTC set.

NOTE: Diagnose and repair any Throttle Position sensor, system voltage, or 5 volt supply DTCs before continuing with this test.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

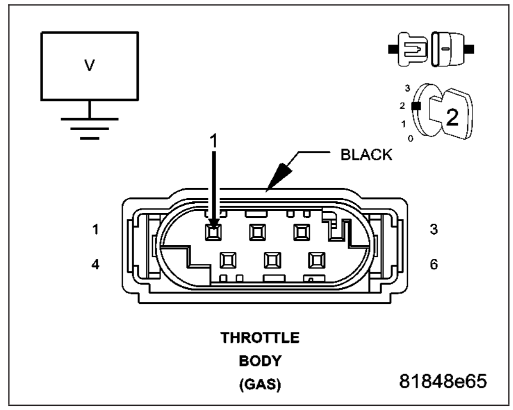
2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the air cleaner assembly.

Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

Attempt to manually open the throttle plate. Use an appropriate tool that will not damage or mar the throttle body.



Were any problems found?

Yes >> Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE

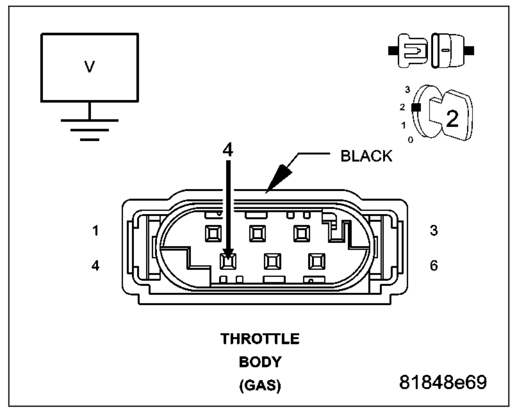
Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connectors.

Turn the ignition on.

Measure the voltage of the (K124) ETC Motor (+) circuit.



Is there any voltage present?

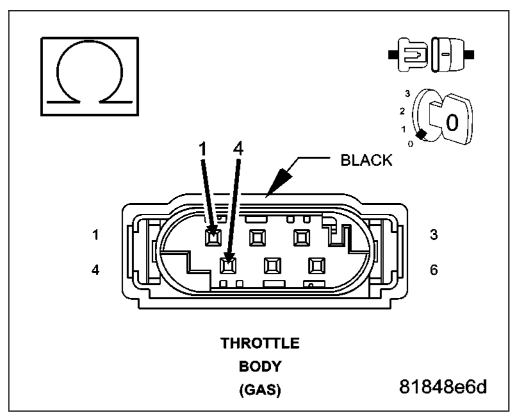
Yes >> Repair the (K124) ETC Motor (+) circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K126) ETC Motor (-) circuit.



Is there any voltage present?

Yes >> Repair the (K126) ETC Motor (-) circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

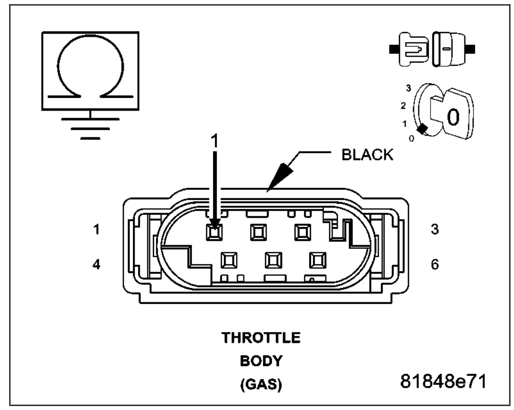
No >> Go to 5

5. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT

Turn the ignition off.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Is the resistance below 100 ohms?



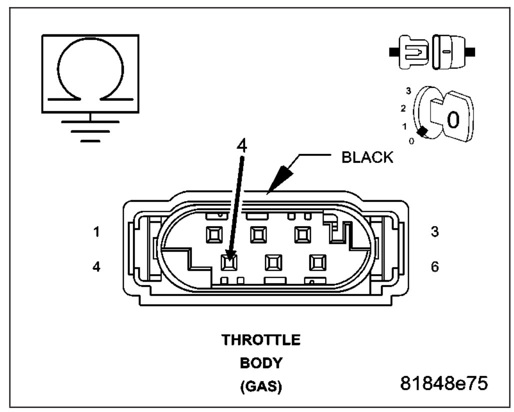
Yes >> Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K124) ETC Motor (+) circuit.



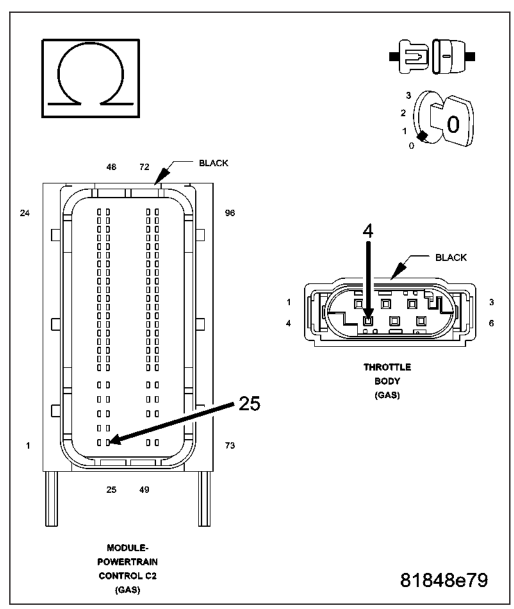
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K124) ETC Motor (+) circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

7. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K126) ETC Motor (-) circuit.



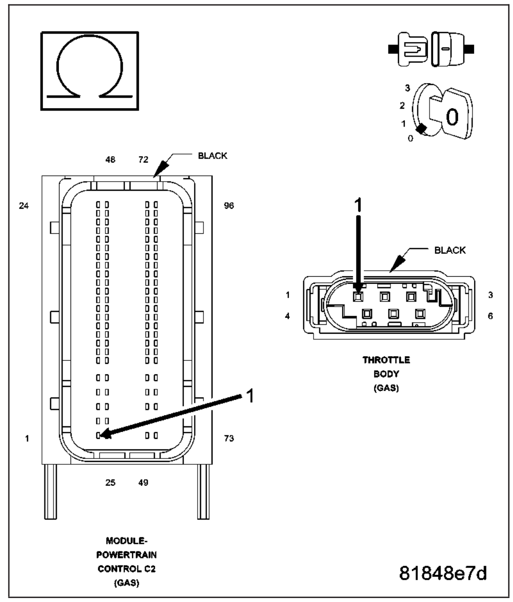
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K126) ETC Motor (-) circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. (K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K126) ETC Motor (-) circuit.



Is the resistance below 5.0 ohms?

Yes >> Go to 9

No >> Repair the (K126) ETC Motor (-) circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K124) ETC Motor (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (K124) ETC Motor (+) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. ETC MOTOR

Reconnect the Throttle Body harness connector.

NOTE: Measure the resistance at the PCM harness connector to avoid damaging throttle body connector terminals.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes >> Go to 11

No >> Replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

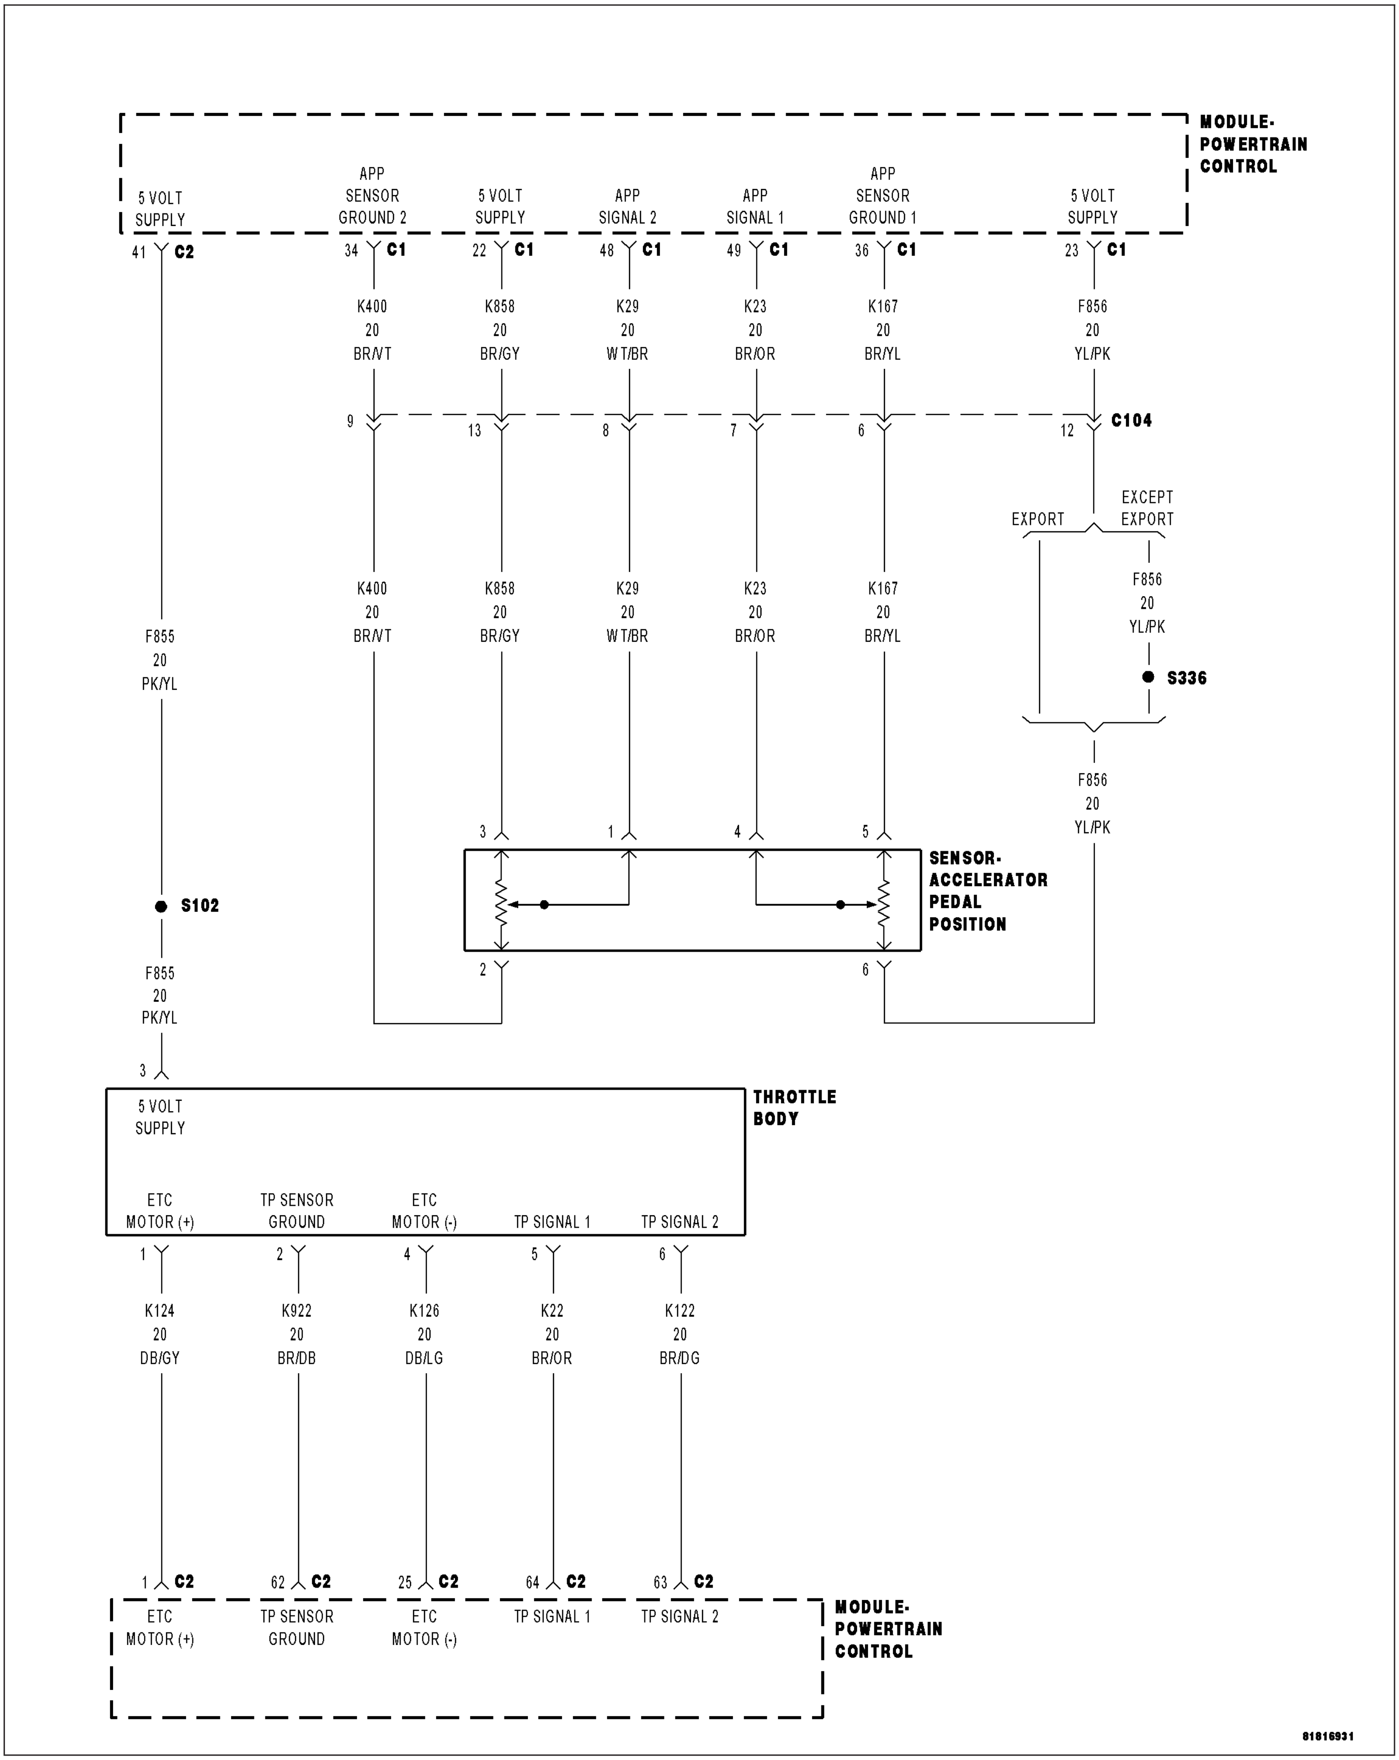
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module per Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2111-ELECTRONIC THROTTLE CONTROL - UNABLE TO CLOSE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and battery voltage greater than 10 volts.
- **Set Condition:**
  Just after key on, the throttle is opened and closed to test the system. If the PCM detects that the TP Sensor does not return to Limp Home Position, this DTC will set. One trip fault. The DTC will set within 5 seconds. ETC light is flashing.

Possible Causes
INTERMITTENT DTC
THROTTLE PLATE STICKING OR OBSTRUCTED
TP SENSOR CIRCUIT(S) HIGH RESISTANCE OR SHORTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
THROTTLE BODY ASSEMBLY
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose any TP Sensor or 5-Volt Supply DTCs before continuing.

NOTE: Maximum engine speed could be reduced while this fault is active, based on where the throttle plate is stuck.

Ignition on, engine not running.

NOTE: The PCM tests the ETC Motor by opening and closing the throttle plate before starting the engine. If the throttle plate does not return to the closed position this DTC will set.

With a scan tool select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the air cleaner assembly.

Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick or not fully close.

Attempt to manually open the throttle plate and allow it to close. Use an appropriate tool that will not damage or mar the throttle body.

Were any problems found?

Yes >> Repair as necessary or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. TP SENSOR NO.1 AND TP SENSOR NO.2 BOTH EQUAL 2.5 VOLTS

With a scan tool, perform the Throttle Follower test and monitor both TP Sensor voltages.

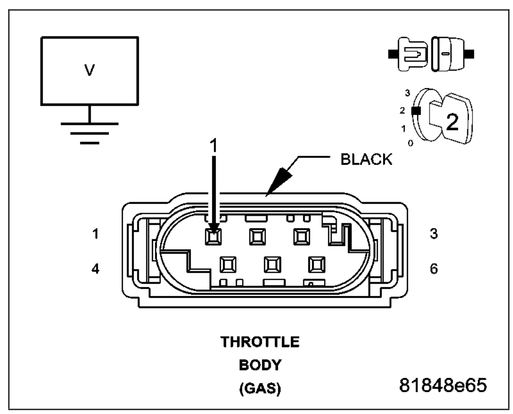
Are both TP Sensor readings stuck at 2.5 volts?

Yes >> Check the TP Sensor Signal circuits for excessive resistance, being shorted together, or shorted to the Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

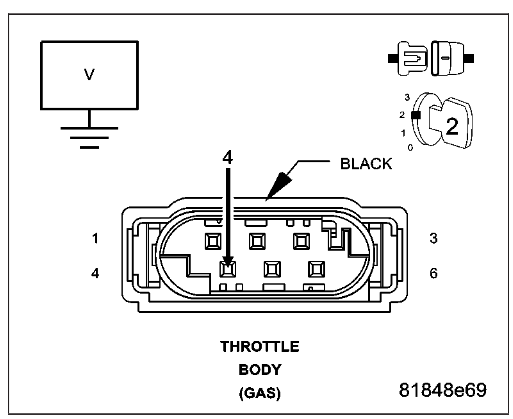
Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connectors.

Turn the ignition on.

Measure the voltage of the (K124) ETC Motor (+) circuit.

Is there any voltage present?



Yes >> Repair the (K124) ETC Motor (+) circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

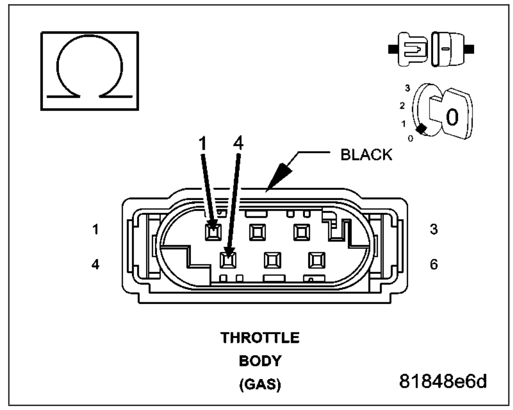
5. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K126) ETC Motor (-) circuit.

Is there any voltage present?

Yes >> Repair the (K126) ETC Motor (-) circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



No >> Go to 6

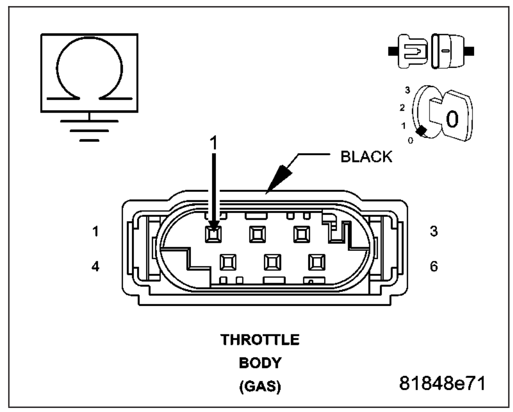
6. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT

Turn the ignition off.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Is the resistance below 100 ohms?

Yes >> Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

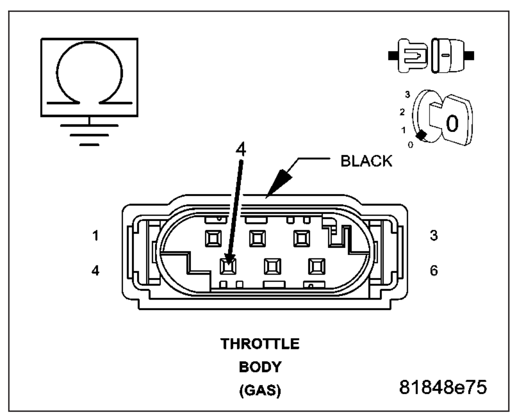
No >> Go to 7

7. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K124) ETC Motor (+) circuit.



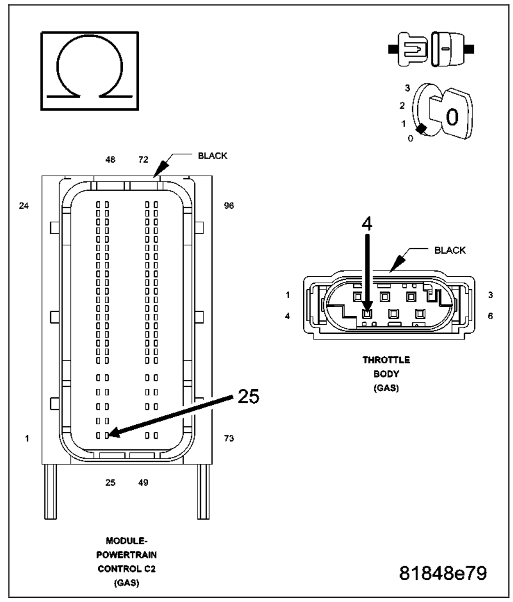
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

Is the resistance below 100 ohms?



Yes >> Repair the short to ground in the (K126) ETC Motor (-) circuit.

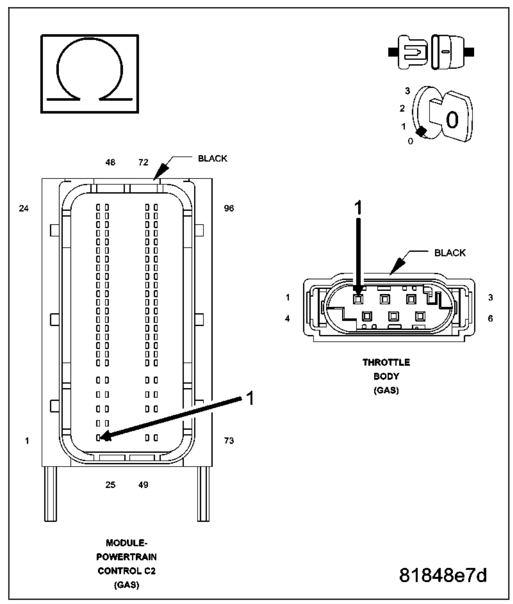
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K126) ETC Motor (-) circuit.

Is the resistance below 5.0 ohms?



Yes >> Go to 10

No >> Repair the (K126) ETC Motor (-) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K124) ETC Motor (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Go to 11

No >> Repair the (K124) ETC Motor (+) circuit for an open circuit or high resistance.

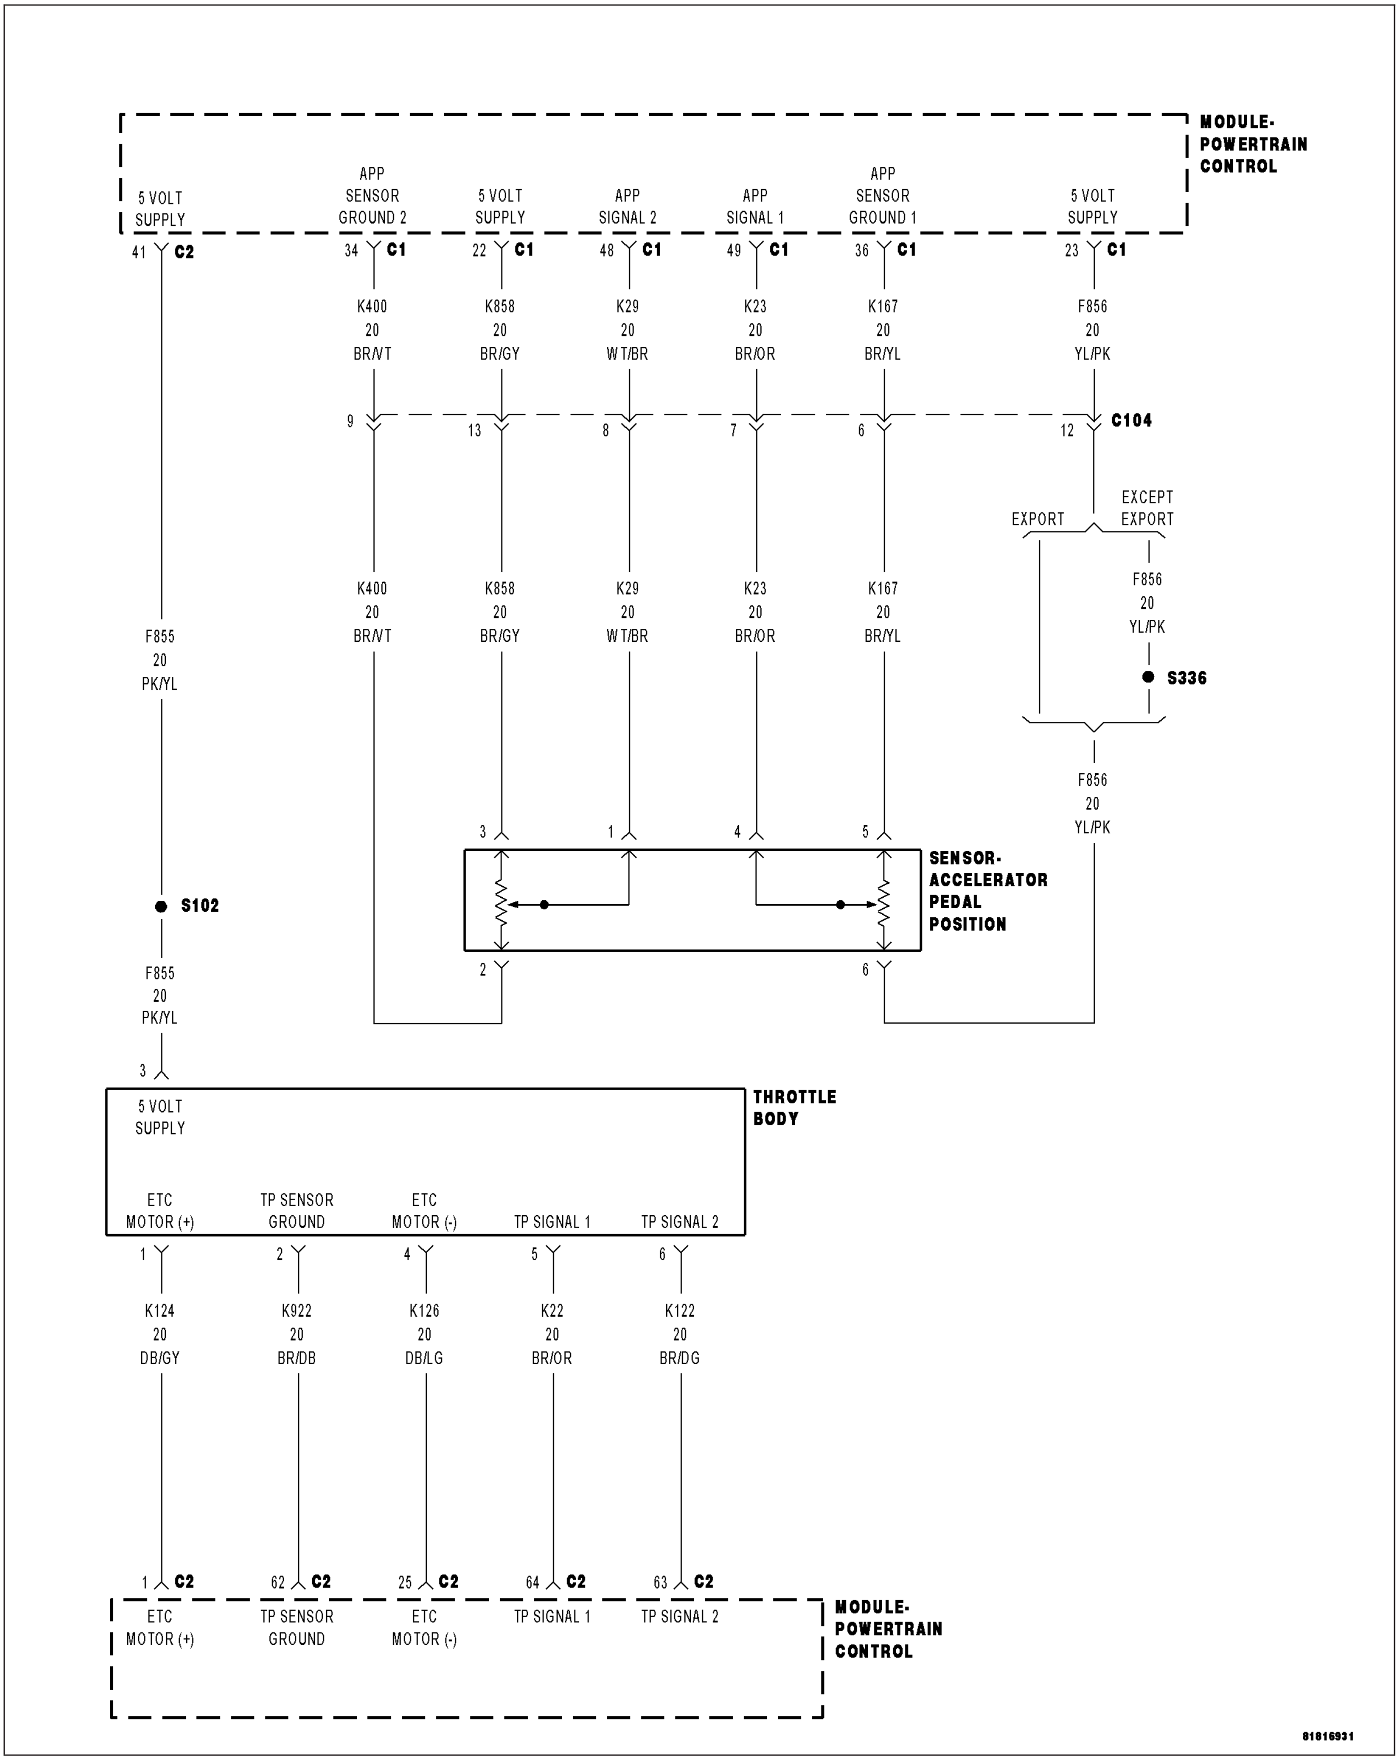
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module per Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2112-ELECTRONIC THROTTLE CONTROL - UNABLE TO OPEN

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and battery voltage greater than 10 volts.
- **Set Condition:**
  Just after key on, the throttle is opened and closed to test the system. If the PCM detects that the TP Sensor does not move from Limp Home Position, this DTC will set. One trip fault. The DTC will set within 5 seconds. ETC light is flashing.

Possible Causes
INTERMITTENT DTC
THROTTLE PLATE STICKING OR OBSTRUCTED
TP SENSOR CIRCUIT(S) HIGH RESISTANCE OR SHORTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND
THROTTLE BODY ASSEMBLY
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose any TP Sensor or 5-Volt Supply DTCs before continuing.

Ignition on, engine not running.

With a scan tool select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the air cleaner assembly.

Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick or not open.

Attempt to manually open the throttle plate. Use an appropriate tool that will not damage or mar the throttle body.

Were any problems found?

Yes >> Repair as necessary or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. TP SENSOR NO.1 AND TP SENSOR NO.2 BOTH EQUAL 2.5 VOLTS

With a scan tool, perform the Throttle Follower test and monitor both TP Sensor voltages.

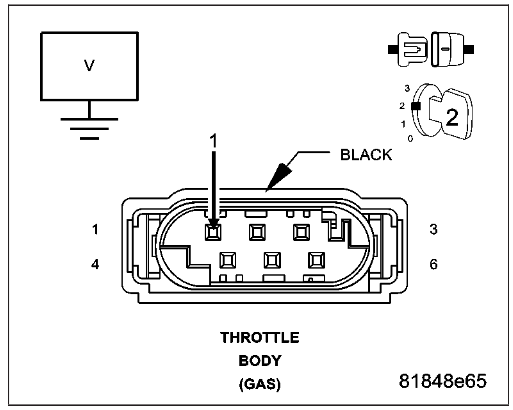
Are both TP Sensor readings stuck at 2.5 volts?

Yes >> Check the TP Sensor Signal circuits for excessive resistance, being shorted together, or being shorted to the Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

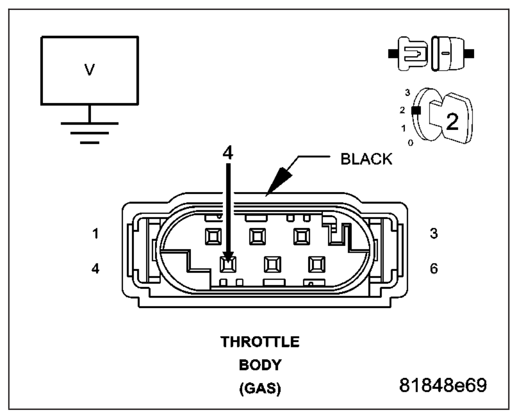
Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connectors.

Turn the ignition on.

Measure the voltage of the (K124) ETC Motor (+) circuit.

Is there any voltage present?



Yes >> Repair the (K124) ETC Motor (+) circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

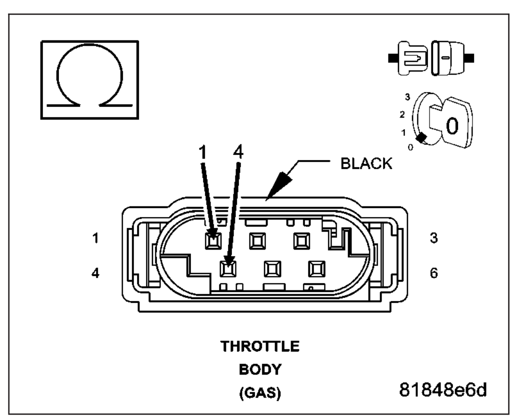
No >> Go to 5

5. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K126) ETC Motor (-) circuit.

Is there any voltage present?

Yes >> Repair the (K126) ETC Motor (-) circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT

Turn the ignition off.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

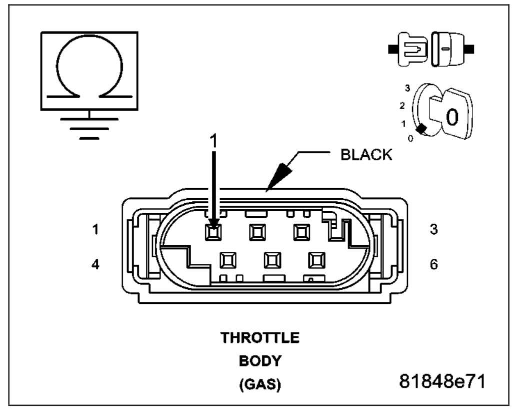
Is the resistance below 100 ohms?

Yes >> Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

7. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

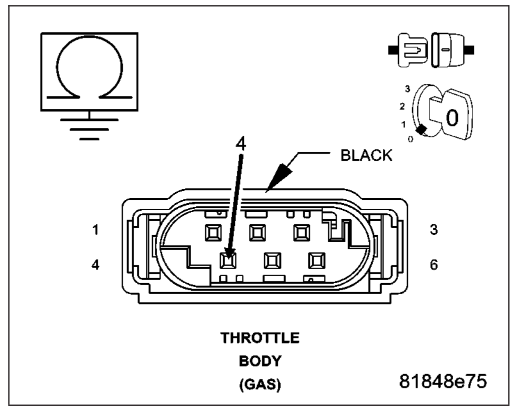
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K124) ETC Motor (+) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

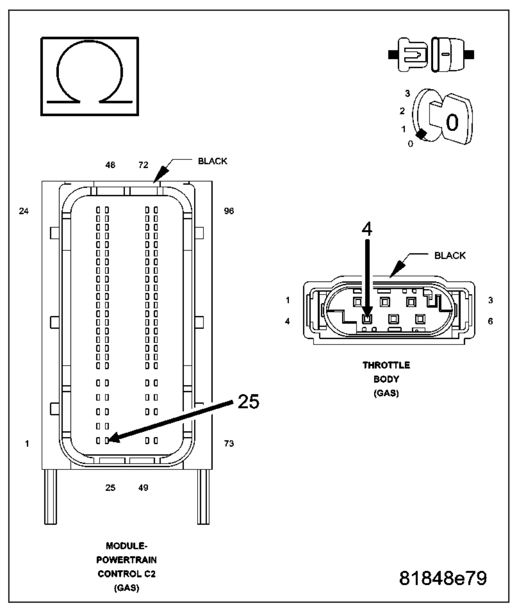
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K126) ETC Motor (-) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. (K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K126) ETC Motor (-) circuit.

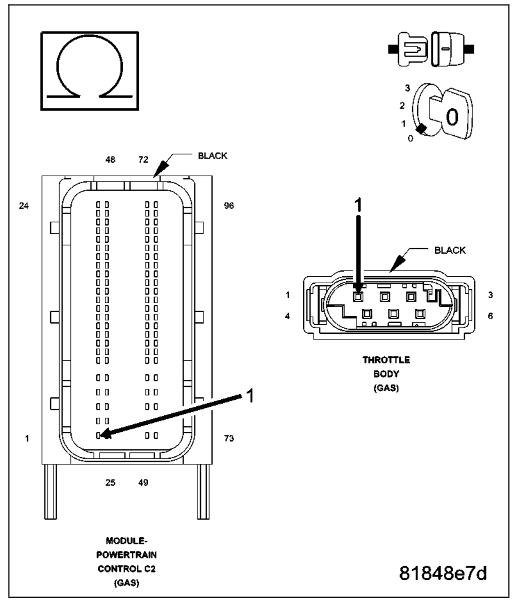
Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (K126) ETC Motor (-) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K124) ETC Motor (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Go to 11

No >> Repair the (K124) ETC Motor (+) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module per Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2115-ACCELERATOR PEDAL POSITION SENSOR 1 MINIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the igniting on. During in-plant testing, the APPS is checked to make sure the minimum and maximum values can be reached. The PCM performs the diagnostic test for this DTC after the diagnostic test for P2166 has passed.
- **Set Condition:**
  APPS 1 has failed to achieve the required minimum value during In-Plant testing. One trip fault and the code will set within 5 seconds. Engine will only idle.

Possible Causes
INTERMITTENT DTC
ETC RELEARN
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: This DTC is set when the APPS values are learned in-plant but do not reach the minimum or maximum voltage range.

NOTE: Diagnose any APPS out of range and 5 volt supply DTCs before continuing.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR

With a scan tool perform the ETC RELEARN function.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. After installation is complete, perform the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test Complete.

P2116-ACCELERATOR PEDAL POSITION SENSOR 2 MINIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the igniting on. During in-plant testing, the APPS is checked to make sure the minimum and maximum values can be reached. The PCM performs the diagnostic test for this DTC after the diagnostic test for P2167 has passed.
- **Set Condition:**
  APPS 2 has failed to achieve the required minimum value during In-Plant testing. One trip fault and the code will be stored within 5 seconds. Engine will only idle.

Possible Causes
INTERMITTENT DTC
ETC RELEARN
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: This DTC is set when the APPS values are learned in-plant but do not reach the minimum or maximum voltage range.

NOTE: Diagnose any APPS out of range and 5 volt supply DTCs before continuing.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

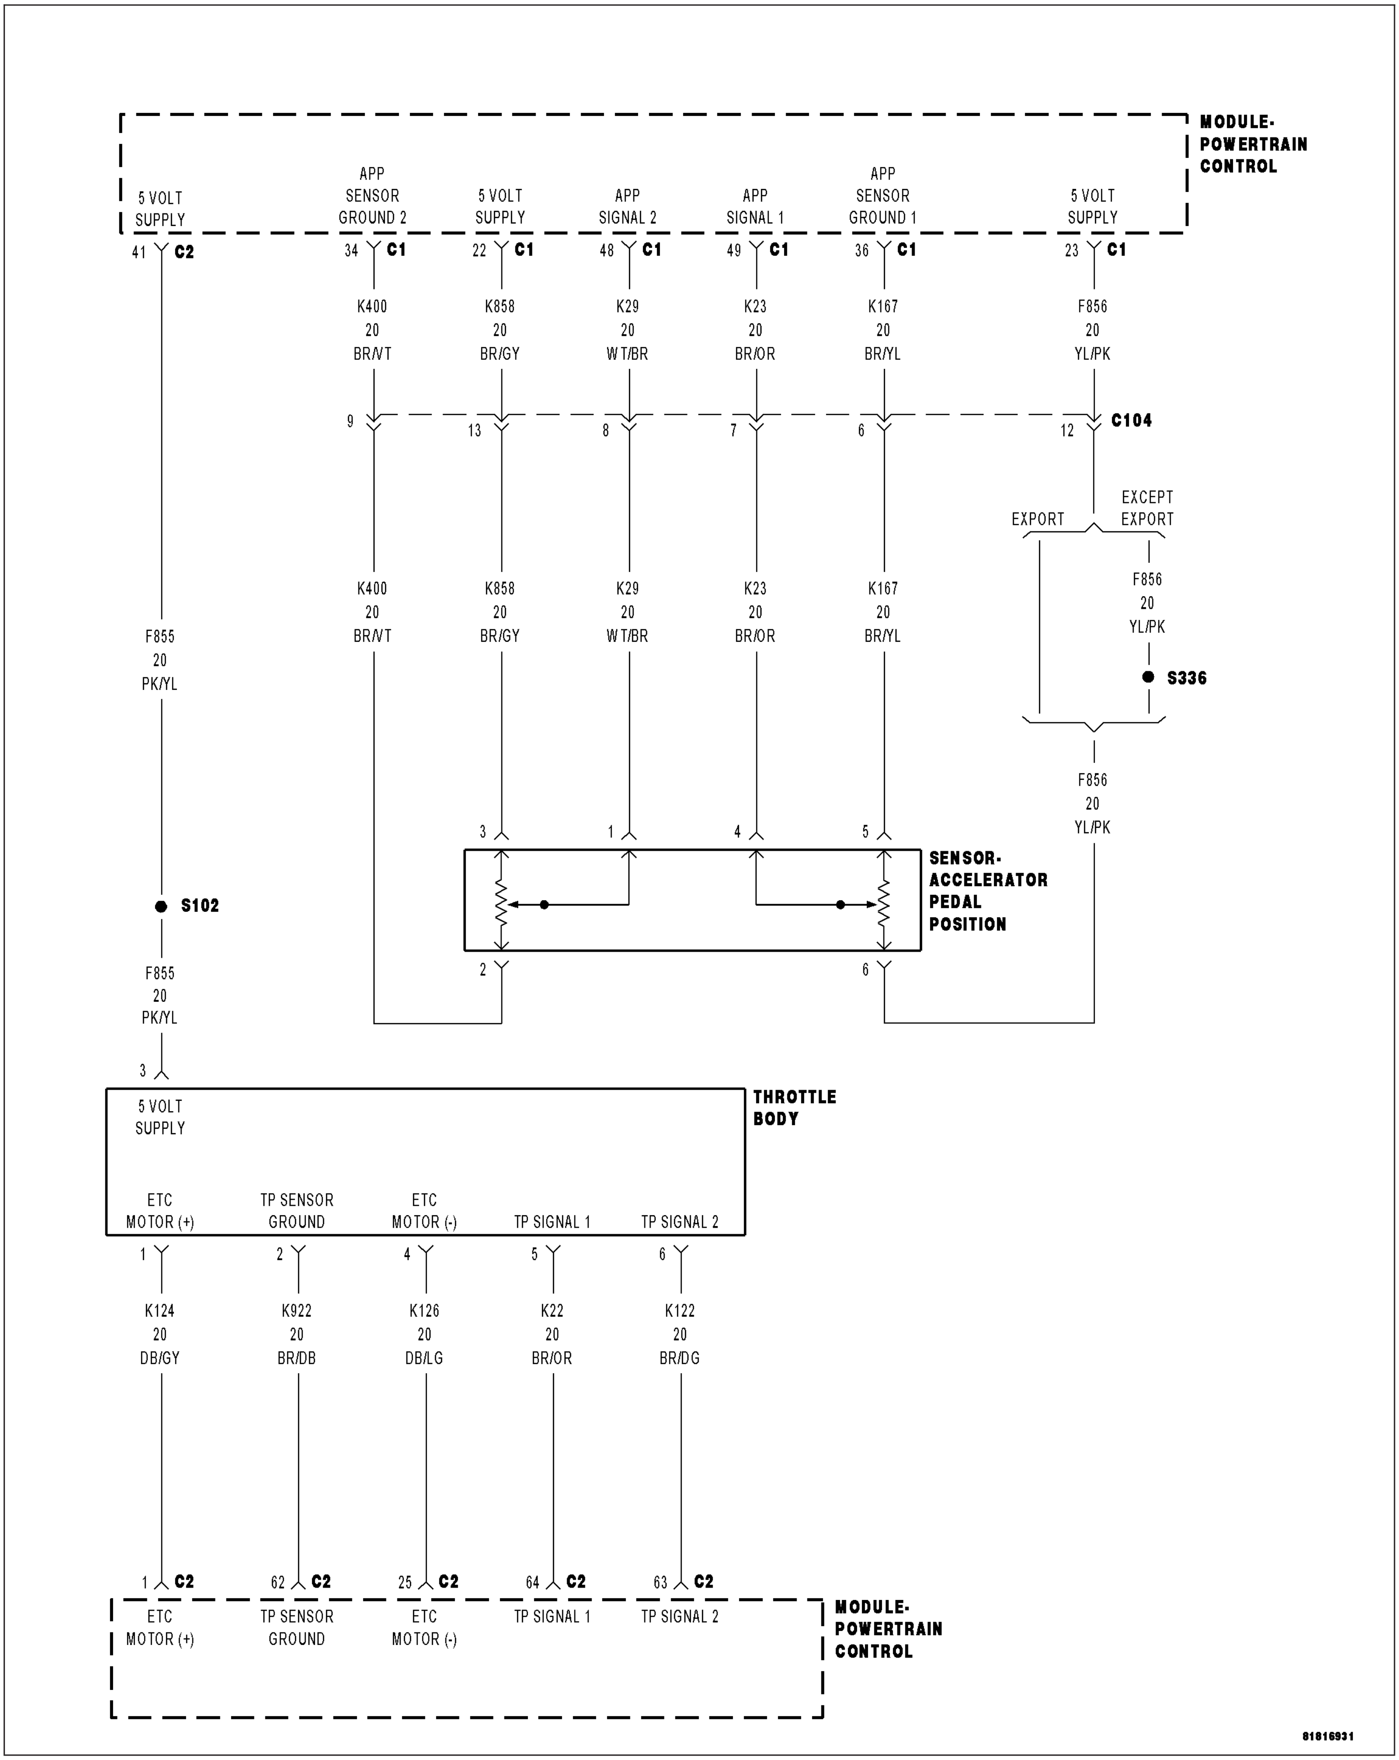
2. ACCELERATOR PEDAL POSITION SENSOR

With a scan tool perform the ETC RELEARN function.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.



Is the status Active for this DTC?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. After installation is complete, perform the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test Complete.

P2118-ELECTRONIC THROTTLE CONTROL MOTOR CURRENT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and ETC motor is not in the Limp Home Position.
- **Set Condition:**
  When the PCM detects an internal error or a short between the ETC Motor (-) and ETC Motor (+) circuits in the ETC Motor Driver. One trip fault. ETC light is flashing.

Possible Causes
THROTTLE PLATE STUCK OR OBSTRUCTED
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE
(K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE
(K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT
(K124) ETC POSITIVE CIRCUIT SHORTED TO GROUND
(K126) ETC NEGATIVE CIRCUIT SHORTED TO GROUND
(K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE
(K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE
ETC MOTOR
PCM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: If this DTC sets intermittently, it is possible that the controller is overheating in extremely hot temperatures. This is considered a normal protection operation. No repair is necessary.

NOTE: Low battery voltage can cause excessive current draw in very hot and cold ambient temperatures. Make sure the battery can pass a load test before continuing. Review Freeze Frame information to determine the ambient temperature when the DTC set.

NOTE: Diagnose and repair any Throttle Position sensor, system voltage, or 5 volt supply DTCs before continuing with this test.
With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. THROTTLE PLATE INSPECTION

Turn the ignition off.

Remove the air cleaner assembly.

Check for any signs of a foreign material (ice or dirt) on the throttle plate or in the throttle bore that can cause the throttle plate to stick.

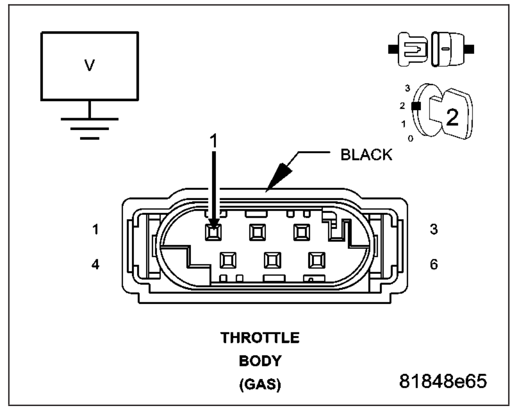
Attempt to manually open the throttle plate. Use an appropriate tool that will not damage or mar the throttle body.

Were any problems found?

Yes >> Remove the debris if possible or replace the Throttle Body Assembly. Disconnect the battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and select the ETC Relearn function.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

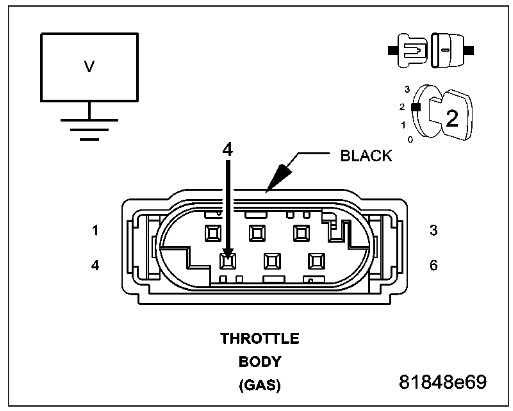
Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connectors.

Turn the ignition on.

Measure the voltage of the (K124) ETC Motor (+) circuit.

Is there any voltage present?



Yes >> Repair the (K124) ETC Motor (+) circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

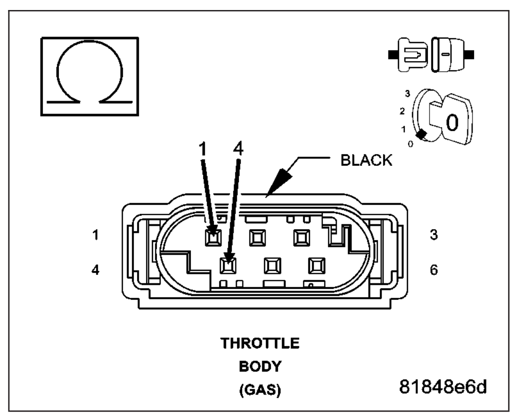
No >> Go to 4

4. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K126) ETC Motor (-) circuit.

Is there any voltage present?

Yes >> Repair the (K126) ETC Motor (-) circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO THE (K126) ETC MOTOR (-) CIRCUIT

Turn the ignition off.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

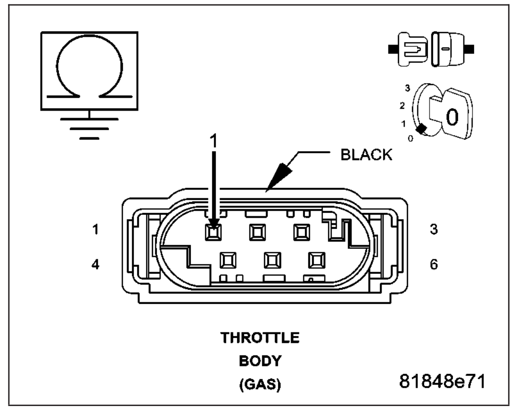
Is the resistance below 100 ohms?

Yes >> Repair the short to between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (K124) ETC MOTOR (+) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K124) ETC Motor (+) circuit.

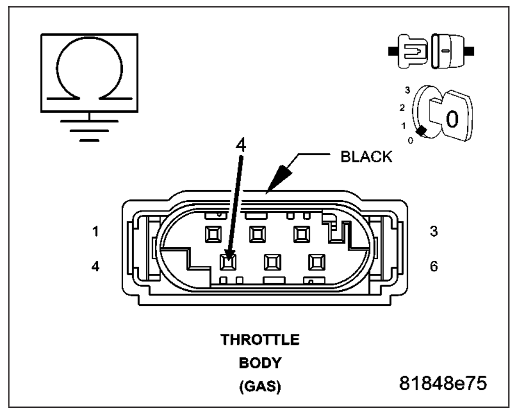
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K124) ETC Motor (+) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 7

7. (K126) ETC MOTOR (-) CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K126) ETC Motor (-) circuit.

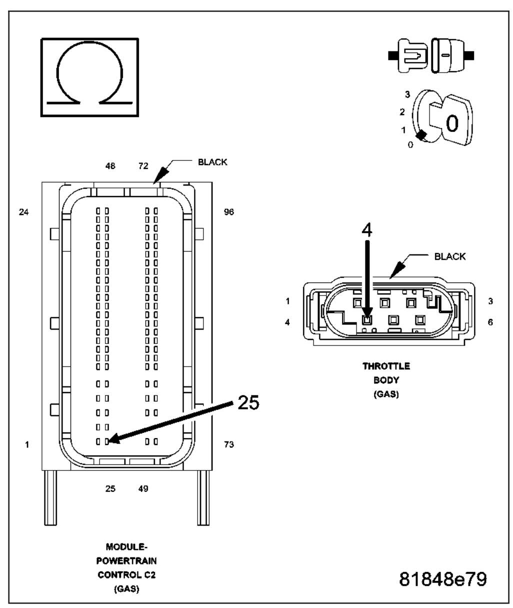
Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K126) ETC Motor (-) circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

8. (K126) ETC MOTOR (-) CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K126) ETC Motor (-) circuit.

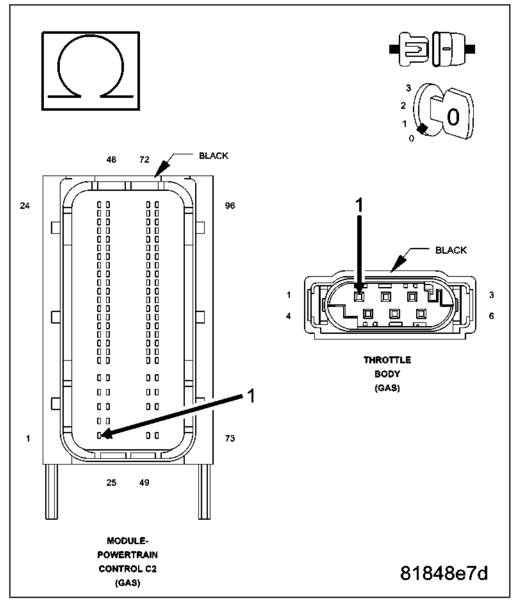
Is the resistance below 5.0 ohms?

Yes >> Go to 9

No >> Repair the (K126) ETC Motor (-) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (K124) ETC MOTOR (+) CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K124) ETC Motor (+) circuit.

Is the resistance below 5.0 ohms?

Yes >> Go to 10

No >> Repair the (K124) ETC Motor (+) circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. ETC MOTOR

Reconnect the Throttle Body harness connector.

NOTE: Measure the resistance at the PCM harness connector to avoid damaging throttle body connector terminals.

Measure the resistance between the (K124) ETC Motor (+) circuit and the (K126) ETC Motor (-) circuit.

Is the resistance between 2.5 and 25 ohms at closed throttle?

Yes >> Go to 11

No >> Replace the Throttle Body Assembly. Disconnect the Battery when replacing the Throttle Body Assembly. After installation is complete, use a scan tool and perform the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. POWERTRAIN CONTROL MODULE (PCM)

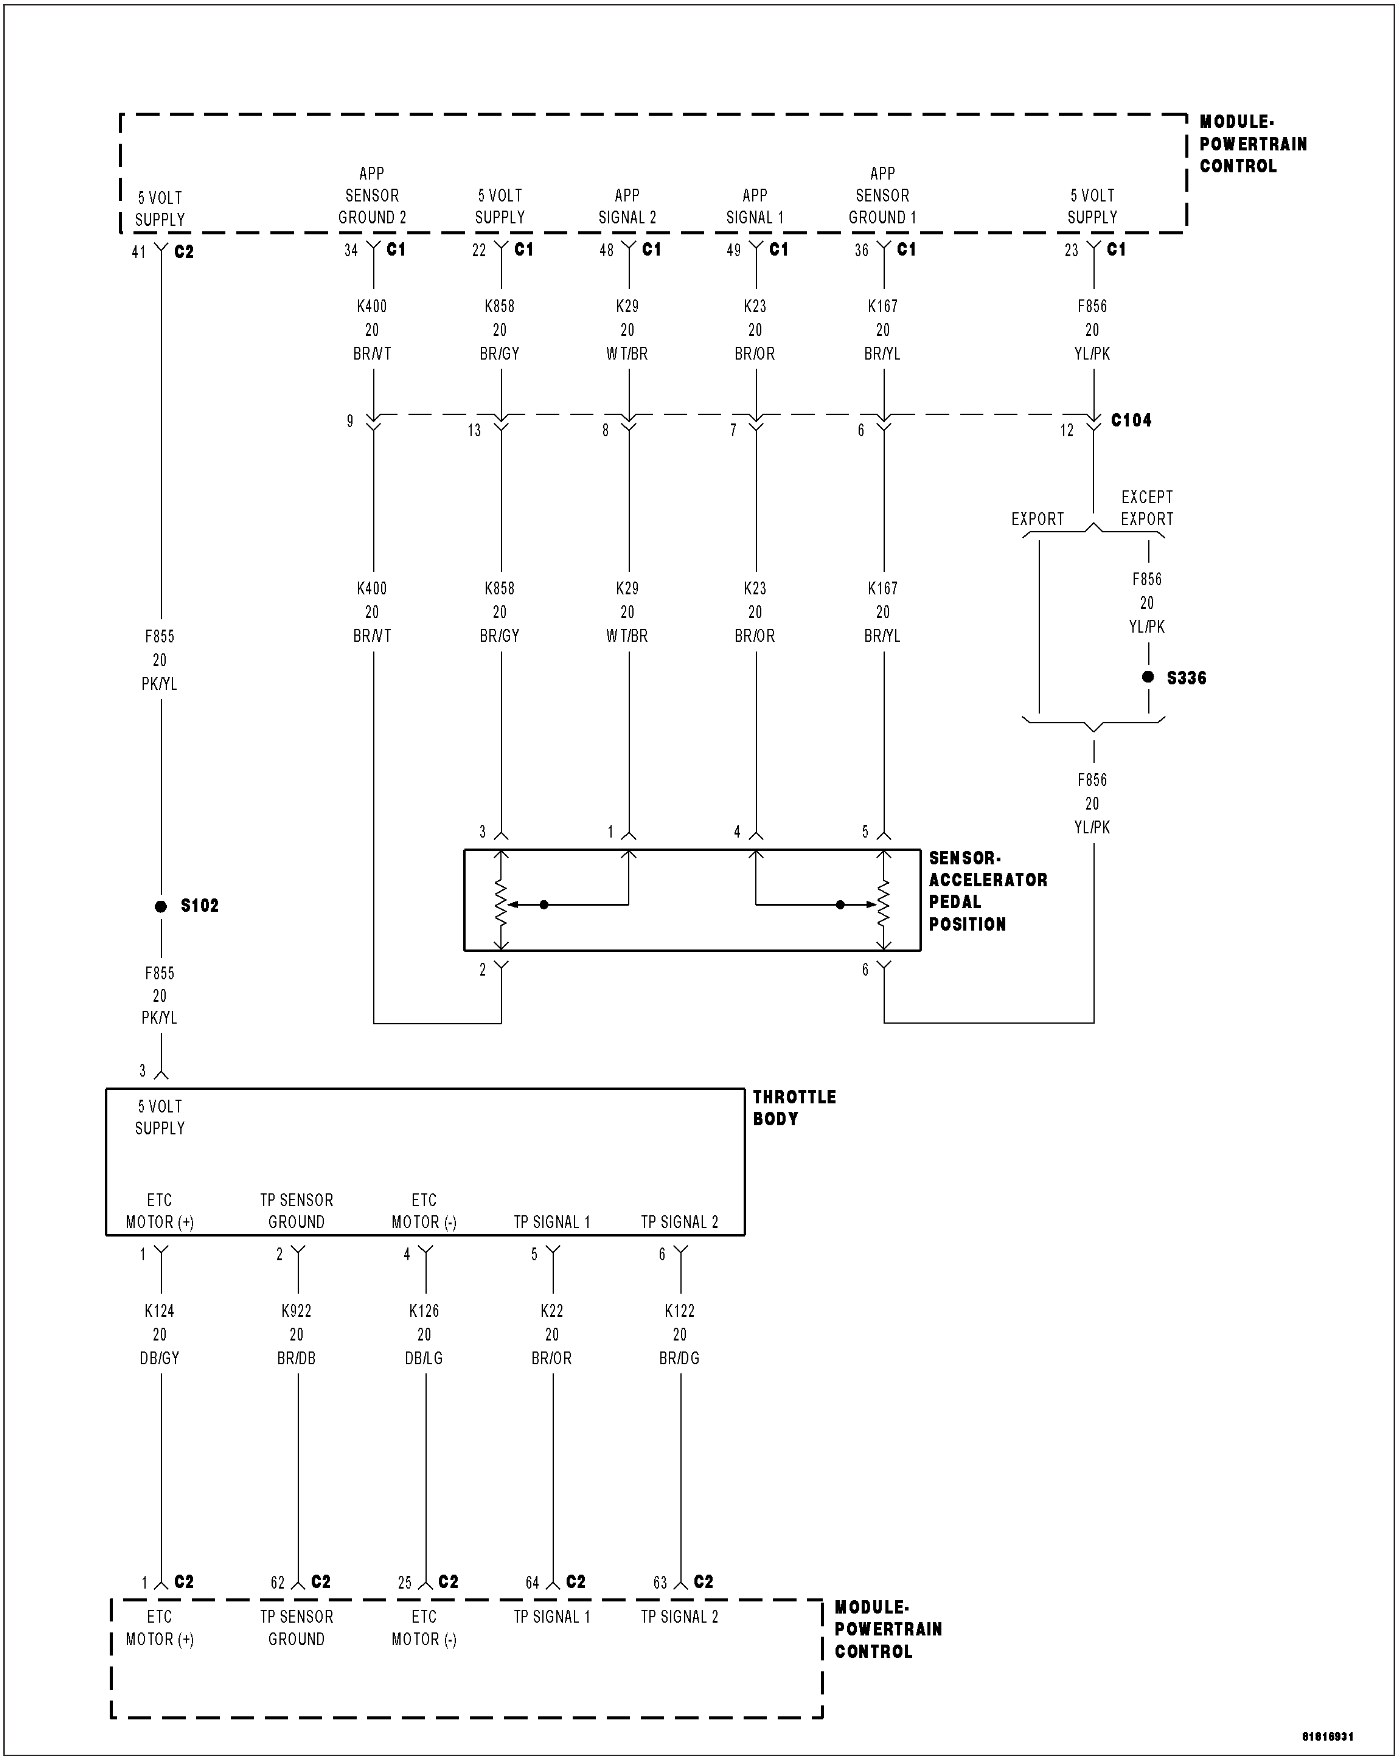
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module per Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2122-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K23) APP Signal 1 circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO GROUND
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

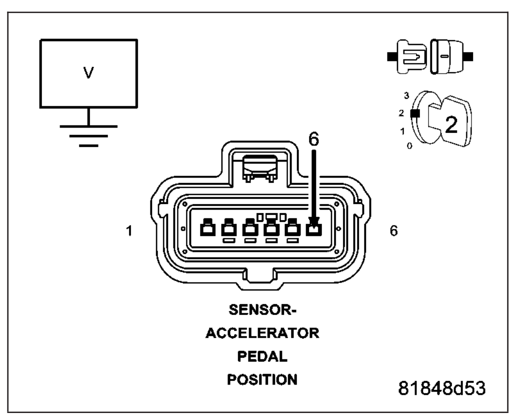
NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (F856) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

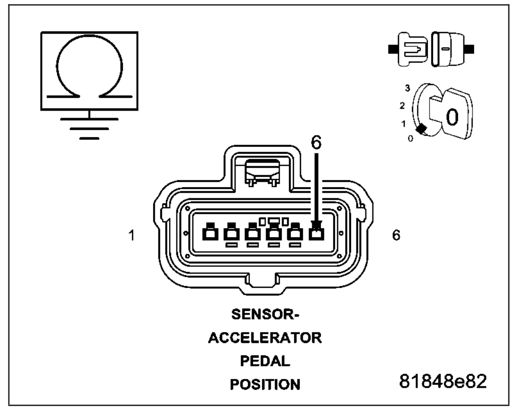
Disconnect the Accelerator Pedal Position Sensor connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Is the voltage above 4.5 volts?

Yes >> Go to 6



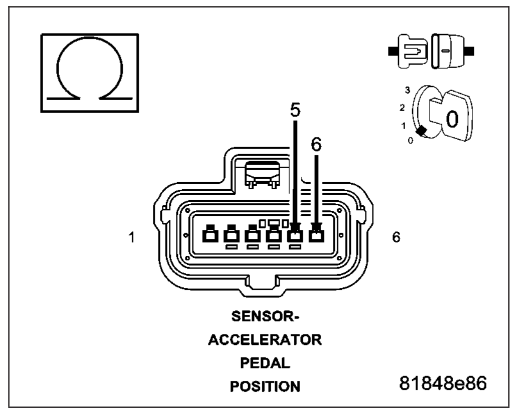
No >> Go to 3

3. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition on.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (F856) 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.



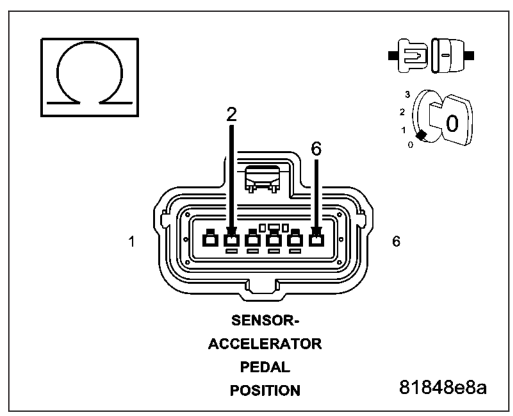
Is the resistance above 1000 ohms?

Yes >> Go to 4

No >> Repair the (F856) 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K167) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.



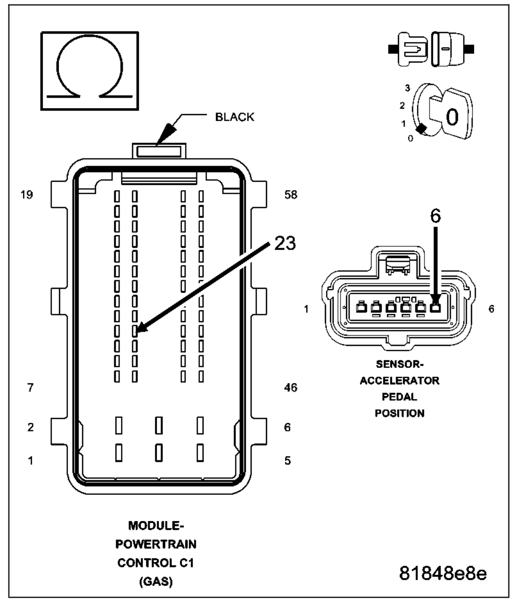
Is the resistance above 100 ohms?

Yes >> Go to 5

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K167) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT

Measure the resistance between the (F856) 5 Volt Supply circuit and the (K400) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (F856) 5 Volt Supply circuit for a short to the (K400) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

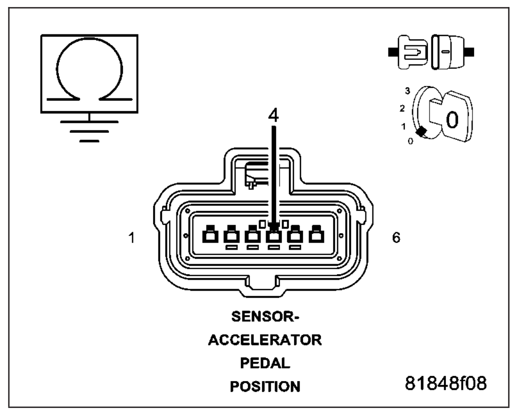
6. (F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (F856) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

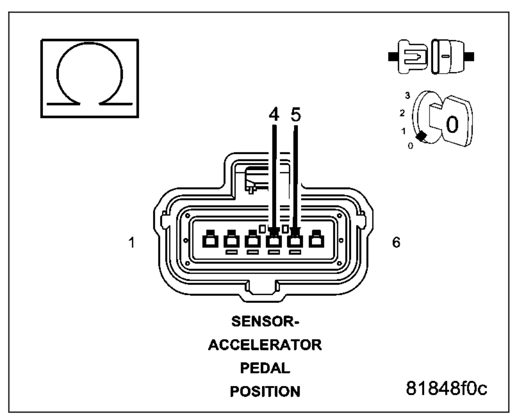
7. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K23) APP Signal 1 circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 8

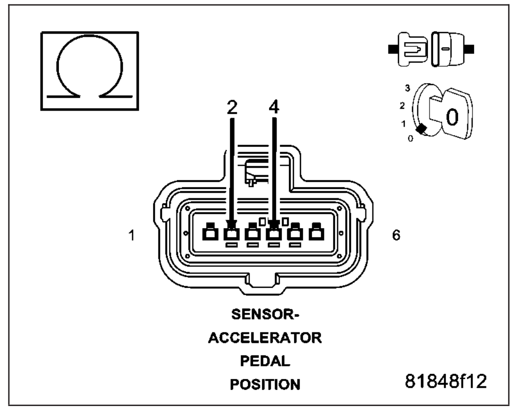
No >> Repair the (K23) APP Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT

Measure the resistance between the (K23) APP Signal 1 circuit and the (K167) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 9

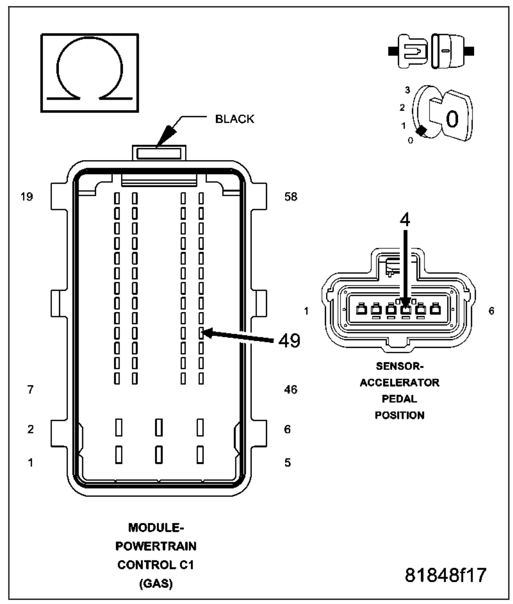
No >> Repair the (K23) APP Signal 1 circuit for a short to the (K167) Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT

Measure the resistance between the (K23) APP Signal 1 circuit and the (K400) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 10

No >> Repair the (K23) APP Signal 1 circuit for a short to the (K400) Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

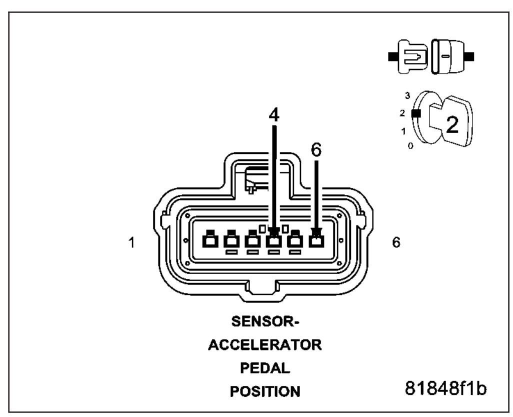
10. (K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K23) APP Signal 1 circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 11

No >> Repair the (K23) APP Signal 1 circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (F856) 5 Volt Supply circuit and the (K23) APP Signal 1 circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

Is the voltage above 4.5 volts with the jumper wire in place?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 12

12. POWERTRAIN CONTROL MODULE (PCM)

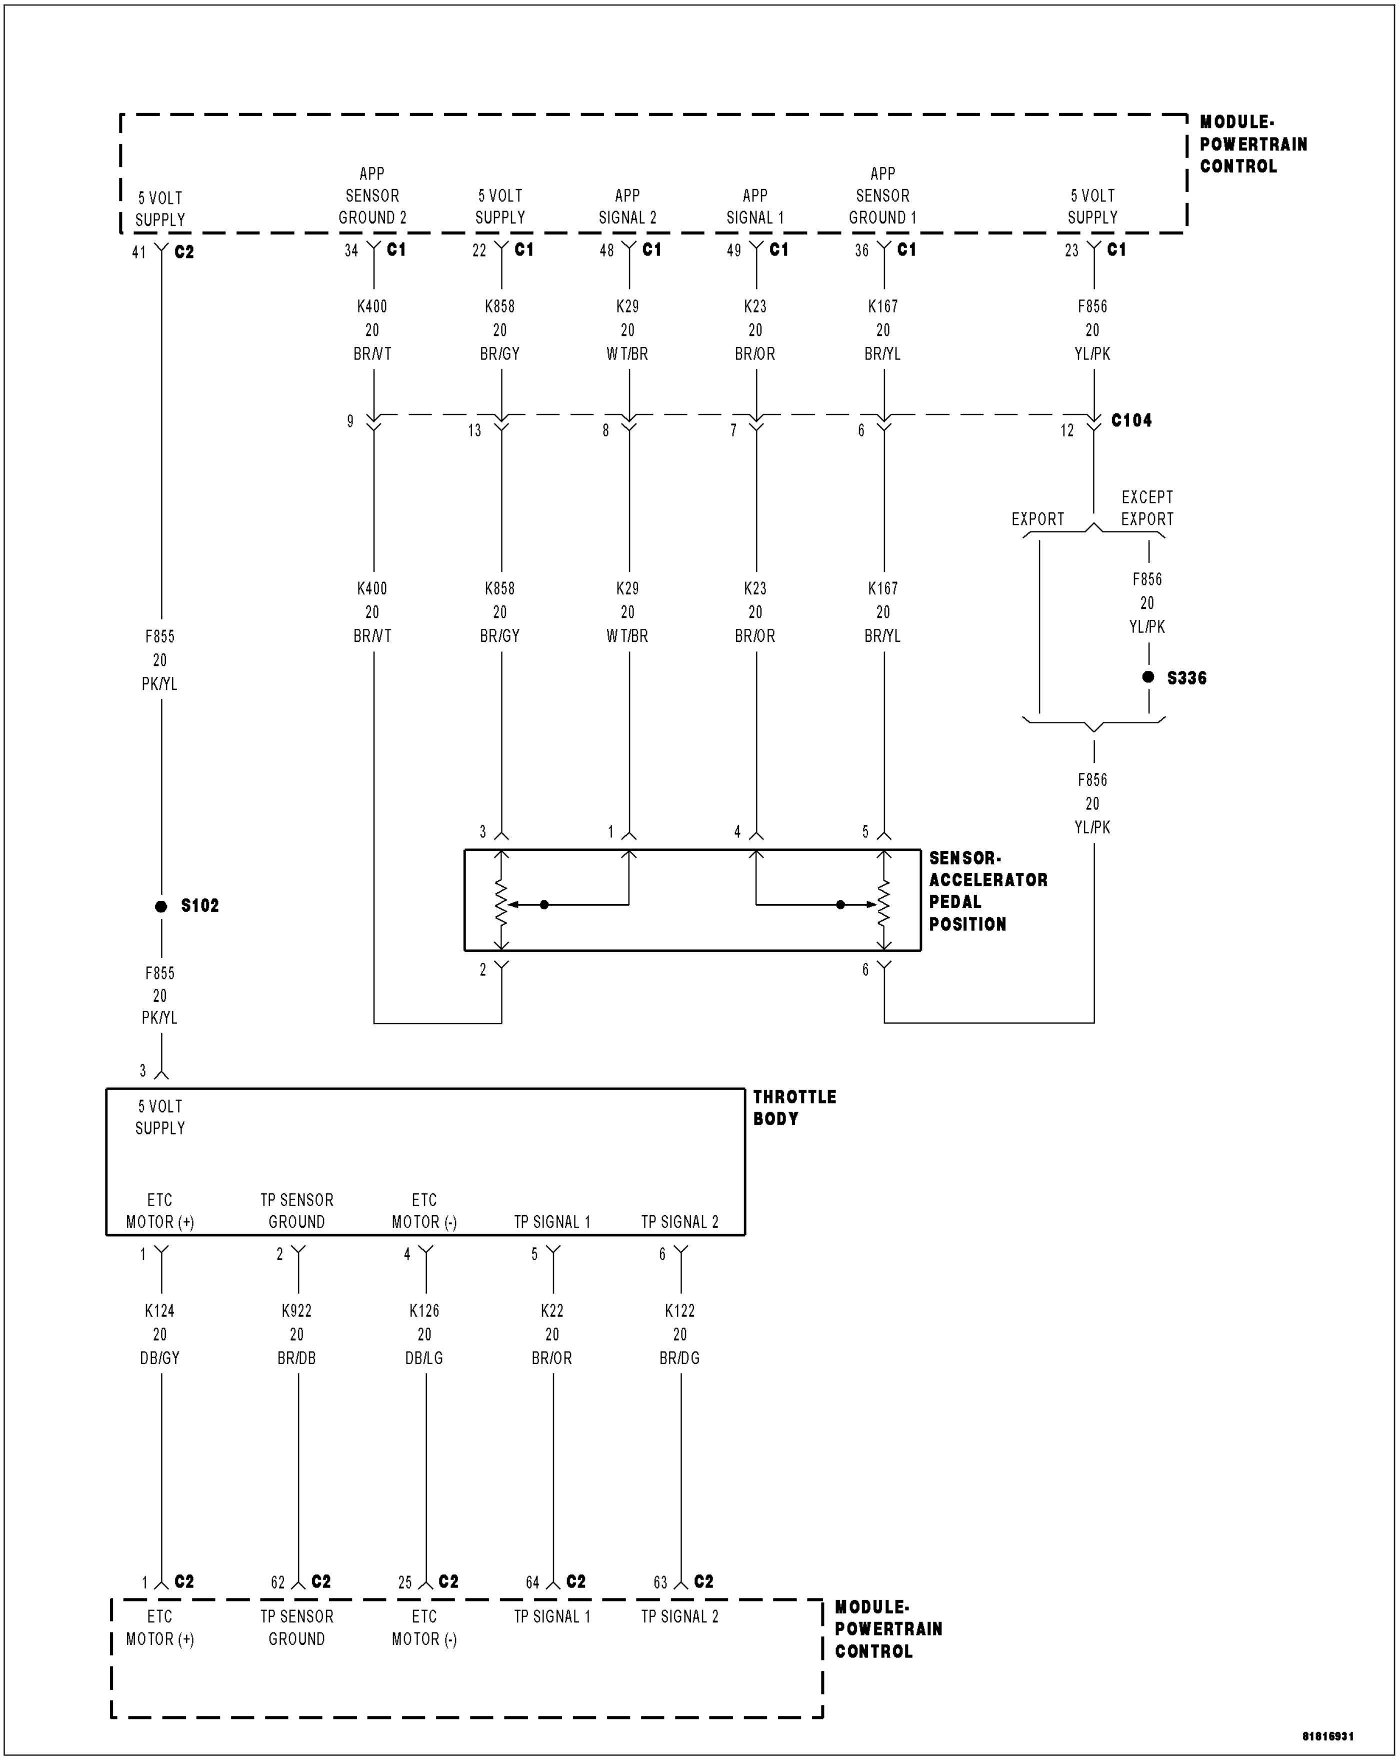
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2123-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K23) APP Signal 1 circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (F856) 5 VOLT SUPPLY CIRCUIT
(K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K858) 5 VOLT SUPPLY CIRCUIT
(K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K167) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

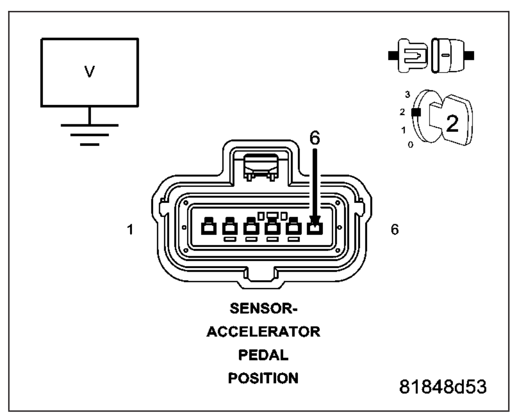
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F856) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

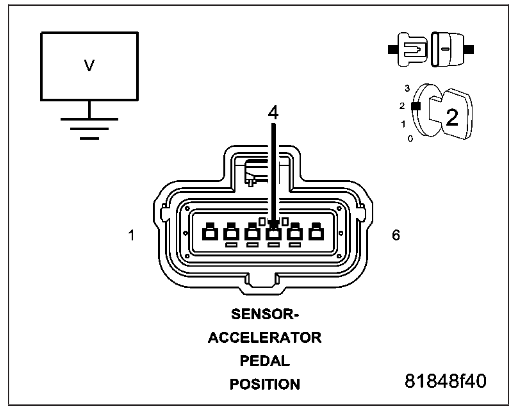
Disconnect the Accelerator Pedal Position Sensor connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (F856) 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Is there any voltage present?



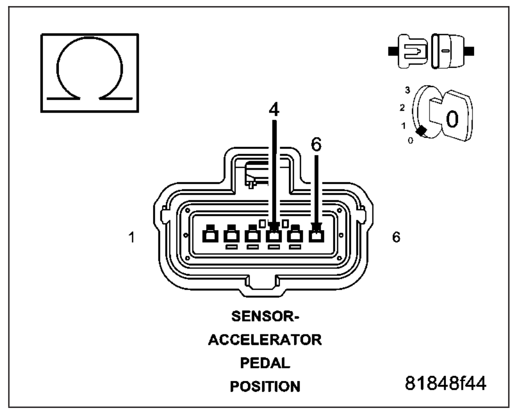
Yes >> Repair the (F856) 5 Volt Supply circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K23) APP Signal 1 circuit in the Accelerator Pedal Position Sensor harness connector.



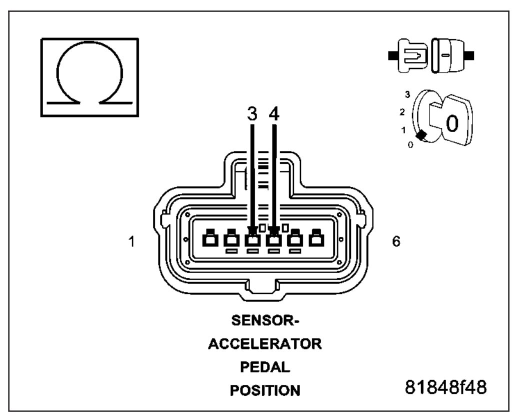
Is there any voltage present?

Yes >> Repair the (K23) APP Signal 1 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (F856) 5 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K23) APP Signal 1 circuit and the (F856) 5 Volt Supply in the Accelerator Pedal Position Sensor harness connector.



Is the resistance below 100 ohms?

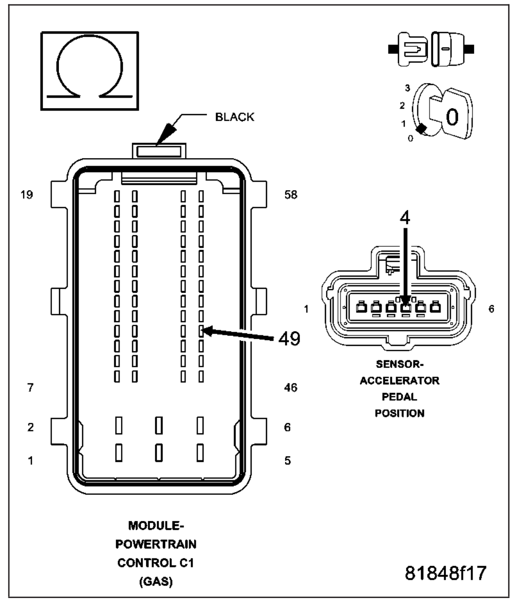
Yes >> Repair the (K23) APP Signal 1 circuit for a short to the (F856) 5 Volt Supply circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (K23) APP SIGNAL 1 CIRCUIT SHORTED TO THE (K858) 5 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K23) APP Signal 1 circuit and the (K858) 5 Volt Supply in the Accelerator Pedal Position Sensor harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (K23) APP Signal 1 circuit for a short to the (K858) 5 Volt Supply circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

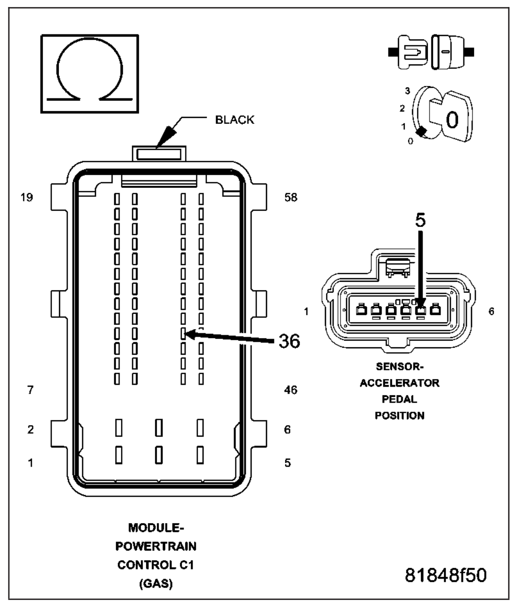
No >> Go to 6

6. (K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K23) APP Signal 1 between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



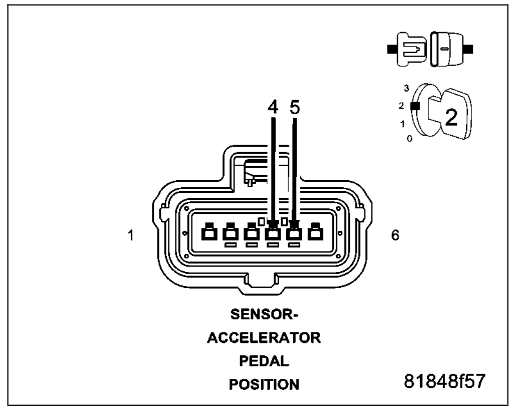
Yes >> Go to 7

No >> Repair the (K23) APP Signal 1 for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K167) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K167) Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 8

No >> Repair the (K167) Sensor Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (K167) Sensor Ground circuit and the (K23) APP Signal 1 circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. POWERTRAIN CONTROL MODULE (PCM)

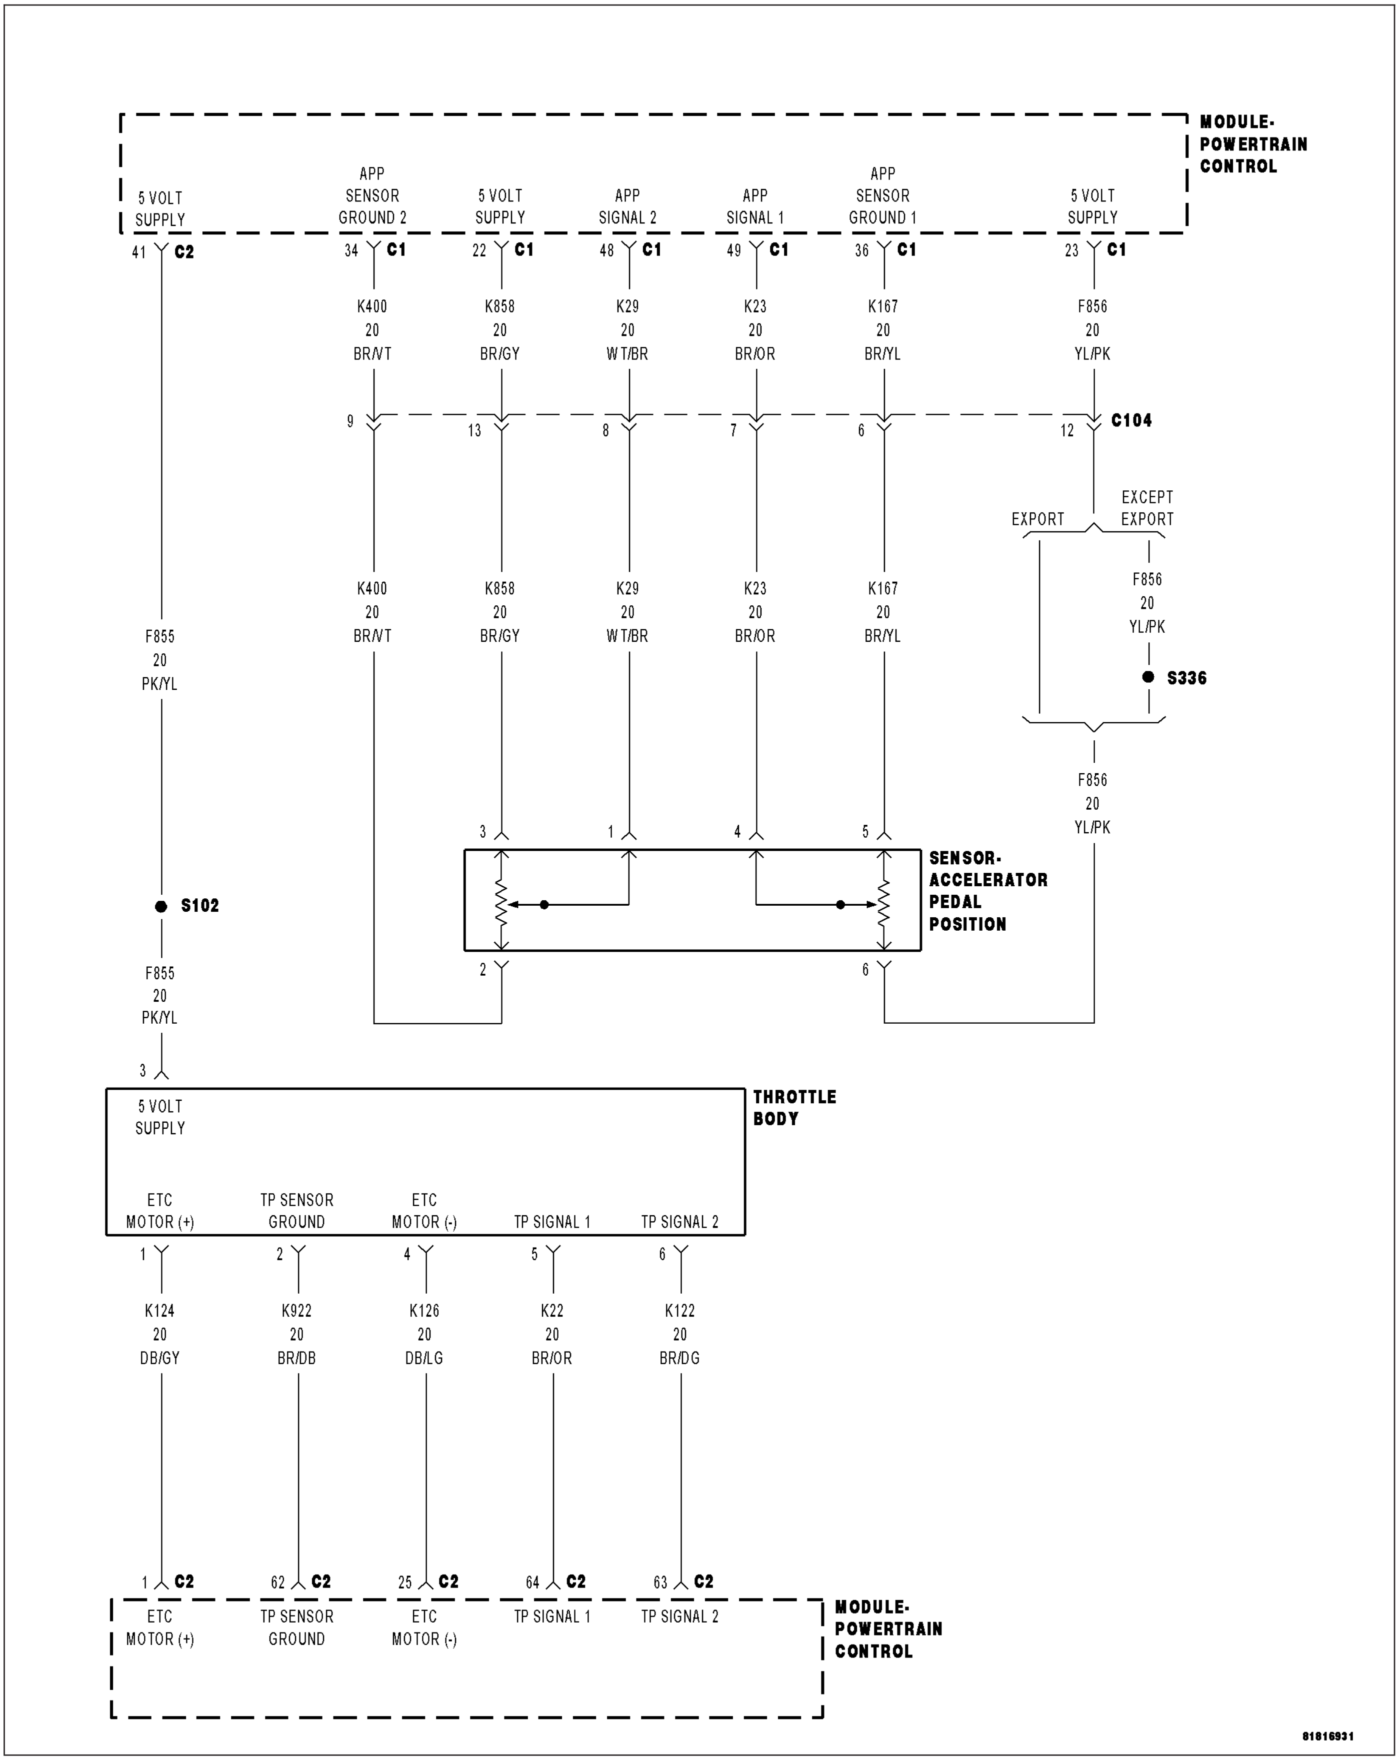
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2127-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K29) APP Signal 2 circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO GROUND
(K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT
(K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT
(K858) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

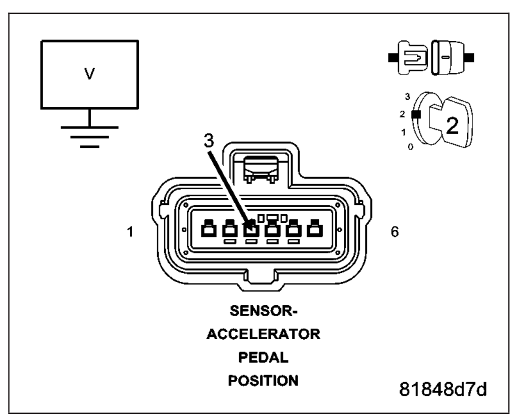
NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K858) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

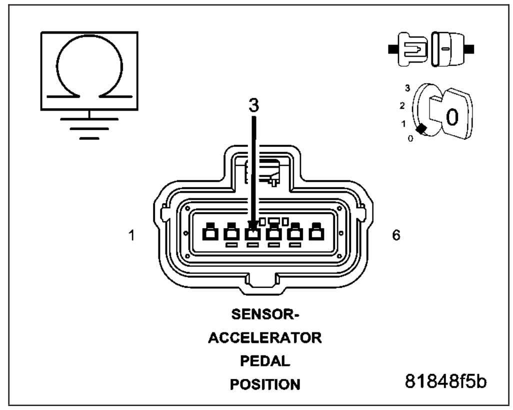
Disconnect the Accelerator Pedal Position Sensor connector.

Turn the ignition on.

Measure the voltage of the (K858) 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Is the voltage above 4.5 volts?

Yes >> Go to 6



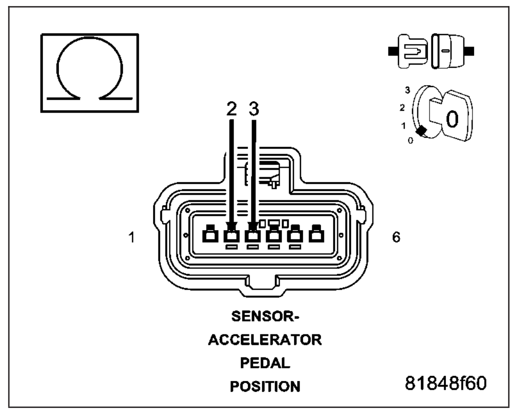
No >> Go to 3

3. (K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition on.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K858) 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.



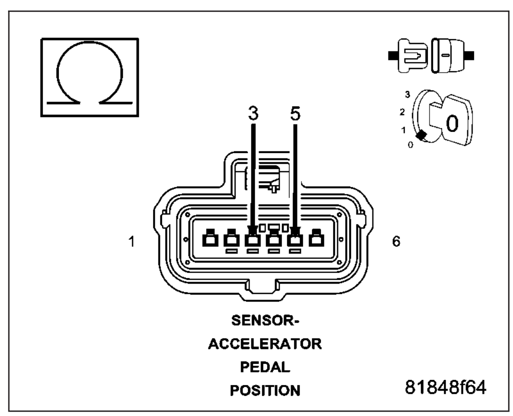
Is the resistance above 1000 ohms?

Yes >> Go to 4

No >> Repair the (K858) 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT

Measure the resistance between the (K858) 5 Volt Supply circuit and the (K400) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.



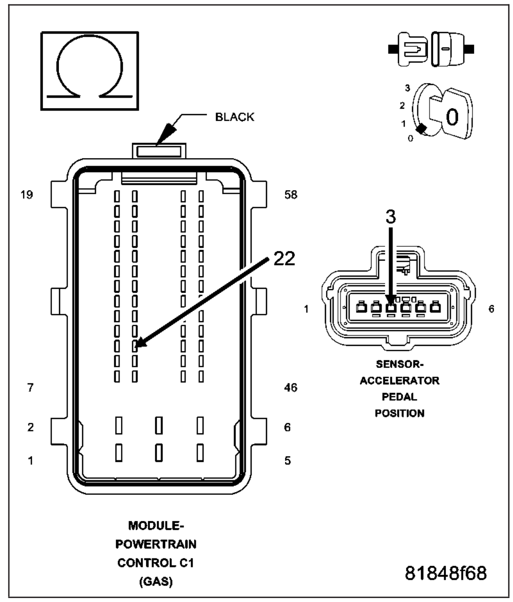
Is the resistance above 100 ohms?

Yes >> Go to 5

No >> Repair the (K858) 5 Volt Supply circuit for a short to the (K400) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT

Measure the resistance between the (K858) 5 Volt Supply circuit and the (K167) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 6

No >> Repair the (K858) 5 Volt Supply circuit for a short to the (K167) Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

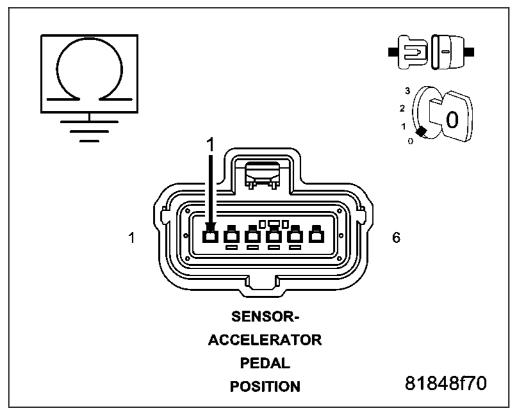
6. (K858) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K858) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the (K858) 5 Volt Supply circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

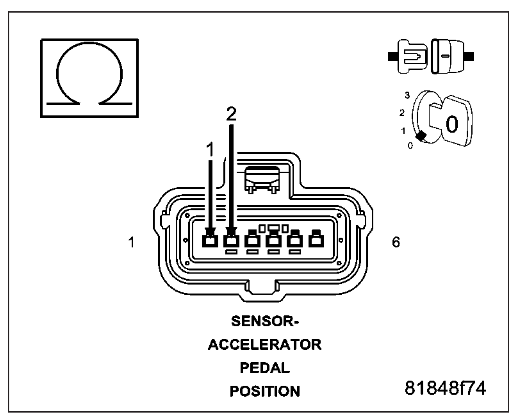
7. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K29) APP Signal 2 circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 8

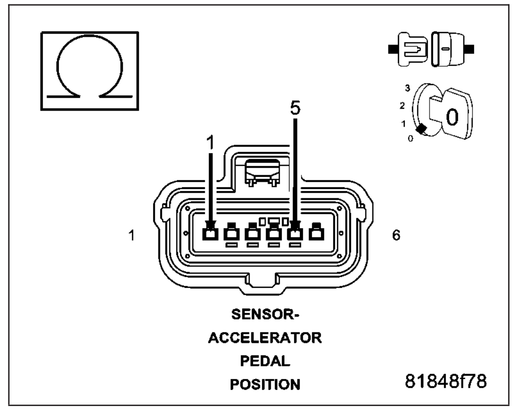
No >> Repair the (K29) APP Signal 2 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO (K400) SENSOR GROUND CIRCUIT

Measure the resistance between the (K29) APP Signal 2 circuit and the (K400) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 9

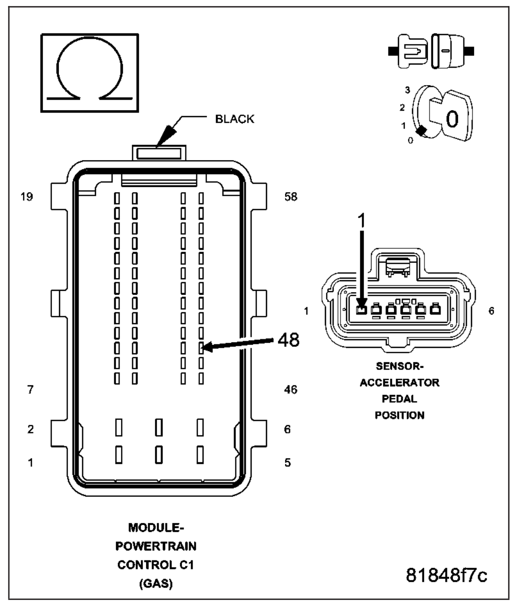
No >> Repair the (K29) APP Signal 2 circuit for a short to the (K400) Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO (K167) SENSOR GROUND CIRCUIT

Measure the resistance between the (K29) APP Signal 2 circuit and the (K167) Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 10

No >> Repair the (K29) APP Signal 2 circuit for a short to the (K167) Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

10. (K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K29) APP Signal 2 circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

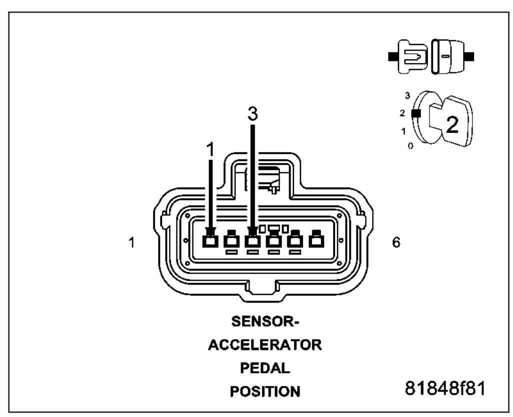
Is the resistance below 5.0 ohms?

Yes >> Go to 11

No >> Repair the (K29) APP Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. ACCELERATOR PEDAL POSITION SENSOR



Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (K858) 5 Volt Supply circuit and the (K29) APP Signal 2 circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

Is the voltage above 4.5 volts with the jumper wire in place?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 12

12. POWERTRAIN CONTROL MODULE (PCM)

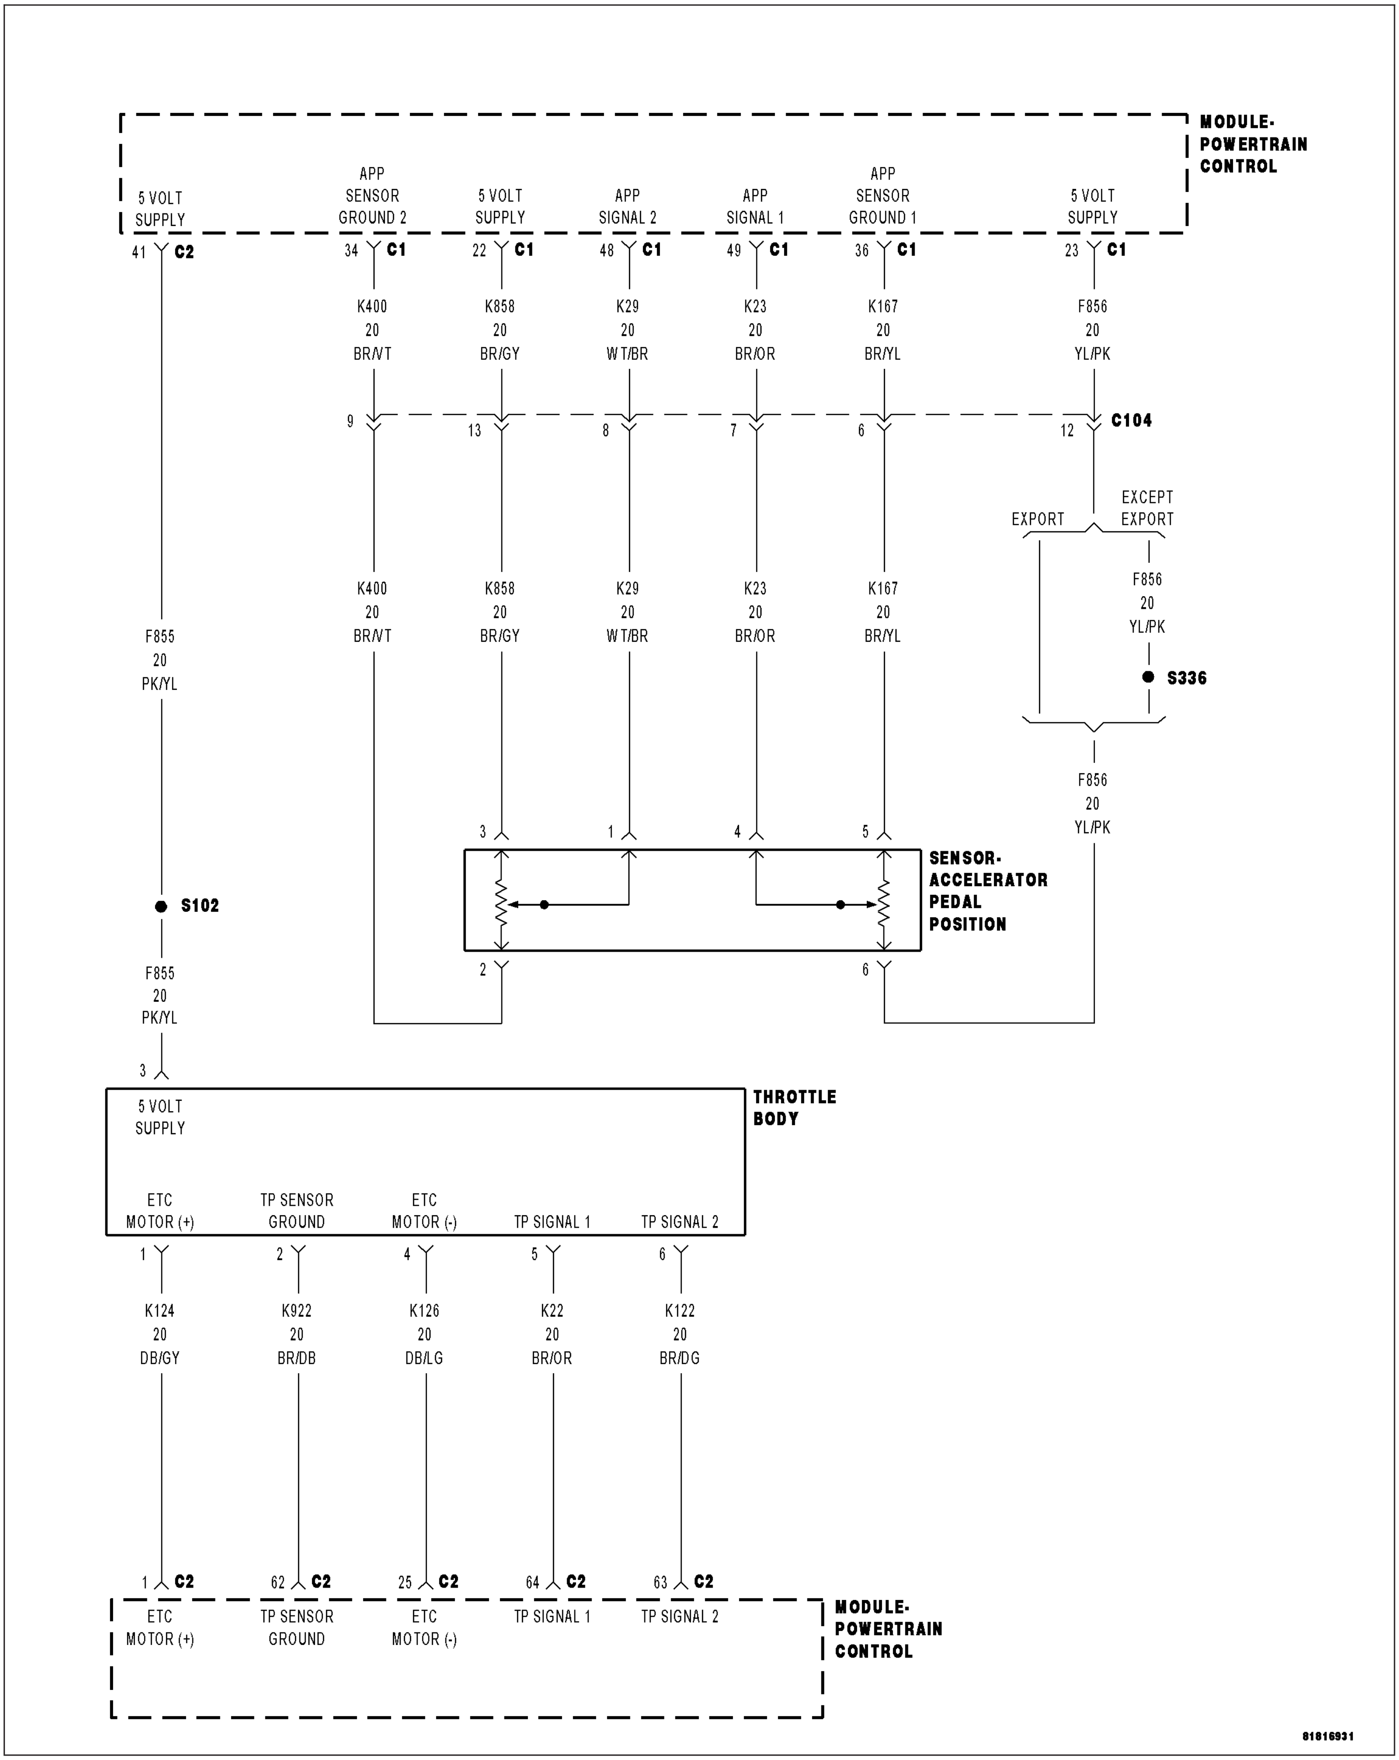
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2128-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K29) APP Signal 2 circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K858) 5 VOLT SUPPLY CIRCUIT
(K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K856) 5 VOLT SUPPLY CIRCUIT
(K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(K400) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: Diagnose and repair any system voltage or sensor supply voltage DTCs before continuing with this test.

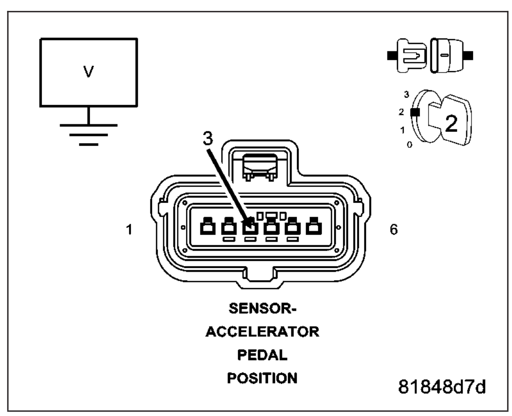
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K858) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

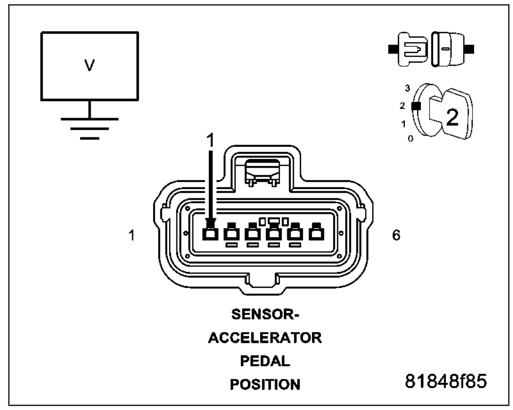
Disconnect the Accelerator Pedal Position Sensor connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K858) 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Is there any voltage present?



Yes >> Repair the (K858) 5 Volt Supply circuit for a short to voltage.

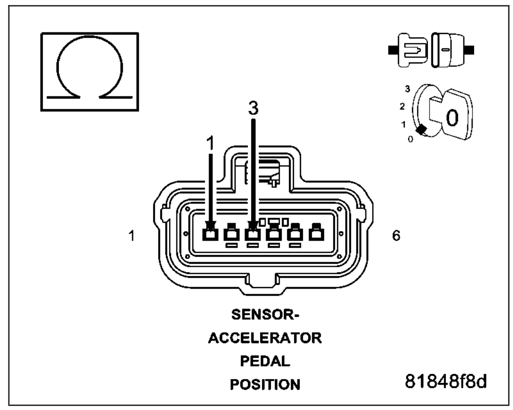
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K29) APP Signal 2 circuit in the Accelerator Pedal Position Sensor harness connector.

Is there any voltage present?



Yes >> Repair the (K29) APP Signal 2 circuit for a short to voltage.

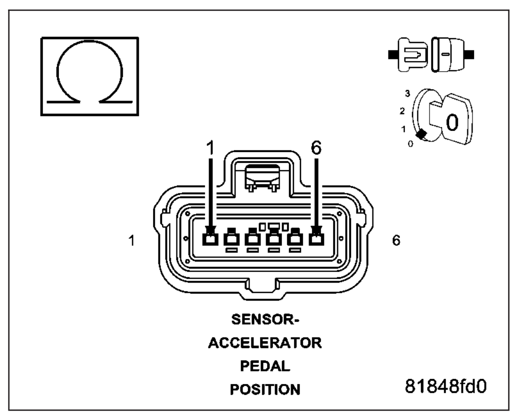
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

4. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K858) 5 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K29) APP Signal 2 circuit and the (K858) 5 Volt Supply in the Accelerator Pedal Position Sensor harness connector.

Is the resistance below 100 ohms?



Yes >> Repair the (K29) APP Signal 2 circuit for a short to the (K858) 5 Volt Supply circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

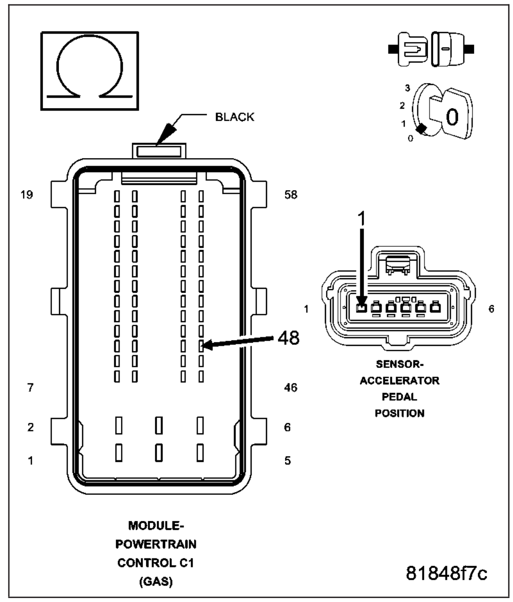
No >> Go to 5

5. (K29) APP SIGNAL 2 CIRCUIT SHORTED TO THE (K856) 5 VOLT SUPPLY CIRCUIT

Measure the resistance between the (K29) APP Signal 2 circuit and the (K856) 5 Volt Supply in the Accelerator Pedal Position Sensor harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (K29) APP Signal 2 circuit for a short to the (K856) 5 Volt Supply circuit.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

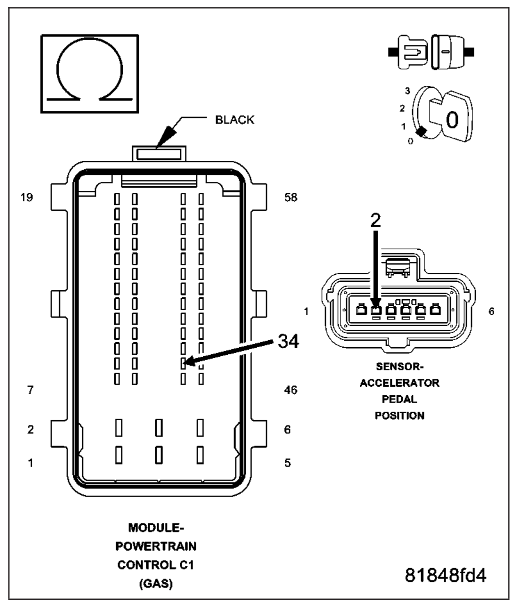
No >> Go to 6

6. (K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K29) APP Signal 2 between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 7

No >> Repair the (K29) APP Signal 2 for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K400) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K400) Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

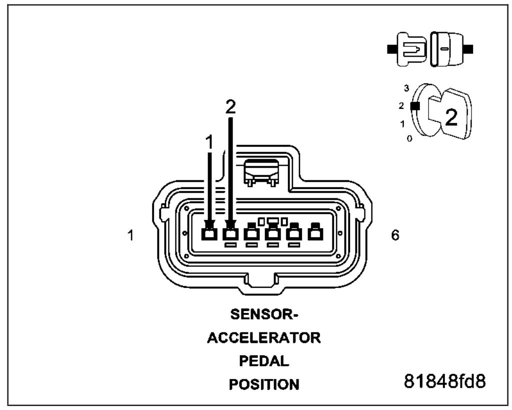
Is the resistance below 5.0 ohms?

Yes >> Go to 8

No >> Repair the (K400) Sensor Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. ACCELERATOR PEDAL POSITION SENSOR



Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (K400) Sensor Ground circuit and the (K29) APP Signal 2 circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, read the Accelerator Pedal Position Sensor signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. POWERTRAIN CONTROL MODULE (PCM)

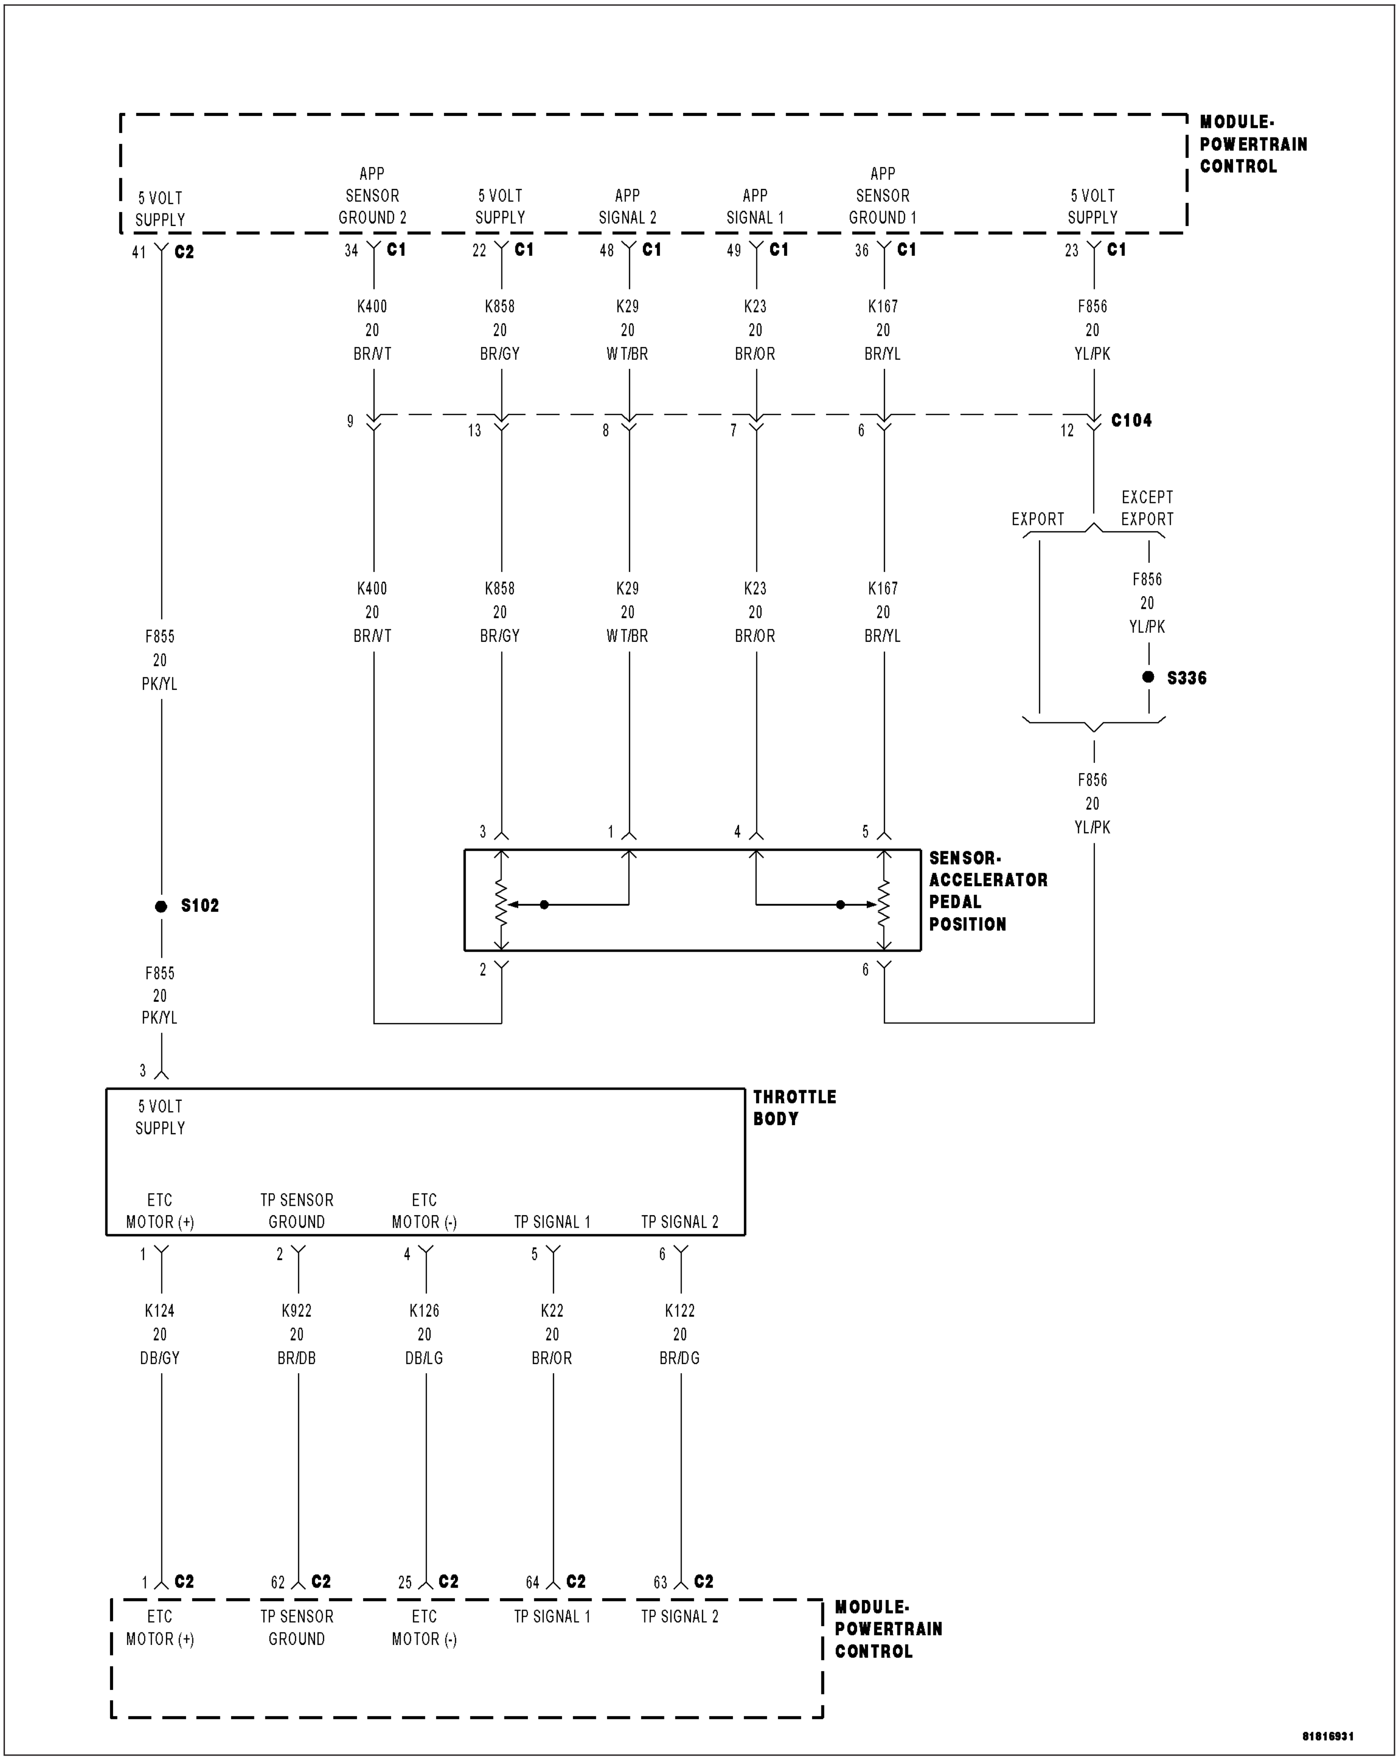
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2135-THROTTLE POSITION SENSOR 12 CORRELATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on, battery voltage greater than 10.4 volts, and no other TP Sensor DTCs present.
- **Set Condition:**
  The PCM detects that the TP Sensor voltages are not plausible. One trip fault and the code will set within 5 seconds. ETC light is illuminated.

Possible Causes
INTERMITTENT DTC
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K22) TP SIGNAL 1 CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K122) TP SIGNAL 2 CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT
(K22) TP SIGNAL 1 CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT
(K122) TP SIGNAL 2 CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT
(F855) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K22) TP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K122) TP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(K922) TP SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
THROTTLE BODY
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Start the engine.

Allow the engine to reach normal operating temperature.

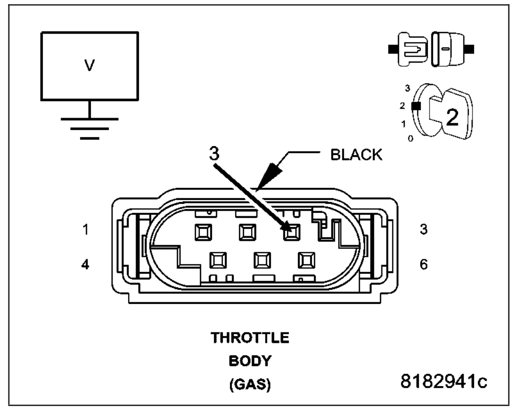
NOTE: Diagnose and repair any system voltage or sensor reference voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



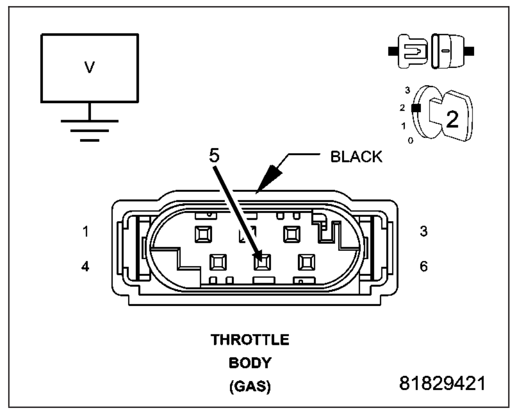
2. (F855) 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Throttle Body connector.

Turn the ignition on.

Measure the voltage of the (F855) 5 Volt Supply circuit in the Throttle Body harness connector.



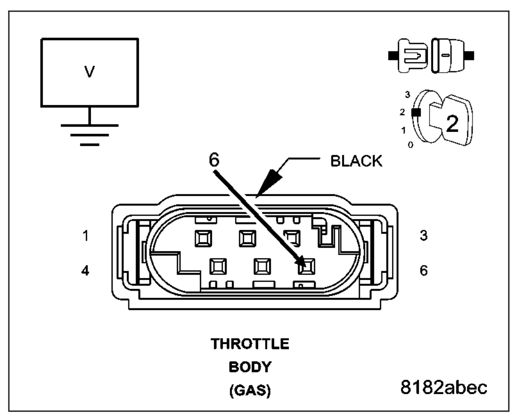
Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 3

No >> Go to 9

3. (K22) TP SIGNAL 1 CIRCUIT VOLTAGE

Measure the voltage of the (K22) TP Signal 1 circuit in the Throttle Body harness connector.



Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 4

No >> Go to 13

4. (K122) TP SIGNAL 2 CIRCUIT VOLTAGE

Measure the voltage of the (K122) TP Signal 2 circuit in the Throttle Body harness connector.

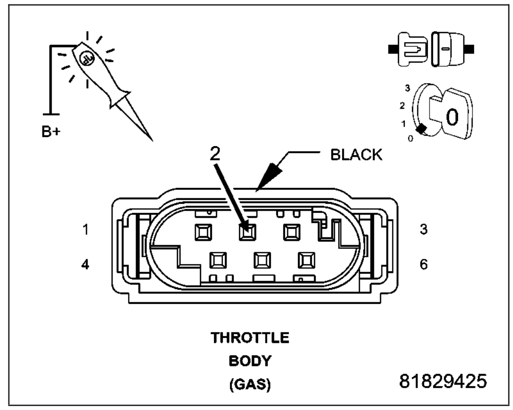
Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 5

No >> Go to 17

5. (K922) TP SENSOR GROUND CIRCUIT TEST

Turn the ignition off.



Using a 12 volt test light connected to 12 volts, check the (K922) TP Sensor Ground in the Throttle Body harness connector.

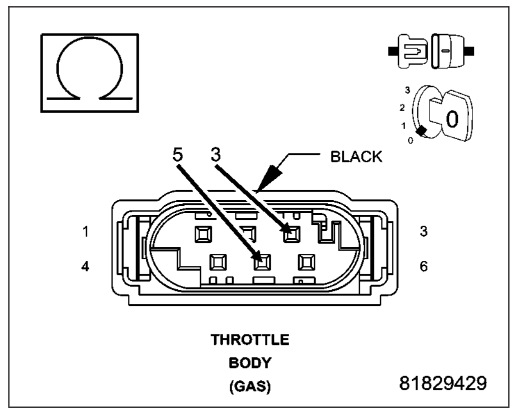
NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 6

No >> Go to 21

6. (F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K22) TP SIGNAL 1 CIRCUIT



Measure the resistance between the (F855) 5 Volt Supply circuit and the (K22) TP Signal 1 circuit in the Throttle Body harness connector.

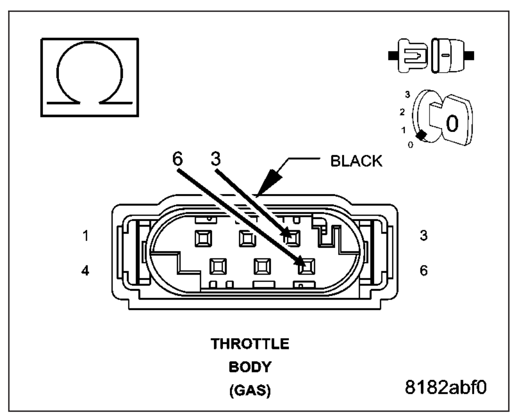
Is the resistance above 100 ohms?

Yes >> Go to 7

No >> Repair the (F855) 5 Volt Supply circuit for a short to the (K22) TP Signal 1 circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K122) TP SIGNAL 2 CIRCUIT



Measure the resistance between the (F855) 5 Volt Supply circuit and the (K122) TP Signal 2 circuit in the Throttle Body harness connector.

Is the resistance above 100 ohms?

Yes >> Go to 8

No >> Repair the (F855) 5 Volt Supply circuit for a short to the (K122) TP Signal 2 circuit.

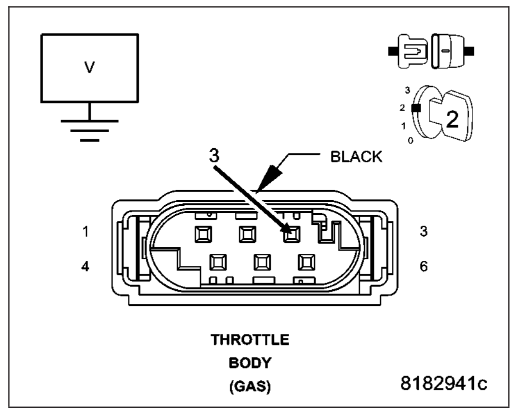
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. THROTTLE BODY

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Inspect the Throttle Body for any condition that would result in an incorrect signal, such as damage or contamination.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

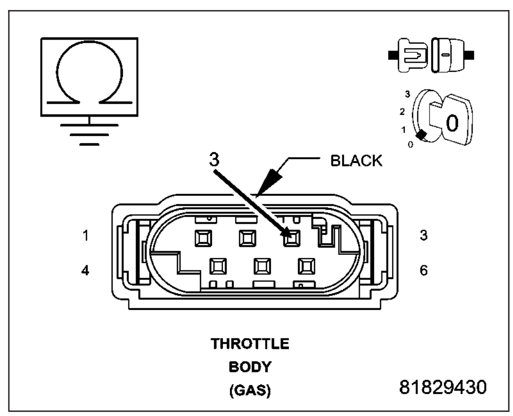
No >> Replace the Throttle Body.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. (F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.



Measure the voltage of the (F855) 5 Volt Supply circuit in the Throttle Body harness connector.

Is there any voltage present?

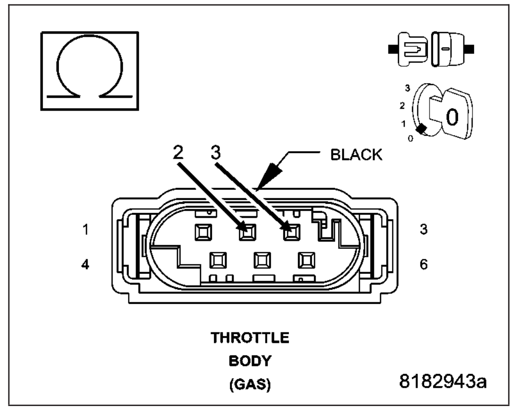
Yes >> Repair the (F855) 5 Volt Supply circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 10

10. (F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (F855) 5 Volt Supply circuit in the Throttle Body harness connector.



Is the resistance above 100 ohms?

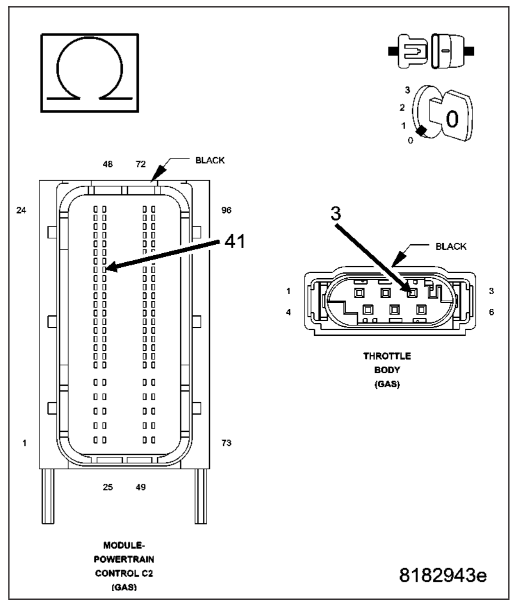
Yes >> Go to 11

No >> Repair the (F855) 5 Volt Supply circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

11. (F855) 5 VOLT SUPPLY CIRCUIT SHORTED TO THE (K922) TP SENSOR GROUND CIRCUIT

Measure the resistance between the (F855) 5 Volt Supply circuit and the (K922) TP Sensor Ground circuit in the Throttle Body harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 12

No >> Repair the (F855) 5 Volt Supply circuit for a short to the (K922) TP Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

12. (F855) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

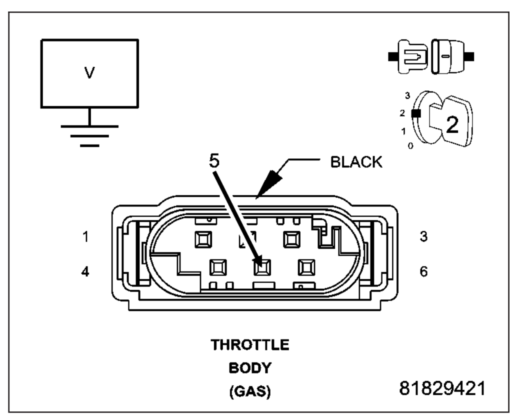
Measure the resistance of the (F855) 5 Volt Supply circuit between the Throttle Body harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 22

No >> Repair the (F855) 5 Volt Supply circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



13. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K22) TP Signal 1 circuit in the Throttle Body harness connector.

Is there any voltage present?

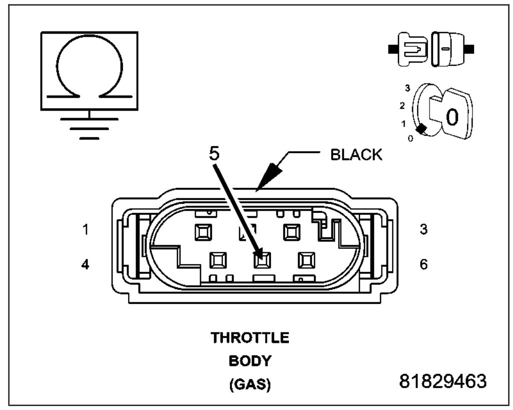
Yes >> Repair the (K22) TP Signal 1 circuit for a short to voltage.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 14

14. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO GROUND

Turn the ignition off.



Measure the resistance between ground and the (K22) TP Signal 1 circuit in the Throttle Body harness connector.

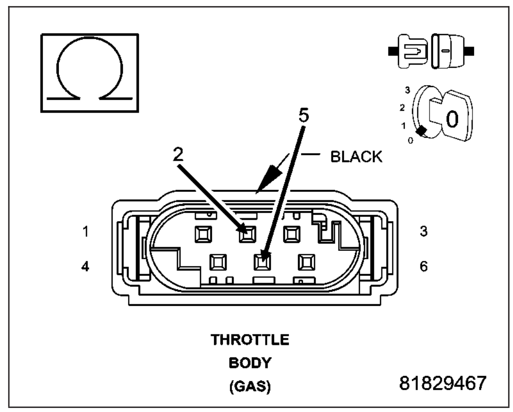
Is the resistance above 100 ohms?

Yes >> Go to 15

No >> Repair the (K22) TP Signal 1 circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

15. (K22) TP SIGNAL 1 CIRCUIT SHORTED TO (K922) TP SENSOR GROUND CIRCUIT



Measure the resistance between the (K22) TP Signal 1 circuit and the (K922) TP Sensor Ground circuit in the Throttle Body harness connector.

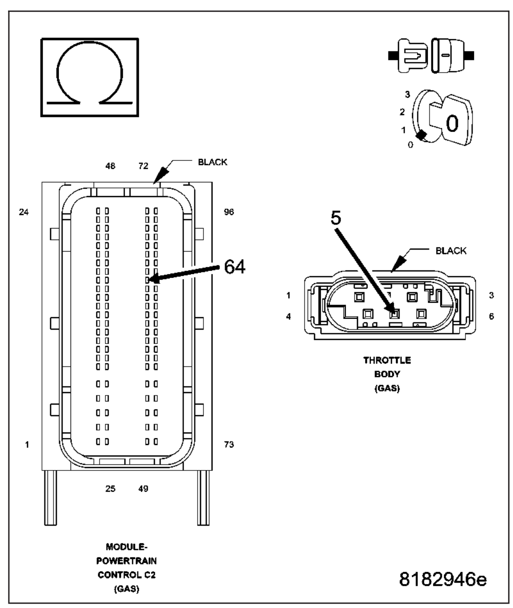
Is the resistance above 100 ohms?

Yes >> Go to 16

No >> Repair the (K22) TP Signal 1 circuit for a short to the (K922) TP Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

16. (K22) TP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE



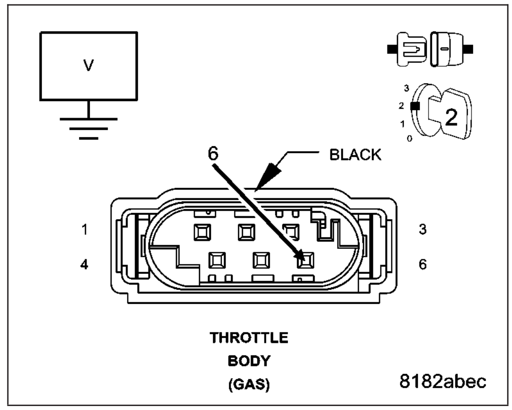
Measure the resistance of the (K22) TP Signal 1 circuit between the Throttle Body harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 22

No >> Repair the (K22) TP Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



17. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO VOLTAGE

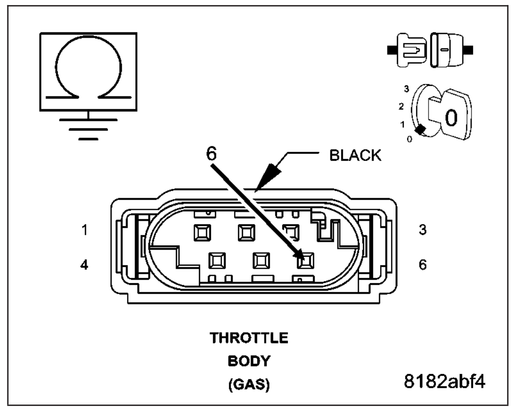
Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K122) TP Signal 2 circuit in the Throttle Body harness connector.

Is there any voltage present?



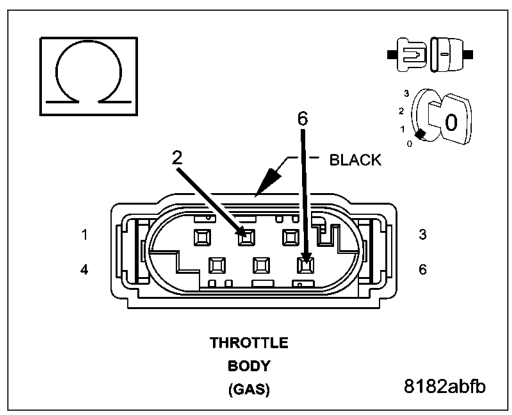
Yes >> Repair the (K122) TP Signal 2 circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 18

18. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K122) TP Signal 2 circuit in the Throttle Body harness connector.



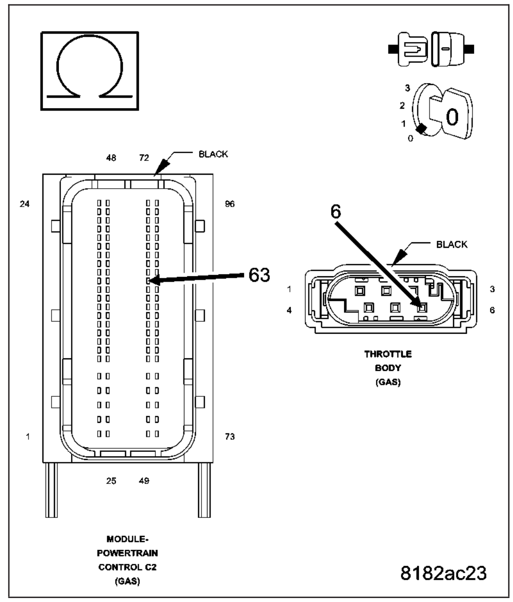
Is the resistance above 100 ohms?

Yes >> Go to 19

No >> Repair the (K122) TP Signal 2 circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

19. (K122) TP SIGNAL 2 CIRCUIT SHORTED TO (K922) TP SENSOR GROUND CIRCUIT

Measure the resistance between the (K122) TP Signal 2 circuit and the (K922) TP Sensor Ground circuit in the Throttle Body harness connector.



Is the resistance above 100 ohms?

Yes >> Go to 20

No >> Repair the (K122) TP Signal 2 circuit for a short to the (K922) TP Sensor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

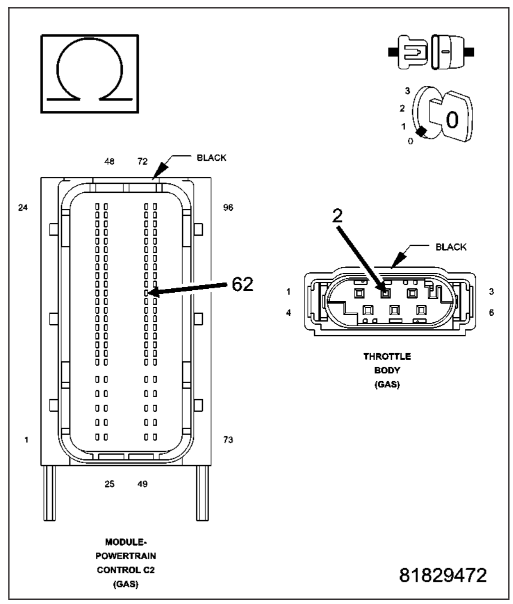
20. (K122) TP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K122) TP Signal 2 circuit between the Throttle Body harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 22

No >> Repair the (K122) TP Signal 2 circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

21. (K922) TP SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance of the (K922) TP Sensor Ground circuit between the Throttle Body harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 22

No >> Repair the circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

22. POWERTRAIN CONTROL MODULE (PCM)

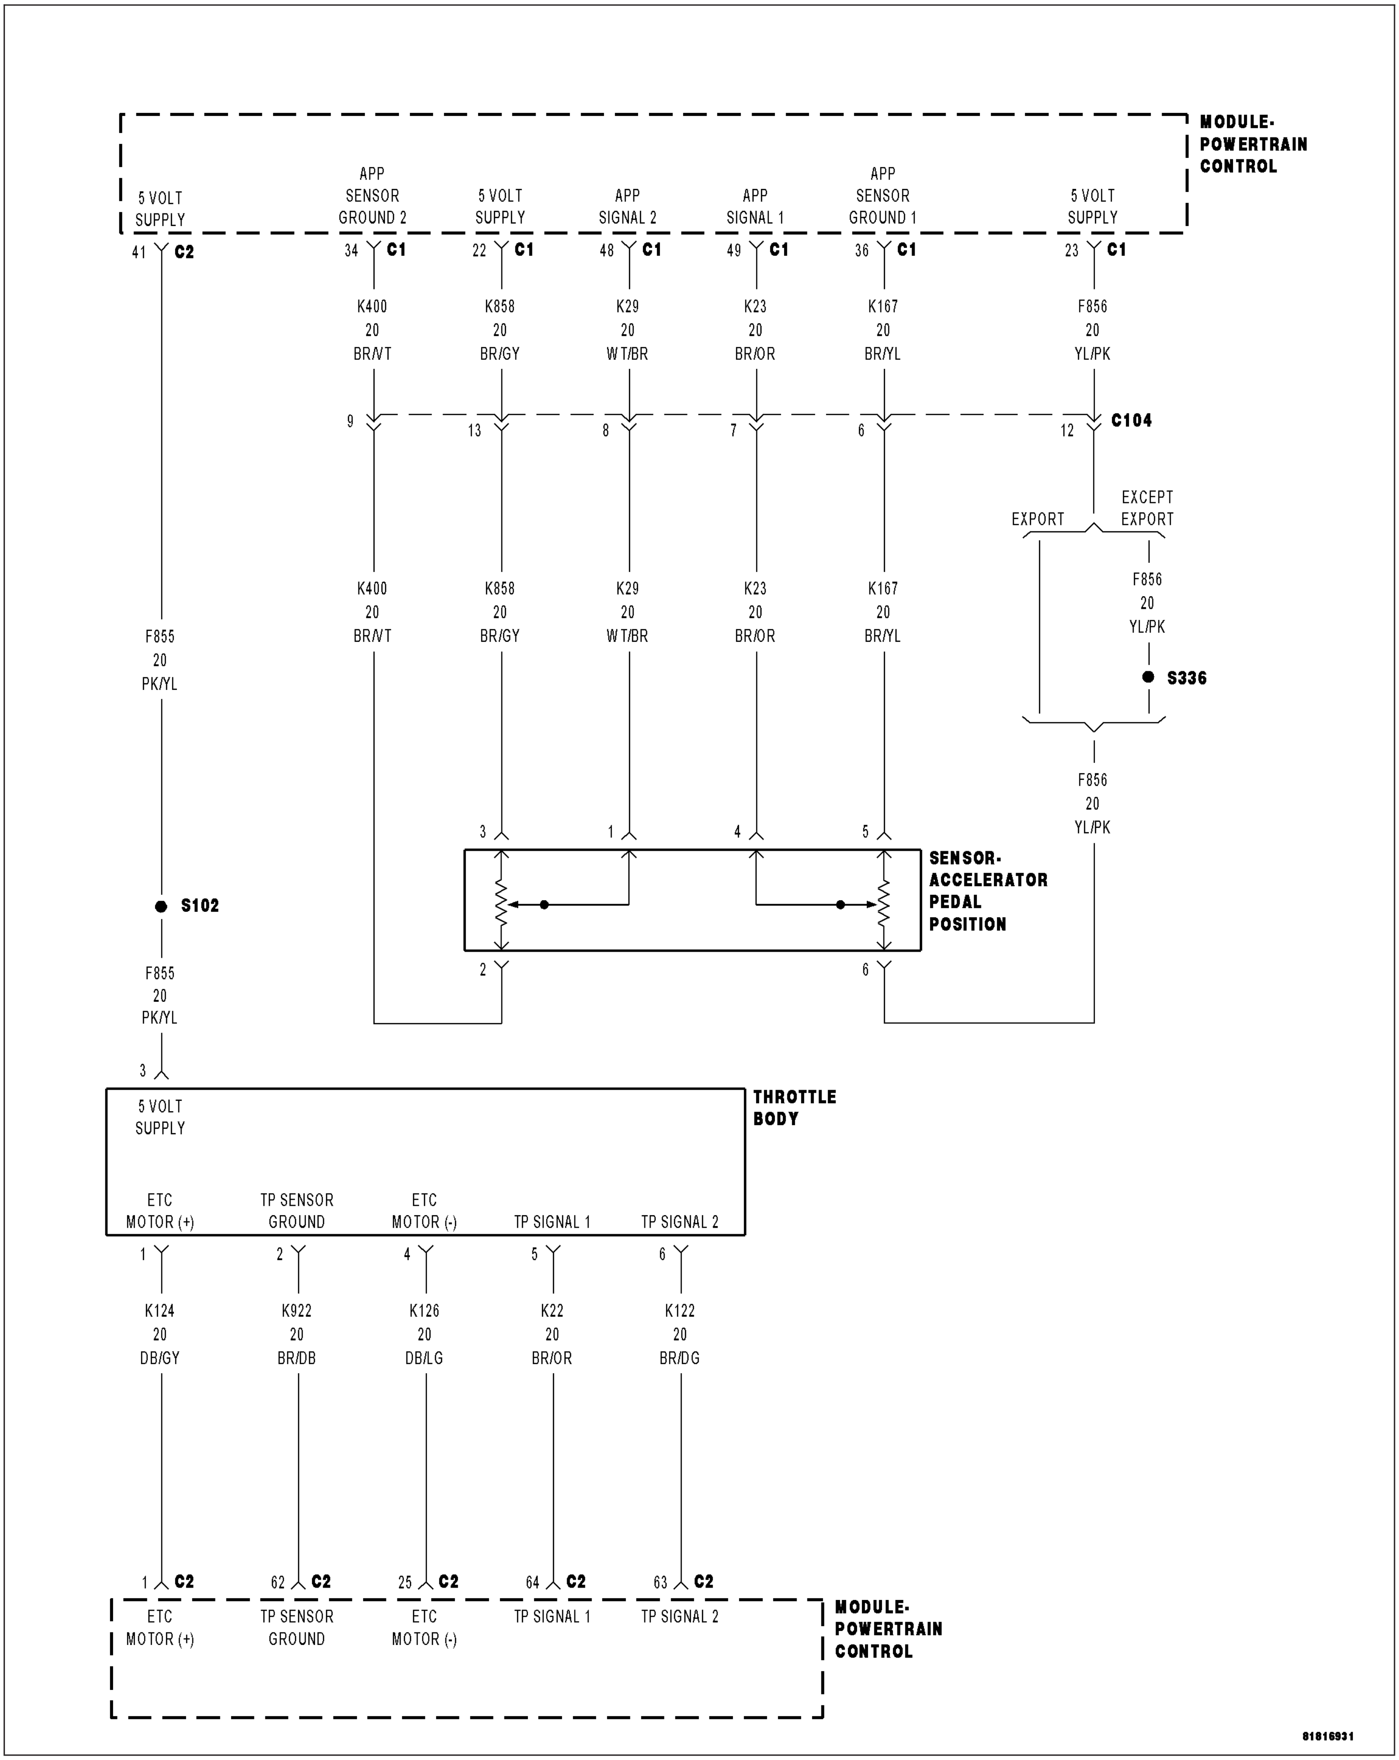
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2138-ACCELERATOR PEDAL POSITION SENSOR 1/2 CORRELATION

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on, battery voltage greater than 10.4 volts, and no APPS 1 and APPS 2 DTCs present.
- **Set Condition:**
  The PCM detects that the correlation between APPS 1 and APPS 2 is not plausible. Idle may be affected when the brake pedal is pressed or if a brake switch circuit error is present. Acceleration rate and engine output are limited. One trip fault and the code will set within 5 seconds. ETC light is flashing.

Possible Causes
INTERMITTENT DTC
(F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K167) APP SENSOR GROUND 1 CIRCUIT OPEN OR HIGH RESISTANCE
(K858) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE
(K400) APP SENSOR GROUND 2 CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

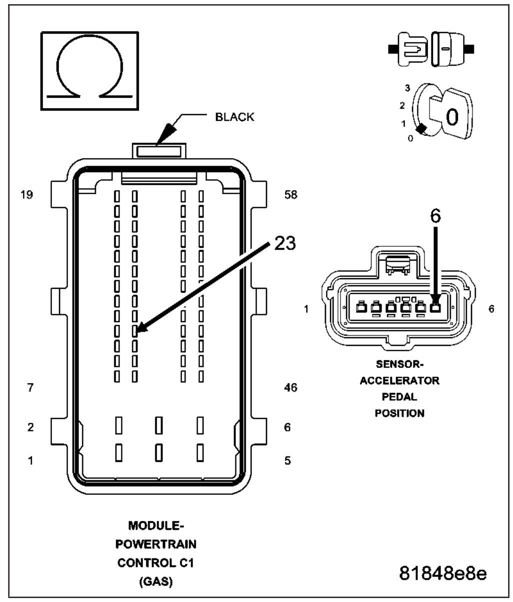
NOTE: Diagnose and repair any APPS, system voltage, or sensor supply voltage DTCs before continuing with this test.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (F856) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

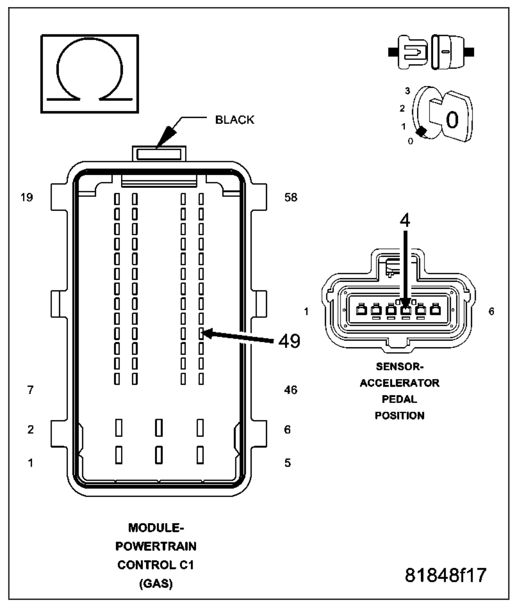
Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor connector.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance of the (F856) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 3

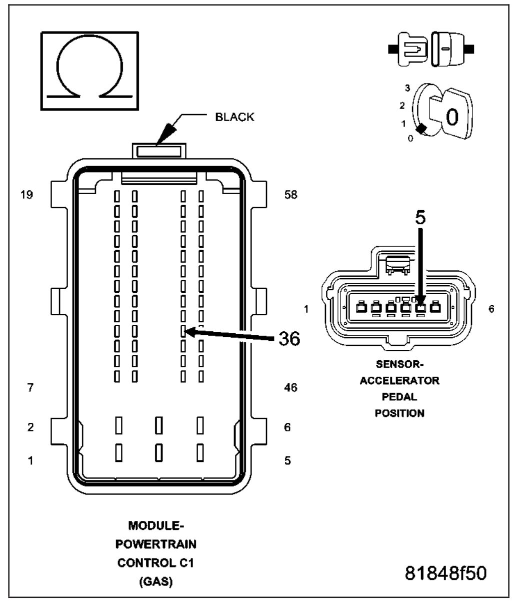
No >> Repair the (F856) 5 Volt Supply circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K23) APP SIGNAL 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K23) APP Signal 1 circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 4

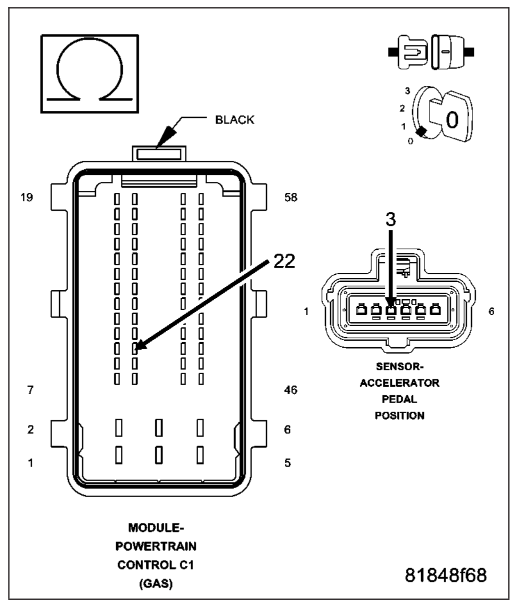
No >> Repair the (K23) APP Signal 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K167) APP SENSOR GROUND 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K167) APP Sensor Ground 1 circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 5

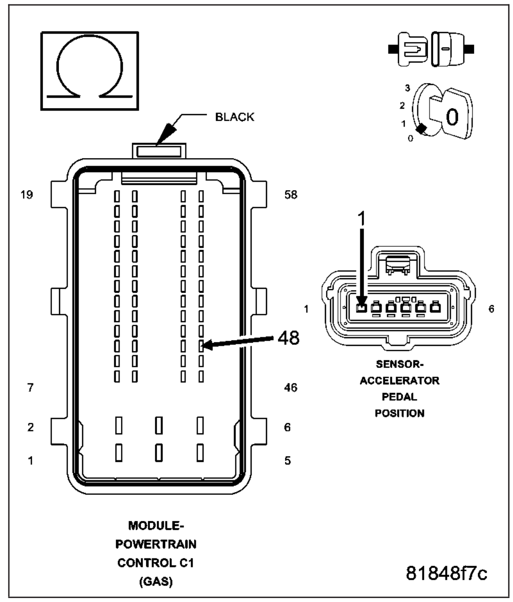
No >> Repair the (K167) APP Sensor Ground 1 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K858) 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K858) 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 6

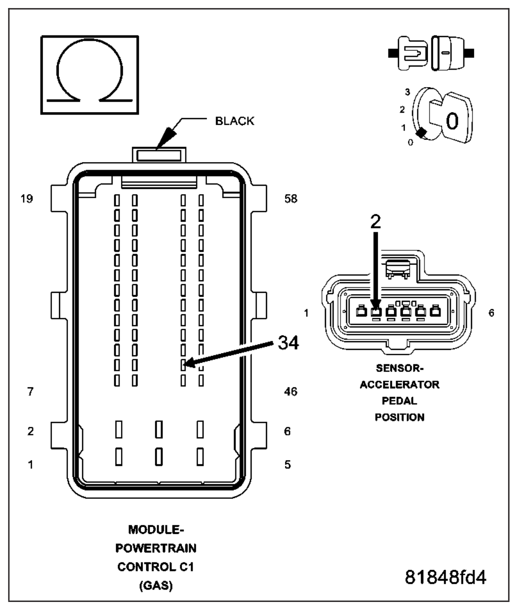
No >> Repair the (K858) 5 Volt Supply circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (K29) APP SIGNAL 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K29) APP Signal 2 circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 7

No >> Repair the (K29) APP Signal 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K400) APP SENSOR GROUND 2 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K400) APP Sensor Ground 2 circuit between the Accelerator Pedal Position Sensor harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 8

No >> Repair the (K400) APP Sensor Ground 2 circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Connect the Accelerator Pedal Position Sensor connector.

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Set up a lab scope to view two graphs simultaneously.

Using one channel on the lab scope, backprobe the (K23) APP Signal 1 circuit at the APP Sensor harness connector.

Using the other channel on the lab scope, backprobe the (K29) APP Signal 2 circuit at the APP Sensor harness connector.

Slowly press and release the Accelerator Pedal while monitoring the lab scope screen.

Does the scope pattern show any missing or erratic signals?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 9

9. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2166-ACCELERATOR PEDAL POSITION SENSOR 1 MAXIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the igniting on. During in-plant testing, the APP Sensor is checked to make sure the minimum and maximum values can be reached.
- **Set Condition:**
  APPS 1 has failed to achieve the required maximum value during In-Plant testing. One trip fault and the code will set within 5 seconds. Engine will only idle.

Possible Causes
INTERMITTENT DTC
ETC RELEARN
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: This DTC is set when the APPS values are learned in-plant but do not reach the minimum or maximum voltage range.

NOTE: Diagnose any APPS out of range and 5 volt supply DTCs before continuing.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR

With a scan tool perform the ETC RELEARN function.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. After installation is complete, perform the ETC RELEARN function.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test Complete.

P2167-ACCELERATOR PEDAL POSITION SENSOR 2 MAXIMUM STOP PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the igniting on. During in-plant testing, the APP Sensors need to be checked to make sure the minimum and maximum values can be reached.
- **Set Condition:**
  APPS 2 has failed to achieve the required maximum value during In-Plant testing. One trip fault and the code will be stored within 5 seconds. Engine will only idle.

Possible Causes
INTERMITTENT DTC
ETC RELEARN
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

NOTE: This DTC is set when the APP Sensor values are learned in-plant but do not reach the minimum or maximum voltage range.

NOTE: Diagnose any APPS out of range and 5 volt supply DTCs before continuing.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR

With a scan tool perform the ETC RELEARN function.

With the scan tool, clear DTCs.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information. After installation is complete, perform the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Test complete.

P2172-HIGH AIRFLOW/VACUUM LEAK DETECTED (INSTANTANEOUS ACCUMULATION)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and engine running with no MAP Sensor DTCs.
- **Set Condition:**
  A large vacuum leak has been detected or the signal voltage for both TP Sensors is stuck at 2.5 volts and calculated MAP is less than actual MAP minus an offset value. One trip fault and the code will set within 5 seconds. ETC light will flash.

Possible Causes
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5 Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VACUUM LEAK

NOTE: This code is enabled on engines equipped with a plastic intake manifold to limit engine operation if a large vacuum leak should occur.

NOTE: A large vacuum leak is the most probable cause of this DTC.

Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.

Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.

Inspect the MAP Sensor and Throttle Body for proper installation.

Inspect the engine for any mechanical conditions that can cause low engine vacuum.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. MAP SENSOR OPERATION

Start the engine.

With a scan tool, monitor the MAP Sensor voltage.

Snap the throttle.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

Yes >> Go to 5

No >> Go to 4

4. MAP SENSOR

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the MAP Sensor circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the MAP Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. THROTTLE FOLLOWER TEST

Ignition on, engine not running.

With a scan tool, perform the Throttle Follower Test and monitor the TP Sensor 1 and TP Sensor 2 voltages.

Slowly press the throttle pedal down.

The voltage for TP Sensor 1 should start at approximately 0.3 volts and increase to above 4.7 volts.

The voltage for TP Sensor 2 should start at approximately 4.7 volts and decrease to approximately 0.3 volts.

Is the voltage within the range specified for each sensor?

Yes >> Go to 7

No >> Go to 6

6. THROTTLE BODY

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the Throttle Body circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Throttle Body in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2173-HIGH AIRFLOW/VACUUM LEAK DETECTED (SLOW ACCUMULATION)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and engine running with no MAP Sensor DTCs.
- **Set Condition:**
  A large vacuum leak has been detected or the signal voltage for both TP Sensors is stuck at 2.5 volts and calculated MAP is less than the Gas Flow Adaptation value. One trip fault the code will set within 5 seconds. ETC light will flash.

Possible Causes
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5 Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VACUUM LEAK

NOTE: This code is enabled on engines equipped with a plastic intake manifold to limit engine operation if a large vacuum leak should occur.

NOTE: A large vacuum leak is the most probable cause of this DTC.

Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.

Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.

Inspect the MAP Sensor and Throttle Body for proper installation.

Inspect the engine for any mechanical conditions that can cause low engine vacuum.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. MAP SENSOR OPERATION

Start the engine.

With a scan tool, monitor the MAP Sensor voltage.

Snap the throttle.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

Yes >> Go to 5

No >> Go to 4

4. MAP SENSOR

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the MAP Sensor circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the MAP Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. THROTTLE FOLLOWER TEST

Ignition on, engine not running.

With a scan tool, perform the Throttle Follower Test and monitor the TP Sensor 1 and TP Sensor 2 voltages.

Slowly press the throttle pedal down.

The voltage for TP Sensor 1 should start at approximately 0.3 volts and increase to above 4.7 volts.

The voltage for TP Sensor 2 should start at approximately 4.7 volts and decrease to approximately 0.3 volts.

Is the voltage within the range specified for each sensor?

Yes >> Go to 7

No >> Go to 6

6. THROTTLE BODY

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the Throttle Body circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Throttle Body in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2174-LOW AIRFLOW/RESTRICTION DETECTED (INSTANTANEOUS ACCUMULATION)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and engine running with no MAP Sensor DTCs.
- **Set Condition:**
  The PCM detects that calculated MAP is greater than actual MAP plus an offset value. One trip fault and the code will set within 5 seconds. Three good trips to turn of the MIL. ETC light will flash.

Possible Causes
AIR INTAKE SYSTEM OBSTRUCTION
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5 Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VACUUM LEAK

Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.

Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.

Inspect the MAP Sensor and Throttle Body for proper installation.

Inspect the air intake system for any restrictions or obstructions.

Inspect the engine for any mechanical conditions that can cause low engine vacuum.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. MAP SENSOR OPERATION

Start the engine.

With a scan tool, monitor the MAP Sensor voltage.

Snap the throttle.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

Yes >> Go to 5

No >> Go to 4

4. MAP SENSOR

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the MAP Sensor circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the MAP Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. THROTTLE FOLLOWER TEST

Ignition on, engine not running.

With a scan tool, perform the Throttle Follower Test and monitor the TP Sensor 1 and TP Sensor 2 voltages.

Slowly press the throttle pedal down.

The voltage for TP Sensor 1 should start at approximately 0.3 volts and increase to above 4.7 volts.

The voltage for TP Sensor 2 should start at approximately 4.7 volts and decrease to approximately 0.3 volts.

Is the voltage within the range specified for each sensor?

Yes >> Go to 7

No >> Go to 6

6. THROTTLE BODY

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the Throttle Body circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Throttle Body in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2175-LOW AIRFLOW/RESTRICTION DETECTED (SLOW ACCUMULATION)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on and engine running with no MAP Sensor DTCs.
- **Set Condition:**
  The PCM detects that calculated MAP is greater than actual MAP plus an offset value. One trip fault and the code will set within 5 seconds. Three good trips to turn off the MIL. ETC light will flash.

Possible Causes
AIR INTAKE SYSTEM OBSTRUCTION
VACUUM LEAK
MAP SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
THROTTLE POSITION SENSOR CIRCUIT(S) OPEN, SHORTED, OR HIGH RESISTANCE
MAP SENSOR
THROTTLE POSITION SENSOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose and repair any TP Sensor or MAP Sensor DTCs before continuing.

NOTE: Diagnose and repair any VSS or 5 Volt supply circuit DTCs before continuing.

NOTE: The throttle plate and linkage should be free from binding and carbon build up.

NOTE: Make sure the throttle plate is at the idle position.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. VACUUM LEAK

Inspect the intake manifold, power brake booster, and PCV system for any vacuum leaks.

Inspect the throttle plate. If the throttle blade is bent or will not close, the throttle body may need to be replaced.

Inspect the MAP Sensor and Throttle Body for proper installation.

Inspect the air intake system for any restrictions or obstructions.

Inspect the engine for any mechanical conditions that can cause low engine vacuum.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. MAP SENSOR OPERATION

Start the engine.

With a scan tool, monitor the MAP Sensor voltage.

Snap the throttle.

Does the MAP Sensor voltage vary from below 2.0 volts at idle to above 3.5 volts at wide open throttle?

Yes >> Go to 5

No >> Go to 4

4. MAP SENSOR

Turn the ignition off.

Disconnect the MAP Sensor harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the MAP Sensor circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the MAP Sensor.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. THROTTLE FOLLOWER TEST

Ignition on, engine not running.

With a scan tool, perform the Throttle Follower Test and monitor the TP Sensor 1 and TP Sensor 2 voltages.

Slowly press the throttle pedal down.

The voltage for TP Sensor 1 should start at approximately 0.3 volts and increase to above 4.7 volts.

The voltage for TP Sensor 2 should start at approximately 4.7 volts and decrease to approximately 0.3 volts.

Is the voltage within the range specified for each sensor?

Yes >> Go to 7

No >> Go to 6

6. THROTTLE BODY

Turn the ignition off.

Disconnect the Throttle Body harness connector.

Disconnect the PCM harness connector.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Check each of the Throttle Body circuits for high resistance or a shorted condition.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

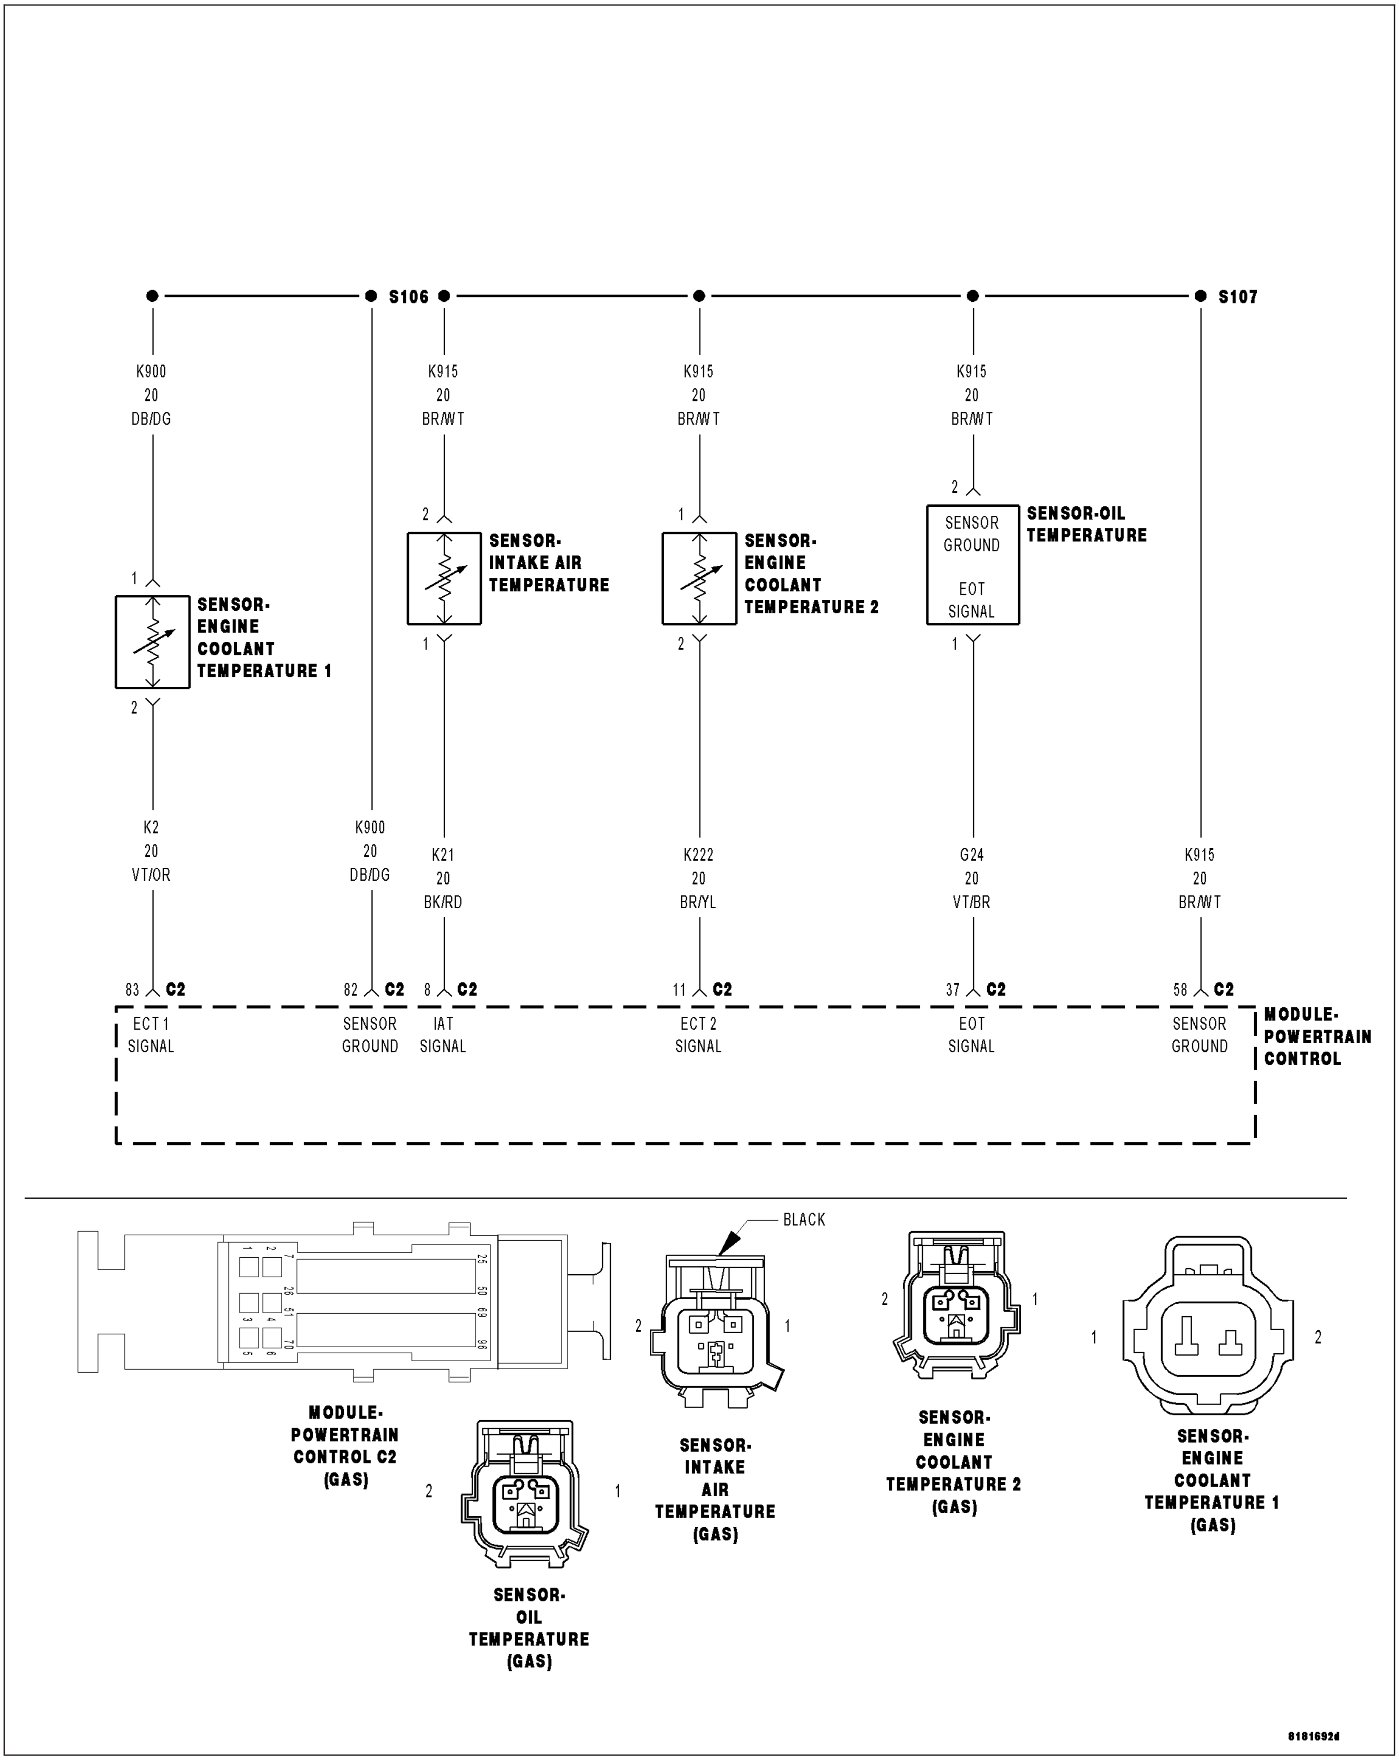
No >> Replace the Throttle Body in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Throttle Body and the Powertrain Control Module (PCM) and between the MAP Sensor and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2181-COOLING SYSTEM PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on, engine running, and no ECT DTCs present.
- **Set Condition:**
  The coolant temperature should change at a specific rate. If this rate is too slow or too fast this fault will set. Two trip fault. Three good trips to clear MIL. ETC light will illuminate on first trip failure.

Possible Causes
INTERMITTENT DTC
LOW COOLANT LEVEL
THERMOSTAT
(K2) ECT 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K2) ECT 1 SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ECT 1 SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND 1 CIRCUIT
(K2) ECT 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) SENSOR GROUND 1 CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR 1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With a scan tool, select View DTCs.

NOTE: Diagnose and repair any Engine Coolant Temperature (ECT) sensor DTCs before proceeding with this test.

NOTE: Inspect the ECT sensor and related PCM connector terminals for corrosion or damage.

NOTE: Extremely cold ambient temperatures may cause this DTC to set.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. LOW ENGINE COOLANT LEVEL

Ignition on, engine not running.

WARNING: Allow the engine to cool before opening the cooling system. The system may be under pressure. Extreme burns or scalding may result. Failure to follow these instructions can result in personal injury or death.

Inspect the cooling system for proper coolant level and condition.

Were any problems found?

Yes >> Inspect the vehicle for a coolant leak. Repair as necessary in accordance with the Service Information. Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. THERMOSTAT

Ignition on, engine not running.

NOTE: Allow the engine to cool to ambient temperature before proceeding with this test.

Using the appropriate service information, determine the proper opening temperature of the thermostat.

With a scan tool, read the ECT sensor value. If the engine was allowed to cool completely, the value should be approximately equal to the ambient temperature.

Start the engine and allow it to reach operating temperature while monitoring the ECT sensor value. The sensor value change should be a smooth transition from start up to normal operating temperature. Monitor the actual coolant temperature with a thermometer.

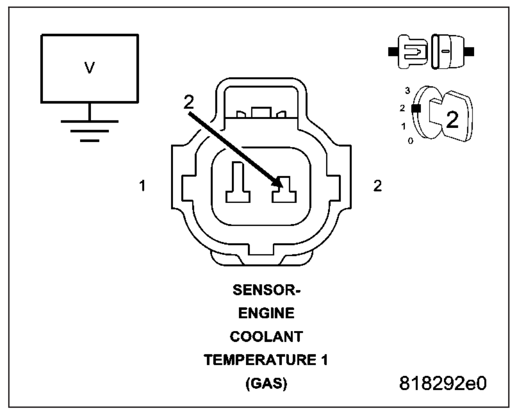
NOTE: As the engine warms up to operating temperature, the actual coolant temperature (thermometer reading) and the coolant temperature value on the scan tool should be relatively close. The thermostat should not open until the engine reaches the temperature specified in the Service Information.

Does the thermostat open at the temperature specified in the Service Information?

Yes >> Go to 4

No >> Replace the thermostat in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K2) ECT 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

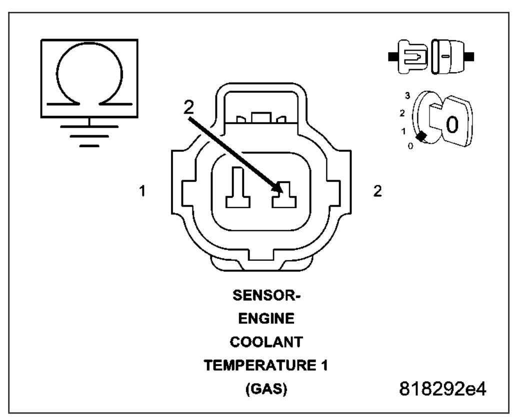
Disconnect the Engine Coolant Temperature Sensor 1 connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K2) ECT 1 Signal circuit in the Engine Coolant Temperature Sensor 1 harness connector.

Is there any voltage present?



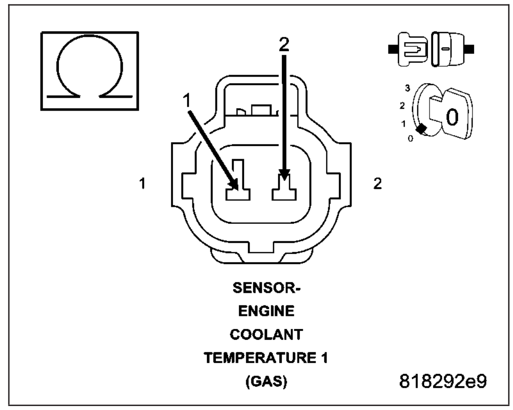
Yes >> Repair the (K2) ECT 1 Signal circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 5

5. (K2) ECT 1 SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K2) ECT 1 Signal circuit in the Engine Coolant Temperature Sensor 1 harness connector.



Is the resistance above 100 ohms?

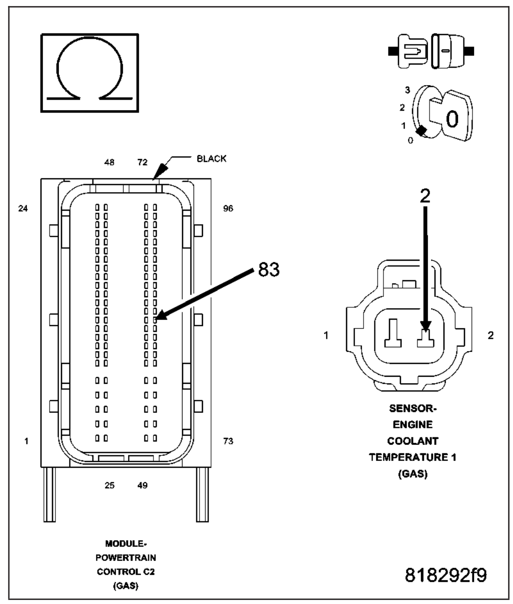
Yes >> Go to 6

No >> Repair the (K2) ECT 1 Signal circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. (K2) ECT 1 SIGNAL CIRCUIT SHORTED TO (K900) SENSOR GROUND 1 CIRCUIT

Measure the resistance between the (K2) ECT 1 Signal circuit and the (K900) Sensor Ground 1 circuit in the Engine Coolant Temperature Sensor 1 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 7

No >> Repair the (K2) ECT 1 Signal circuit for a short to the (K900) Sensor Ground 1 circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (K2) ECT 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

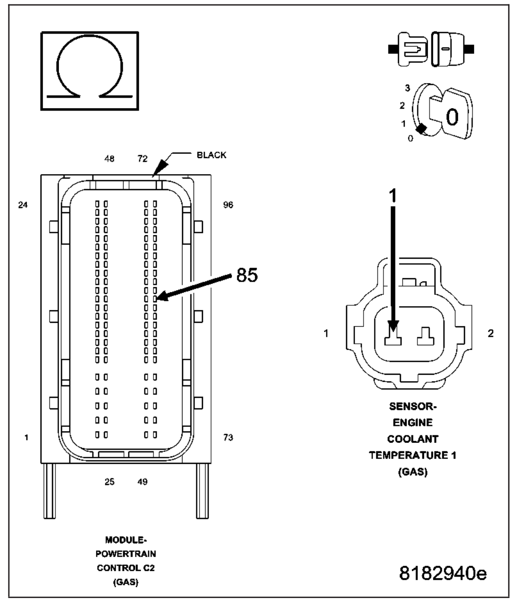
Measure the resistance of the (K2) ECT 1 Signal circuit between the Engine Coolant Temperature Sensor 1 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 8

No >> Repair the (K2) ECT 1 Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



8. (K900) SENSOR GROUND 1 CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K900) Sensor Ground 1 circuit between the Engine Coolant Temperature Sensor 1 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 9

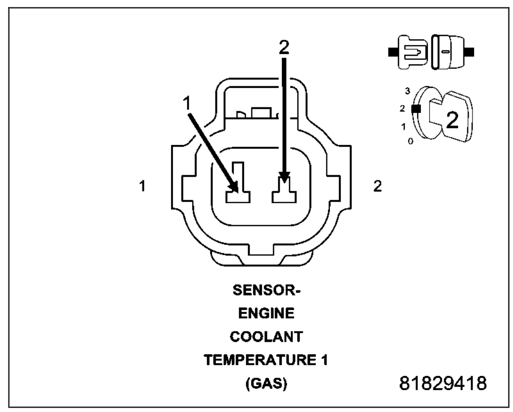
No >> Repair the (K900) Sensor Ground 1 for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. ENGINE COOLANT TEMPERATURE SENSOR 1

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (K900) Sensor Ground 1 circuit and the (K2) ECT 1 Signal circuit in the Engine Coolant Temperature Sensor 1 harness connector.



Turn the ignition on.

With the scan tool, read the Engine Coolant Temperature Sensor 1 signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Engine Coolant Temperature Sensor 1 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 10

10. POWERTRAIN CONTROL MODULE (PCM)

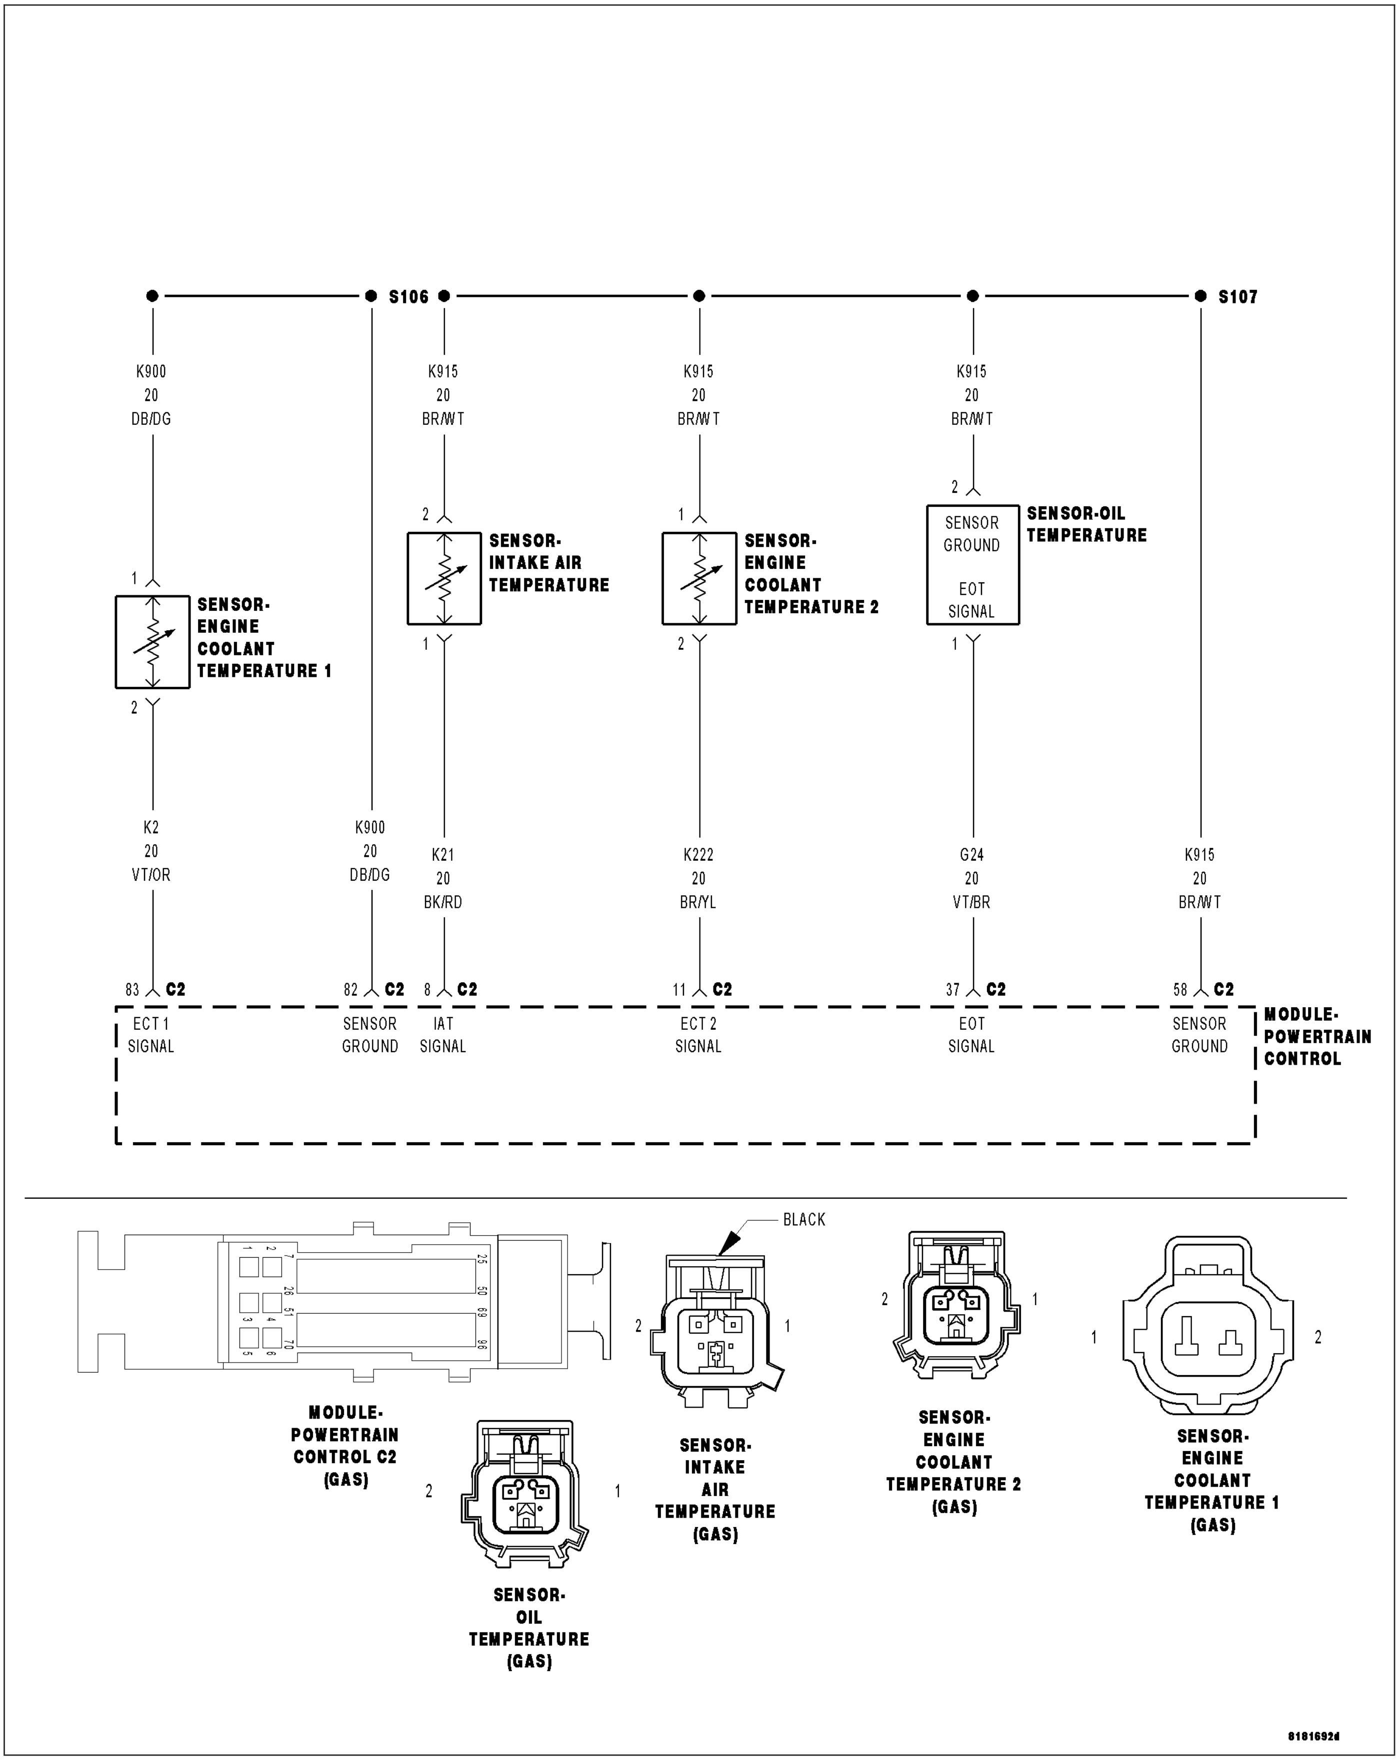
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor 1 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2184-ENGINE COOLANT TEMPERATURE SENSOR 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the Engine Coolant Temperature Sensor 2 circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K222) ECT 2 SIGNAL CIRCUIT SHORTED TO GROUND
(K222) ECT 2 SIGNAL CIRCUIT SHORTED TO (K915) SENSOR GROUND
(K222) ECT 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR 2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

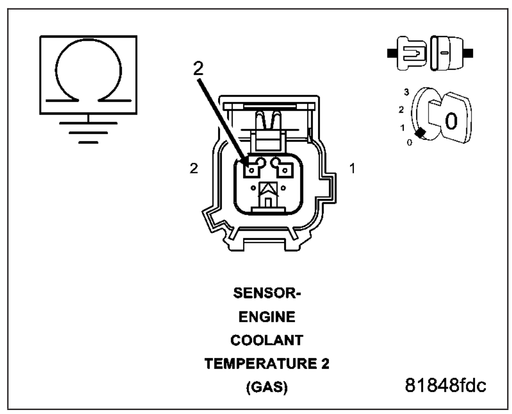
Ignition on, engine not running.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K222) ECT 2 SIGNAL CIRCUIT SHORTED TO GROUND

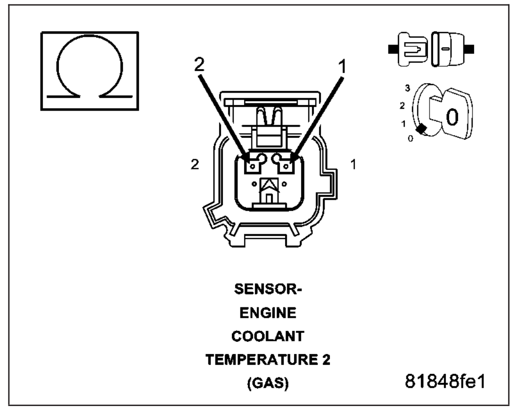
Turn the ignition off.

Disconnect the Engine Coolant Temperature Sensor 2 connector.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K222) ECT 2 Signal circuit in the Engine Coolant Temperature Sensor 2 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 3

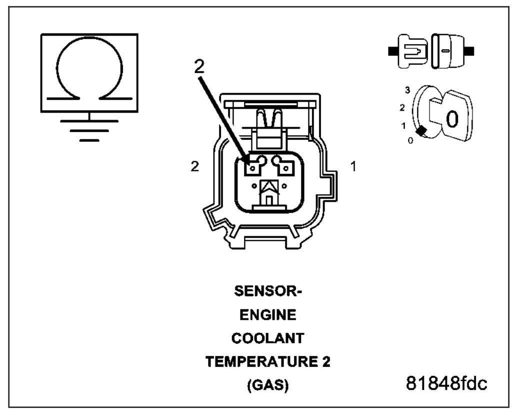
No >> Repair the (K222) ECT 2 Signal circuit for a short to ground.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K222) ECT 2 SIGNAL CIRCUIT SHORTED TO (K915) SENSOR GROUND CIRCUIT

Measure the resistance between the (K222) ECT 2 Signal circuit and the (K915) Sensor Ground circuit in the Engine Coolant Temperature Sensor 2 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 4

No >> Repair the (K222) ECT 2 Signal circuit for a short to the (K915) Sensor Ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K222) ECT 2 SIGNAL CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (K222) ECT 2 Signal circuit between the Engine Coolant Temperature Sensor 2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K222) ECT 2 Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. ENGINE COOLANT TEMPERATURE SENSOR 2

Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

With the scan tool, read the Engine Coolant Temperature Sensor 2 signal voltage.

Is the voltage above 4.5 volts with the Engine Coolant Temperature Sensor 2 harness disconnected?

Yes >> Replace the Engine Coolant Temperature Sensor 2 in accordance with the service information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

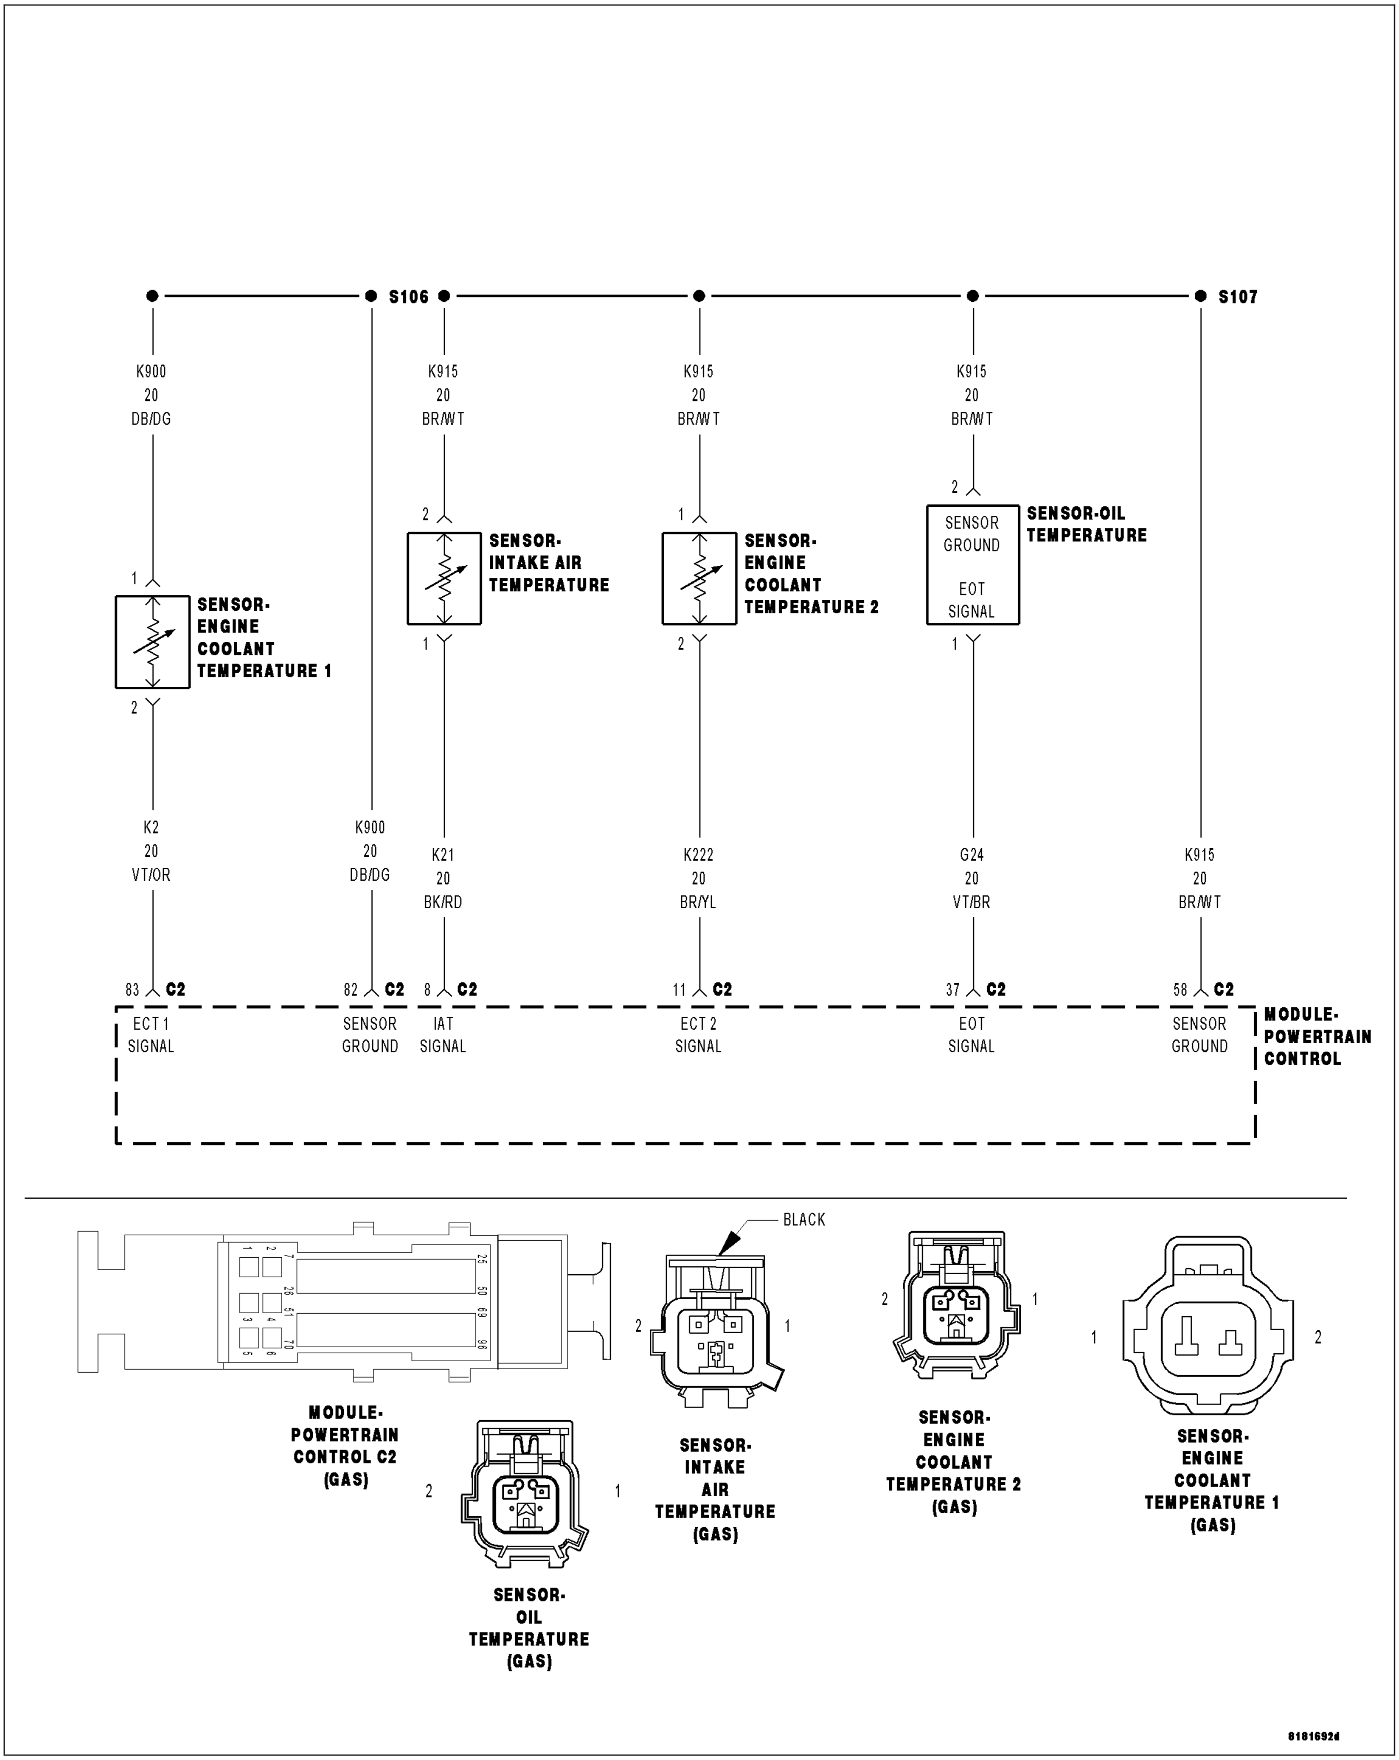
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor 2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2185-ENGINE COOLANT TEMPERATURE SENSOR 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K222) ECT 2 Signal circuit shorted high.

Possible Causes
INTERMITTENT DTC
(K222) ECT 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K222) ECT 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR 2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

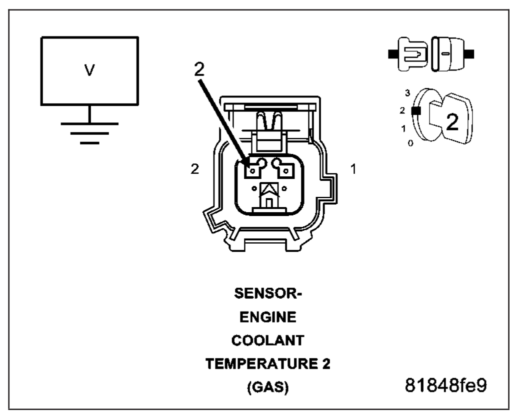
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K222) ECT 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Engine Coolant Temperature Sensor 2 connector.

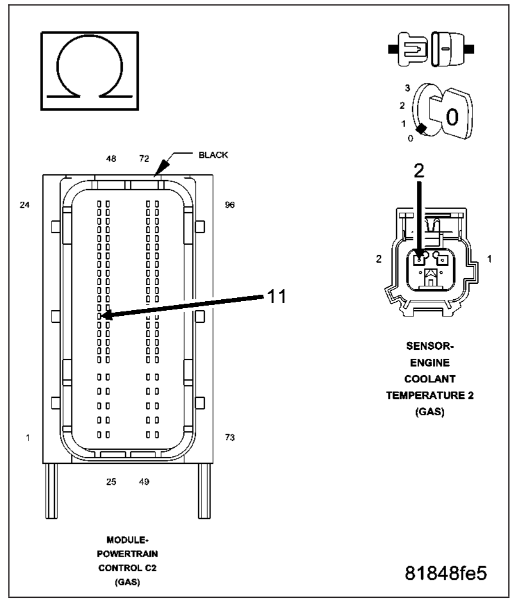
Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K222) ECT 2 Signal circuit in the Engine Coolant Temperature Sensor 2 harness connector.

Is there any voltage present?

Yes >> Repair the (K222) ECT 2 Signal circuit for a short to voltage.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

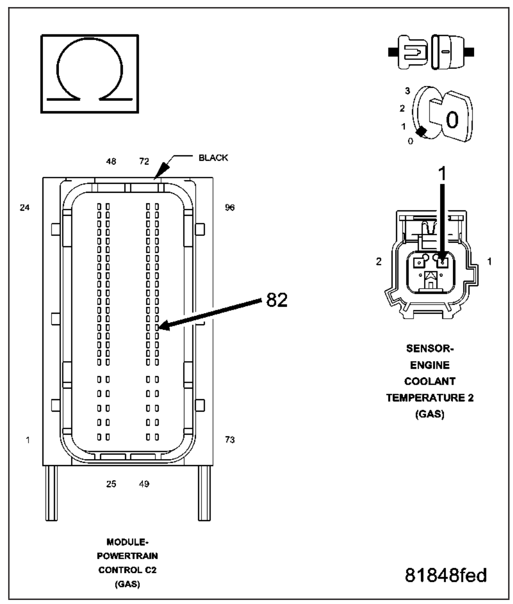
No >> Go to 3

3. (K222) ECT 2 SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K222) ECT 2 Signal circuit between the Engine Coolant Temperature Sensor 2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 4

No >> Repair the (K222) ECT 2 Signal circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K915) SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K915) Sensor Ground circuit between the Engine Coolant Temperature Sensor 2 harness connector and the Powertrain Control Module (PCM) harness connector.

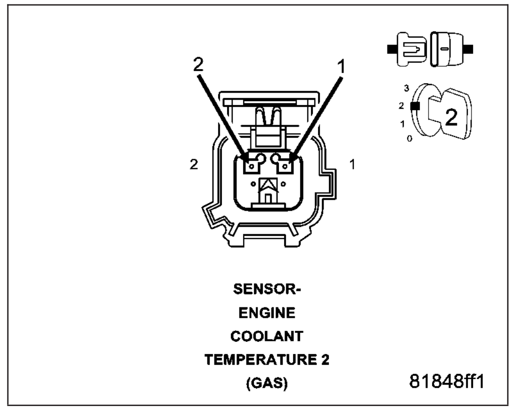
Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K915) Sensor Ground circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. ENGINE COOLANT TEMPERATURE SENSOR 2



Turn the ignition off.

Connect the Powertrain Control Module (PCM) connector.

Connect a jumper wire between the (K222) ECT 2 Signal circuit and the (K915) Sensor Ground in the Engine Coolant Temperature Sensor 2 harness connector.

Turn the ignition on.

With the scan tool, read the Engine Coolant Temperature Sensor 2 signal voltage.

Is the voltage below 1.0 volt with the jumper wire in place?

Yes >> Replace the Engine Coolant Temperature Sensor 2 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor 2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2299-BRAKE PEDAL POSITION / ACCELERATOR PEDAL POSITION INCOMPATIBLE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and no brake or APPS DTCs present.
- **Set Condition:**
  The PCM detects that the Brake Switch and the Accelerator Pedal are both pressed for a calculated amount of time. One trip fault and the code will be set within 5 seconds. ETC light will illuminate, the light will only stay illuminated while DTC is active.

Possible Causes
INTERMITTENT DTC
BRAKE SWITCH AND ACCELERATOR PEDAL PRESSED AT THE SAME TIME
STOP LAMP SWITCH
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If a accelerator pedal assembly becomes mechanically stuck, the output voltage will stay fixed. If this is followed by a long application of the brakes, this DTC will set.

NOTE: Diagnose any stop lamp switch or APPS DTCs before continuing with this test.

NOTE: This DTC will set if the PCM detects that the accelerator pedal and the brake switch are both pressed for a specific amount of time.
With a scan tool, select View DTCs. Record the related Freeze Frame data.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. STOP LAMP SWITCH

With a scan tool, monitor the status of brake switch 1 and brake switch 2.

Pressed and release the brake pedal.

NOTE: The status for each switch should change from Not Pressed to Pressed when the brake switch is pressed.

Does the status change as described above?

Yes >> Go To 3

No >> Check the Stop Lamp Switch for proper adjustment and installation. Check all related circuits for an open or shorted condition using the appropriate wiring diagram. If no other problems are found, replace the Stop Lamp Switch in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. ACCELERATOR PEDAL POSITION SENSOR

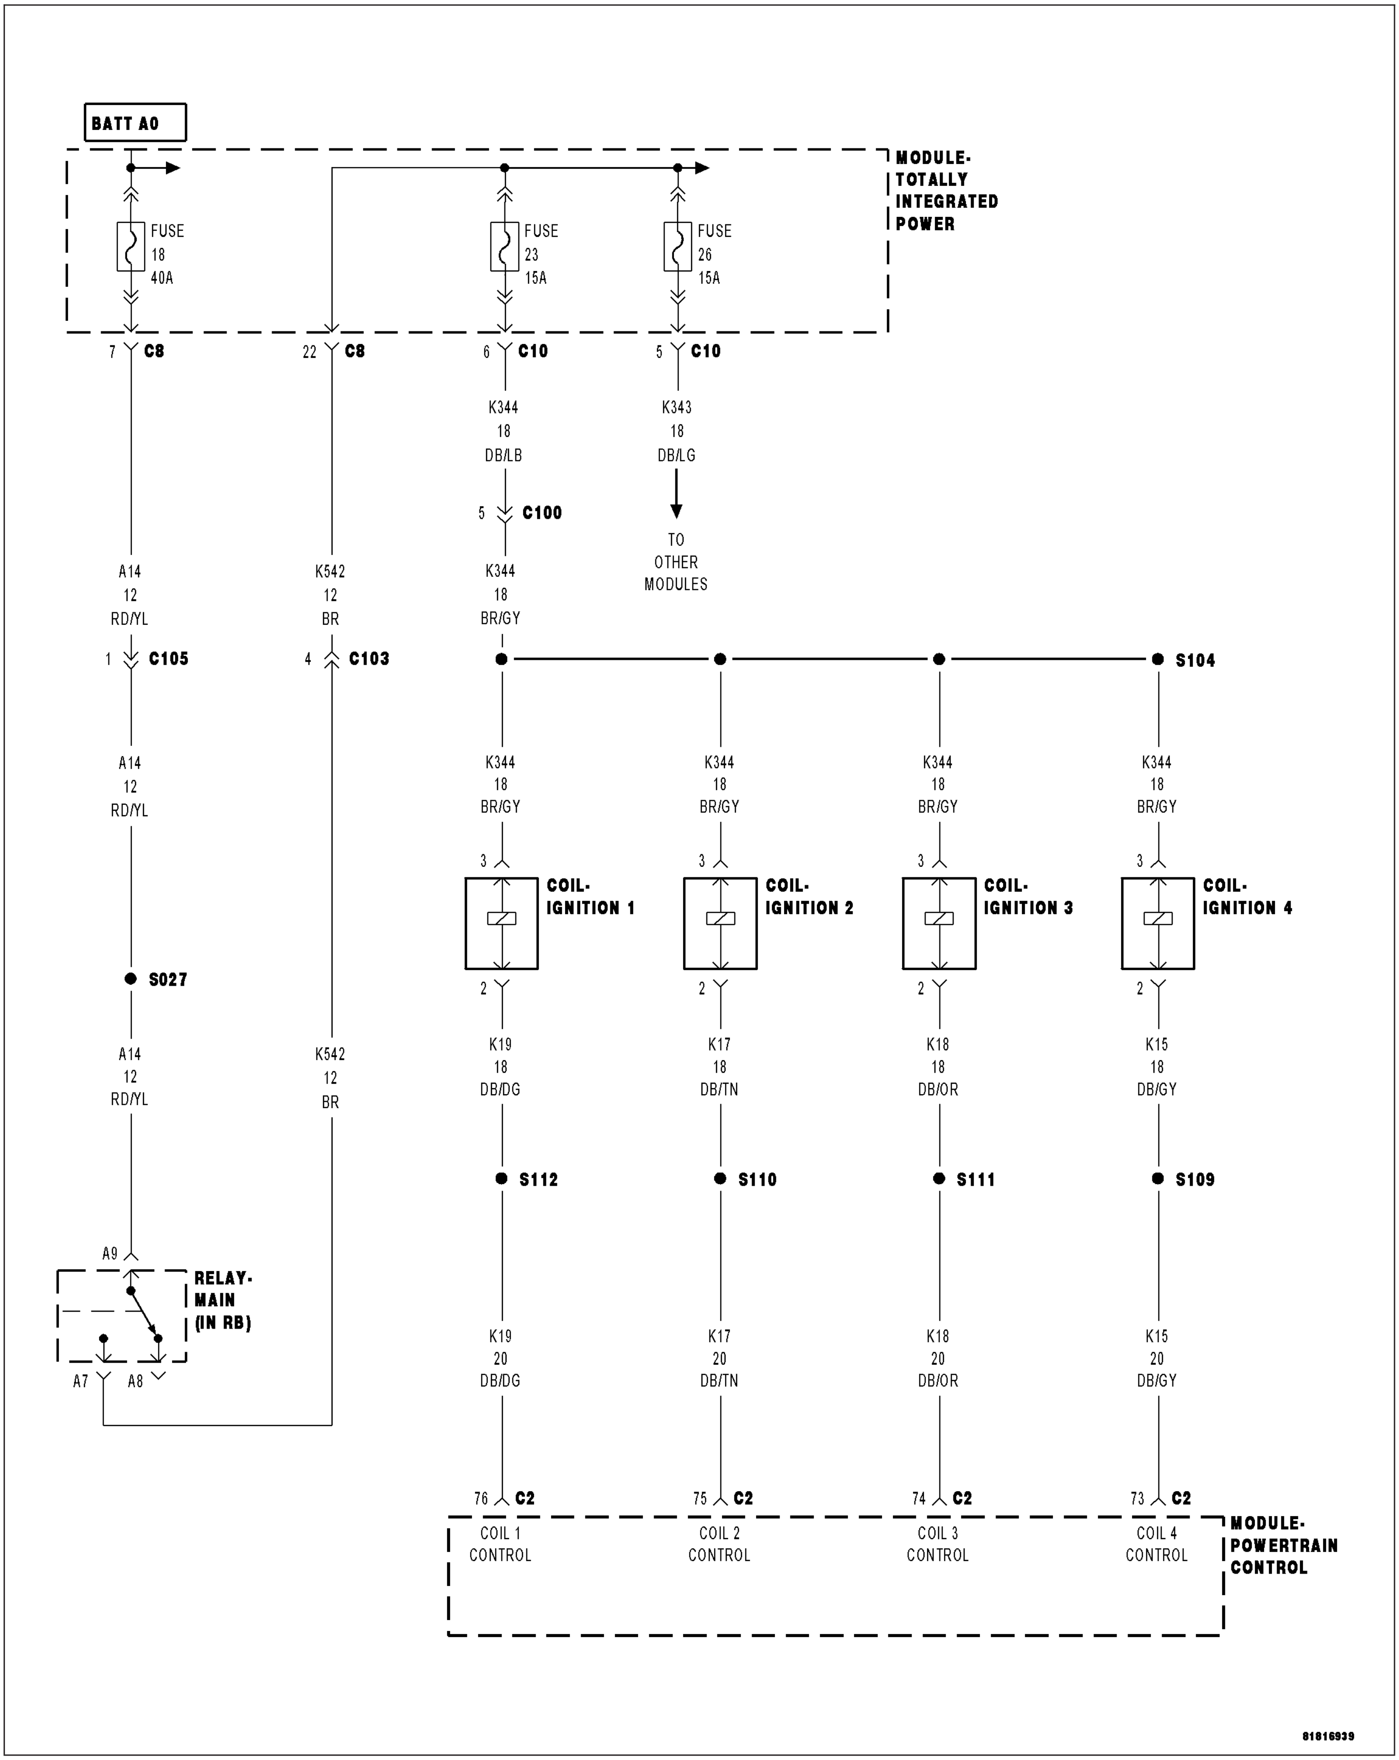
Ignition on, engine not running.

With a scan tool, monitor both APP Sensor voltage readings.

Slowly press the accelerator pedal from idle until it reaches the end stop near the floor.

The APPS 1 voltage should start at approximately 0.875 volts and increase to approximately 4.5 volts with a smooth transition.

The APPS 2 voltage should start at approximately 0.45 volts and increase to approximately 2.3 volts with a smooth transition.



Does the sensor voltage change as described above when the accelerator pedal was pressed.

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Check the appropriate APPS circuits for an open and shorted condition. If no problems are found, replace the APP Sensor Assembly in accordance with the Service Information. After installation, with a scan tool, perform the ETC RELEARN function.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2301-IGNITION COIL 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects that the (K19) Coil 1 Control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K19) COIL 1 CONTROL CIRCUIT SHORTED TO VOLTAGE
(K19) COIL 1 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT
(K19) COIL 1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

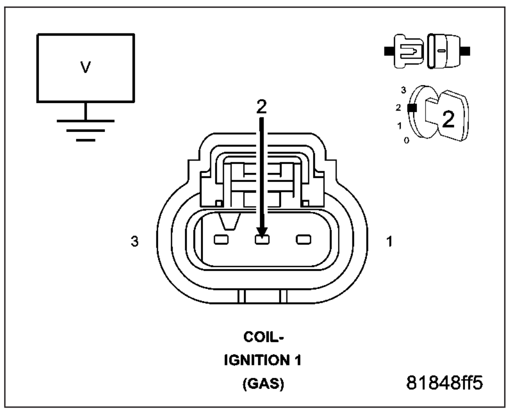
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K19) COIL 1 CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

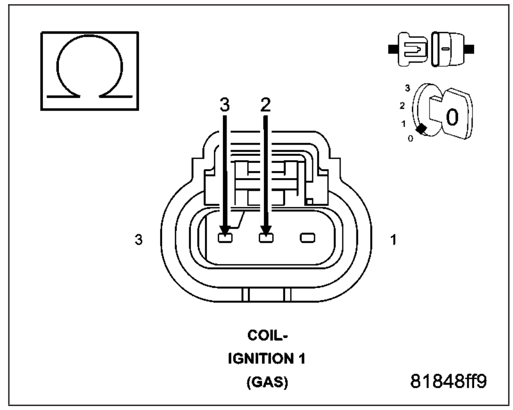
Disconnect the Ignition Coil 1 connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K19) Coil 1 Control circuit in the Ignition Coil 1 harness connector.

Is there any voltage present?



Yes >> Repair the (K19) Coil 1 Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

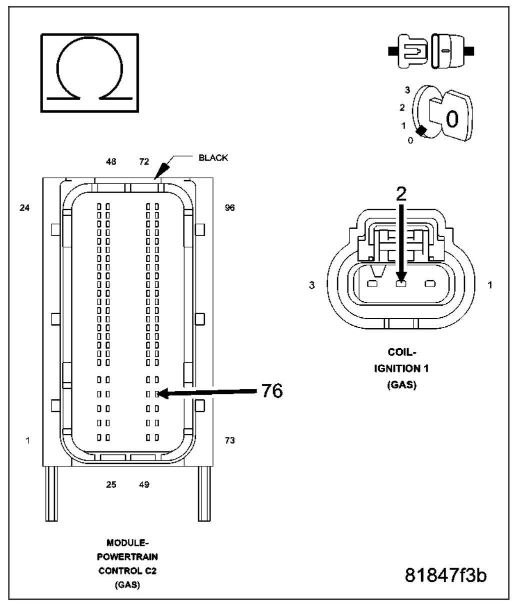
No >> Go to 3

3. (K19) COIL 1 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT

Turn the ignition off.

Measure the resistance between the (K19) Coil 1 Control circuit and the (K344) Fused Main Relay Output circuit in the Ignition Coil 1 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 4

No >> Repair the (K19) Coil 1 Control circuit for a short to the (K344) Fused Main Relay Output circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

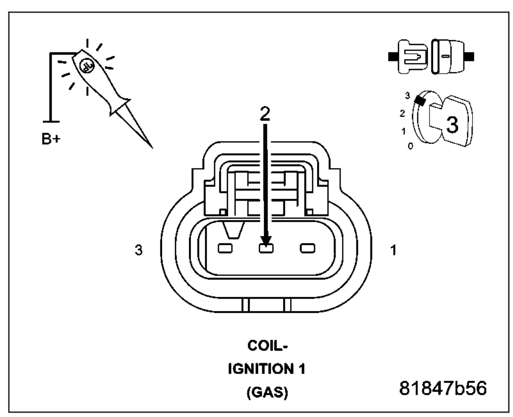
4. (K19) COIL 1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K19) Coil 1 Control circuit between the Ignition Coil 1 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K19) Coil 1 Control circuit for an open circuit or high resistance.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. IGNITION COIL 1

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K19) Coil 1 Control circuit in the Ignition Coil 1 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 1 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

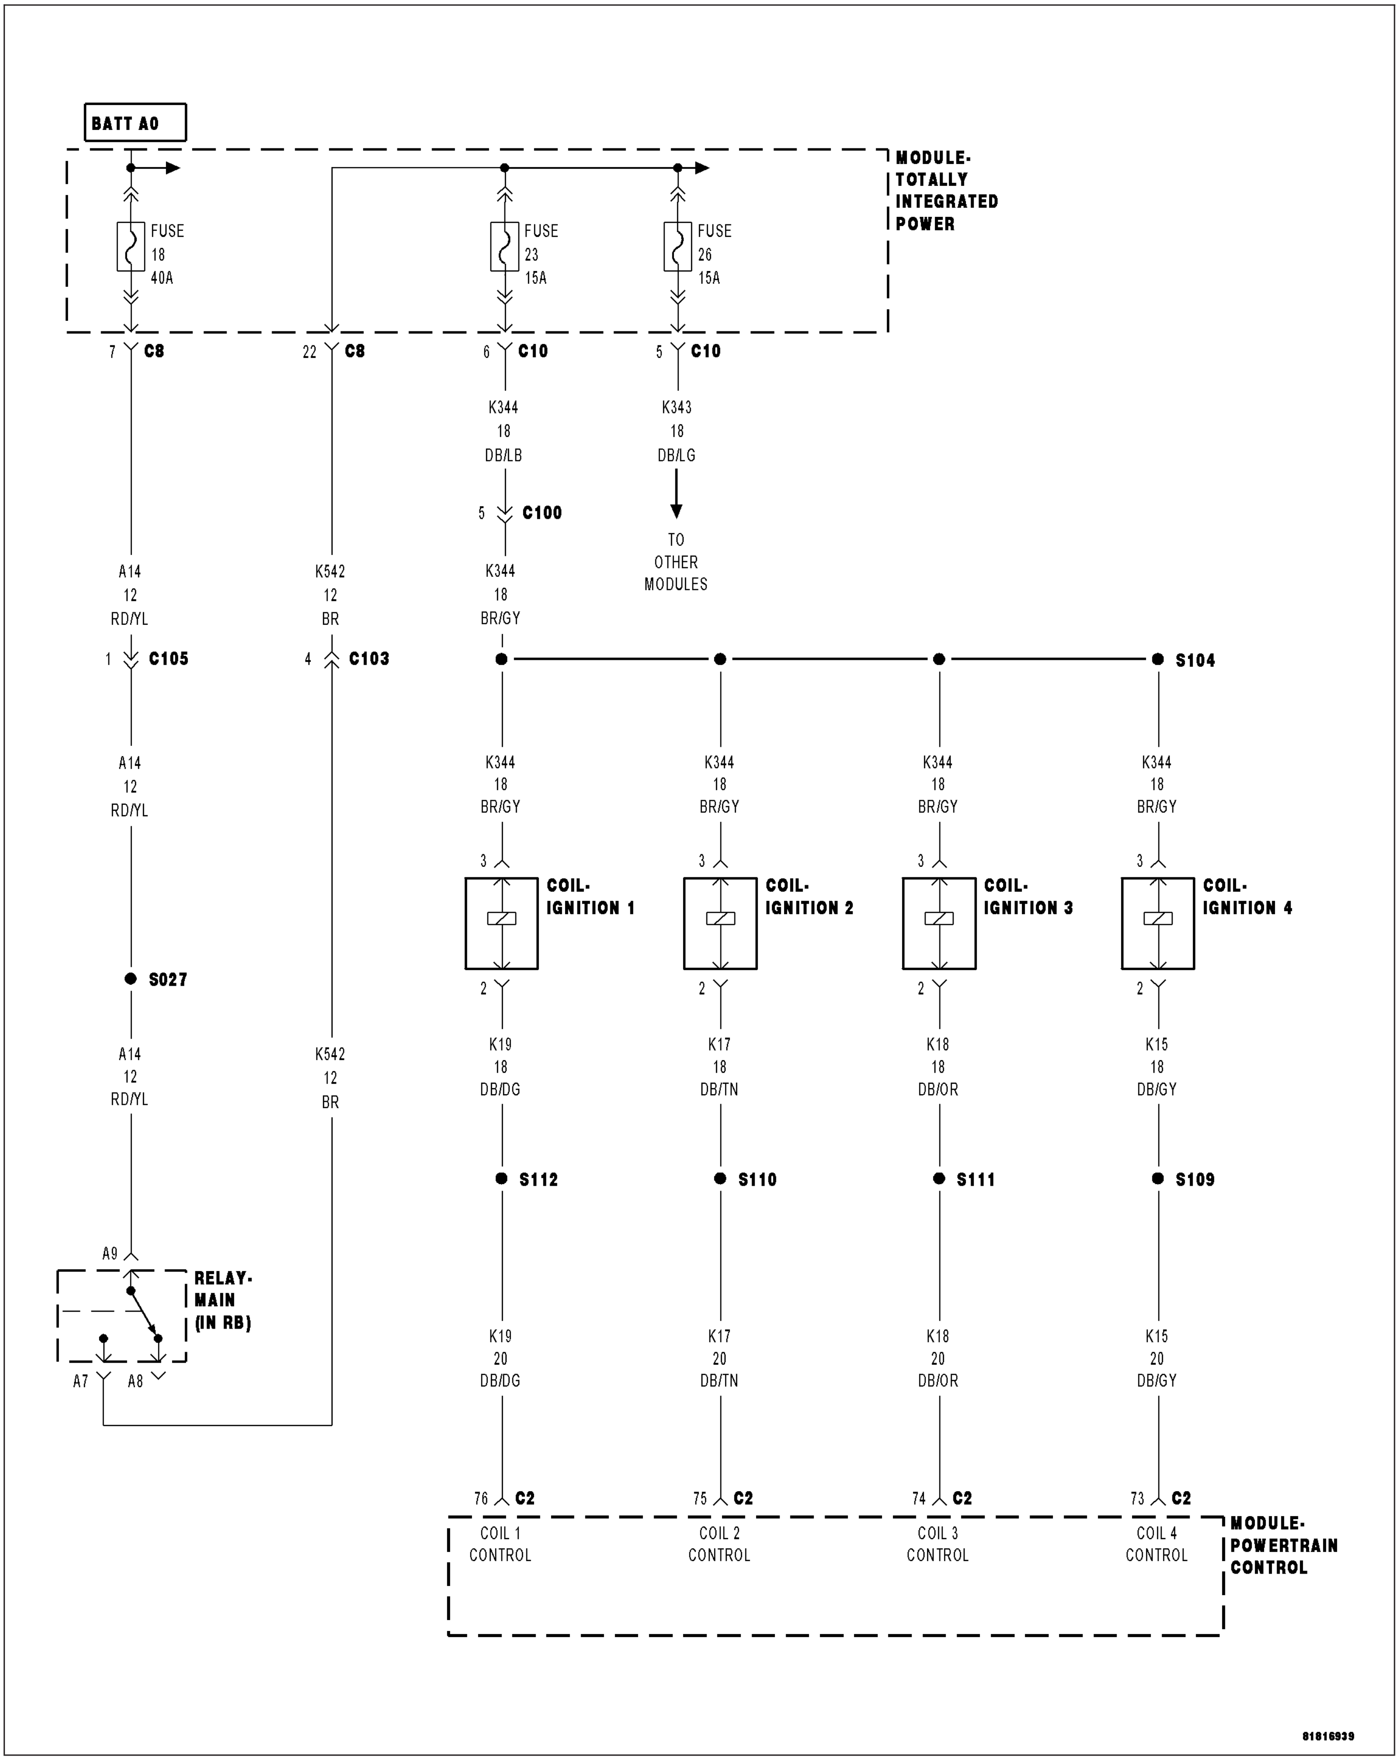
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 1 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2302-IGNITION COIL 1 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K19) Coil 1 Control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K19) COIL 1 CONTROL CIRCUIT SHORTED TO GROUND
(K19) COIL 1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 1
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

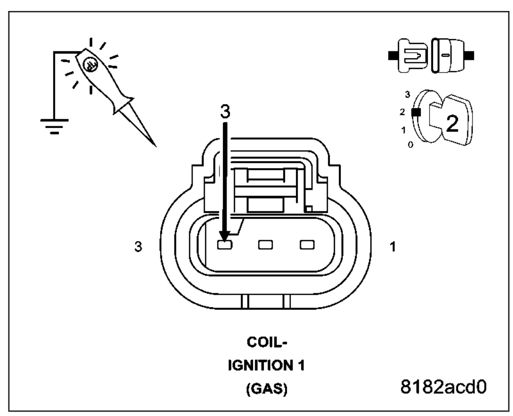
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Ignition Coil 1 harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuit in the Ignition Coil 1 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

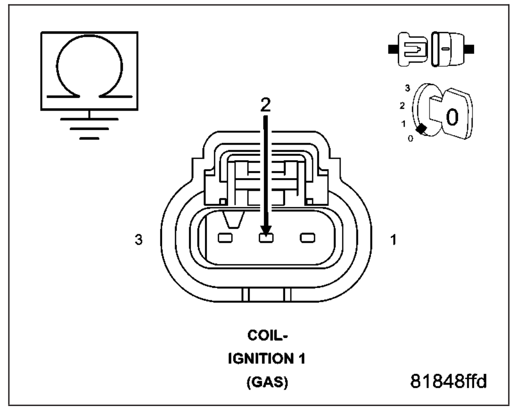
Yes >> Go to 3

No >> Repair the (K344) Fused Main Relay Output circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K19) COIL 1 CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.



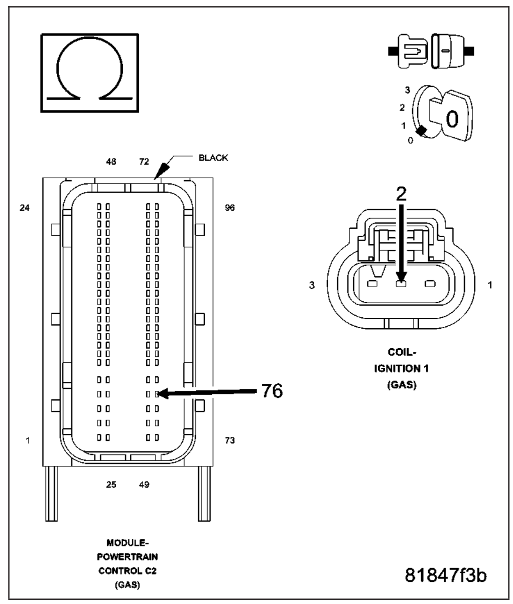
Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K19) Coil 1 Control circuit in the Ignition Coil 1 harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (K19) Coil 1 Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4



4. (K19) COIL 1 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K19) Coil 1 Control circuit between the Ignition Coil 1 harness connector and the Powertrain Control Module (PCM) harness connector.

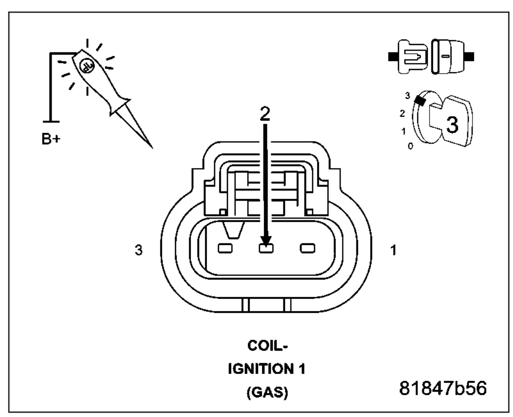
Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K19) Coil 1 Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. IGNITION COIL 1

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.



Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K19) Coil 1 Control circuit in the Ignition Coil 1 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 1 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

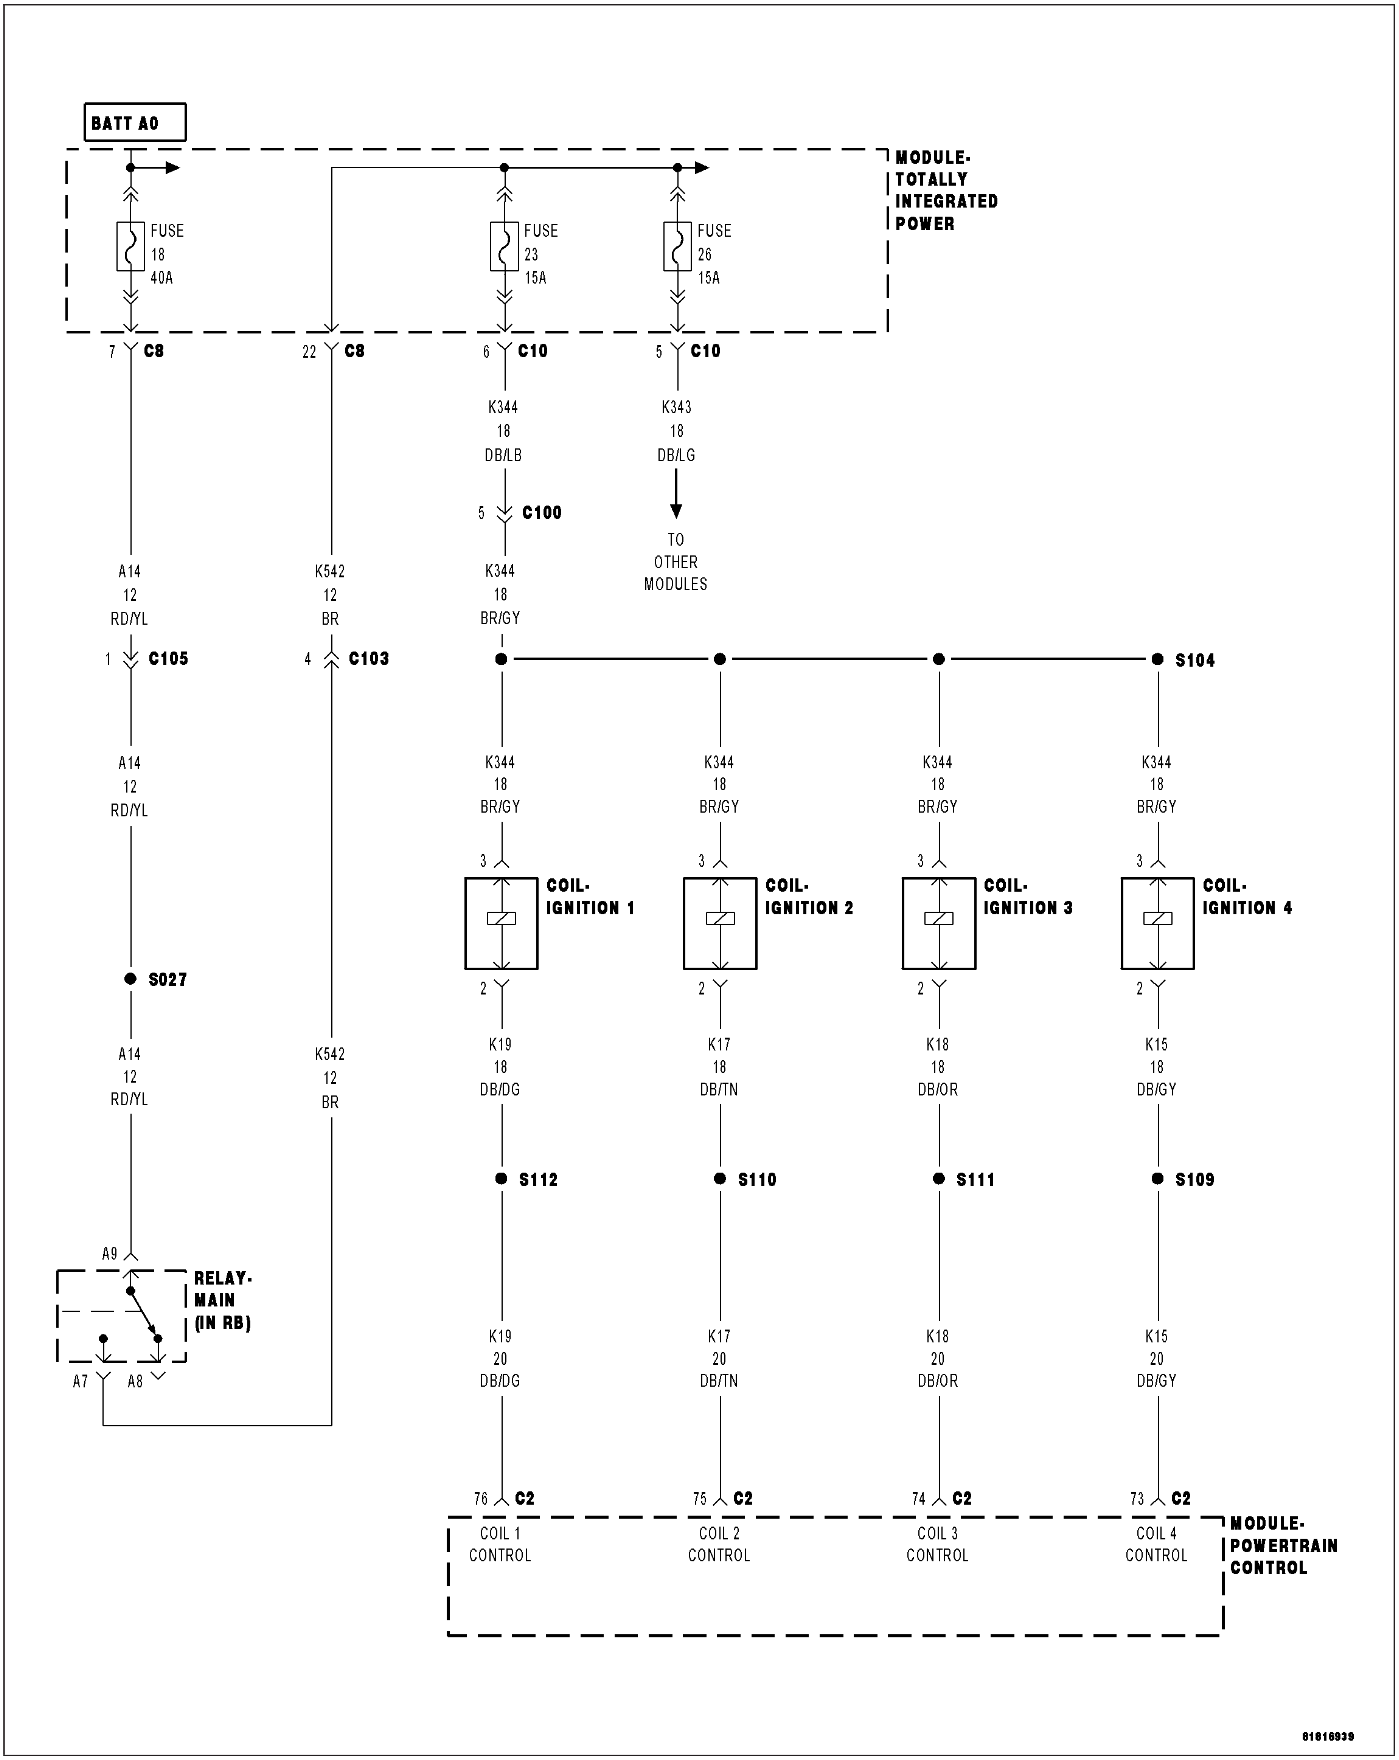
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 1 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2304-IGNITION COIL 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects that the (K17) Coil 2 Control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K17) COIL 2 CONTROL CIRCUIT SHORTED TO VOLTAGE
(K17) COIL 2 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT
(K17) COIL 2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

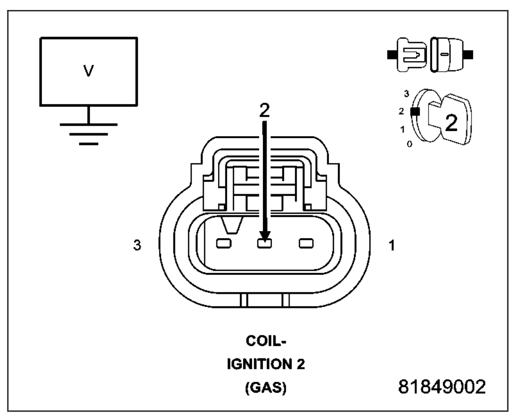
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K17) COIL 2 CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

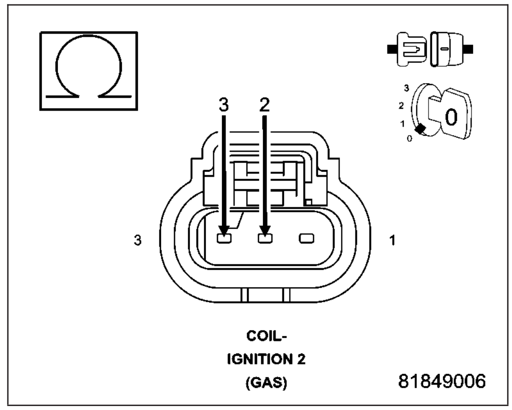
Disconnect the Ignition Coil 2 connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K17) Coil 2 Control circuit in the Ignition Coil 2 harness connector.

Is there any voltage present?



Yes >> Repair the (K17) Coil 2 Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

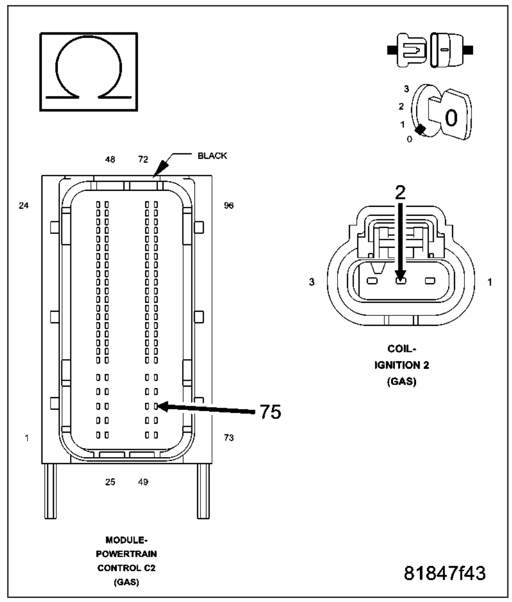
No >> Go to 3

3. (K17) COIL 2 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT

Turn the ignition off.

Measure the resistance between the (K17) Coil 2 Control circuit and the (K344) Fused Main Relay Output circuit in the Ignition Coil 2 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 4

No >> Repair the (K17) Coil 2 Control circuit for a short to the (K344) Fused Main Relay Output circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K17) COIL 2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

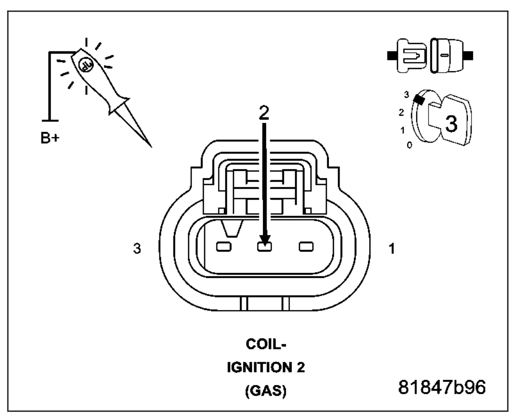
Measure the resistance of the (K17) Coil 2 Control circuit between the Ignition Coil 2 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K17) Coil 2 Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. IGNITION COIL 2

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K17) Coil 2 Control circuit in the Ignition Coil 2 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 2 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

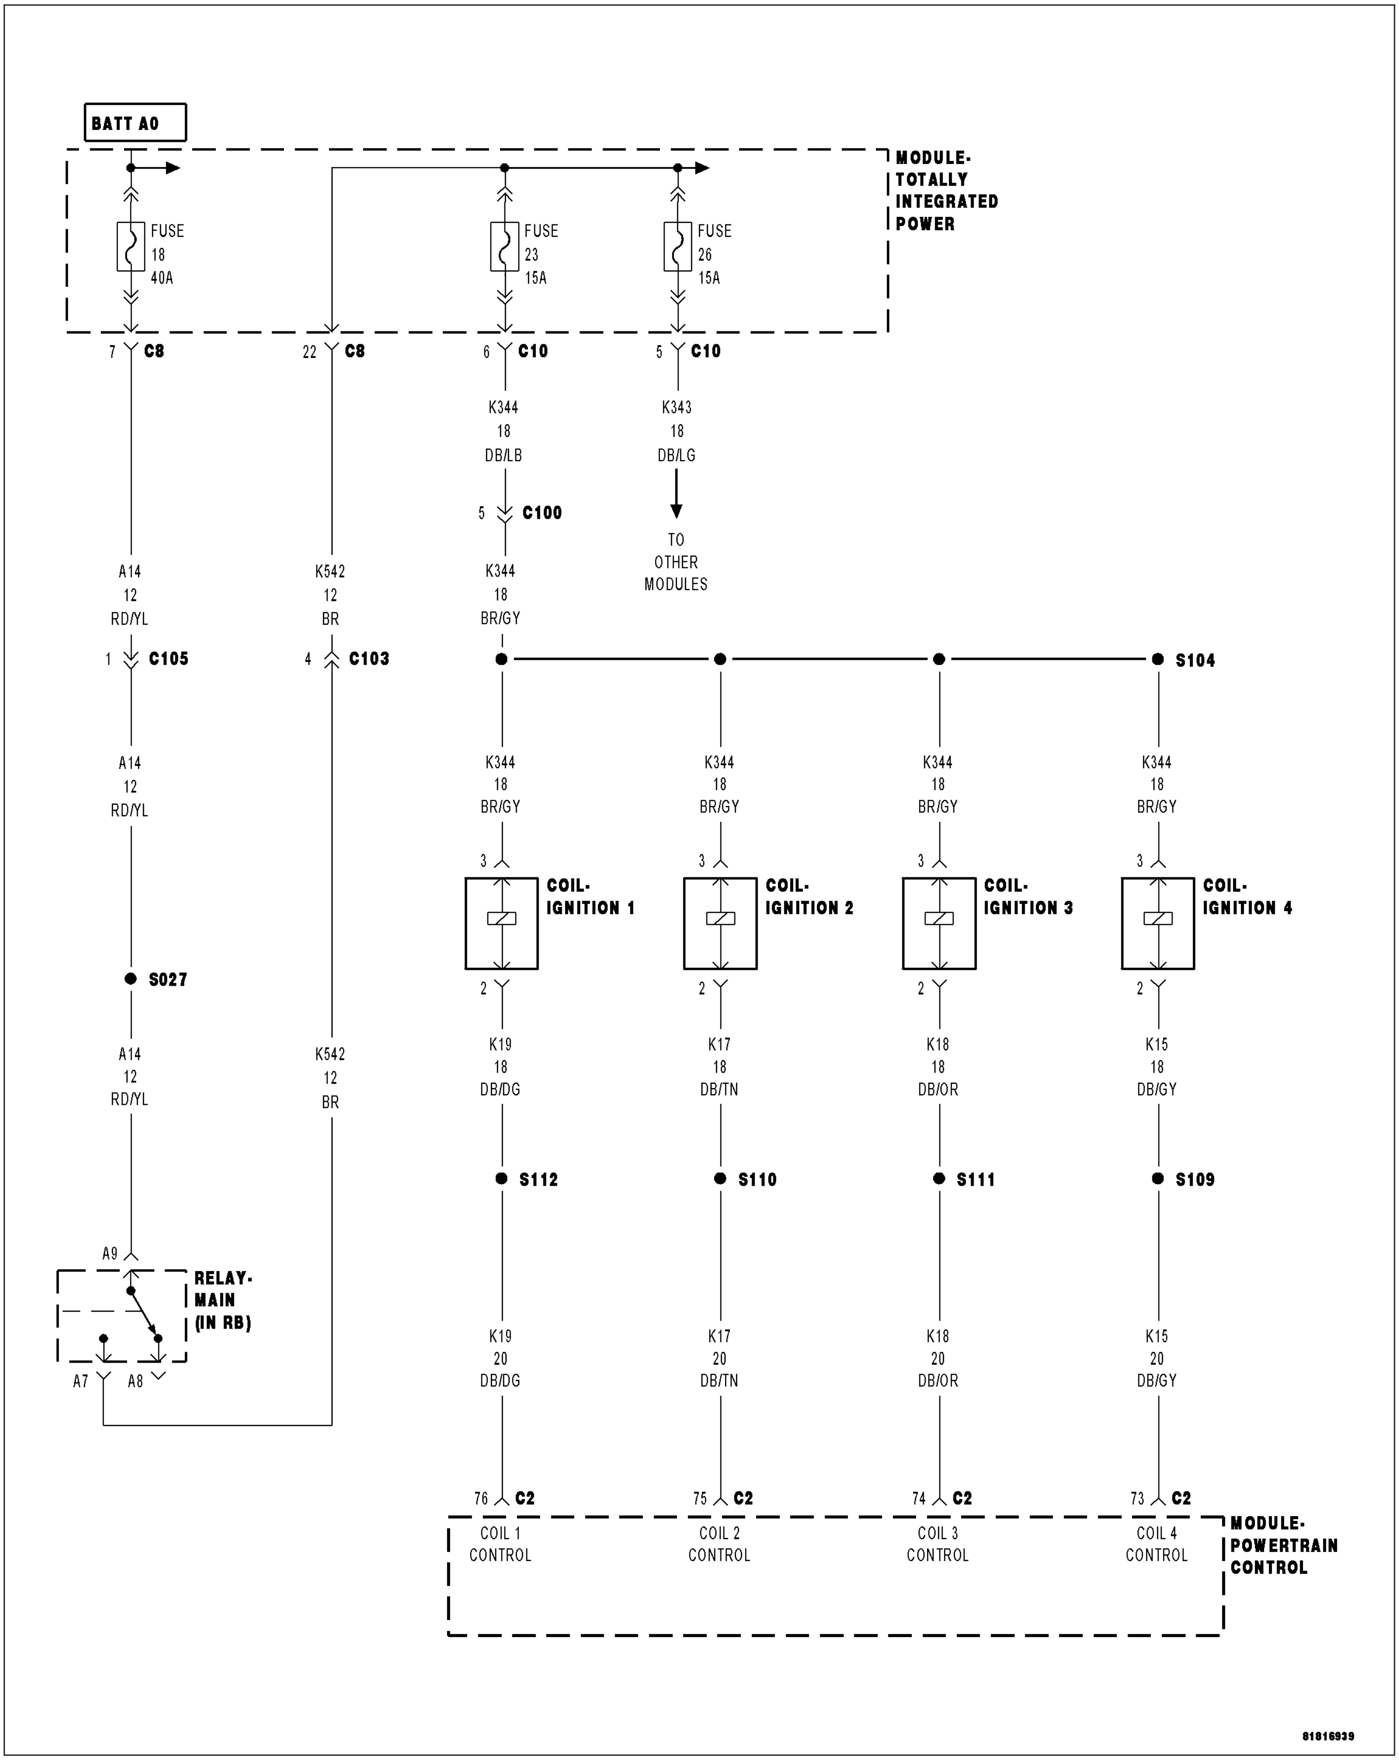
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2305-IGNITION COIL 2 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K17) Coil 2 Control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K17) COIL 2 CONTROL CIRCUIT SHORTED TO GROUND
(K17) COIL 2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 2
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

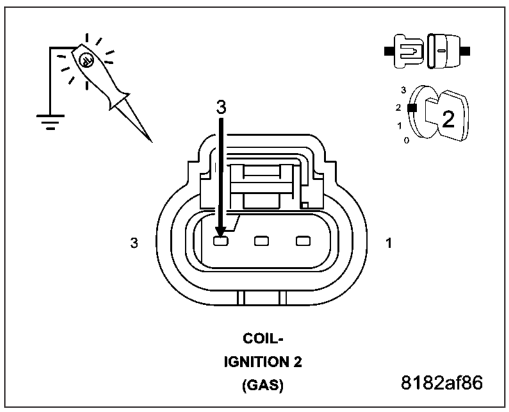
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Ignition Coil 2 harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuit in the Ignition Coil 2 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

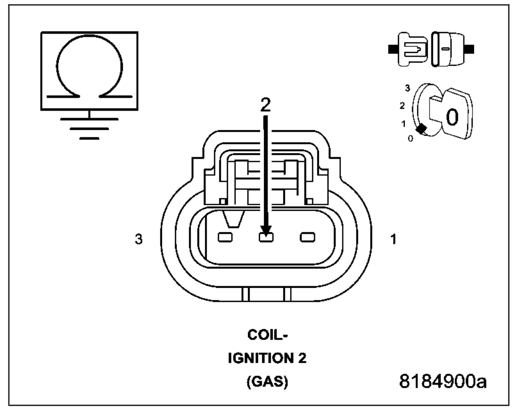
Yes >> Go to 3

No >> Repair the (K344) Fused Main Relay Output circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K17) COIL 2 CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.



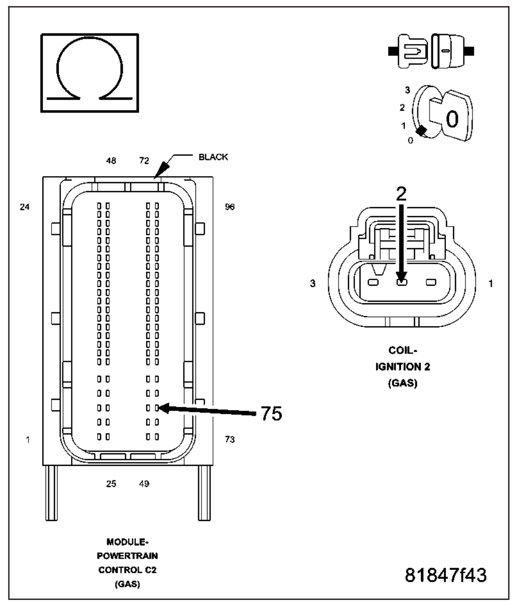
Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K17) Coil 2 Control circuit in the Ignition Coil 2 harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the (K17) Coil 2 Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4



4. (K17) COIL 2 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K17) Coil 2 Control circuit between the Ignition Coil 2 harness connector and the Powertrain Control Module (PCM) harness connector.

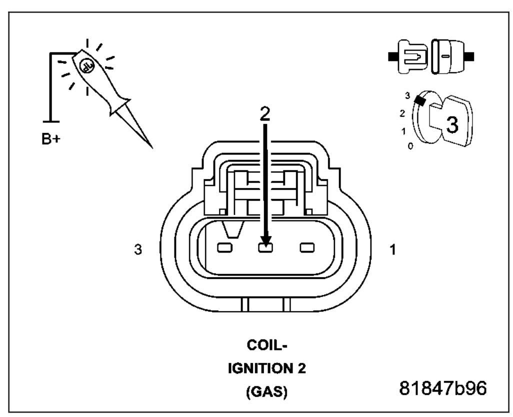
Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K17) Coil 2 Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. IGNITION COIL 2

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.



Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K17) Coil 2 Control circuit in the Ignition Coil 2 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 2 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

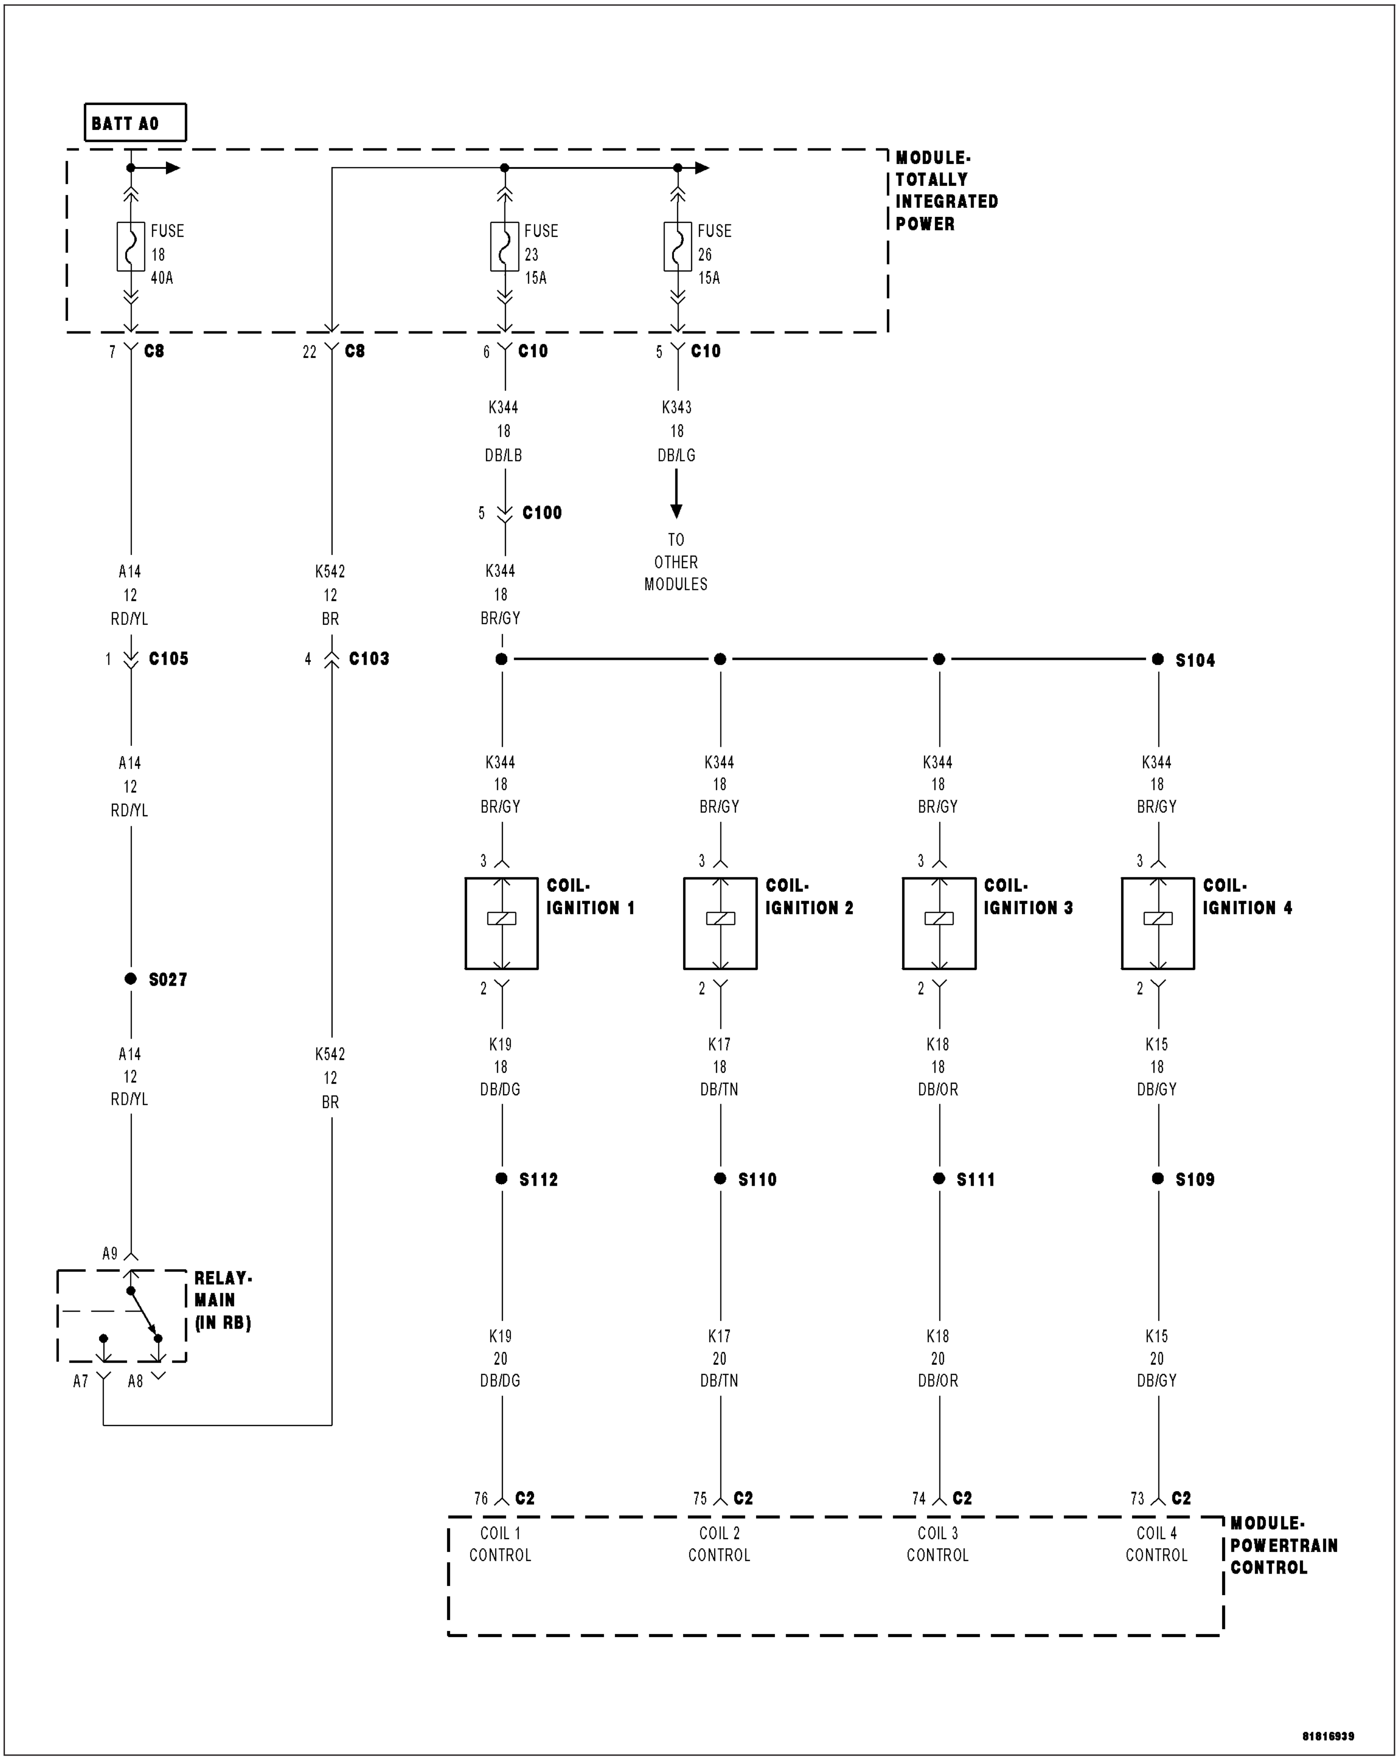
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 2 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2307-IGNITION COIL 3 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects that the (K18) Coil 3 Control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K18) COIL 3 CONTROL CIRCUIT SHORTED TO VOLTAGE
(K18) COIL 3 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT
(K18) COIL 3 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 3
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

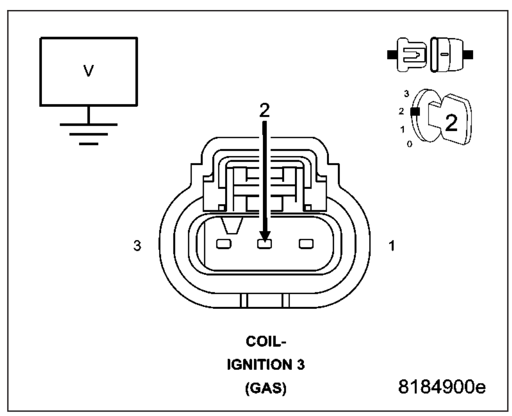
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K18) COIL 3 CONTROL CIRCUIT SHORTED TO VOLTAGE



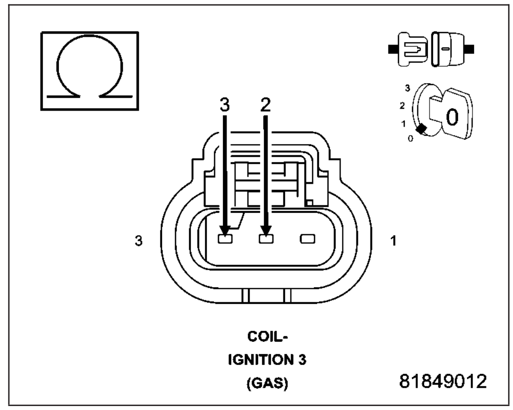
Turn the ignition off.

Disconnect the Ignition Coil 3 connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K18) Coil 3 Control circuit in the Ignition Coil 3 harness connector.



Is there any voltage present?

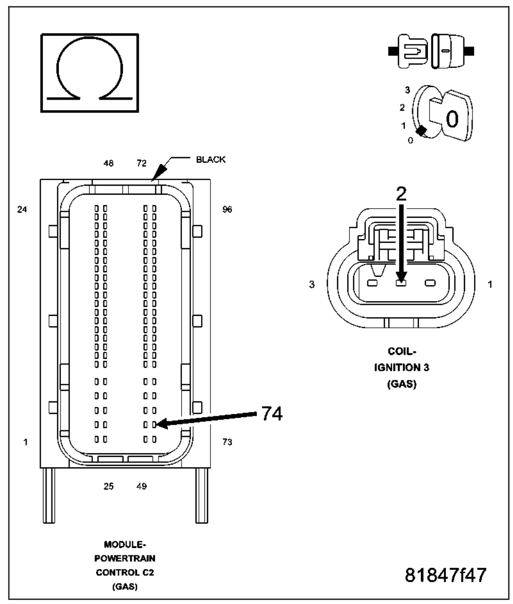
Yes >> Repair the (K18) Coil 3 Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 3

3. (K18) COIL 3 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT

Turn the ignition off.

Measure the resistance between the (K18) Coil 3 Control circuit and the (K344) Fused Main Relay Output circuit in the Ignition Coil 3 harness connector.



Is the resistance above 100 ohms?

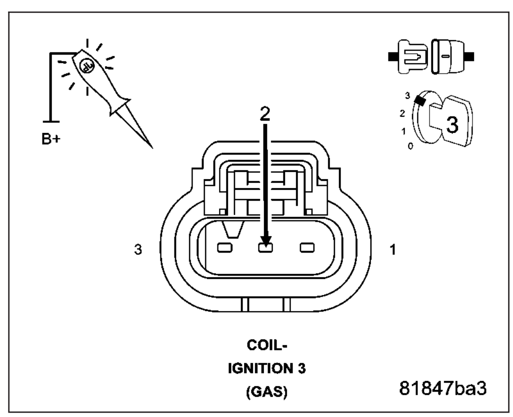
Yes >> Go to 4

No >> Repair the (K18) Coil 3 Control circuit for a short to the (K344) Fused Main Relay Output circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K18) COIL 3 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K18) Coil 3 Control circuit between the Ignition Coil 3 harness connector and the Powertrain Control Module (PCM) harness connector.



Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K18) Coil 3 Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. IGNITION COIL 3

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K18) Coil 3 Control circuit in the Ignition Coil 3 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 3 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

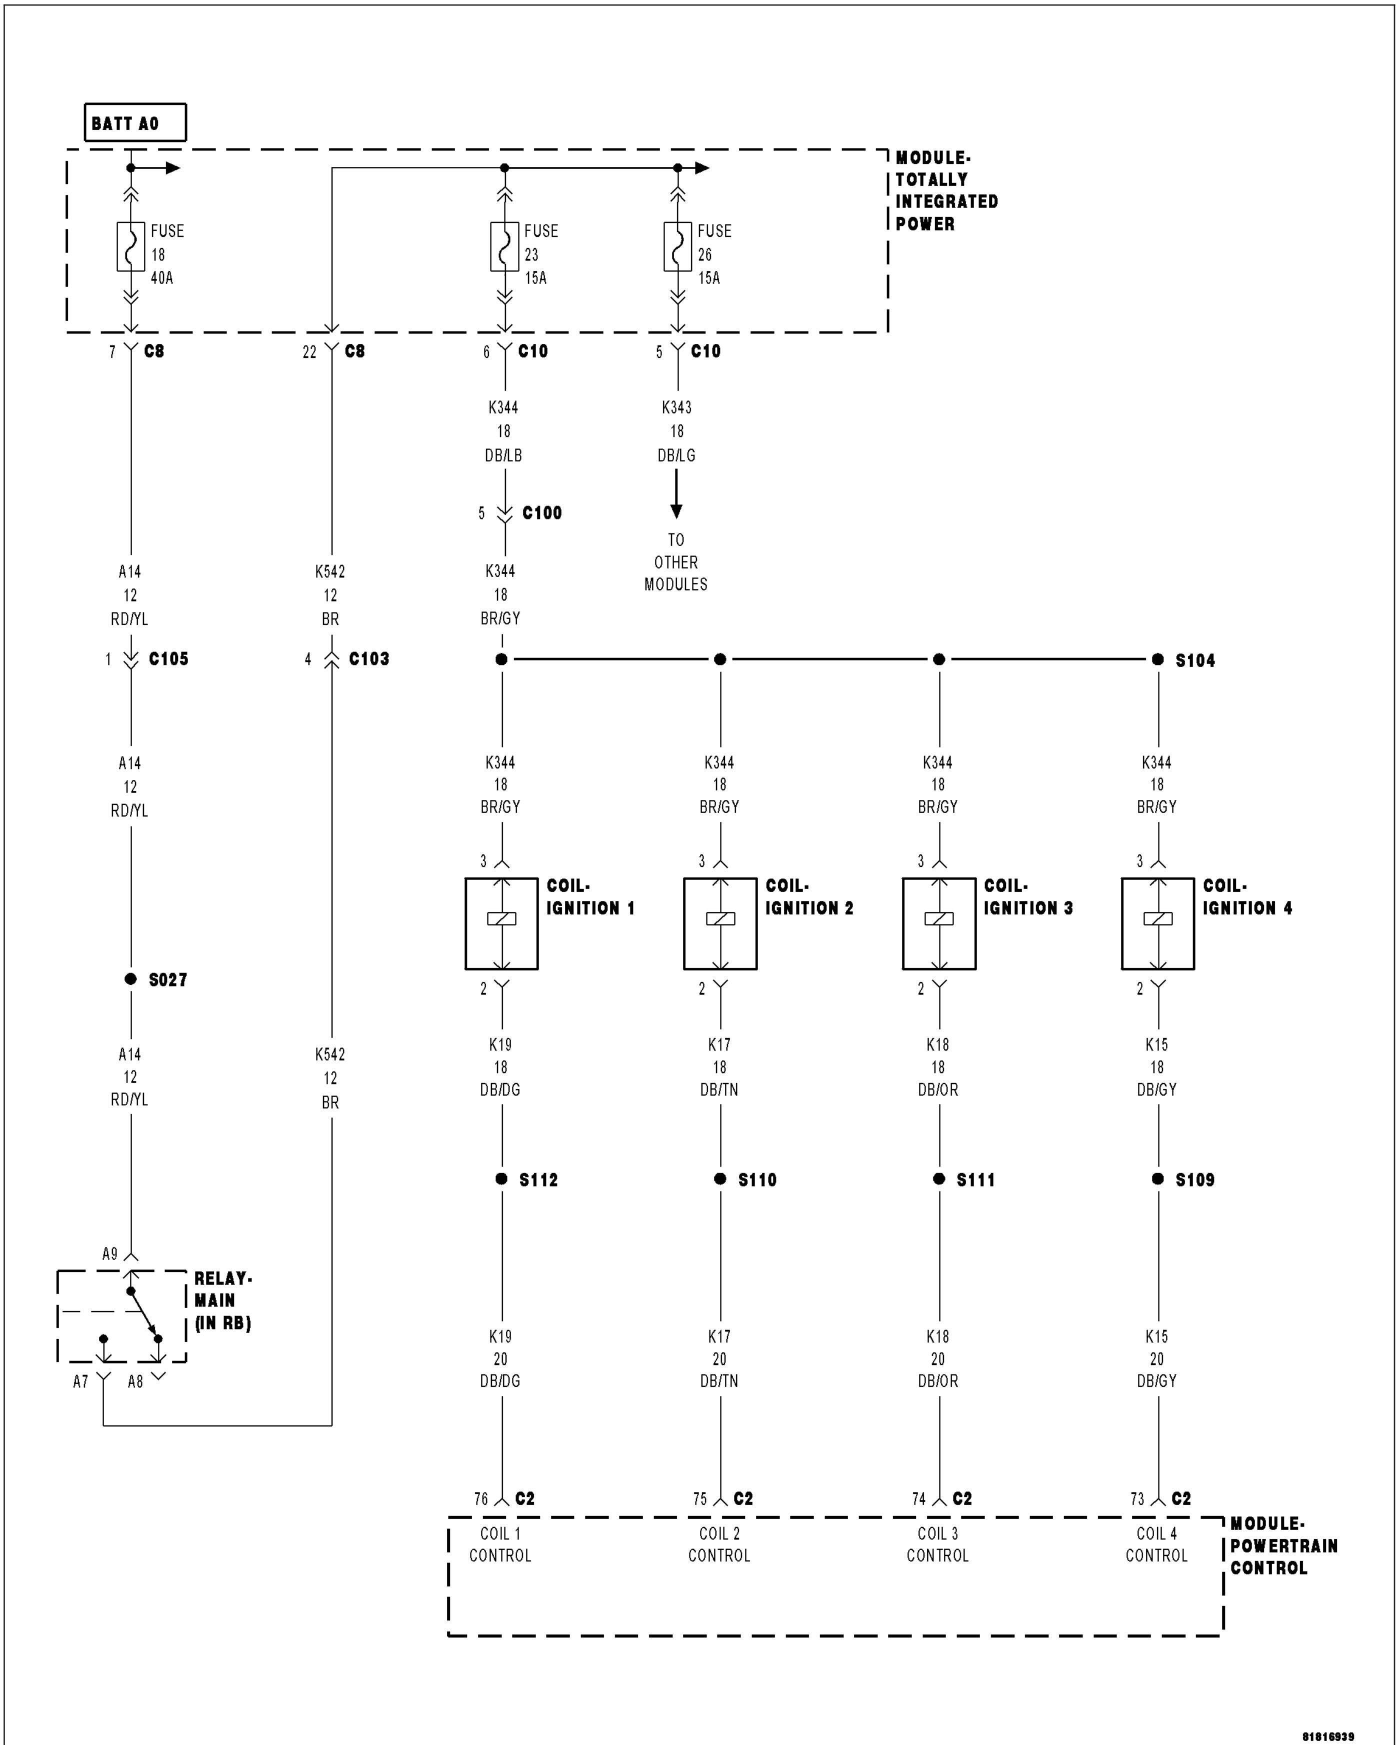
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 3 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2308-IGNITION COIL 3 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K18) Coil 3 Control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K18) COIL 3 CONTROL CIRCUIT SHORTED TO GROUND
(K18) COIL 3 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 3
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

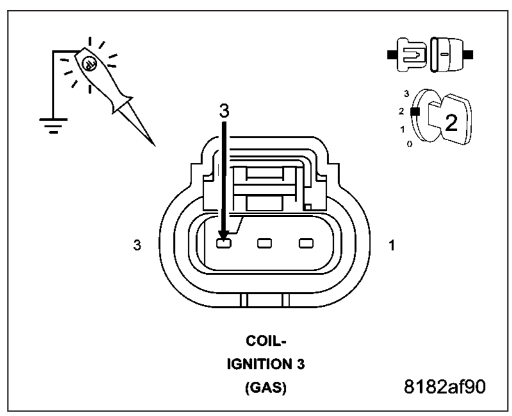
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Ignition Coil 3 harness connector.

Turn the ignition on.

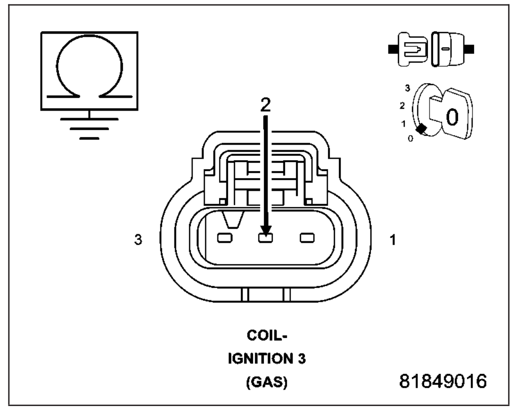
Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuit in the Ignition Coil 3 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (K344) Fused Main Relay Output circuit for an open circuit or high resistance.



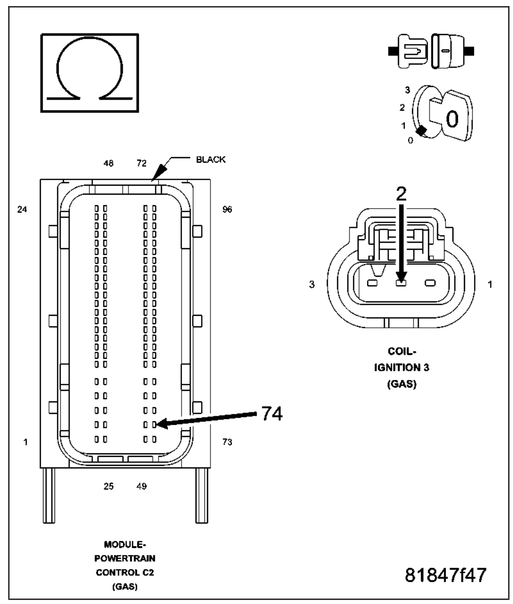
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K18) COIL 3 CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K18) Coil 3 Control circuit in the Ignition Coil 3 harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K18) Coil 3 Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

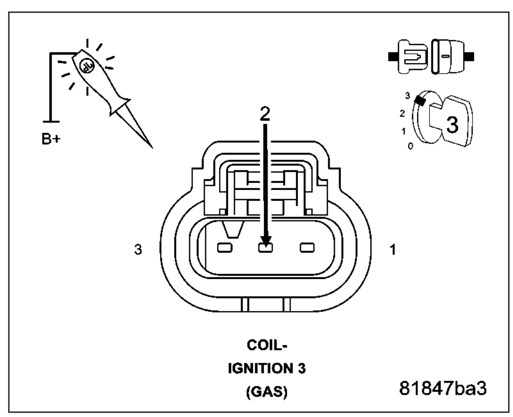
4. (K18) COIL 3 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K18) Coil 3 Control circuit between the Ignition Coil 3 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K18) Coil 3 Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. IGNITION COIL 3

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K18) Coil 3 Control circuit in the Ignition Coil 3 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 3 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

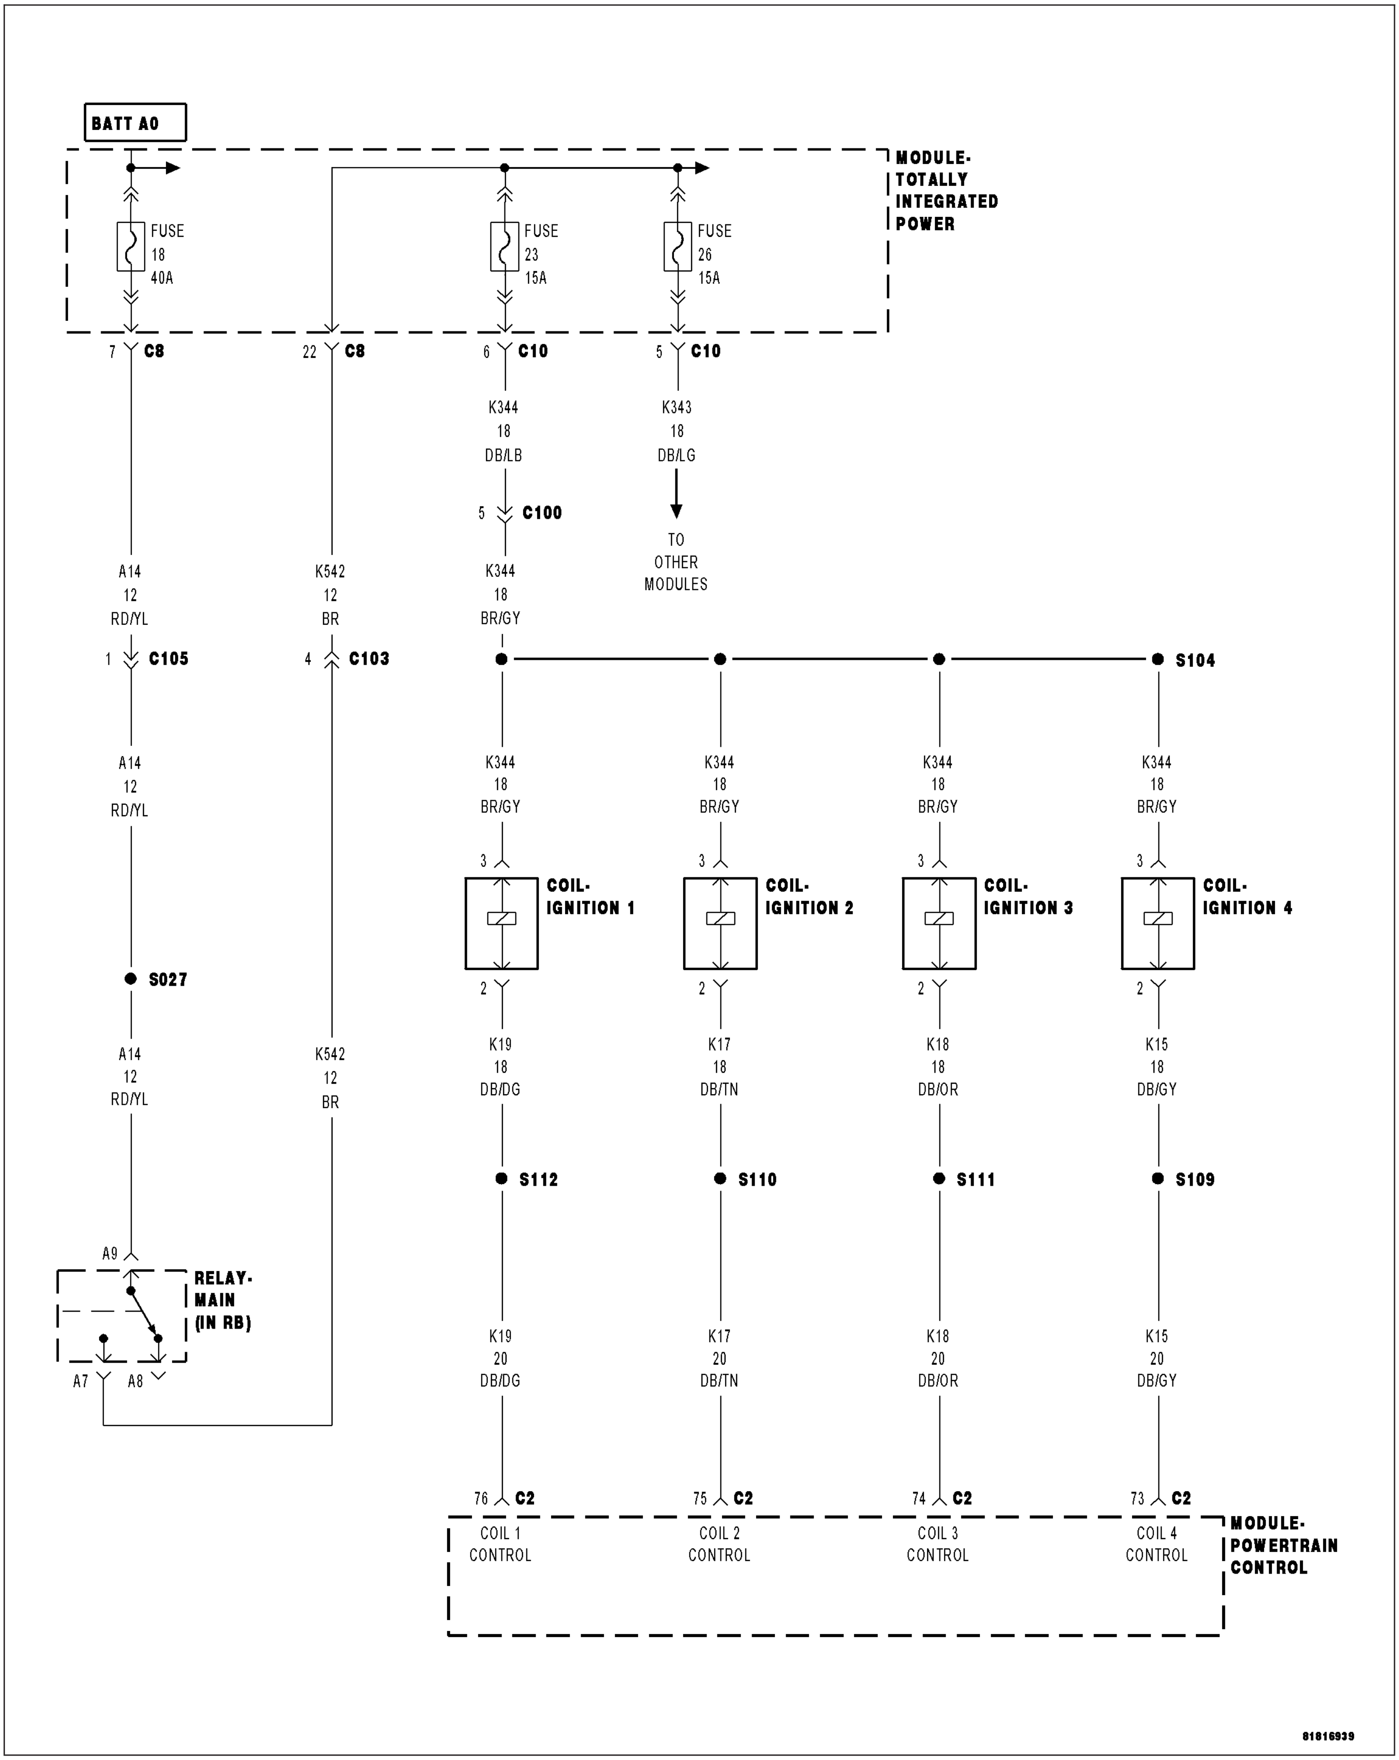
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 3 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2310-IGNITION COIL 4 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The Powertrain Control Module (PCM) detects that the (K15) Coil 4 Control circuit is shorted high.

Possible Causes
INTERMITTENT DTC
(K15) COIL 4 CONTROL CIRCUIT SHORTED TO VOLTAGE
(K15) COIL 4 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT
(K15) COIL 4 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 4
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

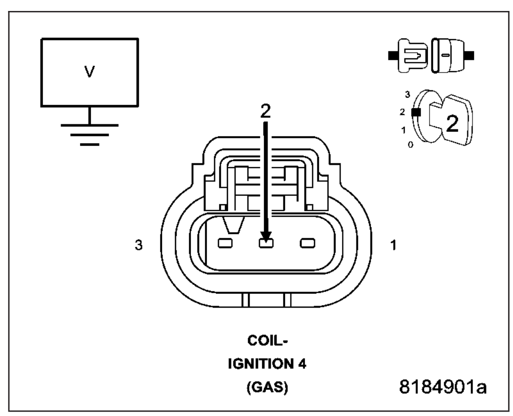
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K15) COIL 4 CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

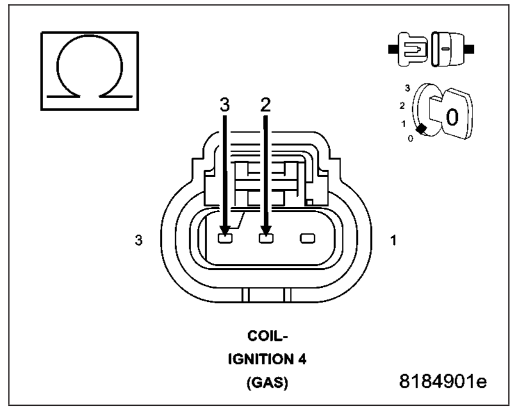
Disconnect the Ignition Coil 4 connector.

Disconnect the Powertrain Control Module (PCM) connector.

Turn the ignition on.

Measure the voltage of the (K15) Coil 4 Control circuit in the Ignition Coil 4 harness connector.

Is there any voltage present?



Yes >> Repair the (K15) Coil 4 Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

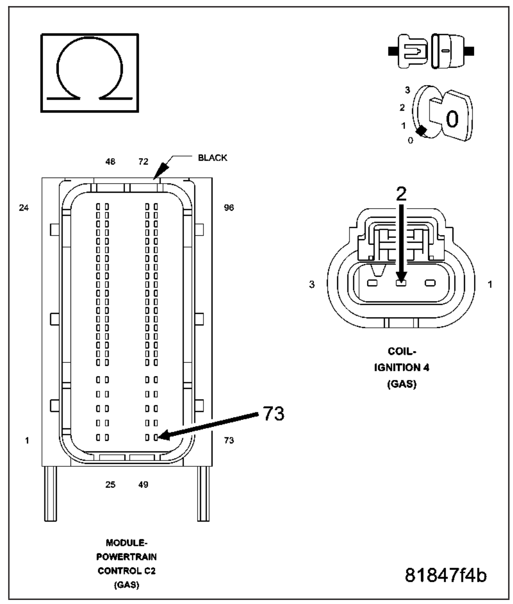
No >> Go to 3

3. (K15) COIL 4 CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT

Turn the ignition off.

Measure the resistance between the (K15) Coil 4 Control circuit and the (K344) Fused Main Relay Output circuit in the Ignition Coil 4 harness connector.

Is the resistance above 100 ohms?



Yes >> Go to 4

No >> Repair the (K15) Coil 4 Control circuit for a short to the (K344) Fused Main Relay Output circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (K15) COIL 4 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

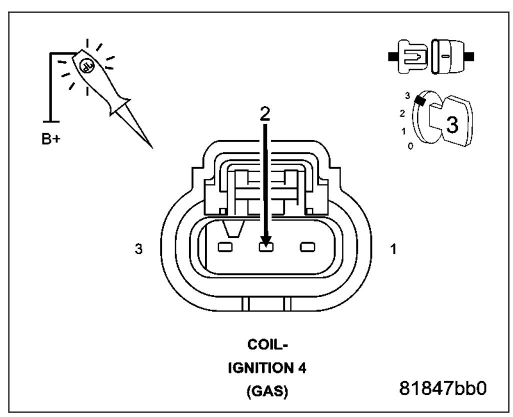
Measure the resistance of the (K15) Coil 4 Control circuit between the Ignition Coil 4 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K15) Coil 4 Control circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. IGNITION COIL 4

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K15) Coil 4 Control circuit in the Ignition Coil 4 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 4 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

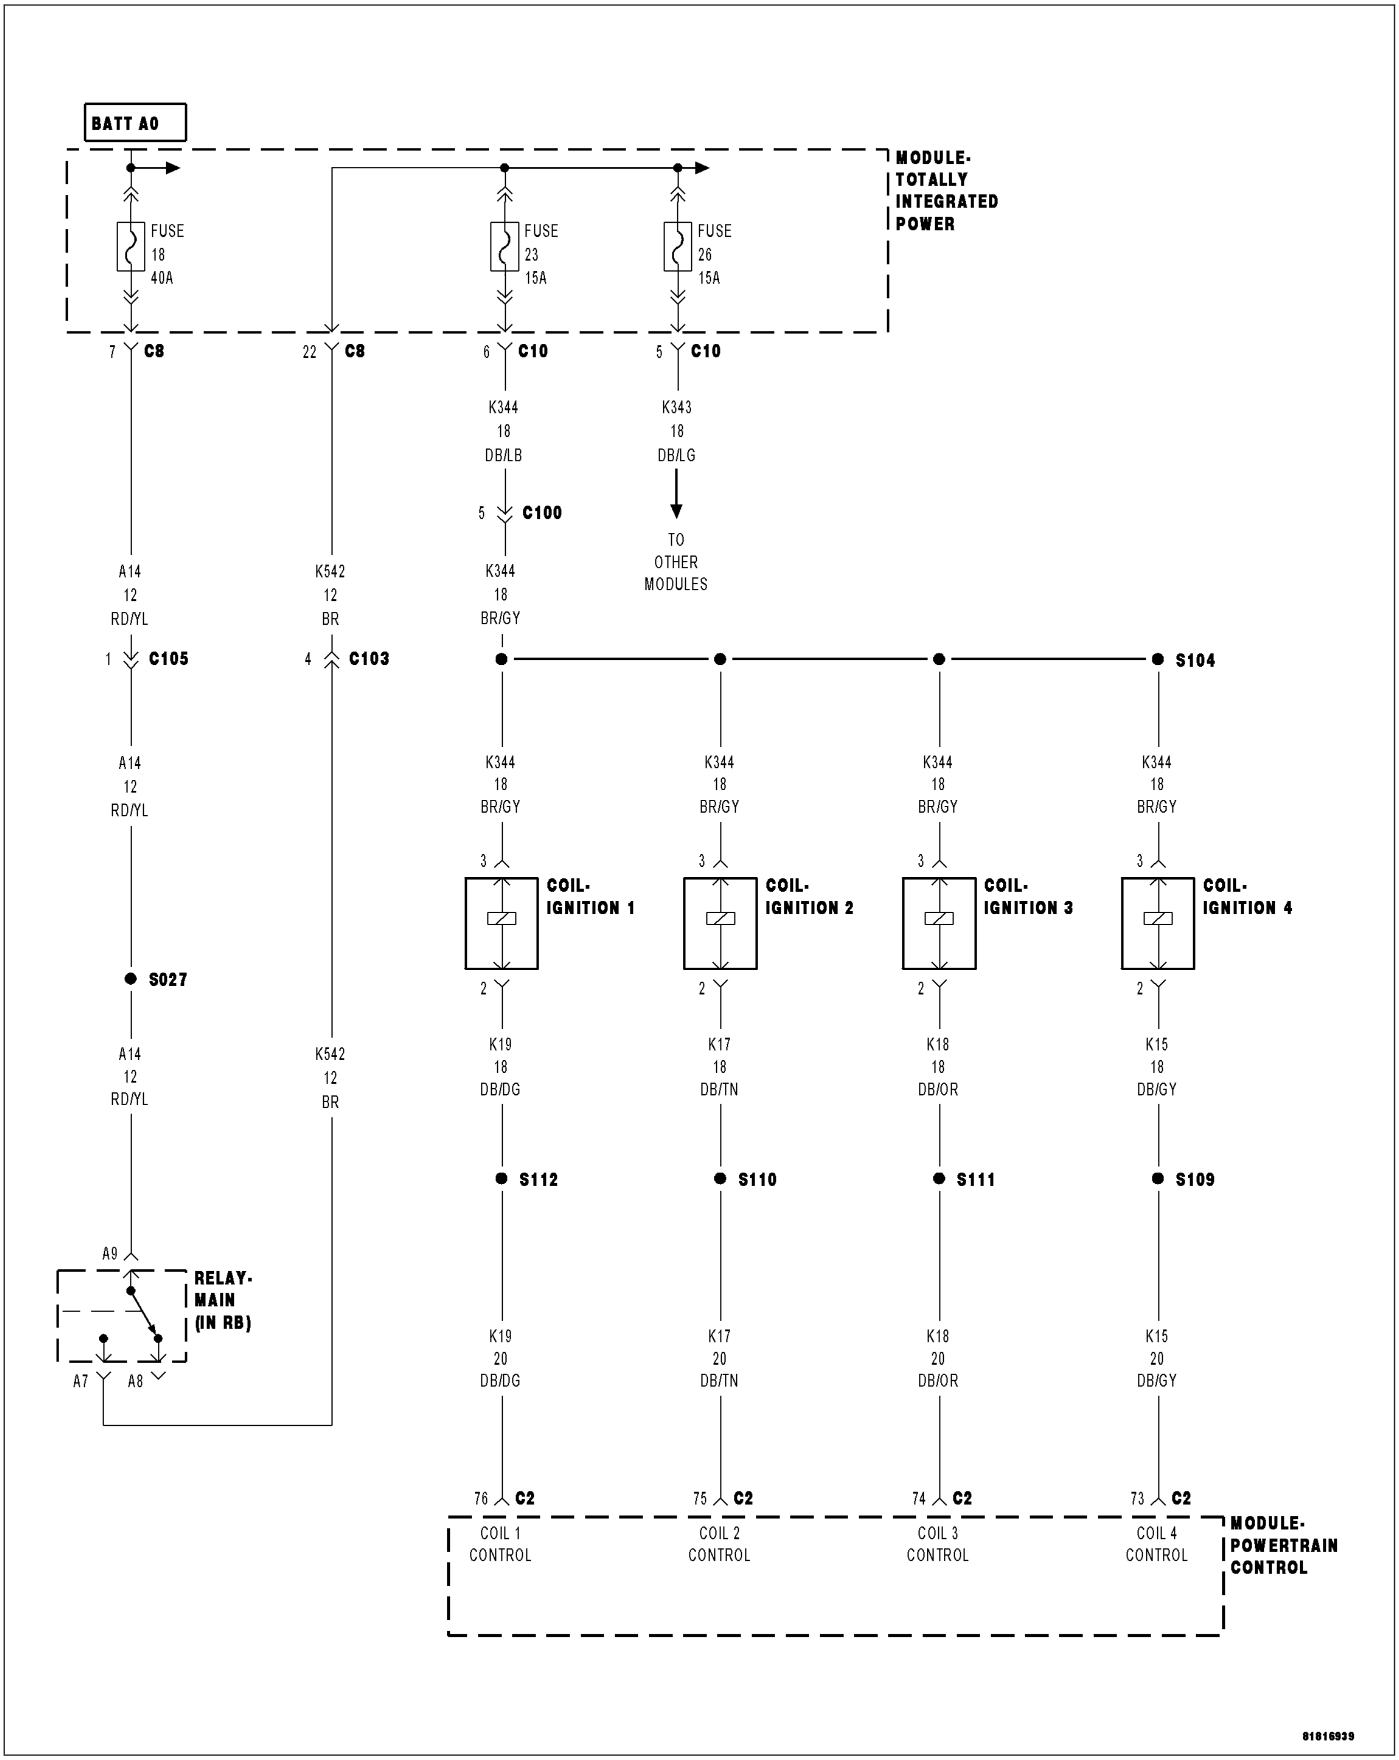
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 4 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2311-IGNITION COIL 4 SECONDARY CIRCUIT-INSUFFICIENT IONIZATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and battery voltage greater than 10.4 volts.
- **Set Condition:**
  The PCM detects that the (K15) Coil 4 Control circuit is shorted low.

Possible Causes
INTERMITTENT DTC
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K15) COIL 4 CONTROL CIRCUIT SHORTED TO GROUND
(K15) COIL 4 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
IGNITION COIL 4
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Powertrain Control Module (PCM).

Start the engine and allow it to reach normal operating temperature.

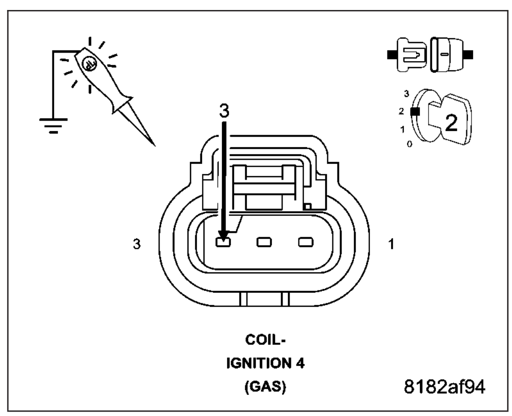
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Ignition Coil 4 harness connector.

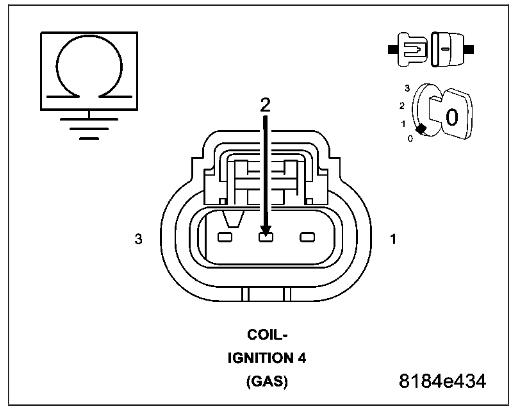
Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuit in the Ignition Coil 4 harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 3



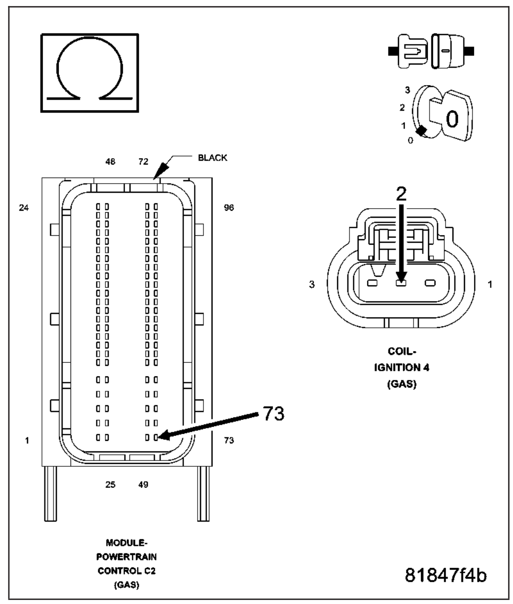
No >> Repair the (K344) Fused Main Relay Output circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K15) COIL 4 CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Powertrain Control Module (PCM) connector.

Measure the resistance between ground and the (K15) Coil 4 Control circuit in the Ignition Coil 4 harness connector.



Is the resistance below 100 ohms?

Yes >> Repair the (K15) Coil 4 Control circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 4

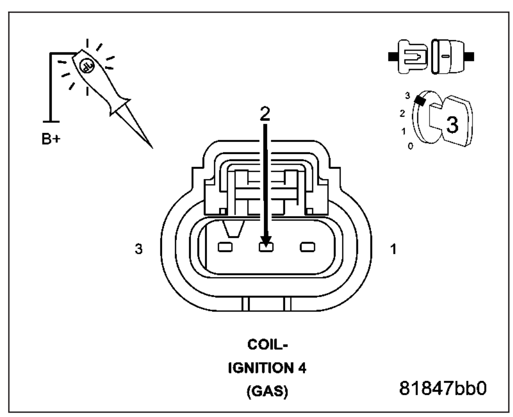
4. (K15) COIL 4 CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K15) Coil 4 Control circuit between the Ignition Coil 4 harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance below 5.0 ohms?

Yes >> Go to 5

No >> Repair the (K15) Coil 4 Control circuit for an open circuit or high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. IGNITION COIL 4

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Connect the Powertrain Control Module (PCM) connector.

Using a 12 volt test light connected to 12 volts, check the (K15) Coil 4 Control circuit in the Ignition Coil 4 harness connector.

Crank the engine for 5 seconds.

NOTE: The test light should blink each time the circuit is activated by the PCM.

Does the test light blink each time the circuit is activated by

the PCM?

Yes >> Replace the Ignition Coil 4 in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

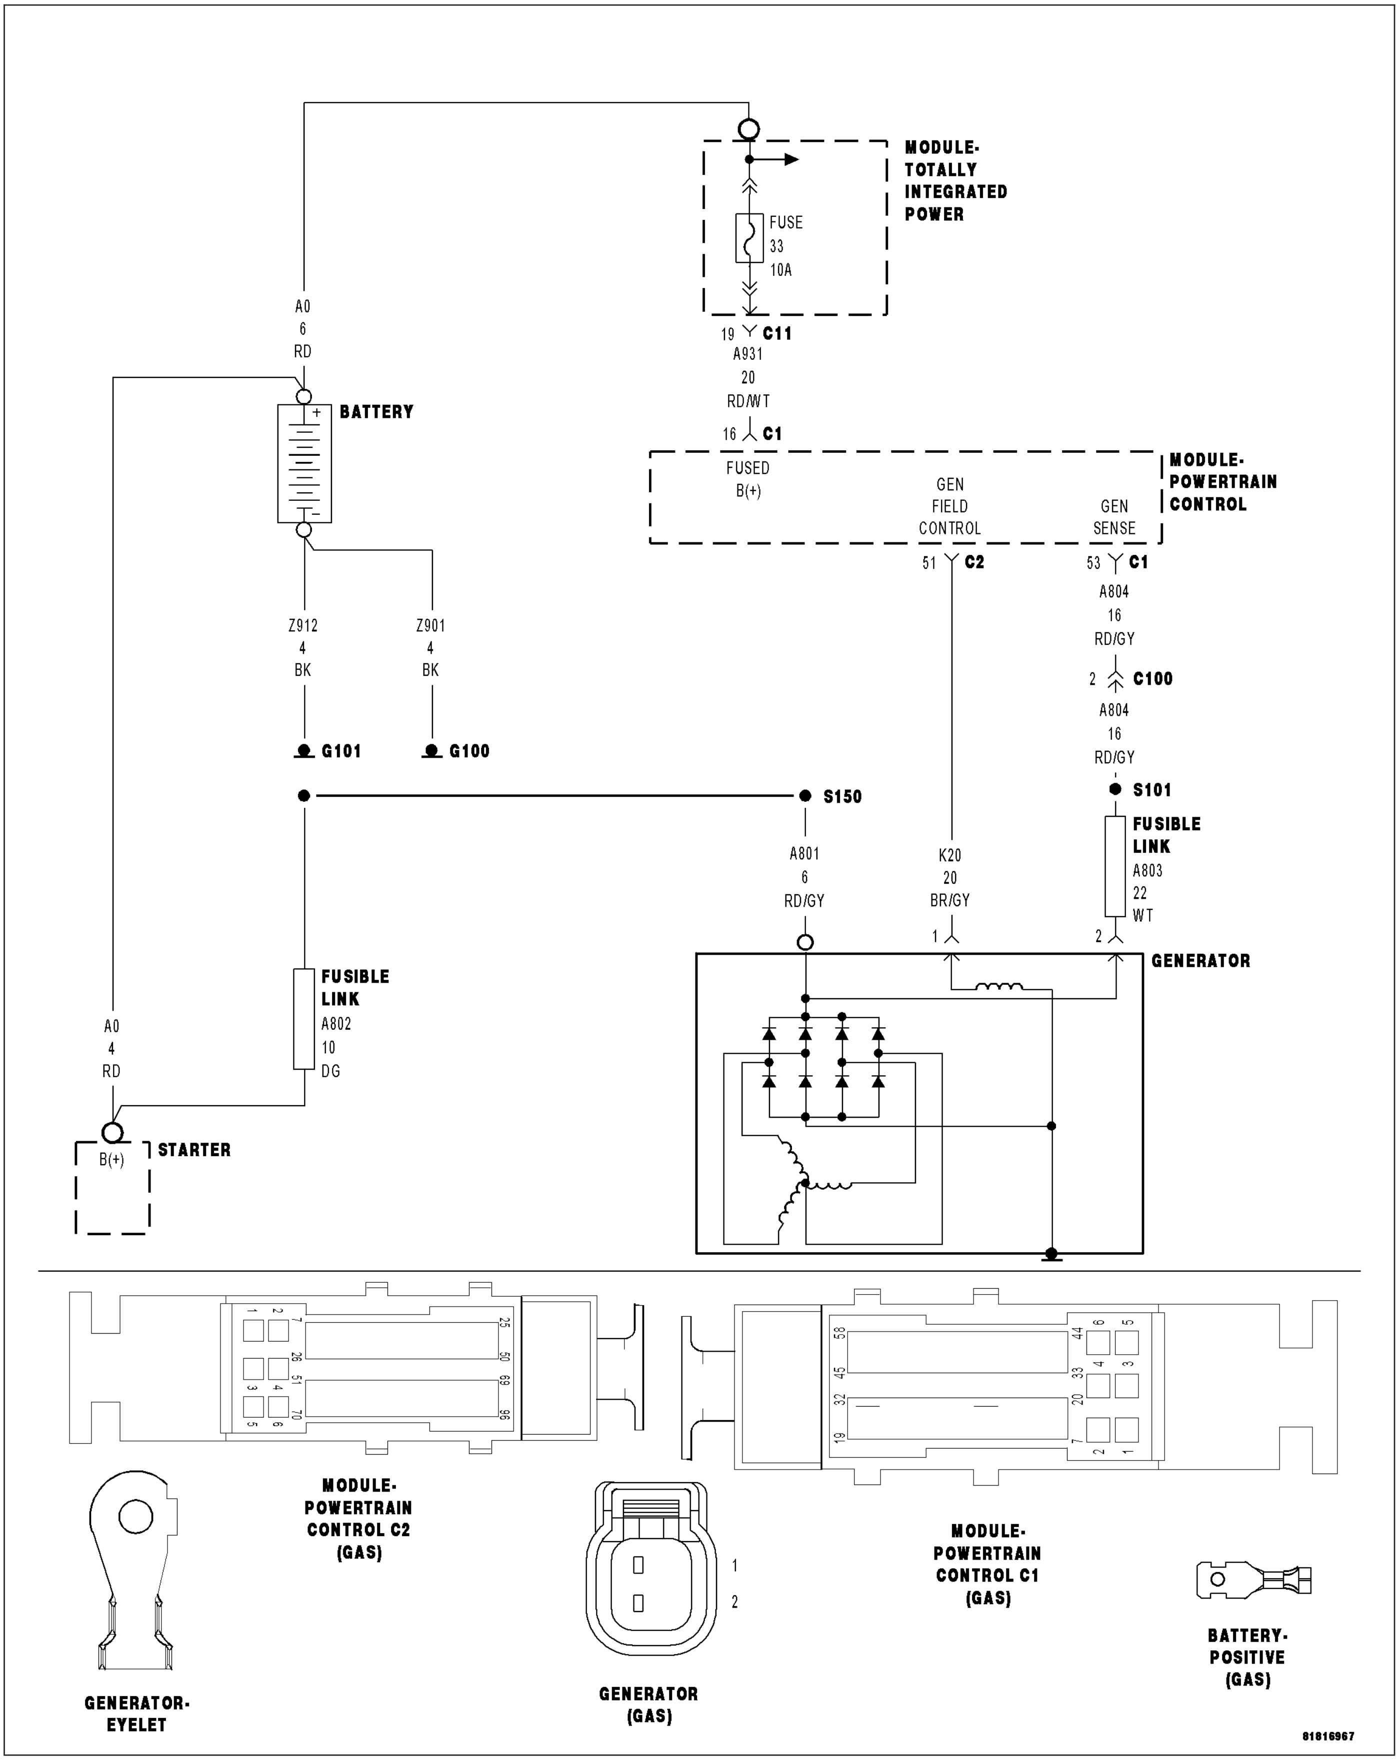
No >> Go to 6

6. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Ignition Coil 4 and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2503-CHARGING SYSTEM OUTPUT LOW

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine speed greater than 1157 RPM.
- **Set Condition:**
  The PCM detects that battery voltage is 1 volt below charging goal voltage for 13.47 seconds. The PCM compares sensed battery voltage with the field driver on and off. If the voltages are the same, this code will set. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
EXCESSIVE RESISTANCE IN THE B(+) CIRCUIT BETWEEN THE GENERATOR AND THE BATTERY
EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND
(K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the generator system output.

NOTE: Inspect the condition and tension of the generator belt before continuing.

NOTE: Inspect the battery before continuing.

Ignition on, engine not running.

With a scan tool, select View DTCs. Record DTC and Freeze Frame information

With a scan tool, clear DTCs.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. EXCESSIVE RESISTANCE IN THE B(+) CIRCUIT

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Make sure all test equipment and cables are clear of any belts, pulleys, or other moving parts.

Monitor the voltage between the generator B(+) output terminal and the battery positive (+) post.

Start the engine.

Is the voltage above 0.4 volts?

Yes >> Repair the battery positive (+) circuit between the generator and battery for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Make sure all test equipment and cables are clear of any belts, pulleys, or other moving parts.

Monitor the voltage between the generator case and battery ground (-) post.

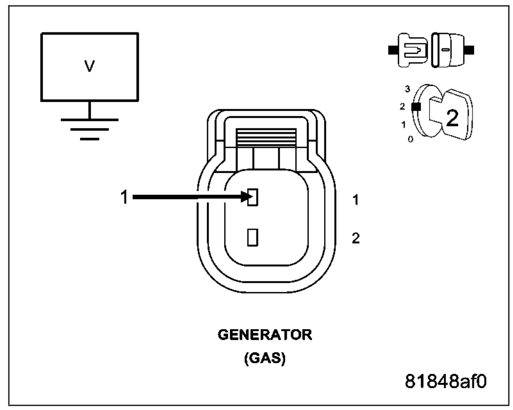
Start the engine and allow it to reach operating temperature.

Is the voltage above 0.1 volts?

Yes >> Repair the excessive resistance in the Generator Case Ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

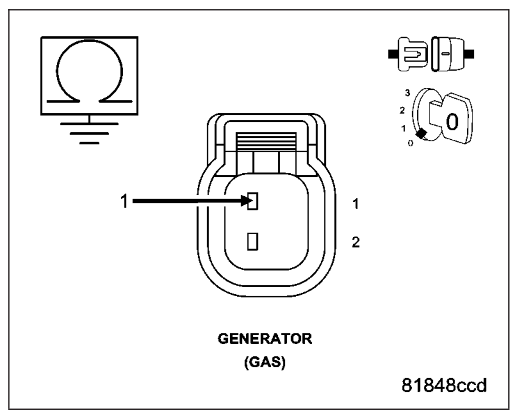
Disconnect the Generator harness connector.

Disconnect the Powertrain Control Module (PCM) harness connector.

Turn the ignition on.

Measure the voltage of the (K20) Gen Field Control circuit.

Is there any voltage present?



Yes >> Repair the (K20) Gen Field Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

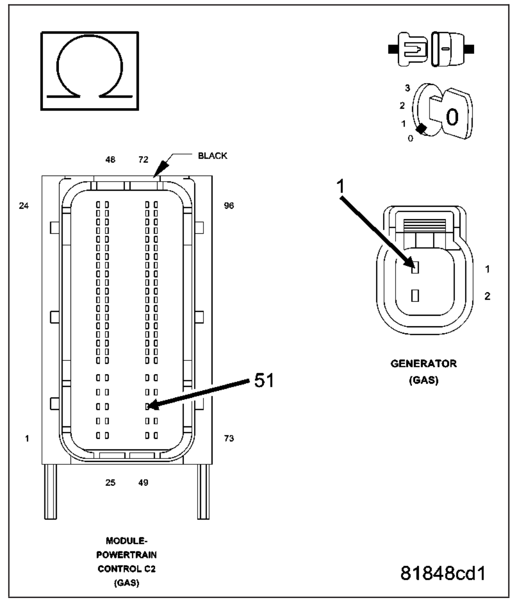
Measure the resistance between ground and the (K20) Gen Field Control circuit in the Generator harness connector.

Is the resistance below 100 ohms?

Yes >> Repair the short to ground in the (K20) Gen Field Control circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. (K20) GEN FIELD CONTROL CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K20) Gen Field Control circuit between the Generator harness connector and the Powertrain Control Module (PCM) harness connector.

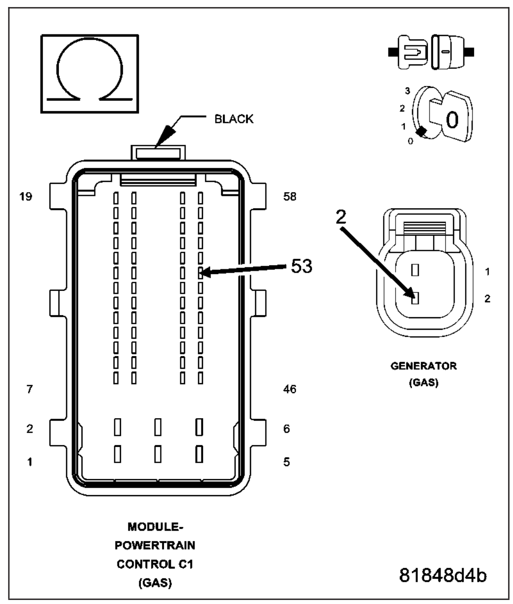
Is the resistance below 5.0 ohms?

Yes >> Go to 7

No >> Repair the open in the (K20) Gen Field Control circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (A804) GEN SENSE CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (A804) Gen Sense between the Generator harness connector and the Powertrain Control Module (PCM) harness connector.

Is the resistance above 5.0 ohms?

Yes >> Go to 8

No >> Repair the (A804) Gen Sense circuit for an open circuit or high resistance.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. GENERATOR

Turn the ignition off.

Connect the Powertrain Control Module (PCM) harness connector.

Turn the ignition on.

With a scan tool, actuate the Generator Field to toggle on and off.

Using a 12-volt test light connected to ground, check the (K20) Gen Field Control in the Generator harness connector.

NOTE: The test light should be illuminated and bright when toggled on. Compare the brightness to that of a direct connection to the battery.

Does the test light toggle on and off correctly during the actuator test?

Yes >> Replace the Generator in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

9. POWERTRAIN CONTROL MODULE (PCM)

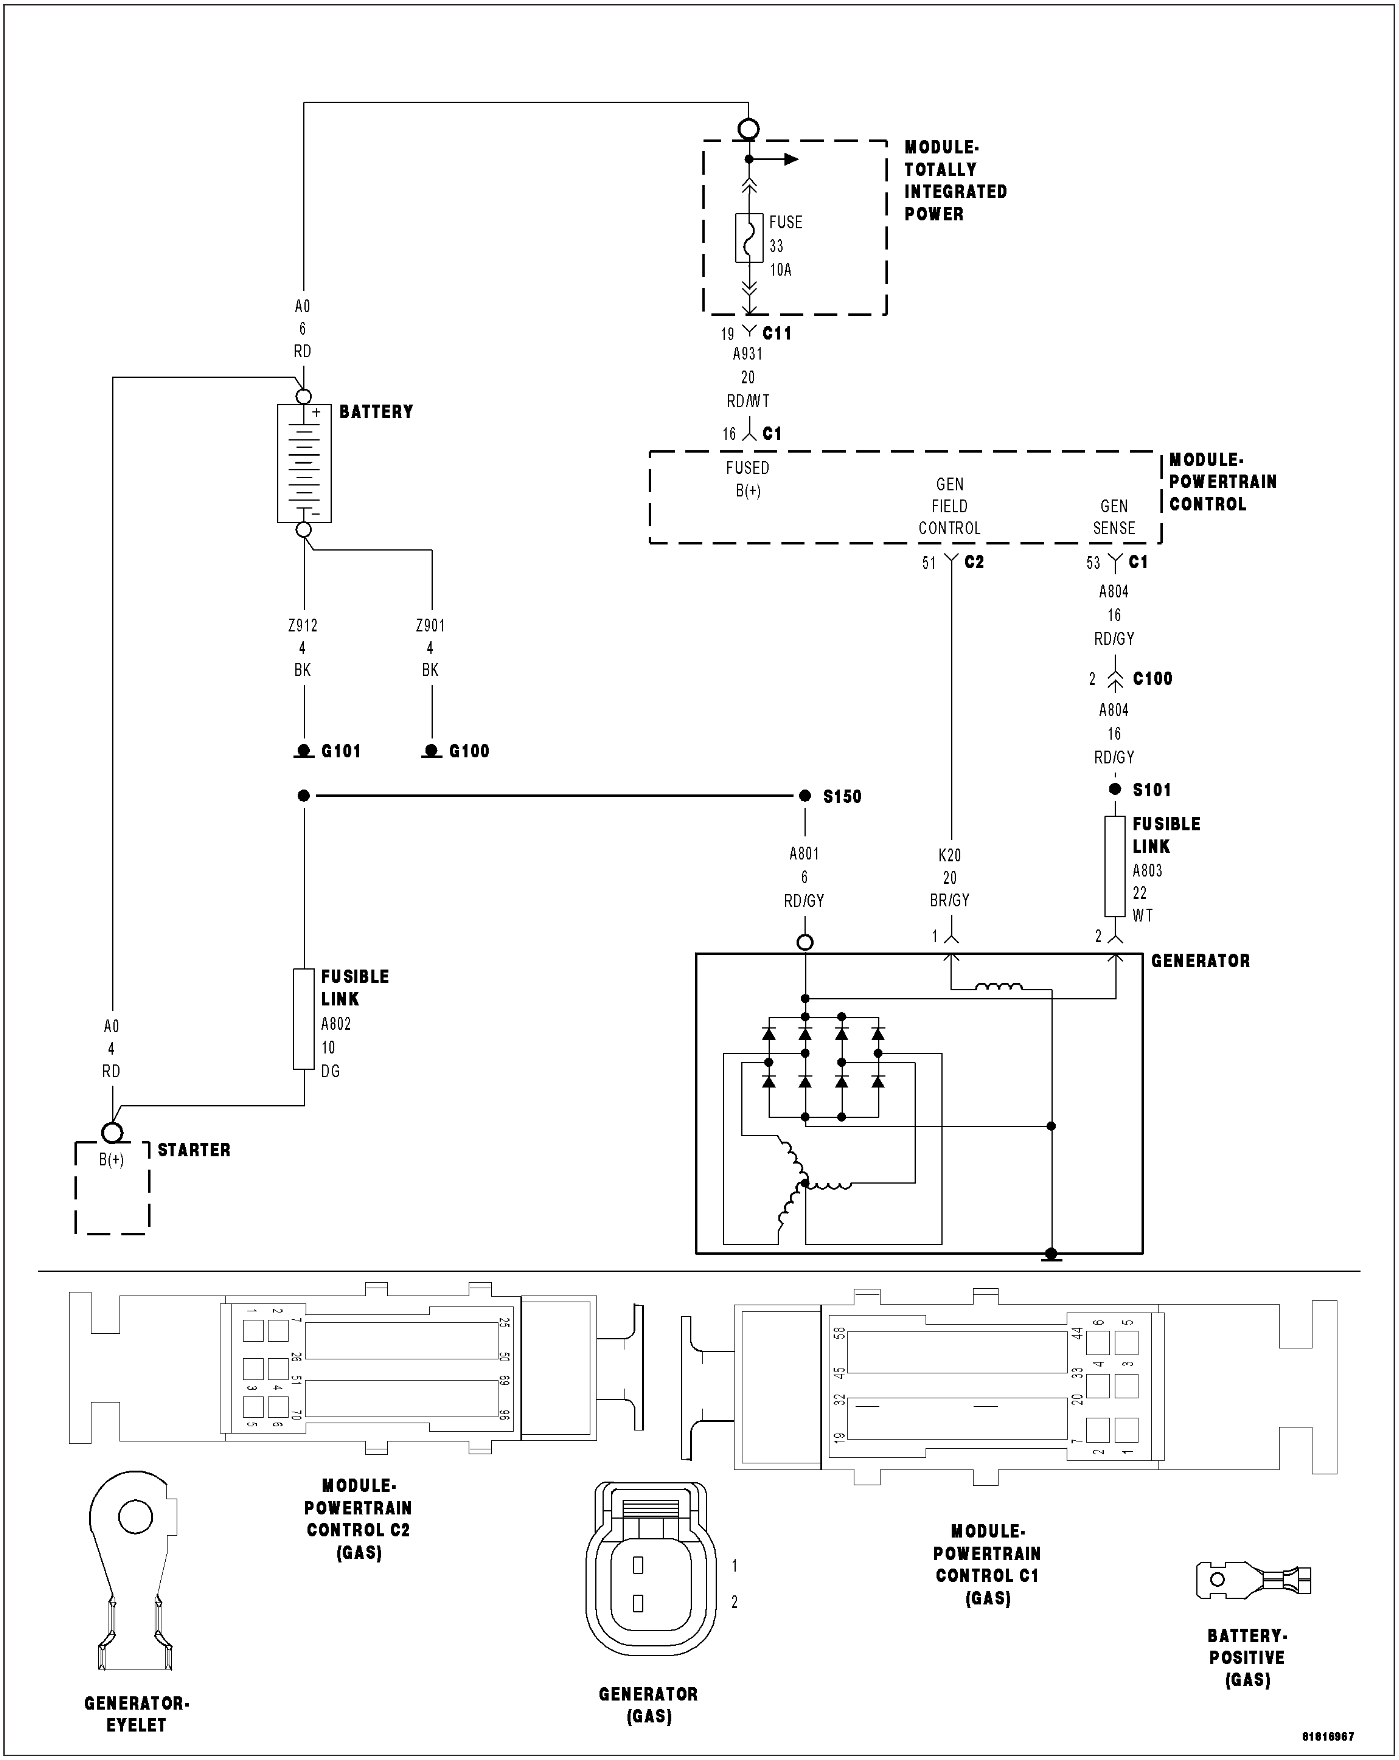
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2504-CHARGING SYSTEM OUTPUT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine speed greater than 1157 RPM.
- **Set Condition:**
  The PCM compares sensed battery voltage with the Gen Sense circuit voltage. If the Gen Sense circuit voltage if greater than sensed battery voltage, this DTC will set. One Trip Fault. Three good trips to turn off the MIL.

Possible Causes
EXCESSIVE RESISTANCE IN THE B(+) CIRCUIT BETWEEN THE GENERATOR AND THE BATTERY
EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND
(A804) GEN SENSE CIRCUIT SHORTED TO VOLTAGE
(K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE
GENERATOR
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Inspect the vehicle for aftermarket accessories that may exceed the Generator system output.

NOTE: Inspect the Generator harness connector and the Generator eyelet for corrosion or damage before continuing.

NOTE: Inspect the condition and tension of the Generator belt before continuing.

NOTE: Inspect the battery before continuing.

Ignition on, engine not running.

With a scan tool, select View DTCs. Record DTC and Freeze Frame information

With a scan tool, clear DTCs.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. EXCESSIVE RESISTANCE IN THE B(+) CIRCUIT

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Make sure all test equipment and cables are clear of any belts, pulleys, or other moving parts.

Monitor the voltage between the generator B(+) output terminal and the battery positive (+) post.

Start the engine.

Is the voltage above 0.4 volts?

Yes >> Repair the battery positive (+) circuit between the generator and battery for high resistance.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. EXCESSIVE RESISTANCE BETWEEN THE GENERATOR CASE AND GROUND

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

NOTE: Make sure all test equipment and cables are clear of any belts, pulleys, or other moving parts.

Monitor the voltage between the generator case and battery ground (-) post.

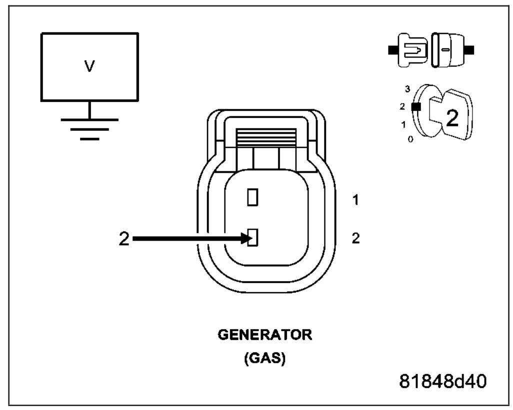
Start the engine and allow it to reach operating temperature.

Is the voltage above 0.1 volts?

Yes >> Repair the excessive resistance in the Generator case ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. (A804) GEN SENSE CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Generator harness connector.

Disconnect the Powertrain Control Module (PCM) harness connector.

Turn the ignition on.

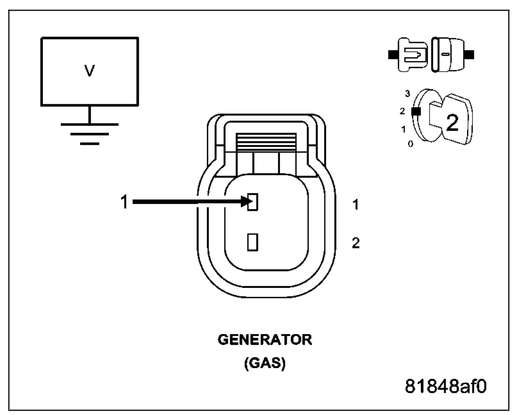
Measure the voltage of the (A804) Gen Sense circuit.

Is there any voltage present?

Yes >> Repair the (A804) Gen Sense circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. (K20) GEN FIELD CONTROL CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Disconnect the Generator harness connector.

Disconnect the Powertrain Control Module (PCM) harness connector.

Turn the ignition on.

Measure the voltage of the (K20) Gen Field Control circuit.

Is there any voltage present?

Yes >> Repair the (K20) Gen Field Control circuit for a short to voltage.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. GENERATOR

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Connect the Generator harness connector.

Connect the Powertrain Control Module (PCM) harness connector.

NOTE: Make sure all test equipment and cables are clear of any belts, pulleys, or other moving parts.

Measure the voltage between the Generator Eyelet terminal and the (A804) Gen Sense circuit in the Generator harness connector.

Start the engine and allow it to reach operating temperature.

Is the voltage above 0.1 volts?

Yes >> Replace the Generator in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 7

7. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Powertrain Control Module (PCM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1607-PCM INTERNAL SHUTDOWN TIMER SLOW RATIONALITY

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on and battery voltage greater than 10 volts.
- **Set Condition:**
  An internal PCM failure has been detected. Two Trip Fault. Three good trips to turn off the MIL.

Possible Causes
PENDING TEMPERATURE SENSOR DTCS
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN OR HIGH RESISTANCE
(A931) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. PENDING TEMPERATURE SENSOR DTCS

Turn the ignition on.

NOTE: If any temperature sensor DTCs are present, allow the vehicle to cool completely before proceeding with this test.

Start the engine and allow it to reach operating temperature.

With the scan tool, select View DTCs.

Are there any pending Engine Coolant Temperature sensor, Ambient Air Temperature sensor, or general temperature DTCs?

Yes >> Diagnose and repair any temperature sensor DTCs and retest.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 2

2. PCM IGNITION CIRCUITS OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the PCM harness connector.

With a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output (Run-Start) circuit.

With a 12-volt test light connected to ground, check the (A931) Fused B+ circuit.

Check the circuits with the ignition switch in the OFF, ON, and START positions.

NOTE: The test light should be illuminated and bright with the ignition switch in the ON and START positions. Compare the brightness to that of a direct connection to the battery.

Wiggle test the circuits while checking with the test light to check the circuit for an intermittent problem.

Does the test light illuminate, or not illuminate, as expected in each of the ignition switch positions?

Yes >> Go to 3

No >> Repair the circuit(s) as necessary. If an open fuse is found, inspect the circuit for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. POWERTRAIN CONTROL MODULE (PCM)

Using the wiring diagram/schematic as a guide, inspect Powertrain Control Module power and ground circuits.
Look for any chafed, pierced, pinched, or partially broken wires.
Look for broken, bent, pushed out or corroded terminals.
Monitor the scan tool data and wiggle test the wiring and connectors.
Look for the any data to change or for the DTC to reset during the wiggle test.
Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

U0001-CAN C BUS

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.
- **Set Condition:**
  The PCM loses communication over the CAN C Bus circuit. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0101-LOST COMMUNICATION WITH TCM

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.
- **Set Condition:**
  The PCM doesn't receive a Bus Message from the Transmission Control Module for 7 consecutive seconds. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

For a complete wiring diagram**Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.
- **Set Condition:**
  The PCM doesn't receive an ABS message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE (ABS) MODULE
FRONT CONTROL MODULE (FCM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0140-LOST COMMUNICATION WITH BODY CONTROL MODULE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts.
- **Set Condition:**
  The PCM doesn't receive a FCM message over the CAN C bus for 7 consecutive seconds. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
BODY CONTROL MODULE (BCM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts.
- **Set Condition:**
  The PCM doesn't receive a message from the TIPM over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0155-LOST COMMUNICATION WITH CLUSTER

For a complete wiring diagram**Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.
- **Set Condition:**
  The PCM doesn't receive a Cluster message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
INSTRUMENT CLUSTER (CCN)
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0168-LOST COMMUNICATION WITH VEHICLE SECURITY MODULE (SKREEM/ WCM)

For a complete wiring diagram**Refer to Section 8W**.

- **When Monitored:**
  Ignition run time is greater than 1 second. Battery voltage between 9 and 16 volts. Engine run time greater than 3 seconds.
- **Set Condition:**
  The PCM doesn't receive a SKREEM message over the CAN C circuit for 7 consecutive seconds. The circuit is continuously monitored.

Possible Causes
CAN C BUS OPEN OR SHORTED CONDITION
SKREEM/WCM
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U110C-LOST FUEL LEVEL MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  When the PCM does not receive a fuel level signal over the CAN C circuit. The circuit is constantly monitored.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Theory of Operation

The fuel level signal is a direct input to the Cluster. The fuel level signal is sent to the TIPM over the CAN B bus circuit. The PCM receives the fuel level signal from the TIPM over the CAN C bus circuit.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) ALSO ACTIVE

With the scan tool read DTCs.

Is the DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) also set?

Yes >> Perform the diagnostic procedure for U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U110E-LOST AMBIENT TEMPERATURE MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM doesn't receive the ambient temperature signal over the CAN C bus from the TIPM. The circuit is continuously monitored.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ambient temperature sensor signal is a direct input to the TIPM. The TIPM sends the PCM the ambient temperature signal over the CAN C bus.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) ALSO ACTIVE

With the scan tool read DTCs.

Is the DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) also set?

Yes >> Perform the diagnostic procedure for DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM).
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U110F-LOST FUEL VOLUME MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  When the PCM does not receive a fuel volume signal from the TIPM over the CAN C circuit. The circuit is constantly monitored.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The fuel level signal is a direct input to the Cluster. The fuel level signal is sent to the TIPM over the CAN B bus circuit. The PCM receives the fuel level signal from the TIPM over the CAN C bus circuit.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) ALSO ACTIVE

With the scan tool read DTCs.

Is the DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) also set?

Yes >> Perform the diagnostic procedure for U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM).
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1110-LOST VEHICLE SPEED MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM doesn't receive a vehicle speed signal from the Anti-Lock Brake Module over the CAN C bus.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Theory of Operation

The PCM receives the vehicle speed signal over the CAN C bus from the Anti-lock Brake Module.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE ALSO SET

With a scan tool, select View DTCs.

Is the DTC U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE also set?

Yes >> Perform the diagnostic procedure for U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1113-LOST A/C PRESSURE MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM doesn't receive the A/C Pressure signal over the CAN C bus from the TIPM. The circuit is continuously monitored.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The A/C Pressure Transducer signal is a direct input to the TIPM. The TIPM sends the PCM the A/C pressure signal over the CAN C bus.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) ALSO ACTIVE

With the scan tool read DTCs.

Is the DTC U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM) also set?

Yes >> Perform the diagnostic procedure for U0141-LOST COMMUNICATION WITH IPM (FCM/TIPM).
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1120-LOST WHEEL DISTANCE MESSAGE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM doesn't receive a vehicle speed signal from the Anti-lock brake Module over the CAN C bus.

Possible Causes
CAN C BUS CIRCUIT OPEN OR SHORTED
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) .

Theory of Operation

The PCM receives the vehicle speed signal over the CAN C bus from the Anti-lock Brake Module.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE ALSO SET

With a scan tool, select View DTCs.

Is the DTC U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE also set?

Yes >> Perform the diagnostic procedure for U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1403-IMPLAUSIBLE FUEL LEVEL SIGNAL

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The fuel level message that the PCM is receiving is implausible. The circuit is continuously monitored.

Possible Causes
CAN B OPEN OR SHORTED
INSTRUMENT CLUSTER (CCN)
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The TIPM receives a fuel level signal over CAN B from the Cluster. The TIPM transmits the fuel level message to the PCM over the CAN C bus.

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CAN B BUS COMMUNICATION DTCS ALSO ACTIVE

With a scan tool select View DTCs in the TIPM.

Are any CAN B Bus DTCs active?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and perform the appropriate diagnostic procedure.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1411-IMPLAUSIBLE FUEL VOLUME SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The fuel volume message the PCM is receiving is implausible. The circuit is continuously monitored.

Possible Causes
CAN B OPEN OR SHORTED
INSTRUMENT CLUSTER (CCN)
TOTALLY INTEGRATED POWER MODULE (TIPM)
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The Front Control Module isn't receiving a fuel volume signal over CAN B from the Cluster Module. The TIPM has to send the PCM a fuel volume signal over CAN C. The signal the TIPM sends over CAN C is implausible.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CAN B BUS HARDWARE DTCS ALSO ACTIVE

With a scan tool, select View DTCs in the TIPM.

Are any CAN B Hardware related DTCs active?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and perform the appropriate diagnostic procedure.
Perform BODY VERIFICATION TEST – VER 1.

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1412-IMPLAUSIBLE VEHICLE SPEED SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored.

Possible Causes
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ABS Module sends vehicle speed information over the CAN C Bus circuit to the PCM.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. DTC U0001-CAN C BUS IS ACTIVE IN THE PCM

With a scan tool, select View DTCs.

Is the DTC U0001-CAN C BUS Active in the PCM?

Yes >> Refer to the Diagnostic Procedure for the U0001-CAN C BUS.

No >> Go To 3

3. ABS MODULE IS ACTIVE ON THE CAN C BUS

Using the Network Review Screen on the scan tool, verify that the ABS Module is active on the bus.

Is the ABS Module active on the bus?

Yes >> Go To 4

No >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for No Response diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1.

4. DTC U0001-CAN C BUS ACTIVE IN THE FCM

With the scan tool, select View DTCs in the FCM.

Is the DTC U0001-CAN C BUS Active in the FCM?

Yes >> Replace the ABS Module in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module (PCM) in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1417-IMPLAUSIBLE LEFT WHEEL DISTANCE SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored.

Possible Causes
VEHICLE SPEED SENSOR DTC ACTIVE IN ANTI-LOCK BRAKE MODULE
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ABS Module sends an implausible distance signal over the CAN C Bus circuit to the PCM.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ABS MODULE IS ACTIVE ON THE CAN C BUS

Using the Network Review Screen on the scan tool, verify that the ABS Module is active on the bus.

Is the ABS Module active on the bus?

Yes >> Go To 3

No >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for No Response diagnostic procedures.

Perform BODY VERIFICATION TEST – VER 1.

3. DTCS STORED OR ACTIVE IN THE ABS MODULE

With the scan tool, select View DTCs in the ABS Module.

Are any DTCs active or stored in the ABS Module?

Yes >> Refer to section 5 - BRAKES - ABS ELECTRICAL DIAGNOSTICS and perform the appropriate diagnostic procedure.
Perform ABS VERIFICATION TEST – VER 1

No >> Go to 4

4. ACTIVE DTCS IN THE TIPM

With the scan tool, select ECU View and select the TIPM.
With the scan tool, select View DTCs in the TIPM.

Are any ABS related DTCs active or stored in the TIPM?

Yes >> Replace the ABS Module in accordance with the Service Information
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module per Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U1418-IMPLAUSIBLE RIGHT WHEEL DISTANCE SIGNAL RECEIVED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Ignition on.
- **Set Condition:**
  The PCM gets an implausible signal over the CAN C circuit from the ABS Module. The circuit is continuously monitored.

Possible Causes
VEHICLE SPEED SENSOR DTC ACTIVE IN ANTI-LOCK BRAKE MODULE
CAN C BUS CIRCUIT SHORTED
CAN C BUS CIRCUIT OPEN
ANTI-LOCK BRAKE (ABS) MODULE
POWERTRAIN CONTROL MODULE (PCM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Theory of Operation

The ABS Module sends an implausible distance signal over the CAN C Bus circuit to the PCM.

Diagnostic Test

1. ACTIVE DTC

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red. Selecting any of the network components allows access to the source of the problem.

Ignition on, engine not running.

With a scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ABS MODULE IS ACTIVE ON THE CAN C BUS

Using the Network Review Screen on the scan tool, verify that the ABS Module is active on the bus.

Is the ABS Module active on the bus?

Yes >> Go To 3

No >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for No Response diagnostic procedures.

Perform BODY VERIFICATION TEST – VER 1.

3. DTCS STORED OR ACTIVE IN THE ABS MODULE

With the scan tool, select View DTCs in the ABS Module.

Are any DTCs active or stored in the ABS Module?

Yes >> Refer to section 5 - BRAKES - ABS ELECTRICAL DIAGNOSTICS and perform the appropriate diagnostic procedure.
Perform ABS VERIFICATION TEST – VER 1

No >> Go to 4

4. ACTIVE DTCS IN THE TIPM

With the scan tool, select ECU View and select the TIPM.

With the scan tool, select View DTCs in the TIPM.

Are any ABS related DTCs active or stored in the TIPM?

Yes >> Replace the ABS Module in accordance with the Service Information
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Powertrain Control Module per Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. NO RESPONSE

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red.

Does the scan tool display a Vehicle Network problem or NO RESPONSE condition?

Yes >> Refer to the appropriate BUS Communication test in Section 8 ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS.

No >> Go To 2

2. NO START

Does the vehicle have a NO START condition?

Yes >> Check the vehicle for any DTC(s), including Vehicle Theft Security related DTC(s), that may cause a no-start condition.

If no DTC(s) are present that relate to a no-start condition, refer to the Non DTC Diagnostic Procedures that relate to Fuel and Starting.

No >> Go To 3

3. VEHICLE REPAIR HISTORY AND TSB(s)

Check the vehicle repair history for repairs that may relate to the current condition.

Inspect the vehicle for aftermarket accessories that may have been installed incorrectly.

Check for any TSB(s) related to the condition or DTC(s).

If a TSB applies, follow the procedure outlined in the TSB.

Select the appropriate response for the condition that applies:

Performing a TSB procedure repaired the condition.

Test Complete.

Perform the PCM Verification Test Ver. 1.

A DTC is present, no TSB applies, or the TSB didn't repair the condition.

Go To 4

No DTC(s) or conditions are present.

Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

4. VEHICLE INSPECTION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

Based on the diagnostic condition that applies, review the following list and perform any tests that relate to the condition:

If multiple DTCs are set in the PCM, review the wiring schematics for problems in any shared supply or ground circuits. Refer to the diagnostic procedure for Checking the PCM Power and Ground Circuits.

Inspect the air intake system and related tubes for damage, restriction, or poor connection.

Inspect the exhaust system and related tubes for damage, restriction, or poor connection.

Remove and inspect the Air Filter for excessive dirt and debris which may cause an air flow restriction.

If the PCM detects and stores a DTC, the PCM also stores the environmental conditions under which the DTC was set.

Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, Clear the stored DTC(s).

Attempt to duplicate the environmental conditions under which the DTC was set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the vehicle conditions under which the DTC conditions will be monitored. Operate the vehicle under those conditions.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the component and the module.

If the DTC(s) are fuel or air related, check the fuel level and quality.

Were any repairs made that corrected the DTC or condition?

Yes >> Test complete.
Perform the PCM Verification Test Ver. 1.

No >> Refer to the diagnostic test procedure related to the DTC.

*INTERMITTENT DTC

For a complete wiring diagram **Refer to Section 8W**

Diagnostic Test

1. INTERMITTENT DTC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

The conditions necessary to set this DTC are not present at this time.

Review the scan tool environmental data. If possible, try to duplicate the conditions under which the DTC set.

If applicable, actuate the component with the scan tool.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change, the actuation to be interrupted, or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Perform a voltage drop test on the related circuits between the suspected component and the PCM.

Inspect and clean all PCM, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits.

For intermittent Misfire DTCs check for restrictions in the Intake and Exhaust system, proper installation of Sensors, vacuum leaks, and binding components that are run by the accessory drive belt.

Use the scan tool to perform a System Test if one applies to the component.

A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes >> Perform the necessary repairs.
Perform the PCM Verification Test Ver. 1.

No >> Test Complete.

*CHECKING THE FUEL DELIVERY SYSTEM

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP GROUND CIRCUIT
PLUGGED FUEL PUMP INLET
FUEL PUMP MODULE

Diagnostic Test

1. FUEL PUMP OPERATION

Ignition on, engine not running.

With a scan tool, actuate the Fuel System test.

NOTE: It may be necessary to use a mechanics stethoscope in the next step.

Listen for fuel pump operation at the fuel tank. The fuel pump should operate smoothly with no excessive noise. If the pump has excessive noise such as grinding, the pump should be replaced.

CAUTION: Stop All Actuations.

Does the Fuel Pump sound to be operate normally?

Yes >> Go to 2

No >> Go to 7

2. FUEL PRESSURE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Install a fuel pressure gauge.

Ignition on, engine not running.

With the scan tool, actuate the Fuel Pump and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

CAUTION: Stop All Actuations.

Choose a conclusion that best matches your fuel pressure reading.

Below Specification

Go to 3

Within Specification

Test Complete.

Above Specification

Replace the Fuel Pump Module in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. RESTRICTED FUEL SUPPLY LINE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure even with the engine off. Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released.

Raise vehicle on hoist, and disconnect the fuel pressure line at the fuel pump module.

Install special tool #6539 (5/16″) or #6631(3/8″) fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the Fuel Pump and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

CAUTION: Stop All Actuations.

Is the fuel pressure within specification now?

Yes >> Repair/replace fuel supply line as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. SADDLE FUEL TANK

Is the vehicle equipped with a saddle type fuel tank?

Yes >> Go to 5

No >> Go to 6

5. CHECKING FUEL TANK SIPHON HOSE AND FUEL LINE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Gain access to the Fuel Pump Module and the Fuel Tank Module.

Inspect the following fuel components:

- Fuel line and siphon hose between the Fuel Pump Module and the Fuel Tank Module. Look for disconnected and/or damaged lines or hoses.
- Fuel Pressure Regulator not properly seated in the module.

Were the above items in good working condition?

Yes >> Go to 6

No >> Repair or replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. CHECKING THE FUEL PUMP INLET

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Remove the Fuel Pump Module and Fuel Tank Module (if equipped), inspect the Fuel Inlet and the bottom of the fuel tank for debris that could cause the fuel pump inlet to be plugged.

Is the Fuel Pump Inlet plugged?

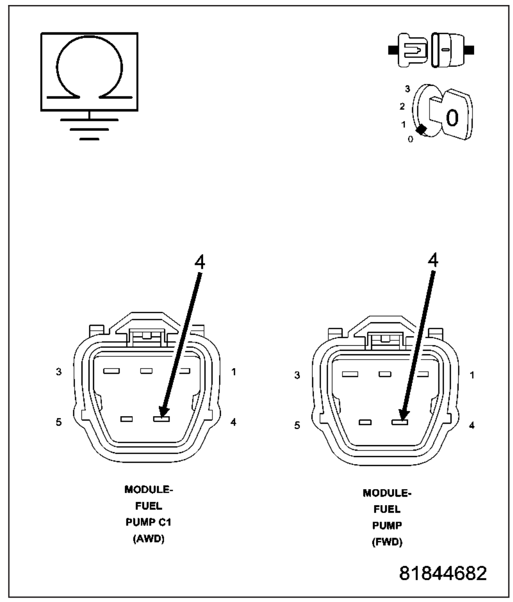
Yes >> Repair/Replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Fuel Pump Module.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. FUEL PUMP MOTOR GROUND CIRCUIT

Turn the ignition off.

Disconnect the Fuel Pump Module harness connector.



Using a 12-volt test light to battery voltage, probe the Fuel Pump Motor Ground circuit in the Fuel Pump Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly.

Yes >> Replace the Fuel Pump Module in accordance with the Service information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the Fuel Pump Motor Ground circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*ENGINE CRANKS BUT DOES NOT START

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
NO START PRE-TEST
POWERTRAIN FUSES OPEN
SECONDARY INDICATORS PRESENT
ENGINE MECHANICAL PROBLEM
FUEL CONTAMINATION

Diagnostic Test

1. NO START PRE-TEST

NOTE: The following list of items must be checked before continuing with any no start tests.

The battery must be fully charged and in good condition. A low charged battery may produce invalid test results. If the battery is low, charge the battery and then attempt to start the vehicle by cranking the engine for 15 seconds, 3 consecutive times. This will allow any DTCs to set that may have been erased due to a dead battery.

Attempt to communicate with the PCM using the scan tool. If the PCM is experiencing a no response condition, refer to section 8 Electrical Electronic Control Module Electrical Diagnostics for the proper tests.

Read the PCM DTCs with the scan tool. If any DTCs are present, they must be repaired before continuing with any other No Start diagnostic tests. Refer to the Table of Contents for the related P-code that is reported by the PCM.

Inspect all fuses in the TIPM and the Junction Box. If an open fuse(s) is found, check the related circuit(s) for a short to ground or high resistance.

Using a test light, check the Powers and Ground to the PCM. The test light must illuminate brightly as if jumpered across a battery.

Attempt to communicate with the Instrument Cluster and VTSS. If you are unable to establish communications refer to 8 Electrical Electronic Control Module Electrical Diagnostics for the proper Diagnostic procedures.

The Sentry Key Immobilizer System must be operating properly. Check for proper communication with the scan tool and check for DTCs that may be stored in the Sentry Key Immobilizer Module (SKREEM). Repair the DTC(s) before continuing.

If no DTCs are found, using the scan tool, select Clear PCM (BATT Disconnect).

Crank the engine several times. Using the scan tool, read DTCs. If a DTC is present perform the DTC diagnostics before continuing.

Were any problems found?

Yes >> Repair as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 2

2. OPEN FUSE

Check for any open fuses in both TIPM or Junction Block that may be related to the no start condition.

NOTE: If an open fuse is found, inspect the related circuit(s) for a short to ground or high resistance.

Are any of the fuses open?

Yes >> Replace the open fuse and check the related circuit(s) for a short to ground.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. SECONDARY INDICATORS PRESENT

NOTE: Diagnose only the Secondary Indicators that would cause a no start.

Ignition on, engine not running.

With the scan tool, check the Secondary Indicators while cranking the engine that would cause a no start condition.

Are there any Secondary Indicators present while cranking the engine?

Yes >> Refer to the Engine Electrical Diagnostics group and perform the tests related to the no start secondary indicator that is reported by the scan tool.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. POSSIBLE MECHANICAL PROBLEMS

Check for any of the following conditions/mechanical problems.

ENGINE VALVE TIMING - must be within specifications, check for broken timing components

ENGINE COMPRESSION - must be within specifications

ENGINE EXHAUST SYSTEM - must be free of any restrictions or leaks.

Are there any engine mechanical problems?

Yes >> Repair as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. FUEL PUMP DELIVERY

Verify that the Fuel tank is not empty before continuing.

Follow the diagnostics for Checking Fuel Delivery in the Driveability section of this section.

Was the No Start condition solved after following the above diagnostic test?

Yes >> Test Complete.

No >> Check for contamination/water in the fuel. Make sure the fuel being used in this vehicle meets manufactures Fuel Requirement, refer to the service manual.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*FUEL PRESSURE LEAK DOWN

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
FUEL PUMP MODULE
FUEL INJECTOR(S)

Diagnostic Test

1. FUEL PUMP MODULE

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair / replace as necessary.

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Install special tool #6539 (5/16″) or #6631 (3/8″) fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi). If the fuel pressure is not within specification refer to Checking The Fuel Delivery System.

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 KPa (35 psi)

Does the fuel pressure drop?

Yes >> Replace Fuel Pump Module.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 2

2. FUEL INJECTOR(S)

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Remove special tool #C4390.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: NOTE: Fuel specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and fuel pump module.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 KPa (35 psi)

Does the fuel pressure drop?

Yes >> Replace the leaking fuel injectors.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

*HARD START FUEL SYSTEM

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
FUEL CONTAMINATION
RESTRICTED FUEL SUPPLY LINE
FUEL PUMP INLET STRAINER PLUGGED
FUEL PUMP MODULE
FAULTY FUEL PUMP MODULE
FUEL INJECTOR(S)

Diagnostic Test

1. CHECKING FUEL PRESSURE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Install a fuel pressure gauge at the engine.

Ignition on, engine not running.

With a scan tool, actuate the Fuel Pump and observe the fuel pressure gauge.

NOTE: NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Choose a conclusion that best matches your fuel pressure reading.

Below Specification
Go to 2

Within Specification
Go to 4

2. RESTRICTED FUEL SUPPLY LINE

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Raise vehicle on hoist, and disconnect the fuel supply line at the fuel pump module.

Install special tool #6539 (5/16″) #6631(3/8″) fuel line adapter and the fuel pressure gauge between the fuel supply line and the fuel pump module.

Ignition on, engine not running.

With the scan tool, actuate the Fuel Pump and observe the fuel pressure gauge.

NOTE: Fuel pressure specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Is the fuel pressure within specification?

Yes >> Visually and physically inspect the fuel supply lines between the fuel tank and the fuel rail. Repair/replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. CHECKING THE FUEL PUMP INLET

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Remove the Fuel Pump Module and Fuel Tank Module (if equipped), inspect the Fuel Pump Inlet and the bottom of the fuel tank for debris that could cause the fuel pump inlet to be plugged.

Is the Fuel Inlet Strainer plugged?

Yes >> Repair/Replace as necessary.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Fuel Pump Module.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. FUEL PUMP MODULE

NOTE: Before continuing visually and physically inspect the fuel delivery system for external leaks or damage. Repair / replace as necessary.

Turn the ignition off.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Install special tool #6539 (5/16″) or #6631 (3/8″) fuel line adapter.

Install the fuel pressure gauge.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and the engine.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 KPa (35 psi).

Does the fuel pressure drop below 241 KPa (35 psi)?

Yes >> Replace Fuel Pump Module.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. FUEL INJECTOR(S)

WARNING: The fuel system is under a constant pressure (even with the engine off). Before testing or servicing any fuel system hose, fitting or line, the fuel system pressure must be released. Failure to follow these instructions can result in personal injury or death.

Remove special tool #C4390.

Start the engine and allow the fuel system to reach maximum pressure.

Turn the ignition off.

NOTE: Fuel specification is 407 KPa +/- 34 KPa (59 psi +/- 5 psi).

Using special tool #C4390, Hose Clamp Pliers, pinch the rubber fuel line between the fuel pressure gauge and fuel pump module.

Monitor the fuel pressure gauge for a minimum of 5 minutes.

NOTE: The pressure should not fall below 241 KPa (35 psi)

Does the fuel pressure drop below 241 KPa (35 psi)?

Yes >> Replace the leaking fuel injectors.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Check the fuel for contaminants.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*NO CRANK CONDITION

For a complete wiring diagram **Refer to Section 8W**.

Possible Causes
MECHANICAL CONDITION
BATTERY CIRCUIT RESISTANCE TOO HIGH
START ENABLE CIRCUITS
TRANSMISSION RANGE SENSOR
FUSED IGNITION SWITCH OUT (START)
CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT
CLUTCH INTERLOCK SWITCH GROUND CIRCUIT
CLUTCH INTERLOCK SWITCH
STARTER

Diagnostic Test

1. MECHANICAL CONDITION

NOTE: Check and diagnose all the TIPM DTC(s) before continuing.

NOTE: Ensure the Gear selector is in Park or Neutral.

NOTE: Verify the battery is fully charged and capable of passing a load test before continuing.

WARNING: Make sure the battery is disconnected, then wait two minutes before proceeding. Failure to do so may result in personal injury or possible death.

Turn the engine over by hand to make sure the engine is not seized.

Is the engine able to turn over?

Yes >> Go to 2

No >> Repair the mechanical condition preventing the starter motor from cranking.
Perform the POWERTRAIN VERIFICATION TEST. (Refer to 9 - ENGINE - STANDARD PROCEDURE)

2. EXCESSIVE RESISTANCE IN THE BATTERY CIRCUIT

Connect the battery cables.

Turn the ignition off.

Check the Battery Cables for excessive resistance using the service information procedure.

Did either Battery Cable have a voltage drop greater than 0.2 of a volt?

Yes >> Repair the excessive resistance in the Battery circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. MANUAL TRANSMISSION

Is this vehicle equipped with a Manual transmission?

Yes >> Go to 8

No >> Go to 4

4. START ENABLE OPERATION (ATX)

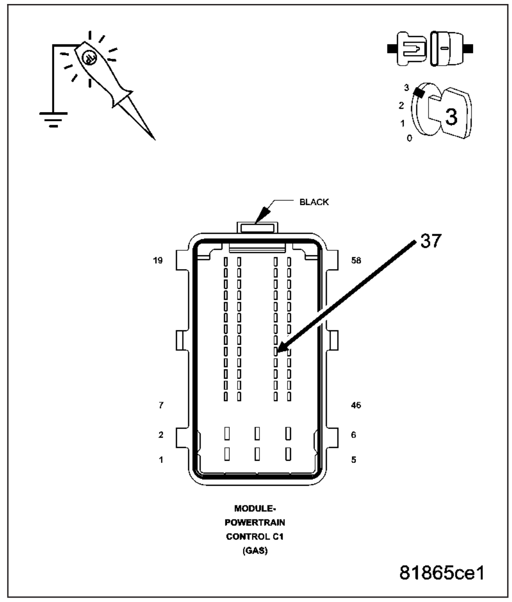
Turn ignition on.

Using a scan tool, monitor the Ignition Start Switch Sense.

Turn the ignition switch to the crank position.

Does the Ignition Start Switch Sense state change from Low to High?

Yes >> Ensure the battery connection is clean and fastened tightly to the Starter. If OK, replace the Starter in accordance with the Service Information.



No >> Go to 5

5. START ENABLE CIRCUIT (ATX)

Turn the ignition off.

Disconnect the PCM harness connector.

Using a 12-volt test light connected to ground, probe the Start Enable circuit in the PCM harness connector while holding the ignition key in the start position.

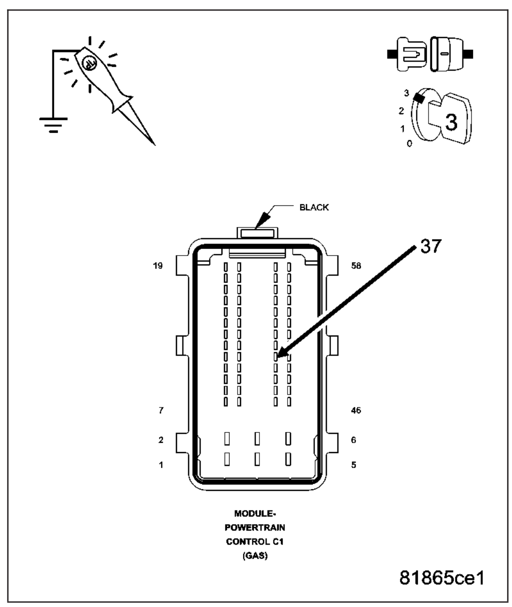
Does the test light illuminate brightly?

Yes >> Replace the PCM in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. TRANSMISSION RANGE SENSOR (ATX)



Turn the ignition off.

Test light still in the above position.

Disconnect the Transmission Range Sensor harness connector.

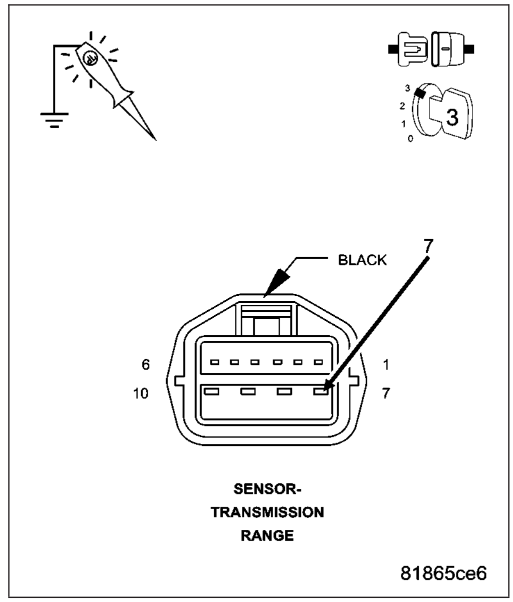
Using a jumper wire, connect one end to the Start Enable circuit and the other to the Fused Ignition Switch Output (Start) circuit in the Transmission Range Sensor harness connector.

Turn the ignition to the crank position.

Does the test light illuminate brightly?

Yes >> Replace Transmission Range Sensor harness.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 7

7. FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT (ATX)

Turn the ignition off.

Using a 12-volt test light connected to ground, probe the Fused Ignition Switch Output (Start) circuit in the Transmission Range Sensor harness connector.

Turn the ignition to the crank position.

Does the test light illuminate brightly?

Yes >> Repair the Start Enable circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Check the Fused Ignition Switch Output (Start) circuit for an open. If OK, replace the TIPM in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. START ENABLE OPERATION (MTX)

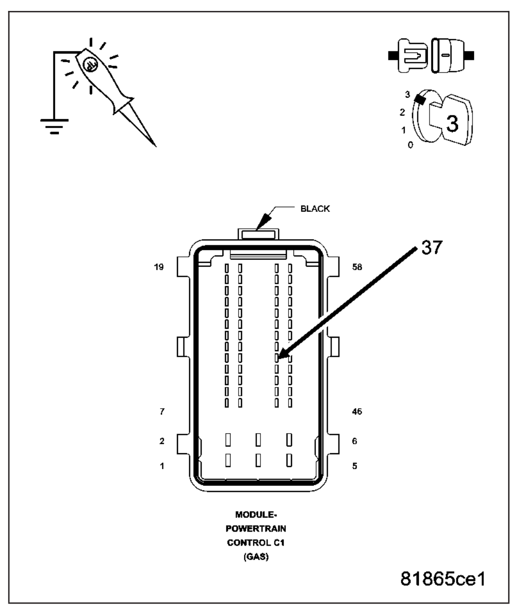
Turn ignition on.

Using a scan tool, monitor the Ignition Start Switch Sense.

Turn the ignition switch to the crank position.

Does the Ignition Start Switch Sense state change from Low to High?

Yes >> Go to 10



No >> Go to 9

9. STATER ENABLE CIRCUIT (MTX)

Turn the ignition off.

Disconnect the PCM harness connector.

Using a 12-volt test light connected to ground, probe the Start Enable circuit in the PCM harness connector while holding the ignition key in the start position.

Does the test light illuminate brightly?

Yes >> Replace the PCM in accordance with the Service information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Check the Start Enable circuit. If OK, replace the TIPM in accordance with the Service Information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. CLUTCH INTERLOCK OPERATION (MTX)

Turn ignition on.

Using a scan tool, monitor the Clutch Switch.

Press the Clutch in and out.

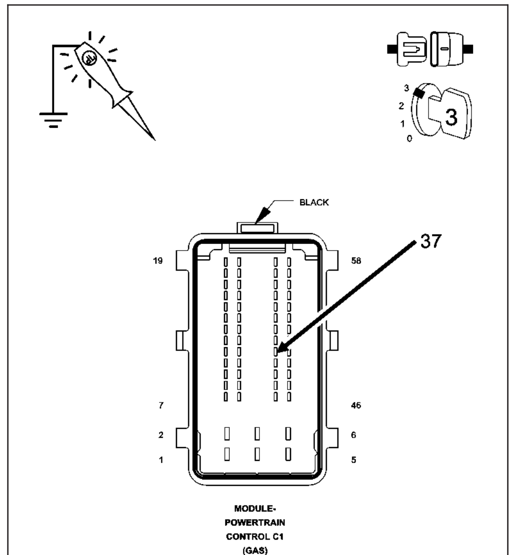
Does Clutch Switch display Released and then Pressed?

Yes >> Replace the Starter in accordance with the Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 11

11. CLUTCH INTERLOCK OPERATION (MTX)

Turn the ignition off.



Disconnect the PCM harness connector.

Using a 12-volt test light connected to battery voltage, probe the Clutch interlock Signal circuit in the PCM harness connector while pressing the clutch pedal in.

Does the test light illuminate brightly?

Yes >> Replace the PCM in accordance with the Service information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

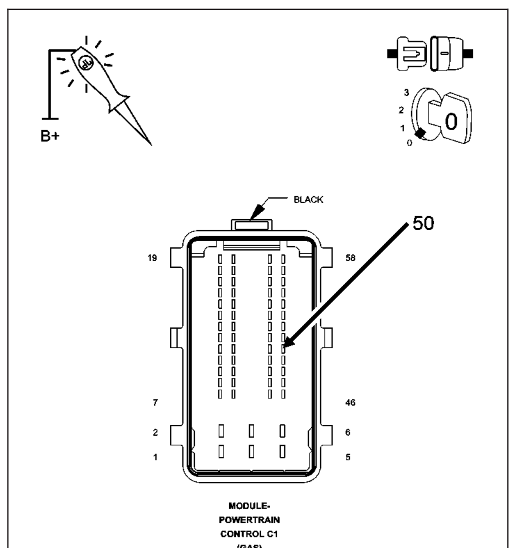
No >> Go to 12

81865ce1

12. CLUTCH INTERLOCK SWITCH (MTX)

Turn the ignition off.

Test light still in the above position.



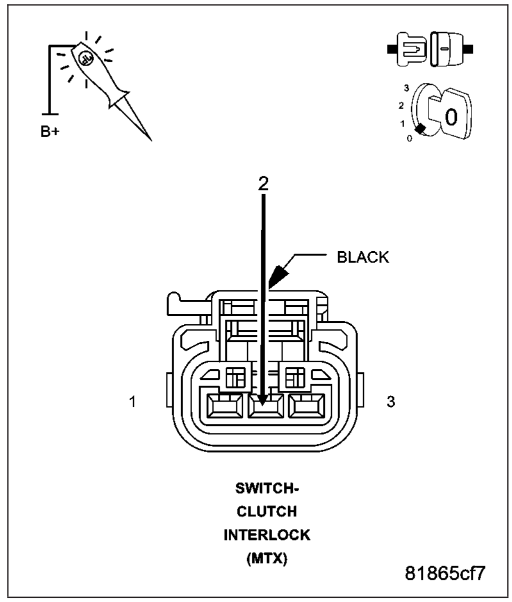
Disconnect the Clutch Interlock Switch harness connector.

Using a jumper wire, connect one end to the Clutch Interlock Switch Signal circuit and the other to the Clutch Interlock Switch ground circuit in the Clutch Interlock Switch harness connector.

Does the test light illuminate brightly?

Yes >> Replace Clutch Interlock Switch.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 13



81865cf3

13. CLUTCH INTERLOCK OPERATION (MTX)

Remove the jumper wire.

Using a 12-volt test light connected to battery voltage, probe the Clutch Interlock Switch ground circuit.

Does the test light illuminate brightly?

Yes >> Repair the Clutch Interlock Switch ground circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the Clutch Interlock Switch signal circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*NO RESPONSE WITH A NO START CONDITION

For a complete wiring diagram **Refer to Section 8W**.

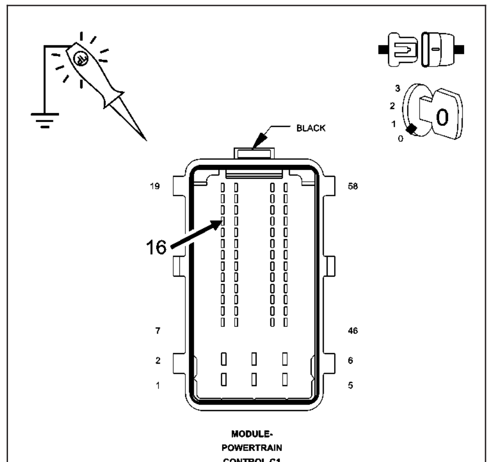
Possible Causes
(A931) FUSED B+ CIRCUIT (PCM)
(F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS (PCM)
(Z925) PCM GROUND CIRCUITS (PCM)
(K51) MAIN RELAY CONTROL CIRCUIT
(A14) FUSED B+ CIRCUIT (MAIN RELAY)
(A935) FUSED B+ CIRCUIT (MAIN RELAY)
(K542) MAIN RELAY OUTPUT CIRCUIT (TO TIPM)
(F342/F343/344) MAIN RELAY OUTPUT CIRCUIT (TO PCM)
TIPM
PCM

Diagnostic Test

1. (A931) FUSED B+ CIRCUIT (PCM)

NOTE: The scan tool and cable must be operating properly for the results of this test to be valid.

NOTE: Make sure the ignition switch was on while trying to communicate with the PCM.



Turn the ignition off.

Disconnect the C1 PCM harness connectors.

Using a 12-volt test light connected to ground, probe the (A931) Fused B+ circuit in the PCM harness connector.

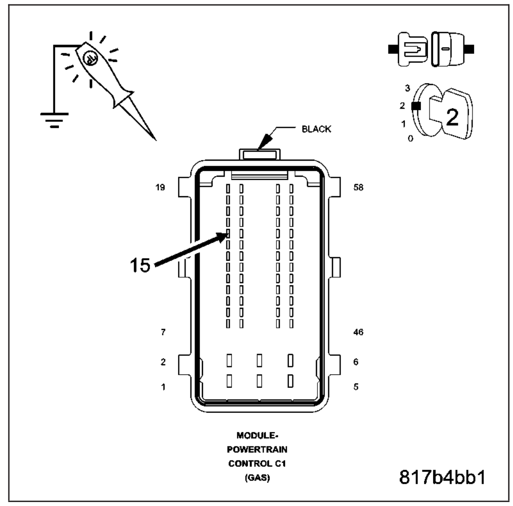
NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

817b4ba8

Yes >> Go to 2

No >> Repair the open or short to ground in the (A931) Fused B+ circuit. Inspect and replace fuses as necessary.



Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (F202) IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS (PCM)

Turn the ignition on.

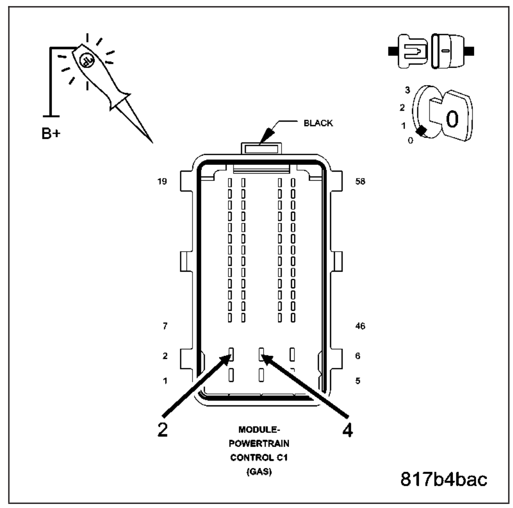
Using a 12-volt test light connected to ground, probe the (F202) Fused Ignition Switch Output circuit in the PCM harness connector.

Turn the ignition to run.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 3



No >> Repair the (F202) Ignition Switch Output circuits. Inspect and replace fuses as necessary.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (Z925) GROUND CIRCUITS (PCM)

Turn the ignition off.

Using a 12-volt test light connected to battery voltage, probe both the (Z925) PCM ground circuits

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at both terminals?

Yes >> Go to 4

No >> Repair the Ground circuit(s).

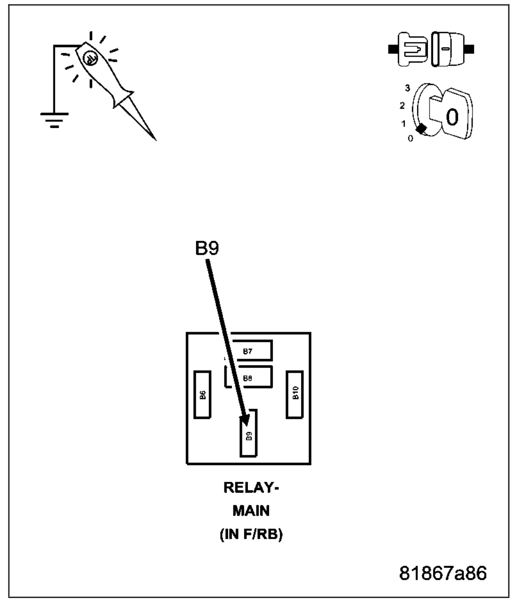
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (A14) FUSED B+ CIRCUIT (MAIN RELAY)

Turn the ignition off.

Remove the Main Relay.

Using a 12-volt test light connected to ground, probe the (A14) Fused B+ circuit at the Main Relay terminal.



NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

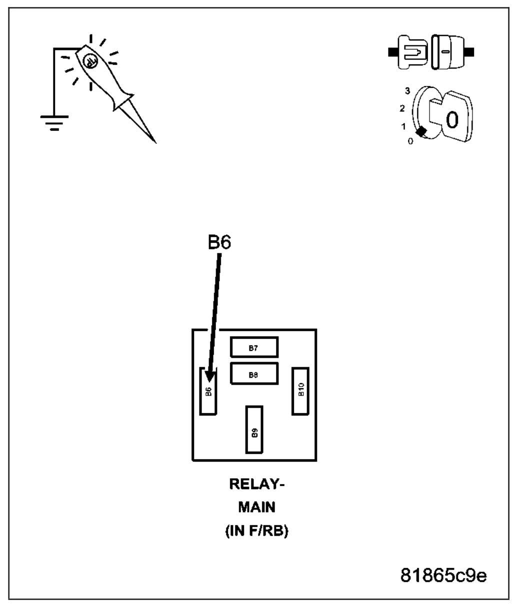
Yes >> Go to 5

No >> Repair the (A14) Fused B+ circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (A935) FUSED B+ CIRCUIT (MAIN RELAY)

Using a 12-volt test light connected to ground, probe the (A935) Fused B+ circuit at the Main Relay terminal.



NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly?

Yes >> Go to 6

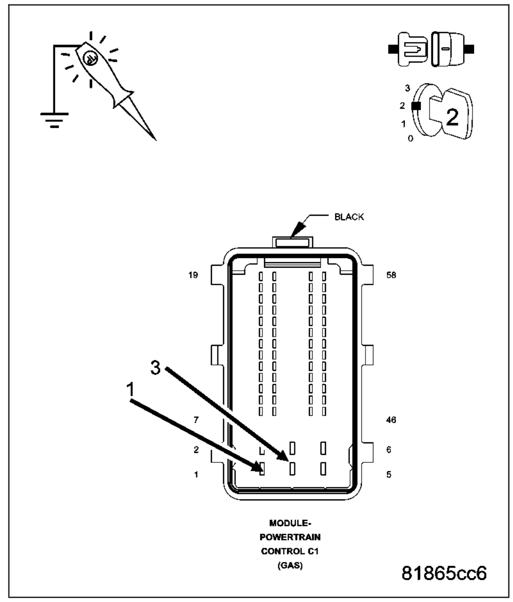
No >> Repair the (A935) Fused B+ circuit.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (F342) MAIN RELAY OUTPUT CIRCUITS

Turn the ignition on.

Using a jumper wire, jumper across the Main Relay from (K542) Main Relay Output circuit and the (A14) Fused B+ circuit.



With a 12-volt test light connected to ground, probe the (F342) Main Relay Output circuits in the PCM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.

Does the test light illuminate brightly at both terminals?

Yes >> Go to 8

No >> Go to 7

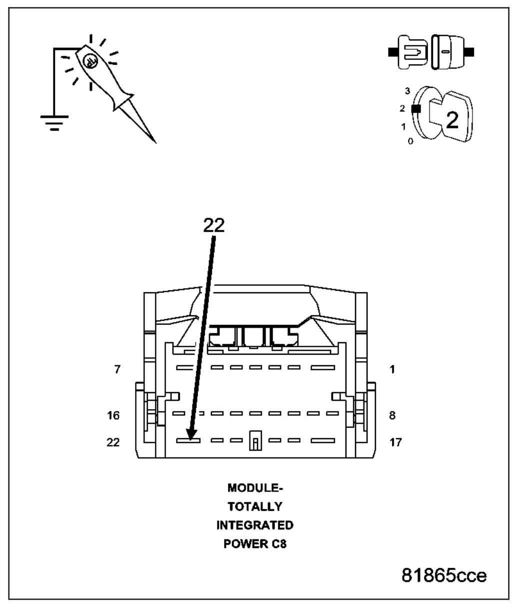
7. (K542) MAIN RELAY OUTPUT CIRCUIT

Jumper wire still installed.

Disconnect the C8 TIPM harness connector.

Using a 12-volt test light connected to ground, probe the (K542) Main Relay Output circuit in the TIPM harness connector.

NOTE: The test light should be illuminated and bright. Compared the brightness to that of a direct connection to the battery.



Does the test light illuminate brightly?

Yes >> Repair the (K542) Main Relay Output circuit between the TIPM and the Main Relay. Inspect the related fuses.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (F342) Main Relay Output circuit(s).

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. MAIN RELAY OUTPUT

Turn the ignition off.

Remove one end of the jumper wire.

Connect the PCM harness connector.

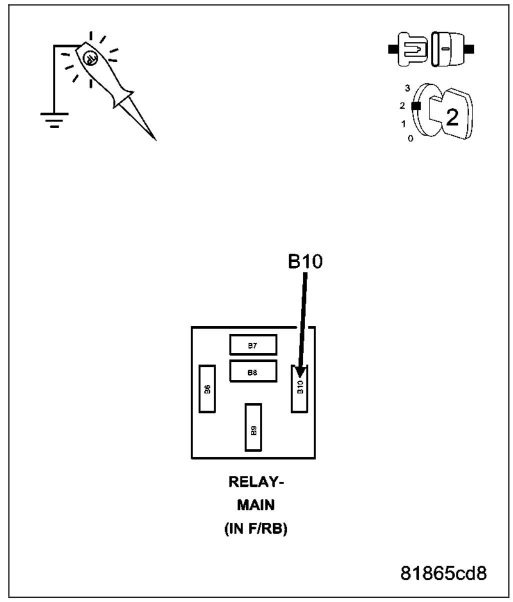
Turn the ignition on.

Return the jumper wire across the Main Relay.

Using a scan tool, attempt to communication with the PCM.

Were you able to communication with the PCM?

Yes >> Go to 9



No >> Go to 11

9. MAIN RELAY

NOTE: To continue the following test, leave the jumper wire in place with the ignition on.

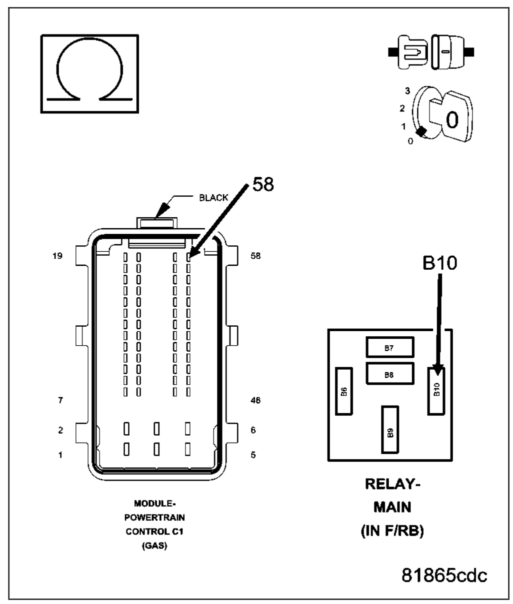
Using the scan tool, actuate the Main Relay.

Using a 12-volt test light connected to battery voltage, probe the (K51) Main Relay Control circuit in the Main Relay connector.

Does the test light illuminate and flash on and off?

Yes >> Replace the Main Relay.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 10



10. (K51) MAIN RELAY CONTROL CIRCUIT

Turn the ignition off.

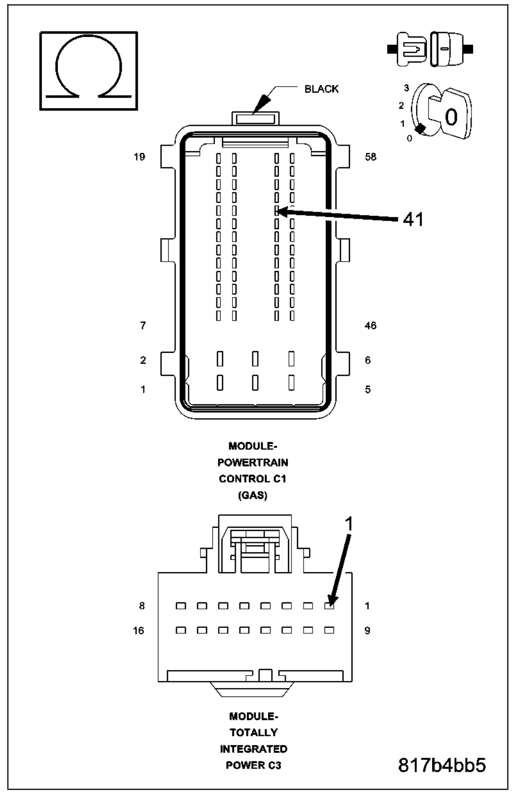
Disconnect the PCM harness connector.

Disconnect the C1 PCM harness connector.

Measure the resistance of the (K51) Main Relay Control circuit between the PCM harness connector and the Main relay connector.

Is the resistance below 5.0 ohms?

Yes >> Repair the open in the (K51) Main Relay Control circuit.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Replace and program the Powertrain Control Module per Service Information.
Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

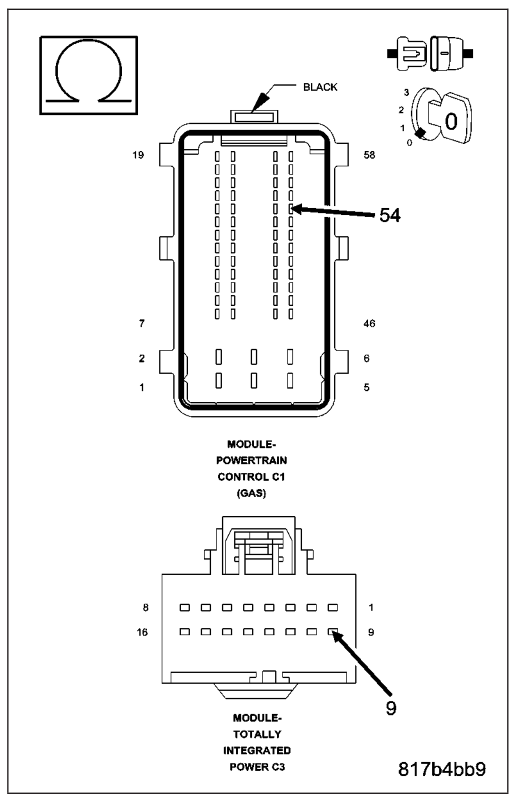
11. (D65) CAN C BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the TIPM connector and the PCM harness connector.

Is the resistance below 5.0 ohms?



Yes >> Go to 12

No >> Repair the (D65) CAN C Bus (+) circuit for an open.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

12. (D64) CAN C BUS (-) CIRCUIT OPEN

Measure the resistance of the (D64) CAN C Bus (-) circuit between the TIPM connector and the PCM harness connector.

Is the resistance below 5.0 ohms?

Yes >> Replace and program the Powertrain Control Module in accordance with the service information.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (D64) CAN C Bus (-) circuit for an open.

Perform the PCM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

VERIFICATION TEST

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. SELECT THE PROPER VERIFICATION TEST

Select the verification test for the repair that has been completed:

Speed Control repair
Go To 2

Charging System repair
Go To 3

No Start repair
Go To 4

All other repairs
Go To 5

2. SPEED CONTROL VERIFICATION TEST

1. Inspect the vehicle to verify that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. With the scan tool, erase all diagnostic trouble codes (DTCs).
3. Road test the vehicle at a speed above 60 km/h (35 MPH).
4. Press the Cruise On/Off switch to turn the speed control on.
5. Move the speed control switch to the Set/Decel position. If the speed control does not engage, the repair is not complete, continue with step 12.
6. Move the speed control switch to the Resume/Accel position. If the vehicle speed does not increase by 3 km/h (2 MPH), the repair is not complete, continue with step 12.
7. Using caution, press and release the brake pedal. If the speed control does not disengage, the repair is not complete, continue with step 12.
8. With the vehicle speed at least 60 km/h (35 MPH), move the speed control switch to the Resume/Accel position. If the speed control does not resume at the previously set speed, the repair is not complete, continue with step 12.
9. Move the speed control switch to the Set/Decel position. If the vehicle does not decelerate, the repair is not complete, continue with step 12.
10. Hold the speed control switch in the Set/Decel position and release the switch with the vehicle speed above 60 km/h (35 MPH). If the vehicle speed does not adjust and set a new vehicle speed, the repair is not complete, continue with step 12.
11. With the speed control engaged, press the Cruise On/Off switch. If the speed control does not disengage, the repair is not complete, continue with step 12.
12. If the vehicle did not successfully perform all of the previous steps, check for Technical Service Bulletins (TSBs) that pertain to this speed control problem and then, if necessary, return to the Symptom List.
13. If the vehicle successfully performed all of the previous steps, the speed control system is now functioning as designed. The repair is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.

3. CHARGING SYSTEM VERIFICATION TEST

1. Inspect the vehicle to verify that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. With the scan tool, erase all diagnostic trouble codes (DTCs).
3. Start the engine.
4. Raise the engine speed to 2000 RPM for at least 30 seconds.
5. Allow the engine to idle.
6. Turn the ignition off for 20 seconds.
7. Turn the ignition on.
8. With the scan tool, read PCM DTCs.
9. If this DTC has set again, or another DTC has set, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
10. If the charging system is functioning correctly and there are no DTCs, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.

4. NO START VERIFICATION TEST

NOTE: IMPORTANT! If the Powertrain Control Module or Sentry Key Immobilizer Module has been replaced, verify the programming procedure for the module has been performed in accordance with the Service Information.

2. Inspect the vehicle to verify that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
3. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter.
4. With the scan tool, erase all diagnostic trouble codes (DTCs).
5. Turn the ignition off for at least 10 seconds.
6. Attempt to start the engine.
7. If the engine will not start, refer to any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
8. If the engine starts and continues to run, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.

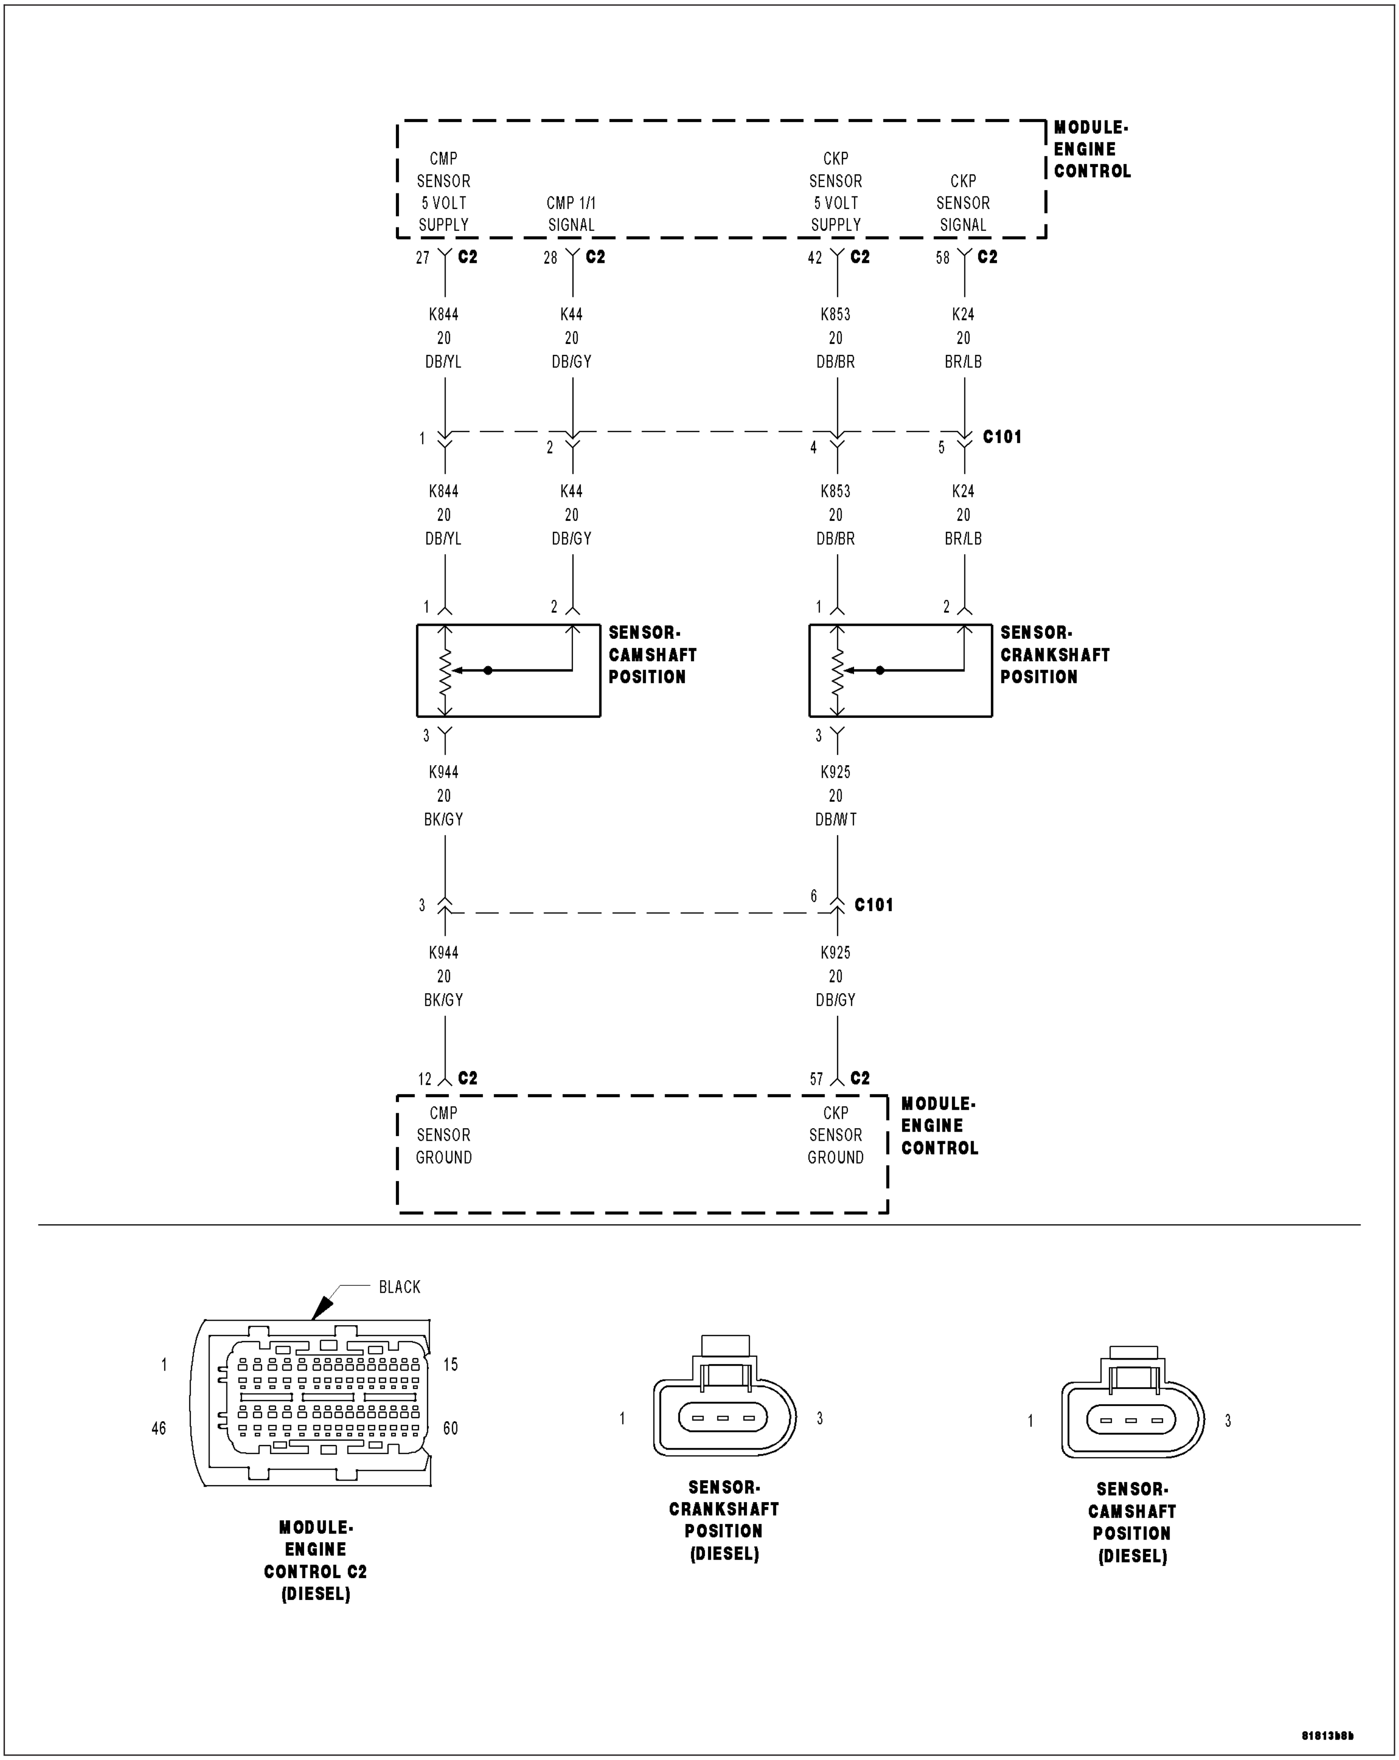
5. ROAD TEST VERIFICATION TEST

1. Inspect the vehicle to verify that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. If not, proceed to step 5.
3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and testing is now complete.
4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the Symptom List if necessary.
5. For previously read DTCs that have not been dealt with, return to the Symptom List and follow the diagnostic path for that DTC; otherwise, continue.
6. If the Powertrain Control Module (PCM) has been replaced, continue with step 9.
7. With the scan tool, erase all diagnostic trouble codes (DTCs), then disconnect the scan tool.
8. Turn the ignition off for at least 10 seconds.
9. If equipped with a Transfer Case Position Switch, perform step 10, otherwise, continue with step 11.
10. With the ignition switch on, place the Transfer Case Shift Lever in each gear position, stopping for 15 seconds in each position.
11. Road test the vehicle. For some of the road test, go at least 64 km/h (40 MPH). If this test is for an A/C Control condition, drive the vehicle for at least 5 minutes with the A/C on.
12. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue.
13. Upon completion of the road test, turn the engine off and check for DTCs with the scan tool.
14. If the repaired DTC has set again, the repair is not complete. Check for any pertinent Technical Service Bulletins (TSBs) and return to the Symptom List. If there are no DTCs, the repair was successful and is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.



ENGINE ELECTRICAL DIAGNOSTICS - DIESEL

TABLE OF CONTENTS

ENGINE ELECTRICAL DIAGNOSTICS - DIESEL

DIAGNOSIS AND TESTING

P0016–CRANKSHAFT / CAMSHAFT TIMING MISALIGNMENT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  Engine cranking and Engine running
- **Set Condition:**
  Engine Control Module detects an error when the camshaft position is out of phase with the crankshaft position.

Possible Causes
(K44) ERRATIC CAM POSITION SENSOR 1 SIGNAL
CAMSHAFT POSITION SENSOR TONE WHEEL/PULSE RING
(K24) ERRATIC CRANKSHAFT POSITION SENSOR SIGNAL
CRANKSHAFT POSITION SENSOR TONE WHEEL/PULSE RING
CAMSHAFT POSITION SENSOR
CRANKSHAFT POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

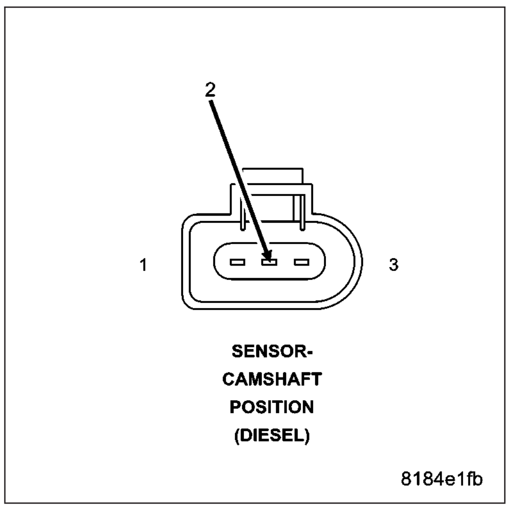
1. ACTIVE DTC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

With the scan tool clear the DTC(s).

Start the engine and run until operating temp is reached.

If the DTC does not reset it may be necessary to test drive the vehicle.



Did this DTC set again?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING THE (K44) CMP SIGNAL WITH A LAB SCOPE

With a lab scope, backprobe the (K44) CMP Signal circuit at the CMP Sensor harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.

Observe the lab scope screen.

Are there any irregular or missing signals?

Yes >> Go To 3

No >> Go To 6

3. CMP WIRE HARNESS INSPECTION

Turn the ignition off.

Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Make sure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) are torqued to their proper specification.

Refer to any TSBs that may apply.

Were any of the above conditions present?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. TONE WHEEL/PULSE RING INSPECTION

Remove the Camshaft Position Sensor.

Inspect the Tone Wheel/Pulse Ring for damage, foreign material, or excessive movement.

Were any problems found?

Yes >> Repair or replace the Tone Wheel/Pulse Ring as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. CAMSHAFT POSITION SENSOR

If there are no possible causes remaining, view repair.

Repair

Replace the Camshaft Position Sensor.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. ERRATIC CMP SIGNAL

Turn the ignition off.

Remove the lab scope probe.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Ignition on, engine not running.

With scan tool, erase DTCs.

Start the engine.

Gently tap on and wiggle the Cam Position Sensor.

Ignition on, engine not running.

Inspect the Sensor connector and harness connector, and inspect the ECM connector and harness connector for loose, bent, corroded, or pushed out pins/terminals.

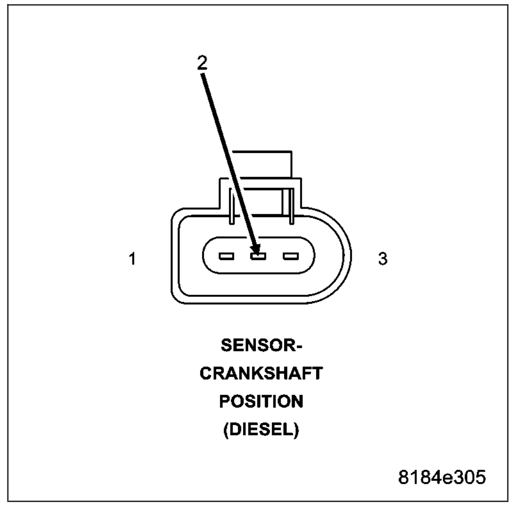
Inspect the related wire harness and the splices in the CMP circuit.

Did this DTC set again?

Yes >> Repair the wiring/connector concerns as needed or replace the Camshaft Position Sensor.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 7

7. CHECKING THE (K24) CKP SIGNAL WITH A LAB SCOPE



Turn the ignition off.

With a lab scope, backprobe the (K24) CKP Signal circuit at the CKP harness connector.

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.

Observe the lab scope screen.

Are there any irregular or missing signals?

Yes >> Go To 8

No >> Go To 10

8. CKP WIRE HARNESS INSPECTION

Turn the ignition off.

Visually inspect the related wire harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wire harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Make sure the Crankshaft Position Sensor and the Camshaft Position Sensor are properly installed and the mounting bolt(s) are torqued to their proper specification.

Refer to any TSBs that may apply.

Were any of the above conditions present?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 9

9. TONE WHEEL/FLEX PLATE INSPECTION

Remove the Crankshaft Position Sensor.

Inspect the Tone Wheel/Flex Plate slots for damage, foreign material, or excessive movement.

Were any problems found?

Yes >> Repair or replace the Tone Wheel/Flex Plate as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Crankshaft Position Sensor.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. ERRATIC CKP SIGNAL

NOTE: The conditions that set this DTC are not present at this time. The following test may help in identifying the intermittent condition.

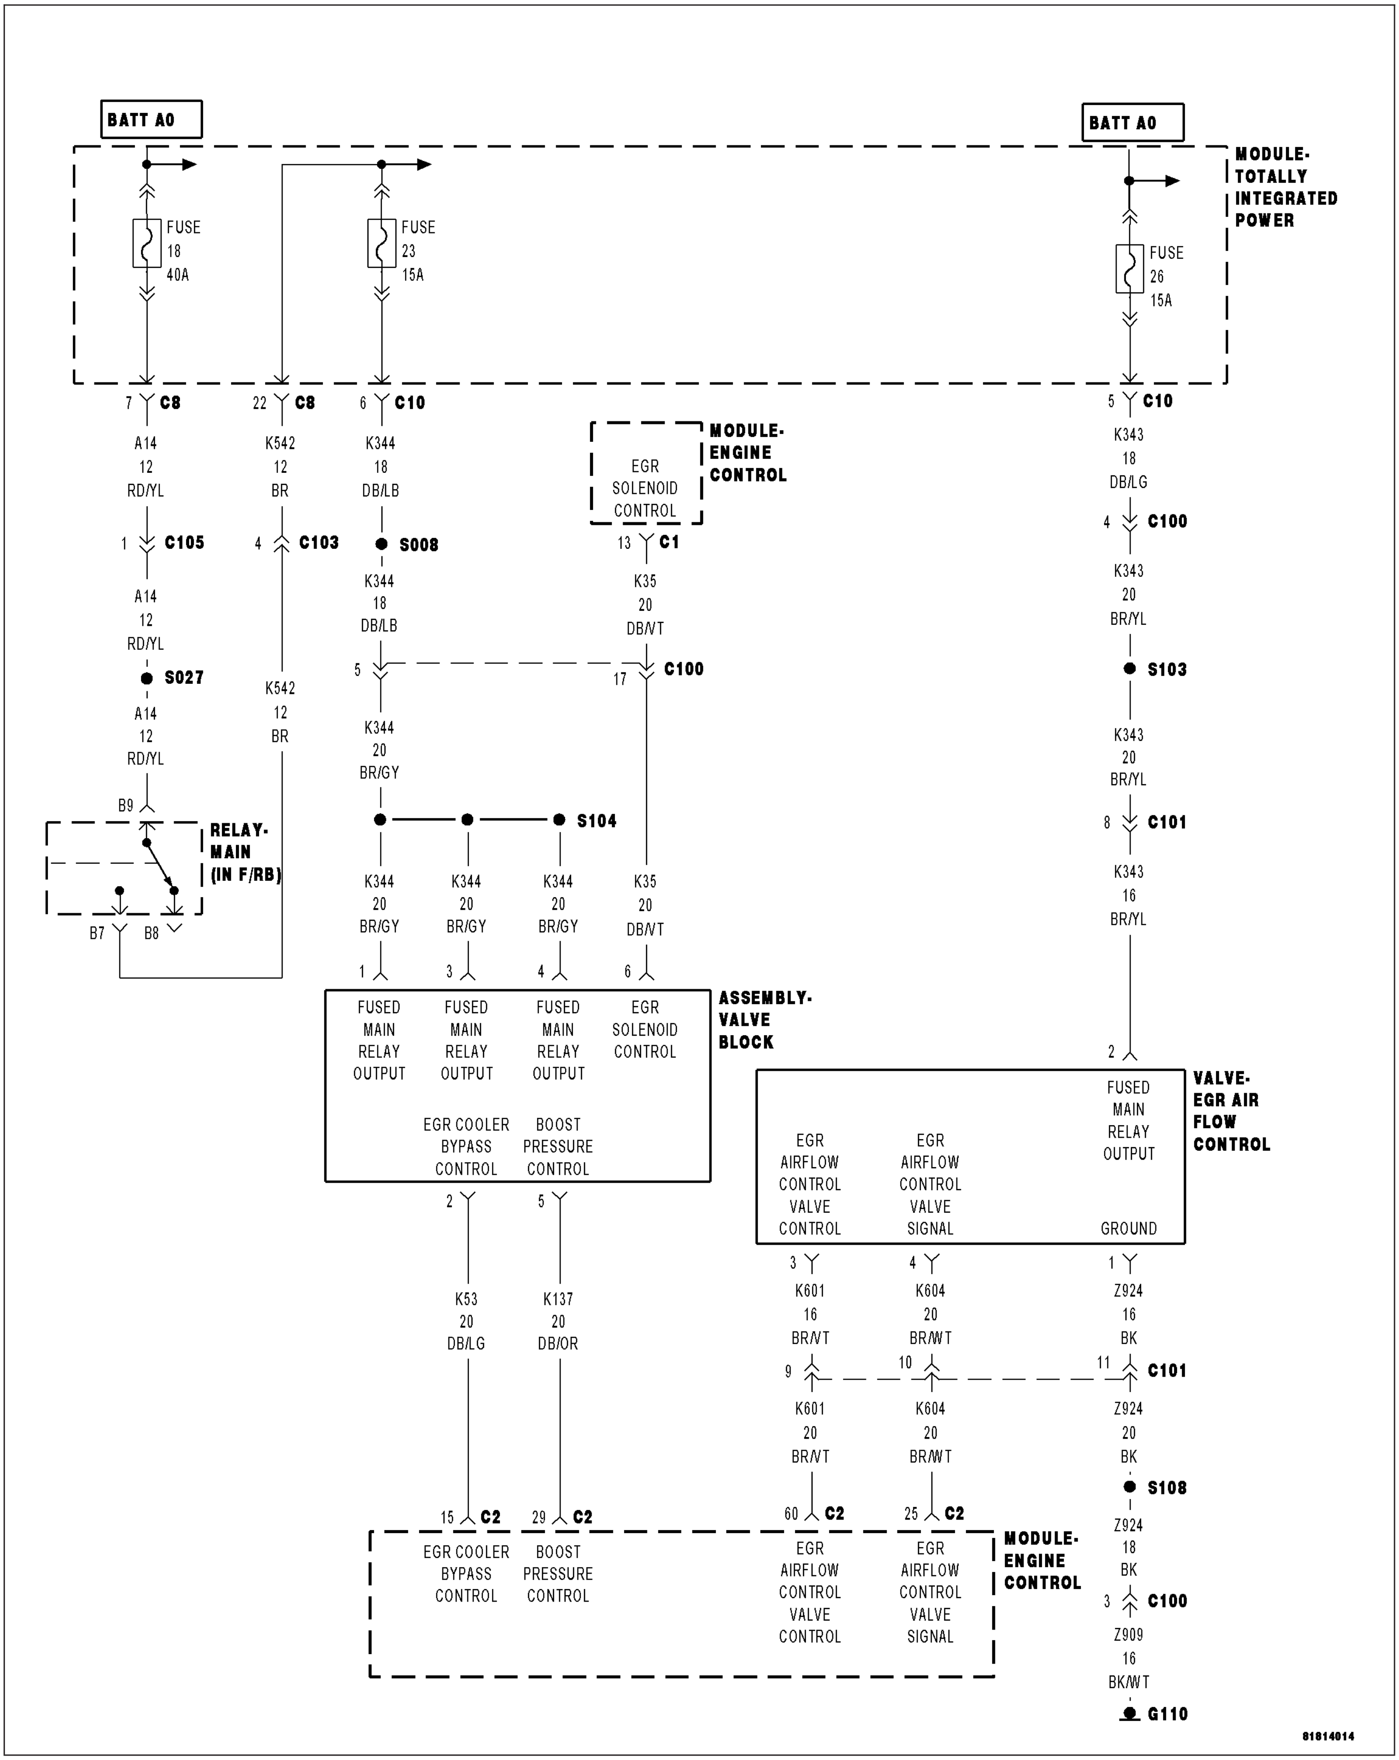
WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Start the engine.

Gently tap on and wiggle the Crank Position Sensor.

Turn the ignition off.

Inspect the Sensor connector and harness connector, and inspect the ECM connector and harness connector for loose, bent, corroded, or pushed out pins/terminals.



Inspect the related wire harness and the splices in the CKP circuits.

Were any problems found?

Yes >> Repair the wiring/connector concerns as needed or replace the Crankshaft Position Sensor. Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

P0045 - TURBOCHARGER BOOST CONTROL CIRCUIT/OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Boost Pressure command off.
- **Set Condition:**
  The ECM detects that the (K137) Boost Pressure Control circuit is open for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO GROUND
(K137) BOOST PRESSURE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
VALVE BLOCK ASSEMBLY
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Boost Pressure at 100%.

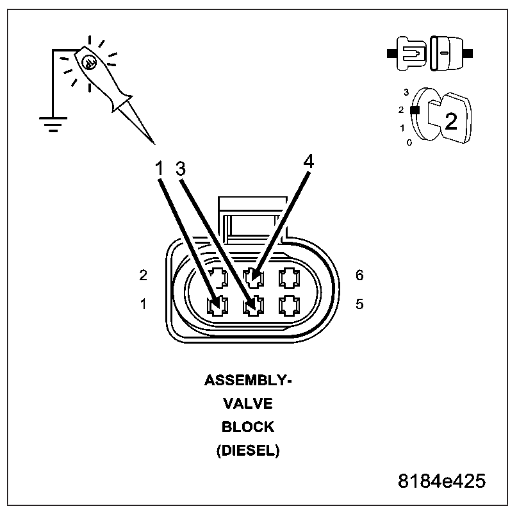
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Valve Block Assembly harness connector.

Turn the ignition on.

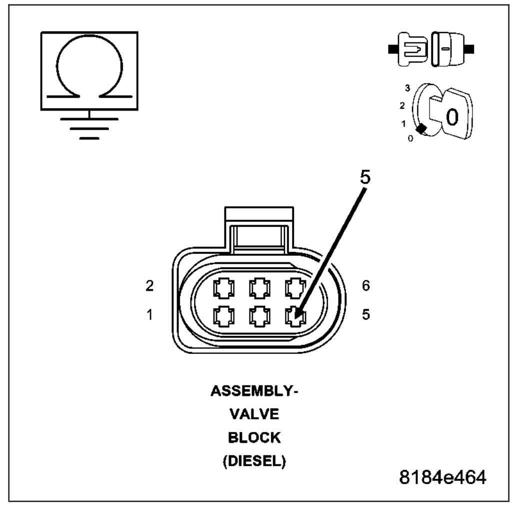
Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuits in the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright for each circuit?

Yes >> Go to 3

No >> Repair the (K344) Fused Main Relay Output circuit(s) for an open circuit or high resistance.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

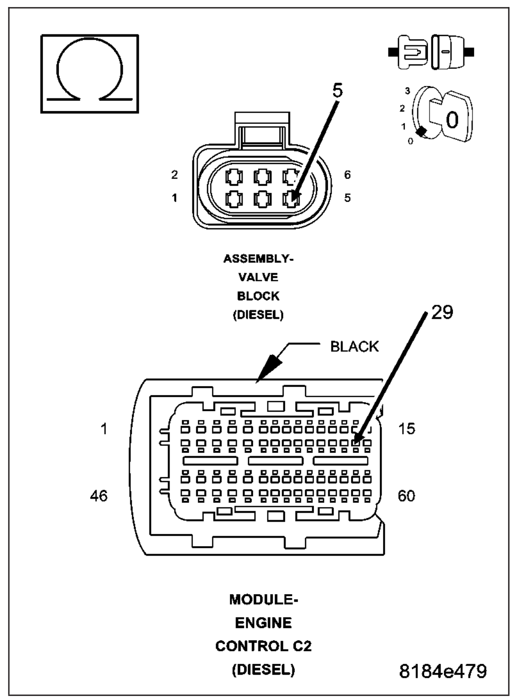
3. (K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K137) Boost Pressure Control circuit in the Valve Block Assembly harness connector.

Is the resistance above 10.0 ohms?



Yes >> Go to 4

No >> Repair the (K137) Boost Pressure Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K137) BOOST PRESSURE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K137) Boost Pressure Control circuit between the Valve Block Assembly harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 5

No >> Repair the (K137) Boost Pressure Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. VALVE BLOCK ASSEMBLY

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Control circuit in Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 0%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Control circuit in the Valve Block Assembly harness connector.

NOTE: The test light should not be illuminated.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes >> Replace the Valve Block Assembly in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

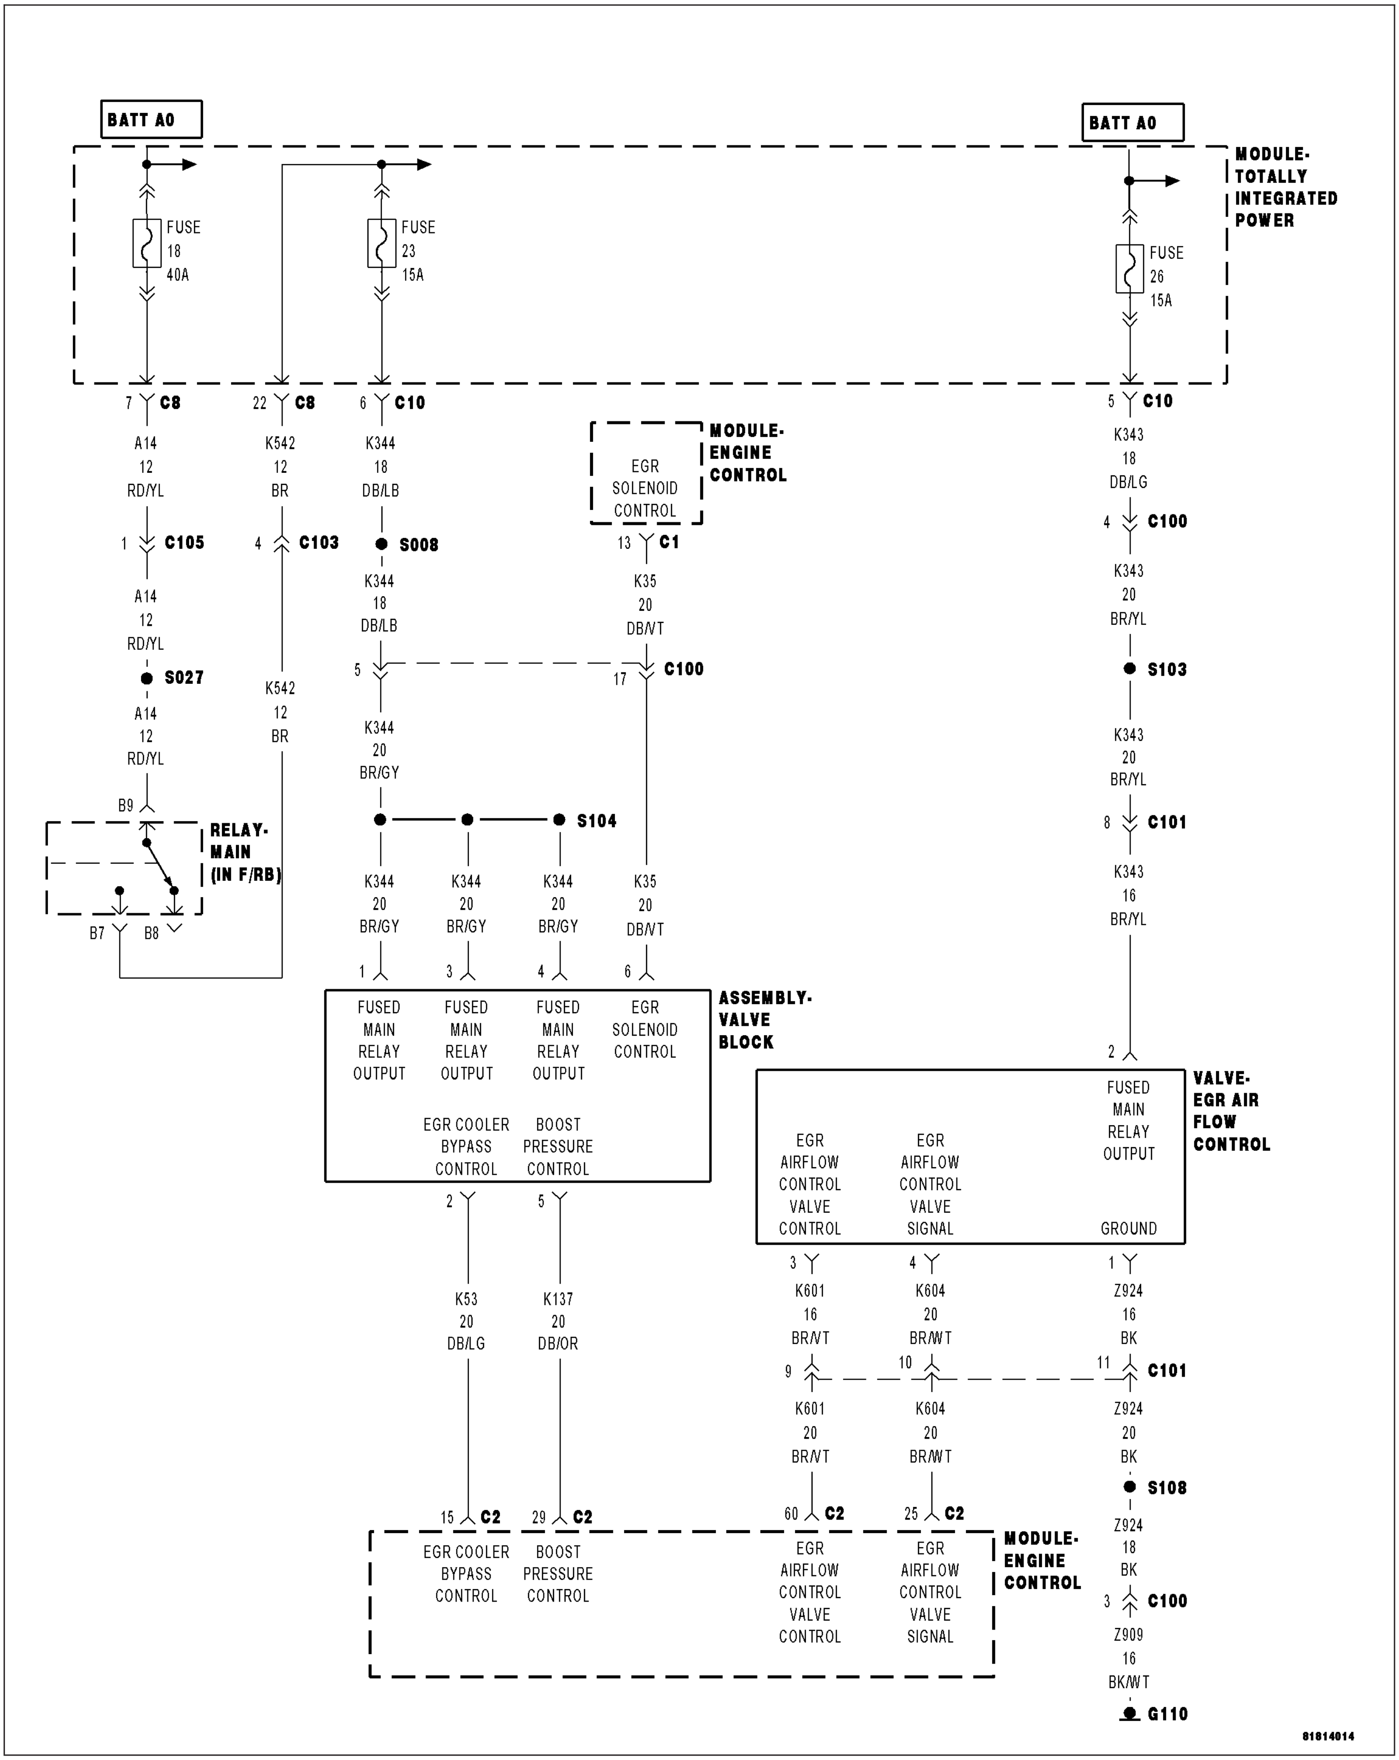
No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Valve Block Assembly and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0047 - TURBOCHARGER BOOST CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Boost Pressure command off.
- **Set Condition:**
  The ECM detects that the (K137) Boost Pressure Control circuit is shorted to ground for 5.3 seconds.

Possible Causes
INTERMITTENT DTC
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO GROUND
(K137) BOOST PRESSURE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
VALVE BLOCK ASSEMBLY
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Boost Pressure at 100%.

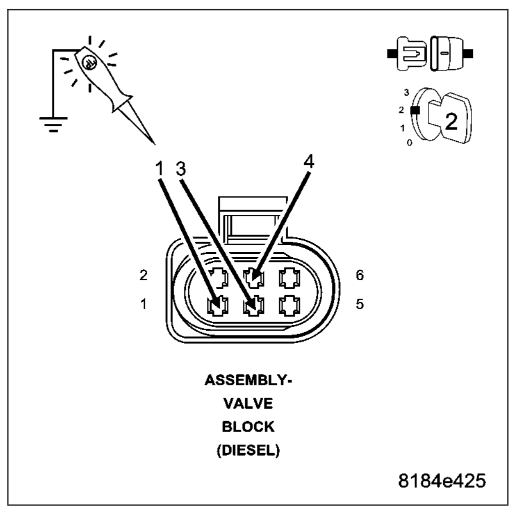
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Valve Block Assembly harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuits in the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright for each circuit?

Yes >> Go to 3

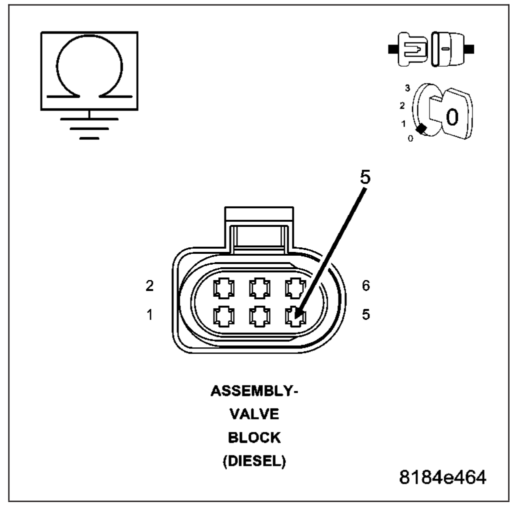
No >> Repair the (K344) Fused Main Relay Output circuit(s) for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.



Measure the resistance between ground and the (K137) Boost Pressure Control circuit in the Valve Block Assembly harness connector.

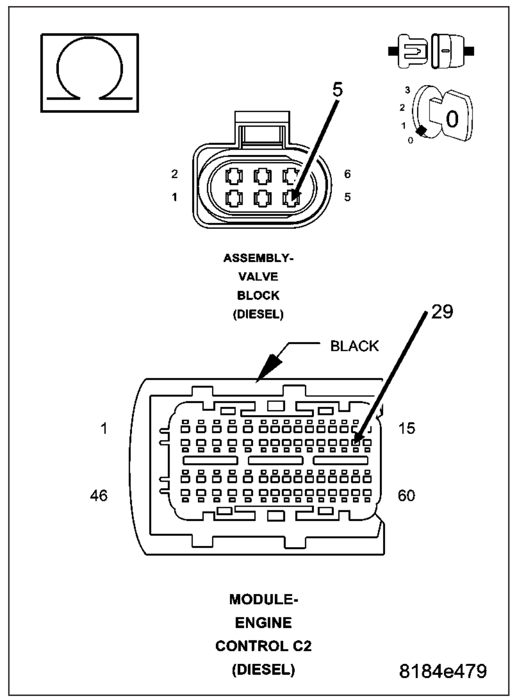
Is the resistance above 1000.0 ohms?

Yes >> Go to 4

No >> Repair the (K137) Boost Pressure Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K137) BOOST PRESSURE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K137) Boost Pressure Control circuit between the Valve Block Assembly harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 5

No >> Repair the (K137) Boost Pressure Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. VALVE BLOCK ASSEMBLY

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Control circuit in the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 0%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Control circuit in the Valve Block Assembly harness connector.

NOTE: The test light should not be illuminated.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes >> Replace the Valve Block Assembly in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

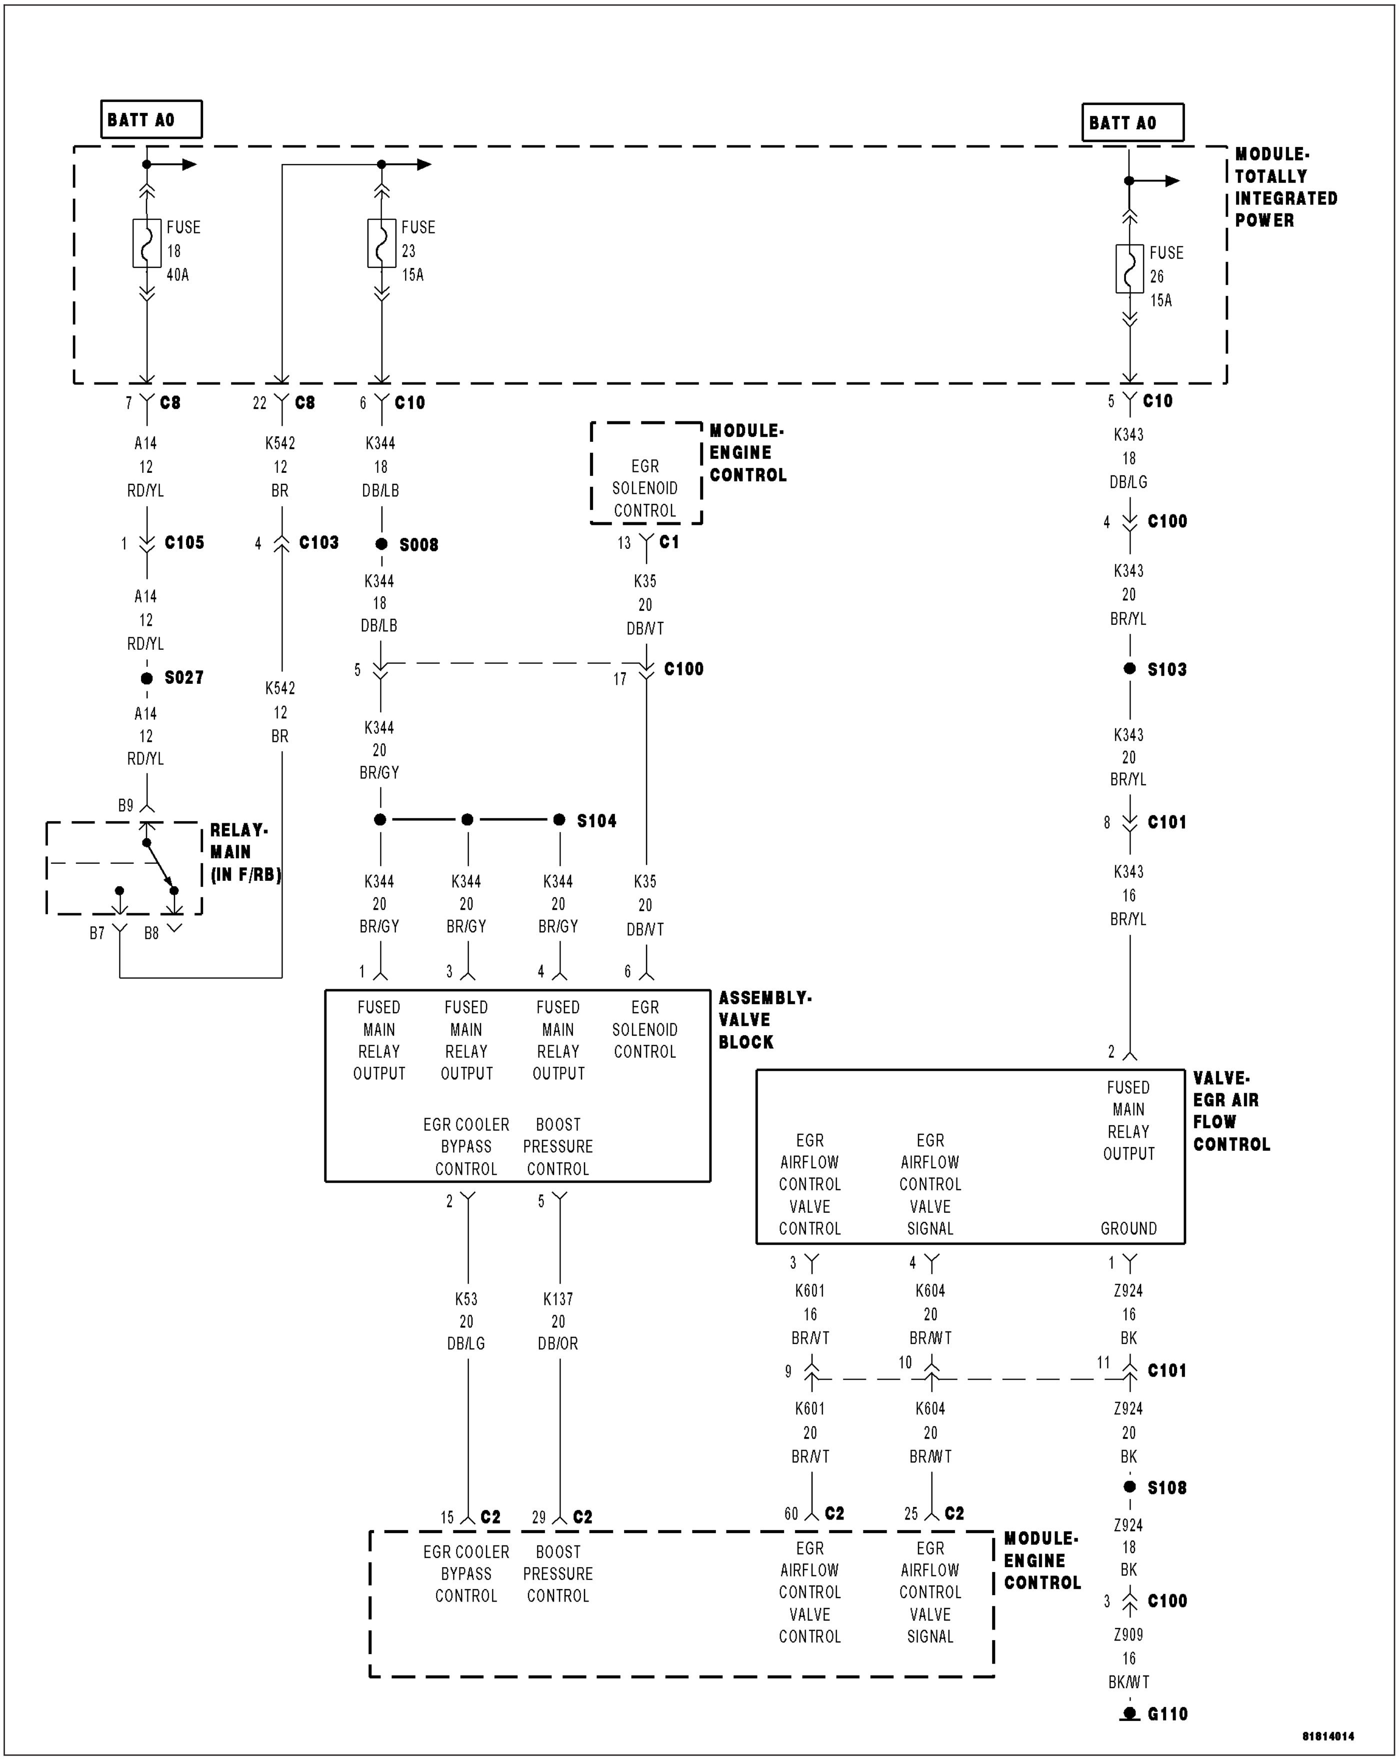
No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Valve Block Assembly and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0048 - TURBOCHARGER BOOST CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Boost Pressure command on.
- **Set Condition:**
  The ECM detects that the (K137) Boost Pressure Control circuit is shorted to voltage for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K137) BOOST PRESSURE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
VALVE BLOCK ASSEMBLY
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Boost Pressure at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

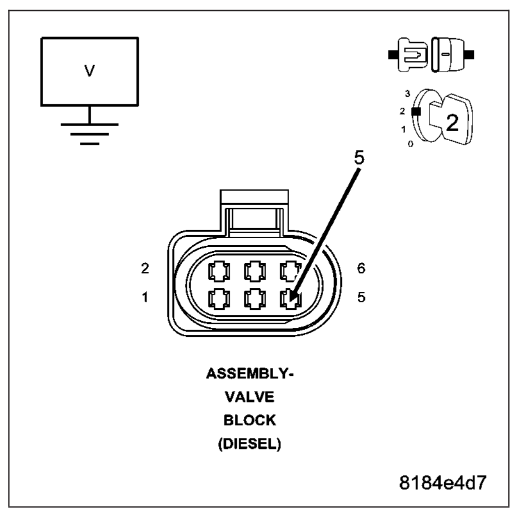
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K137) BOOST PRESSURE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Valve Block Assembly harness connector.



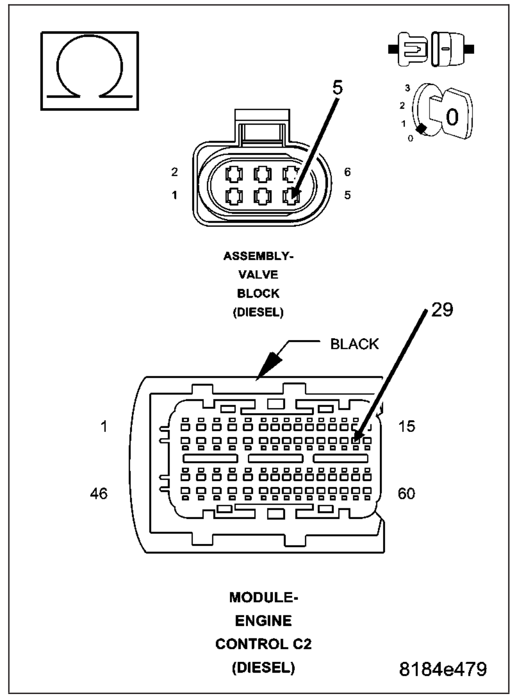
Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K137) Boost Pressure Control circuit in the Valve Block Assembly harness connector.



Is there any voltage present?

Yes >> Repair the (K137) Boost Pressure Control circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K137) BOOST PRESSURE CONTROL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K137) Boost Pressure Control circuit between the Valve Block Assembly harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (K137) Boost Pressure Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. VALVE BLOCK ASSEMBLY

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Boost Pressure (Boost Pressure Actuator) to 100%.

Using a 12 volt test light connected to 12 volts, check the (K137) Boost Pressure Control circuit in the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100%?

Yes >> Replace the Valve Block Assembly in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. ENGINE CONTROL MODULE (ECM)

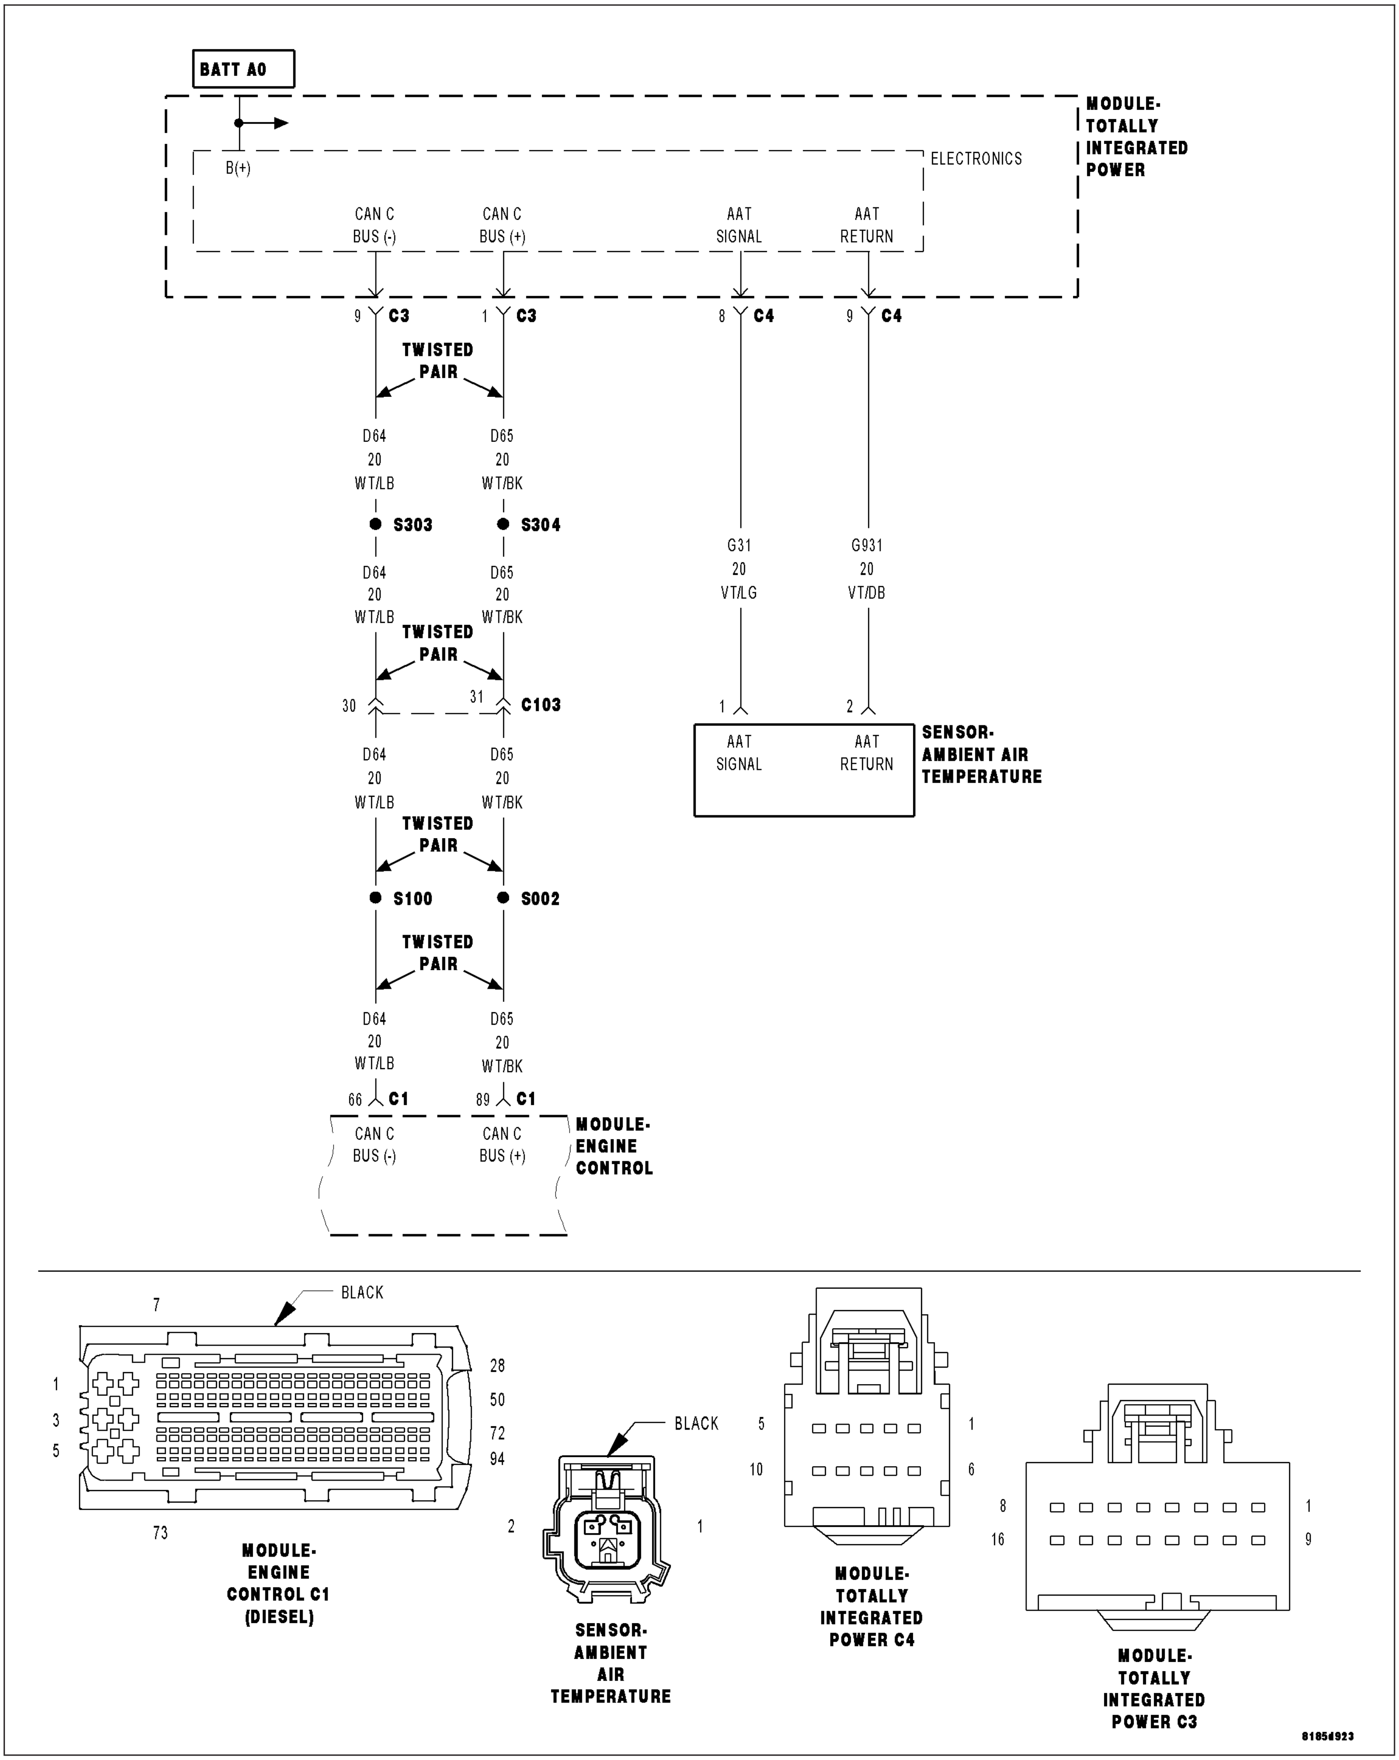
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Valve Block Assembly and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0071-AMBIENT AIR TEMPERATURE SENSOR PERFROMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Ambient Air Temperature Sensor signal is implausible for 0.5 second.

Possible Causes
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(G931) AMBIENT AIR TEMP SENSOR GROUND CIRCUIT OPEN
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT OPEN
AMBIENT TEMPERATURE SENSOR
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

Turn the ignition off for 10 seconds.

Turn the ignition on.

Monitor the scan tool for TIPM DTCs.

Did this DTC set again?

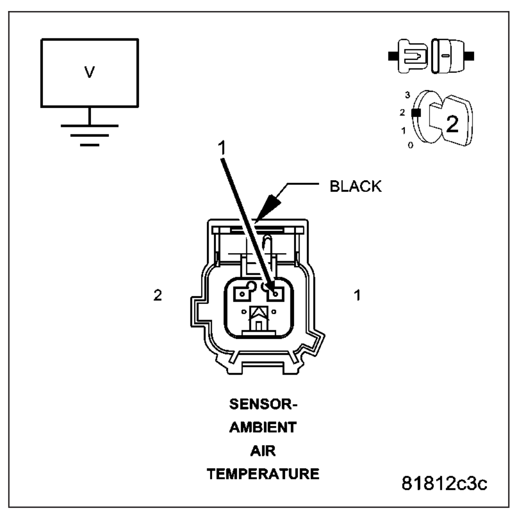
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Ambient Air Temperature Sensor harness connector.



Disconnect the TIPM C4 harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage on the (G31) Ambient Air Temperature Sensor Signal circuit at the AAT Sensor harness connector.

NOTE: Remove the jumper wire.

Is the voltage below 1.0 volt?

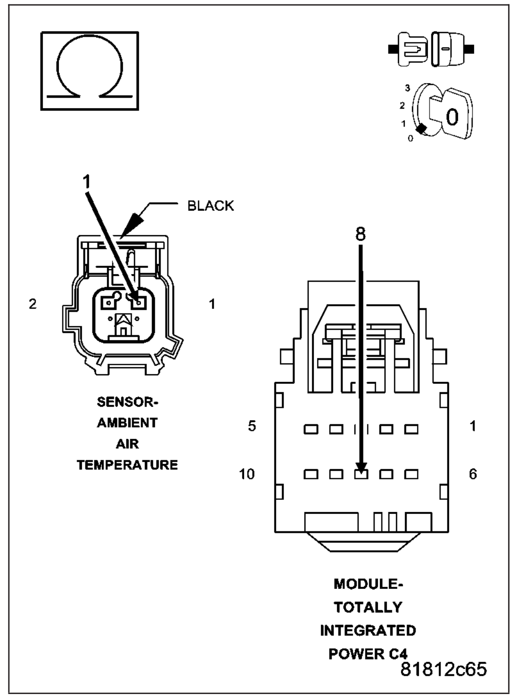
Yes >> Go To 3

No >> Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off.



Measure the resistance of the (G31) Ambient Air Temperature Sensor Signal circuit between the AAT Sensor harness connector and Totally Integrated Power Module C4 harness connector.

Is the resistance below 10.0 ohms?

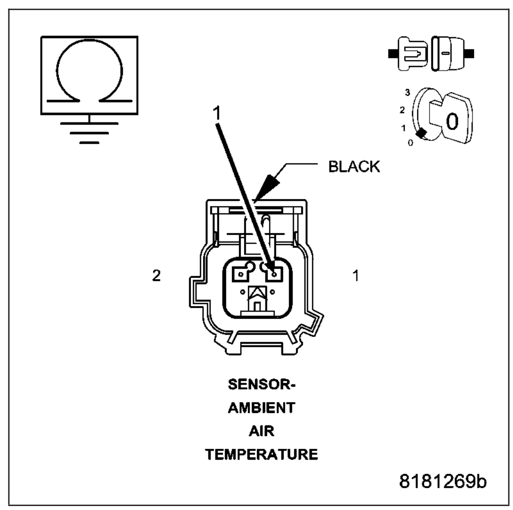
Yes >> Go To 4

No >> Repair the (G31) Ambient Air Temperature Sensor Signal circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.



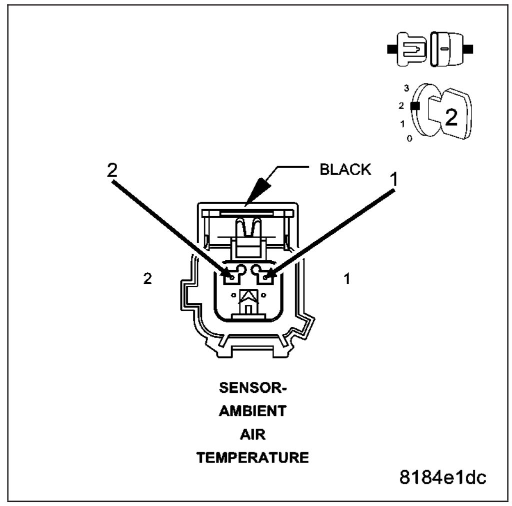
Measure the resistance between ground and the (G31) Ambient Air Temperature Sensor Signal circuit at the AAT Sensor harness connector.

Is the resistance above 1000 ohms?

Yes >> Go To 5

No >> Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



5. AMBIENT AIR TEMPERATURE SENSOR

Turn the ignition off.

Connect a jumper wire between the (G31) Ambient Air Temperature Sensor Signal and the (G931) Sensor Ground circuit in the Ambient Air Temperature Sensor harness connector.

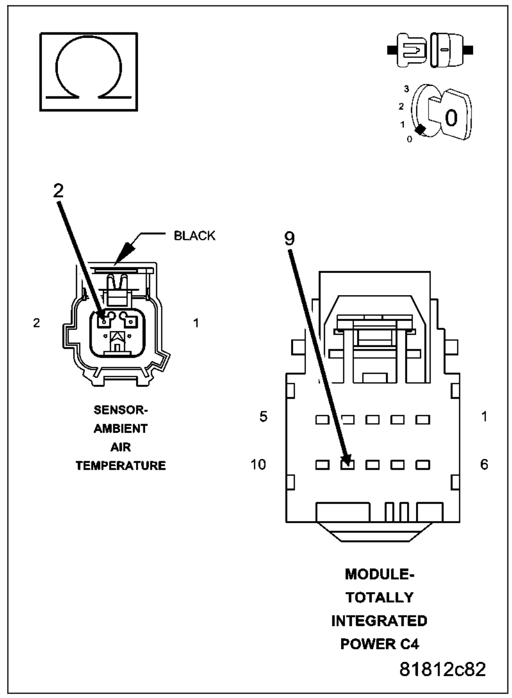
Turn the ignition on.

Monitor the scan tool for TIPM DTCs.

Does the scan tool display P0072 AMB TEMP. SENSOR CIRCUIT SIGNAL VOLTAGE TOO LOW?

Yes >> Replace the Ambient Air Temperature Sensor.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



No >> Go To 6

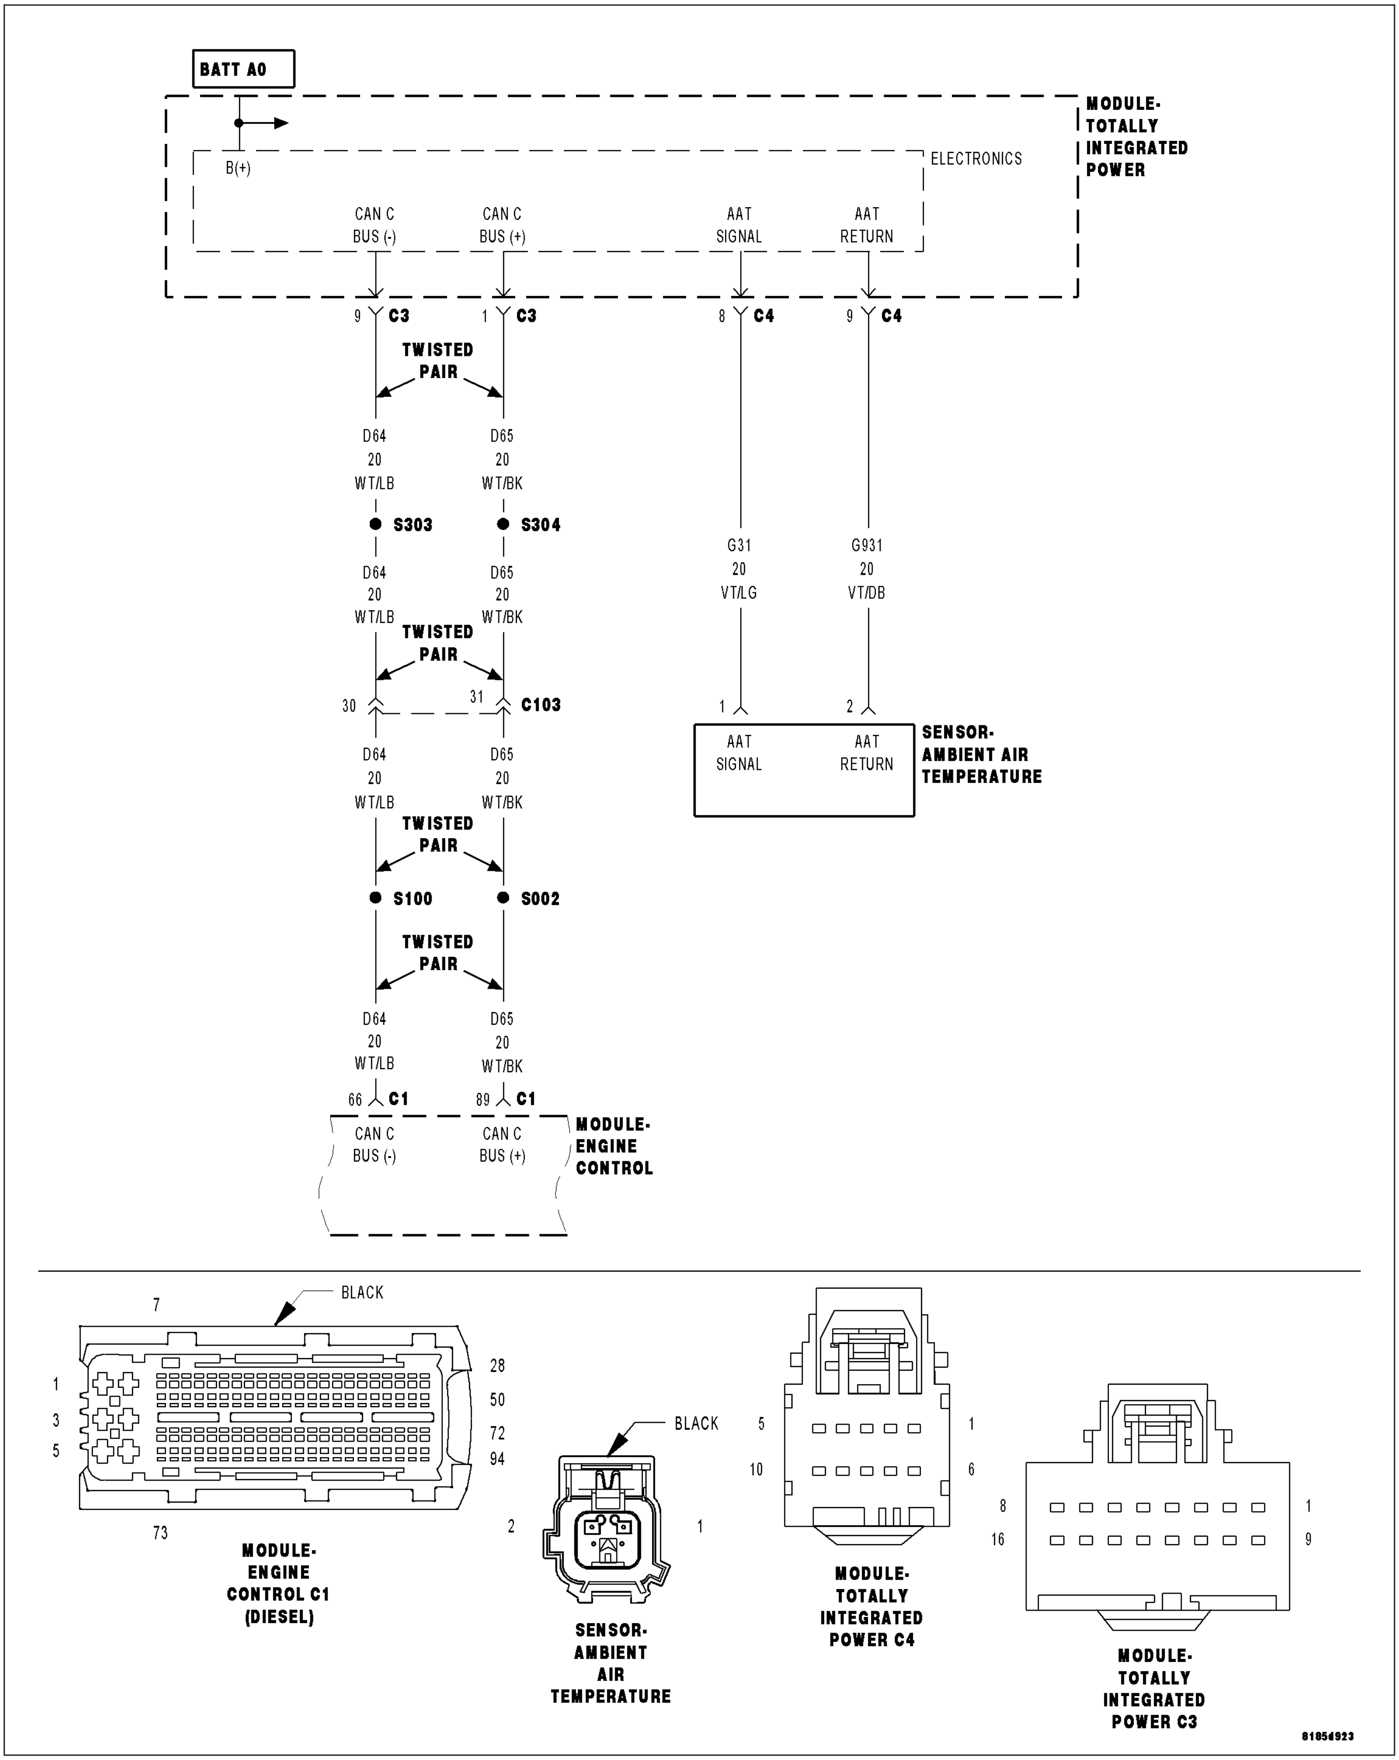
6. (G931) AMBIENT AIR TEMP SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM harness connectors.

Measure the resistance of the (G931) Ambient Air Temp Sensor Ground circuit between the TIPM harness connector and the Ambient Air Temperature Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace and program the Totally Integrated Power Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the (G931) Ambient Air Temperature Sensor Ground circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0072-AMBIENT AIR TEMPERATURE SIGNAL VOLTAGE TOO LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Ambient Air Temperature Sensor signal is below 0.20 volts.

Possible Causes
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO (G931) SENSOR GROUND
AMBIENT AIR TEMPERATURE SENSOR
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

Monitor the scan tool for TIPM DTCs for at least 2 minutes.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. AMBIENT AIR TEMPERATURE SENSOR

Turn the ignition off.

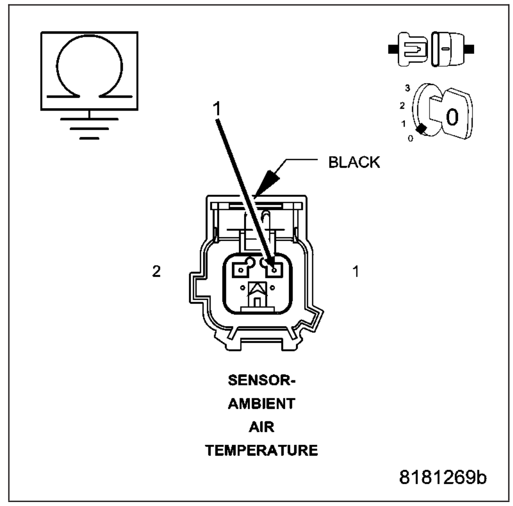
Disconnect the Ambient Air Temperature Sensor harness connector.

Turn the ignition on.

Monitor the scan tool for TIPM DTCs for at least 2 minutes.

Does the scan tool display P0073 AMB AIR TEMP SENSOR SIGNAL VOLTAGE TOO HIGH?

Yes >> Replace the Ambient Air Temperature Sensor.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



No >> Go To 3

3. (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

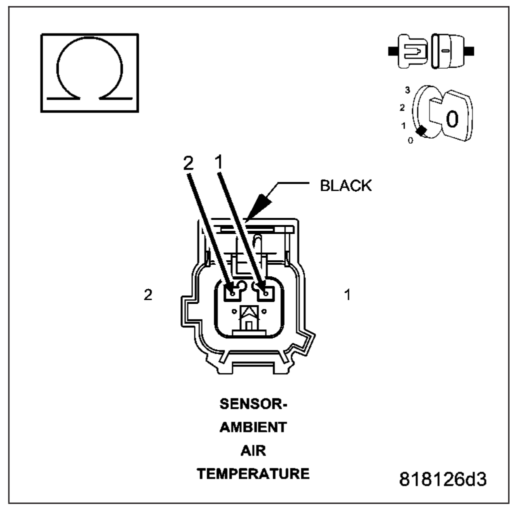
Turn the ignition off.

Disconnect the TIPM harness connectors.

Measure the resistance between ground and the (G31) Ambient Air Temperature Sensor Signal circuit.

Is the resistance above 1000 ohms?

Yes >> Go To 4



No >> Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to ground.

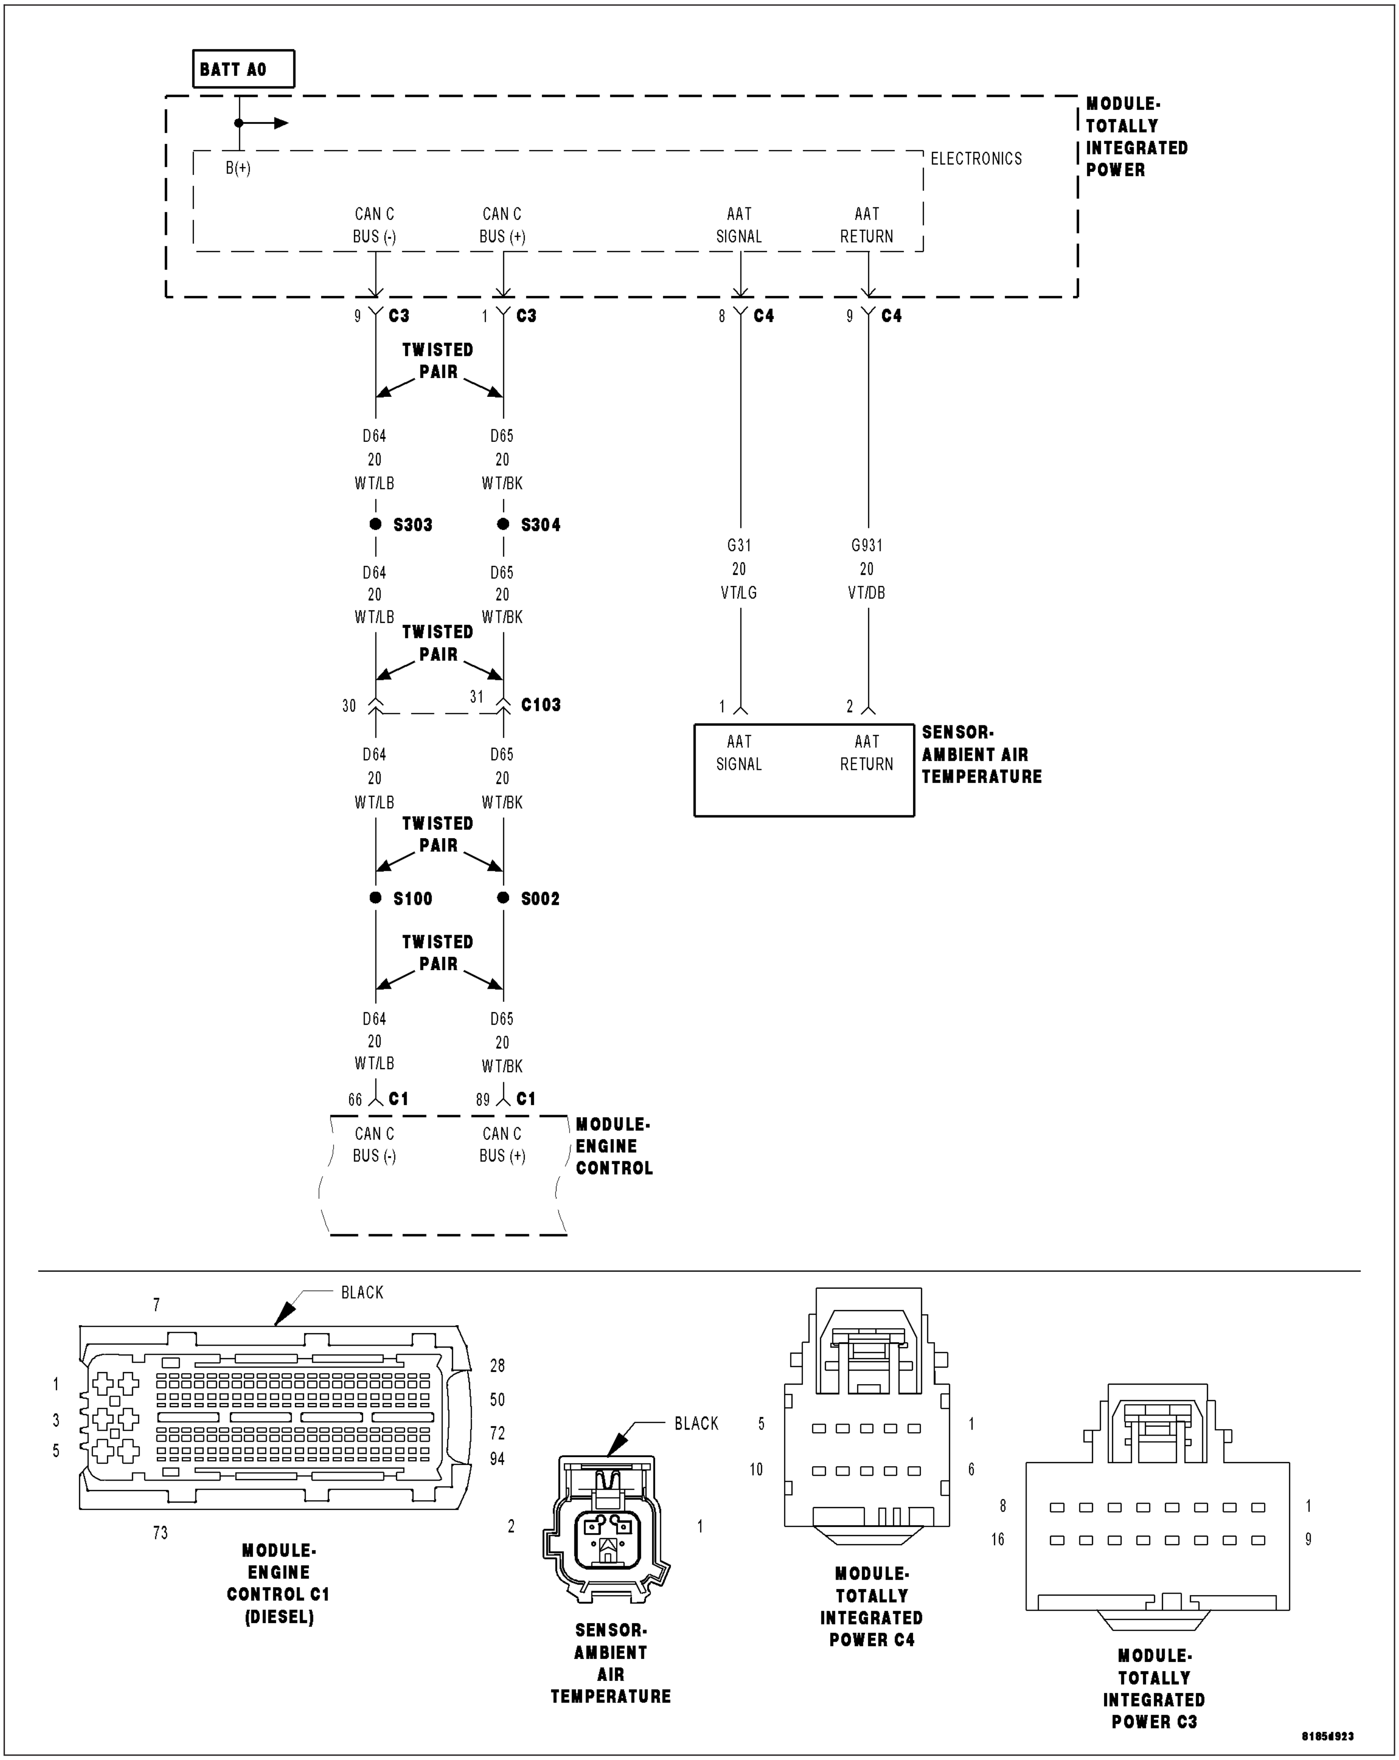
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO (G931) SENSOR GROUND

Turn the ignition off.

Measure the resistance between the (G31) Ambient Air Temperature Sensor Signal circuit and the (G931) Sensor Ground circuit.

Is the resistance above 1000 ohms?



Yes >> Replace and program the TIPM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to the (G931) Sensor Ground circuit.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0073-AMBIENT AIR TEMPERATURE SIGNAL VOLTAGE TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Ambient Air Temperature Sensor signal is above 5.0 volts.

Possible Causes
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G931) AMBIENT AIR TEMP SENSOR GROUND CIRCUIT OPEN
(G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT OPEN
AMBIENT AIR TEMPERATURE SENSOR
TOTALLY INTEGRATED POWER MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase TIPM DTCs.

Turn the ignition off for 10 seconds.

Turn the ignition on.

Monitor the scan tool for TIPM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Ambient Air Temperature Sensor harness connector.

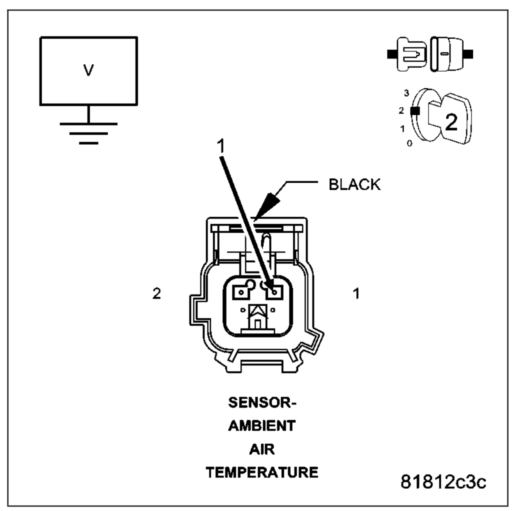
Disconnect the TIPM C4 harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage on the (G31) Ambient Air Temperature Sensor Signal circuit.



NOTE: Remove the jumper wire.

Is the voltage below 1.0 volt?

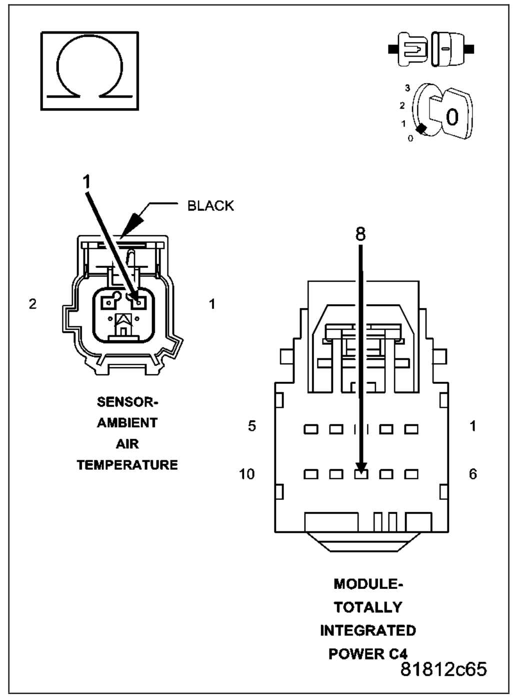
Yes >> Go To 3

No >> Repair the (G31) Ambient Air Temperature Sensor Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (G31) AMBIENT AIR TEMP SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off.



Measure the resistance of the (G31) Ambient Air Temperature Sensor Signal circuit between TIPM C4 harness connector and the Ambient Air Temperature Sensor harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (G31) Ambient Air Temperature Sensor Signal circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. AMBIENT AIR TEMPERATURE SENSOR

Connect a jumper wire between the (G31) Ambient Temperature Sensor Signal and the (G931) Sensor Ground circuit in the Ambient Temperature Sensor harness connector.

Turn the ignition on.

Monitor the scan tool for TIPM DTCs.

Does the scan tool display P0070 AMB TEMP. SENSOR CIRCUIT SIGNAL VOLTAGE TOO LOW?

Yes >> Replace the Ambient Air Temperature Sensor.

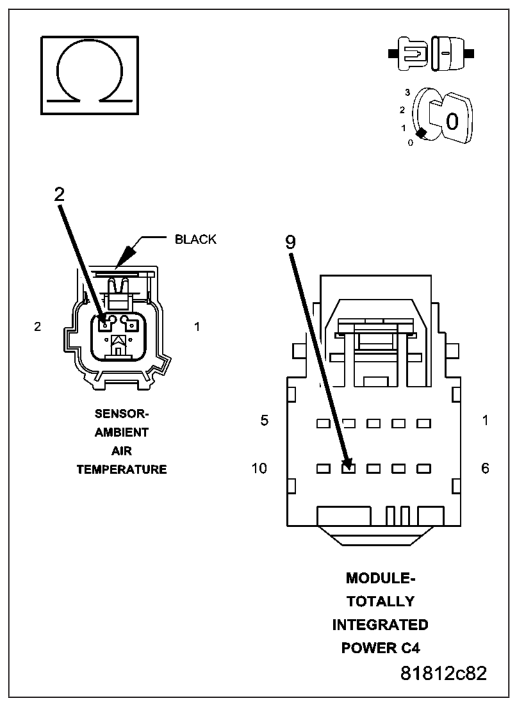
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 5

5. (G931) AMBIENT AIR TEMP SENSOR GROUND CIRCUIT OPEN

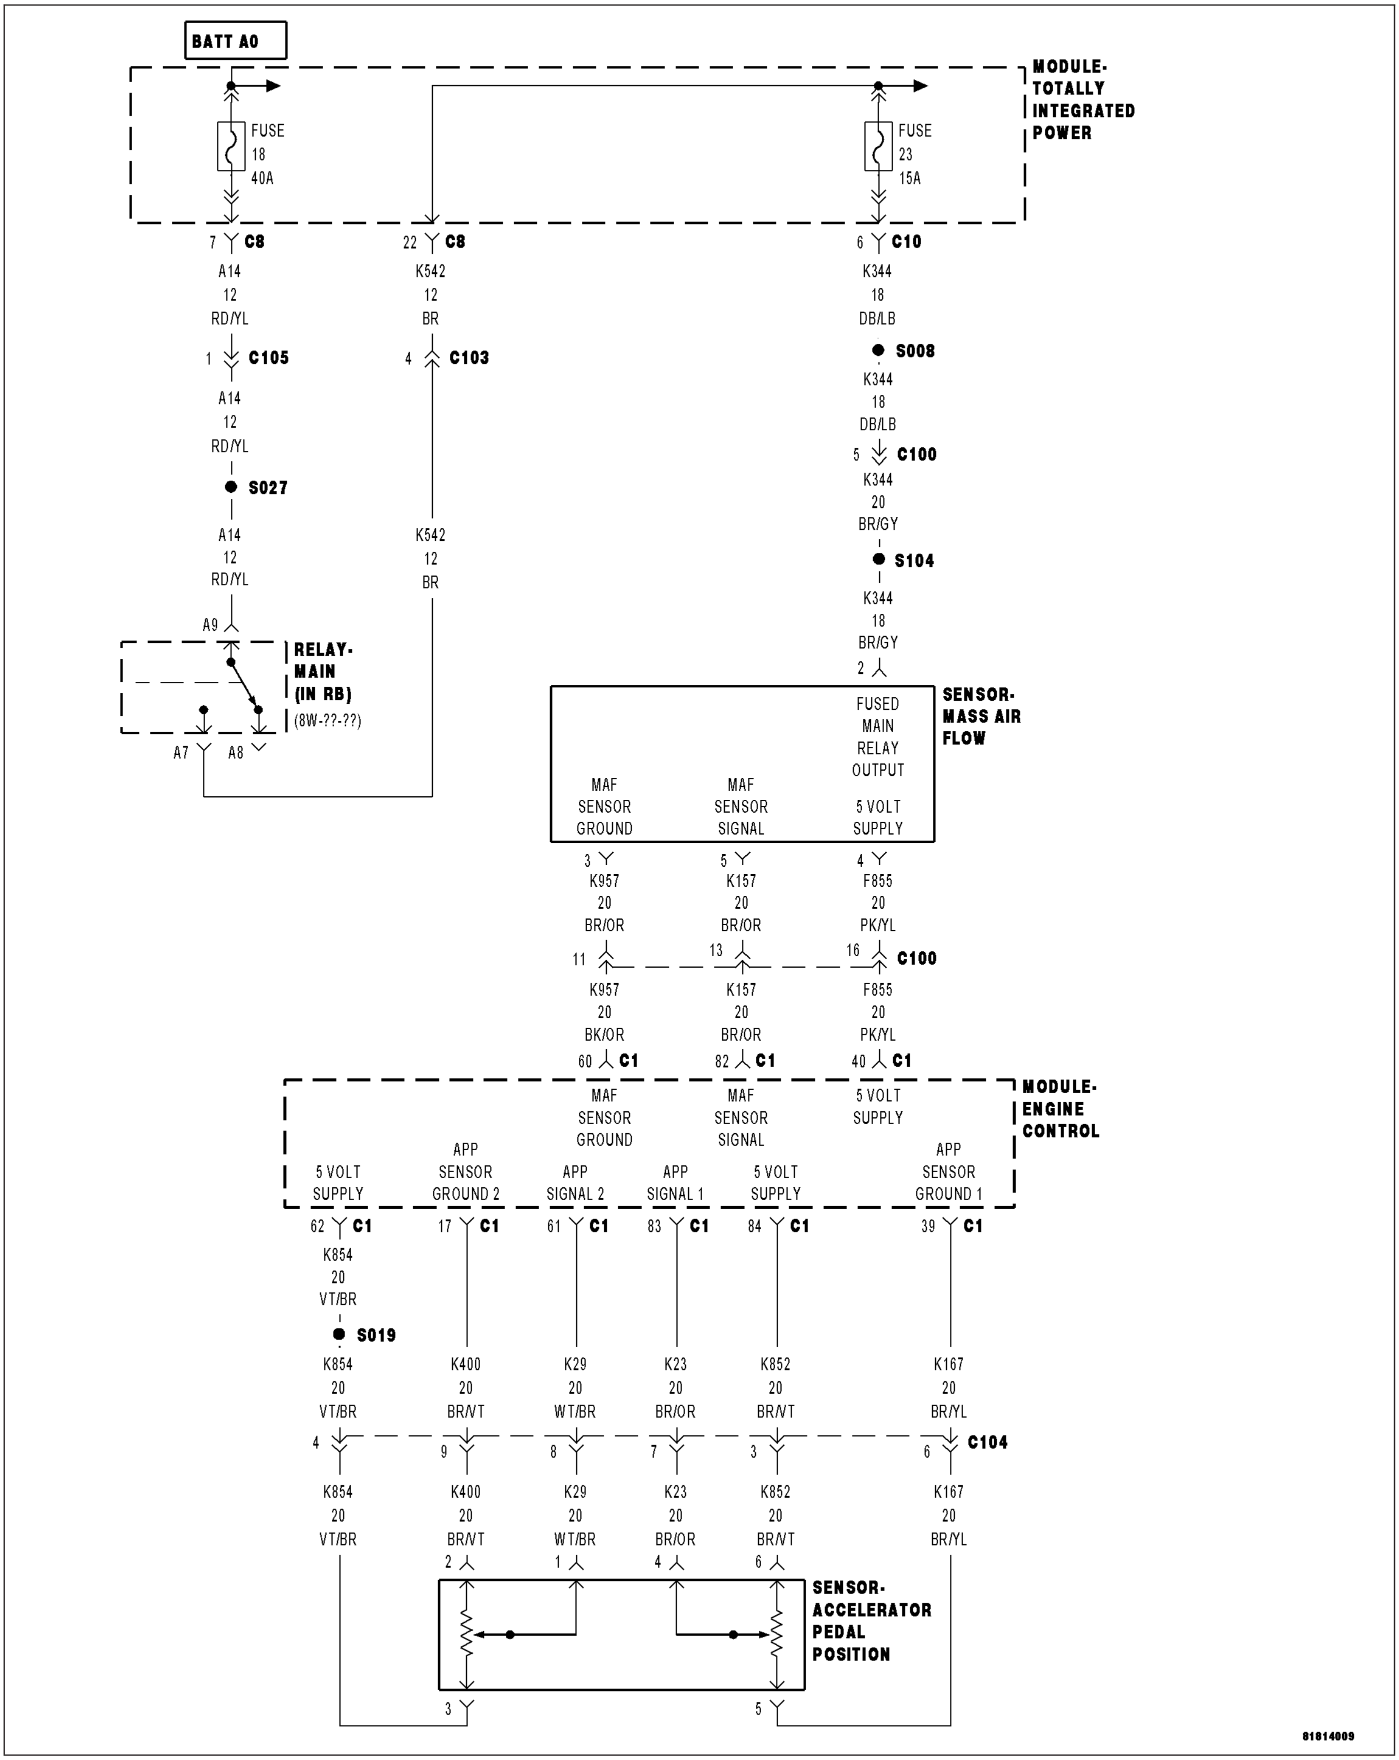
Turn the ignition off.

Measure the resistance of the (G931) Ambient Air Temperature Sensor Ground circuit between the TIPM C4 harness connector and the Ambient Air Temperature Sensor harness connector.



Is the resistance below 10.0 ohms?

Yes >> Replace and program the TIPM in accordance with the Service Information.



Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the (G931) Ambient Air Temperature Sensor Ground circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0101-MASS AIR FLOW SENSOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects that the (K157) Mass Air Flow Sensor Signal circuit is not within a valid range.

Possible Causes
INTERMITTENT DTC
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT
MASS AIR FLOW SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

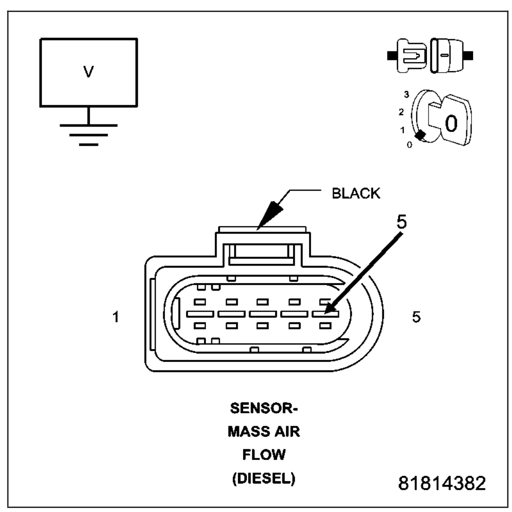
Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

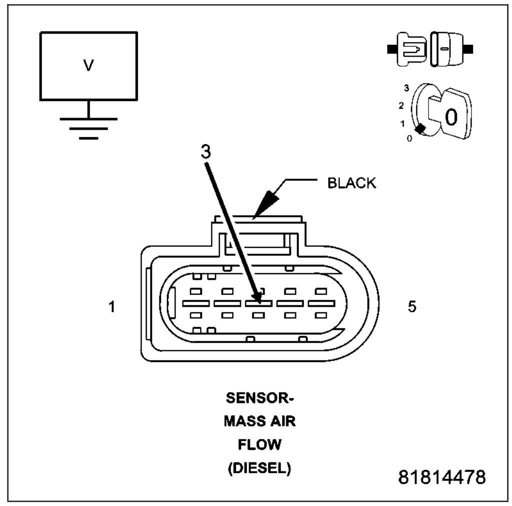
Turn the ignition off.

Disconnect the Mass Air Flow Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?



Yes >> Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to voltage.

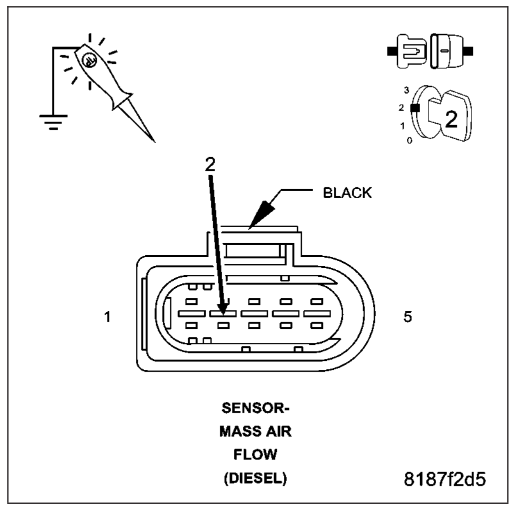
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?



Yes >> Repair the (K957) Mass Air Flow Sensor Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuit in the Mass Air Flow Sensor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

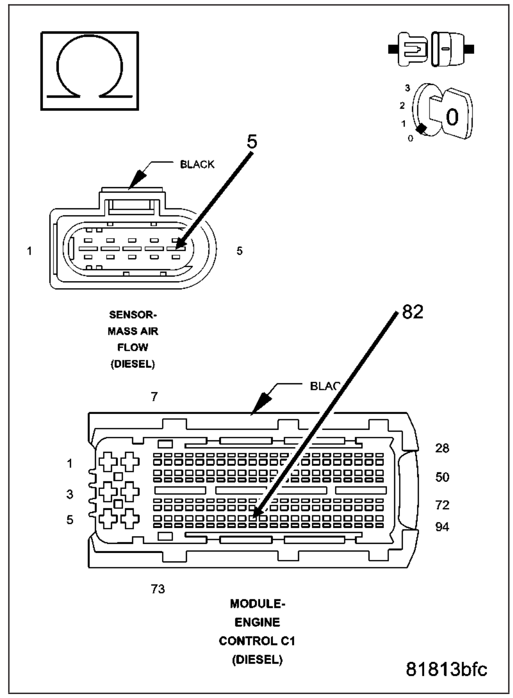
Is the test light illuminated and bright?

Yes >> Go to 5

No >> Repair the (K344) Fused Main Relay Output circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

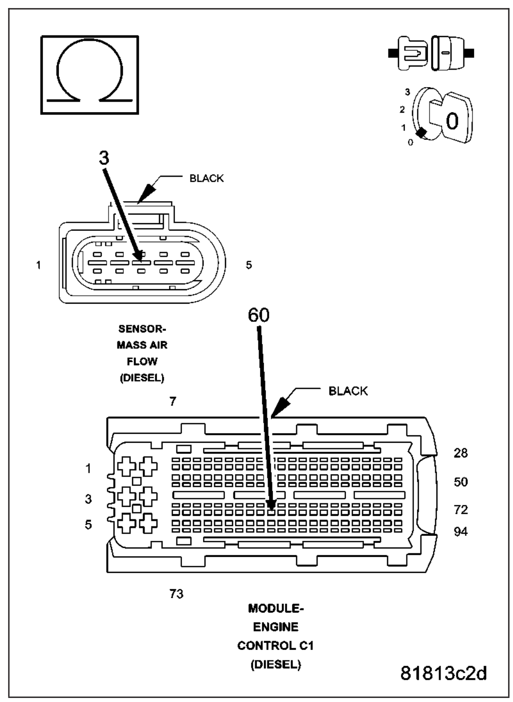
Is the resistance below 10.0 ohms?

Yes >> Go to 6

No >> Repair the (K157) Mass Air Flow Sensor Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

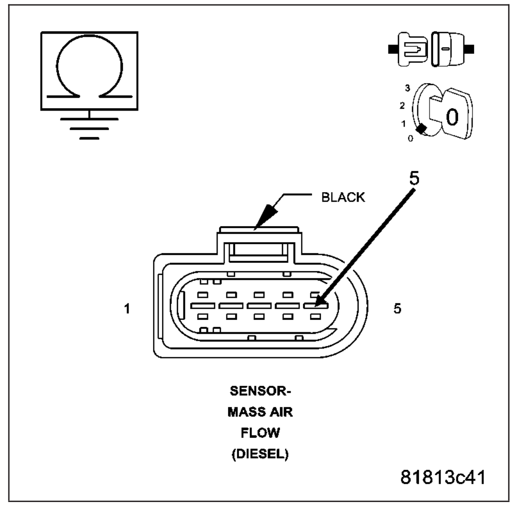
6. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K957) Mass Air Flow Sensor Ground circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 7



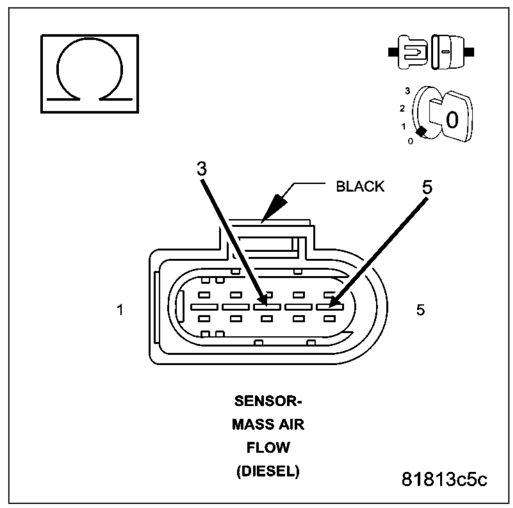
No >> Repair the (K957) Mass Air Flow Sensor Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is the resistance above 10.0 ohms?



Yes >> Go to 8

No >> Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT

Measure the resistance between the (K157) Mass Air Flow Sensor Signal circuit and the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor harness connector.

Is the resistance above 10.0 ohms?

Yes >> Go to 9

No >> Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to the (K957) Mass Air Flow Sensor Ground circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. MASS AIR FLOW SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) connector.

Replace the Mass Air Flow Sensor in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 10

No >> Test Complete.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. ENGINE CONTROL MODULE (ECM)

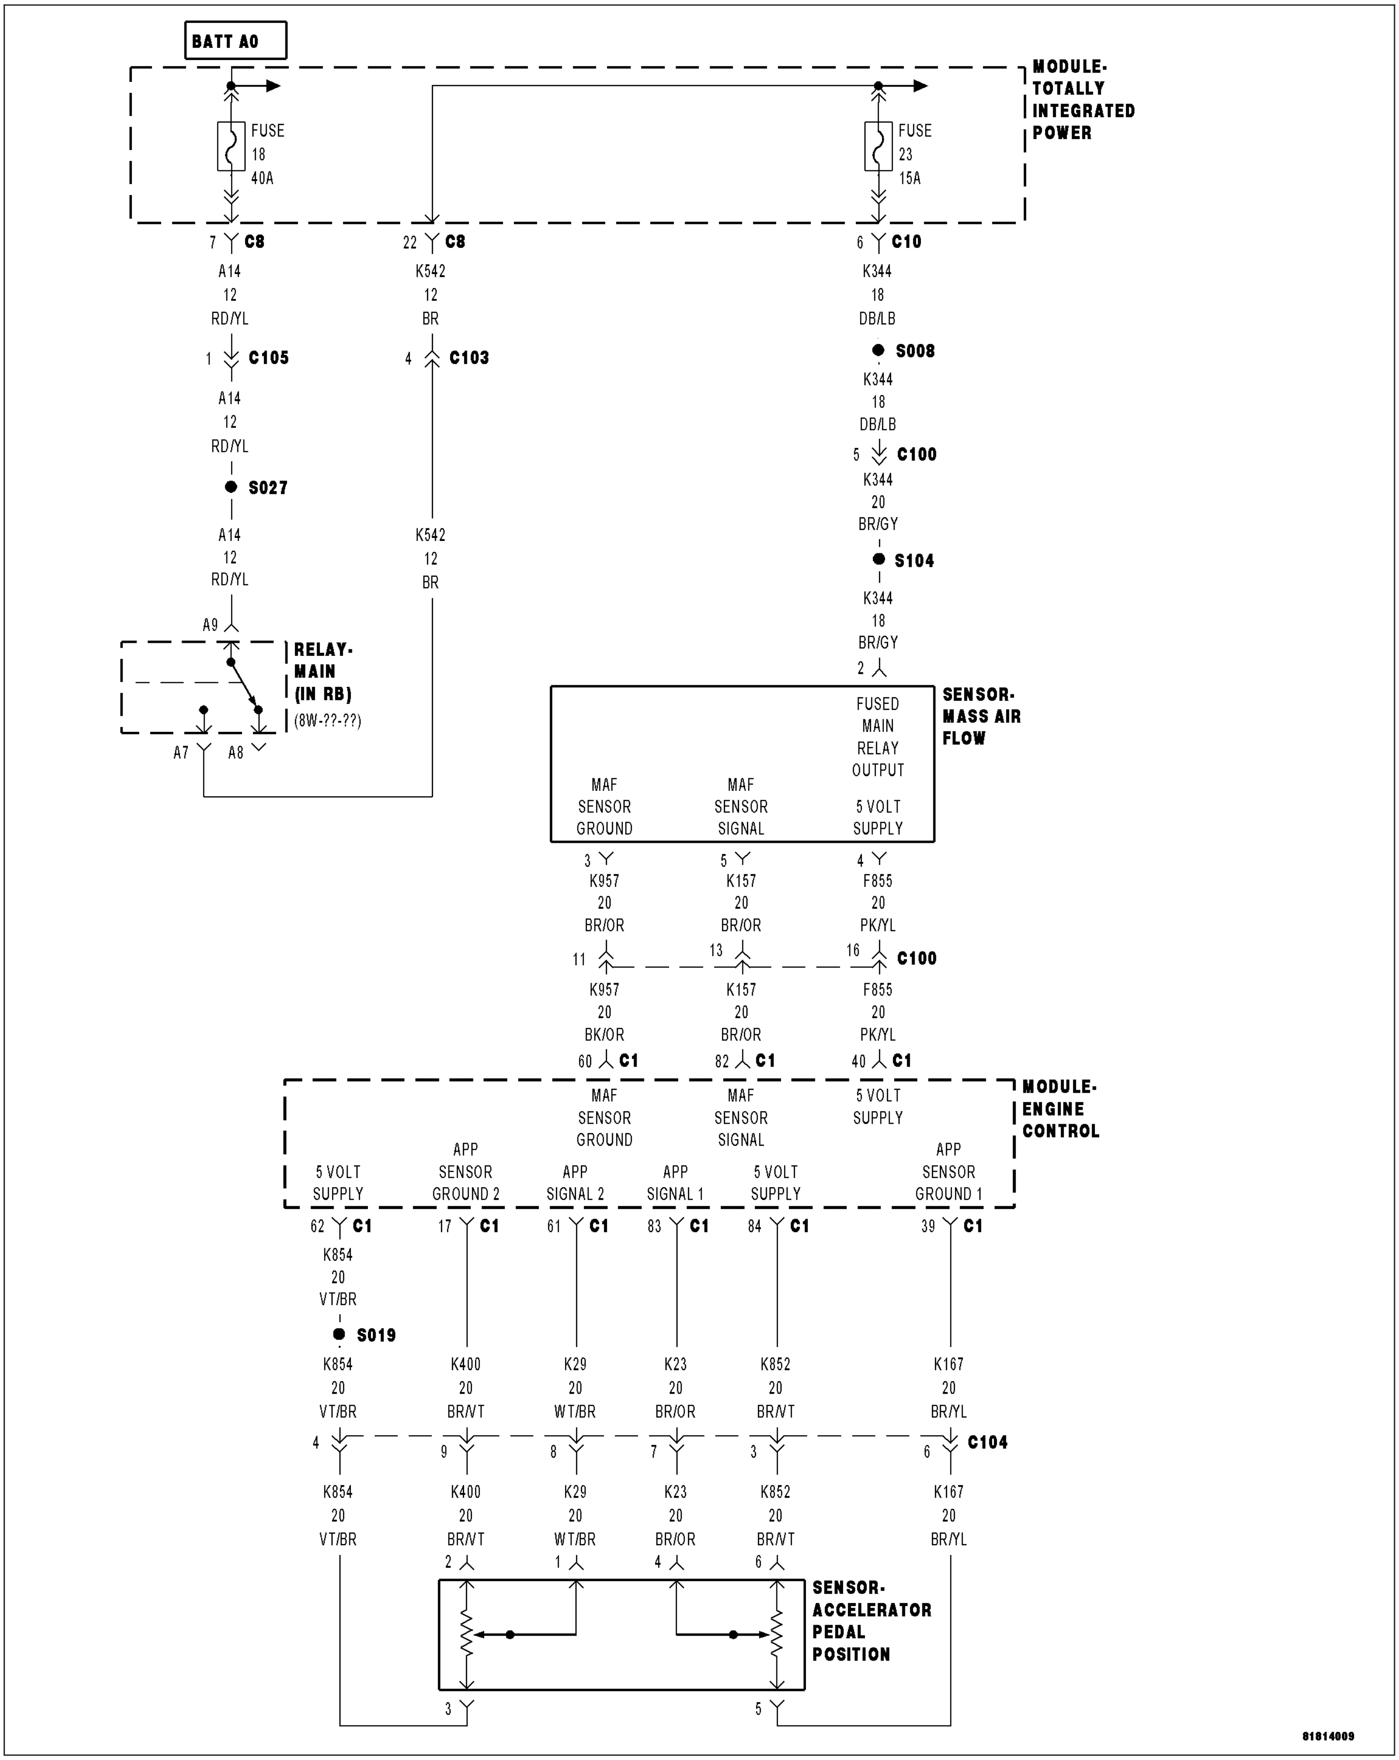
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0102-MASS AIR FLOW SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  No reference Voltage DTC's present. With the engine running and engine speed below 5100 rpm..
- **Set Condition:**
  The (K157) Mass Air Flow Sensor Signal is below the valid operating range for 1.0 second.

Possible Causes
INTERMITTENT DTC
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(F855) MASS AIR FLOW SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT
MASS AIR FLOW SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

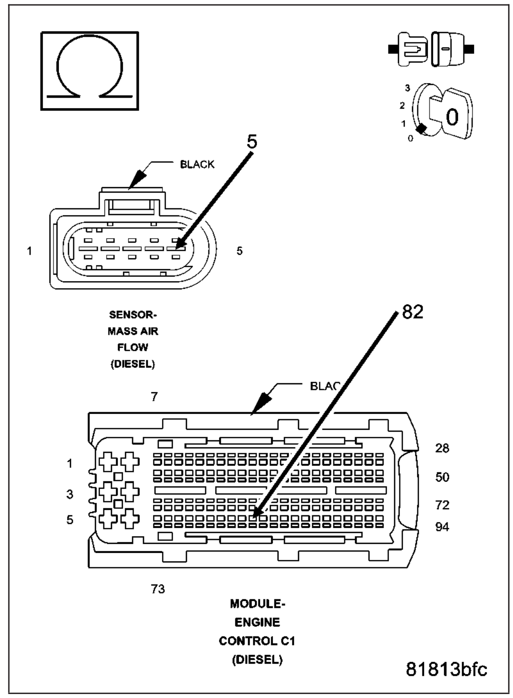
1. DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, Clear DTCs in the Engine Control Module (ECM).
Start the engine and allow it to reach normal operating temperature.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure.



2. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

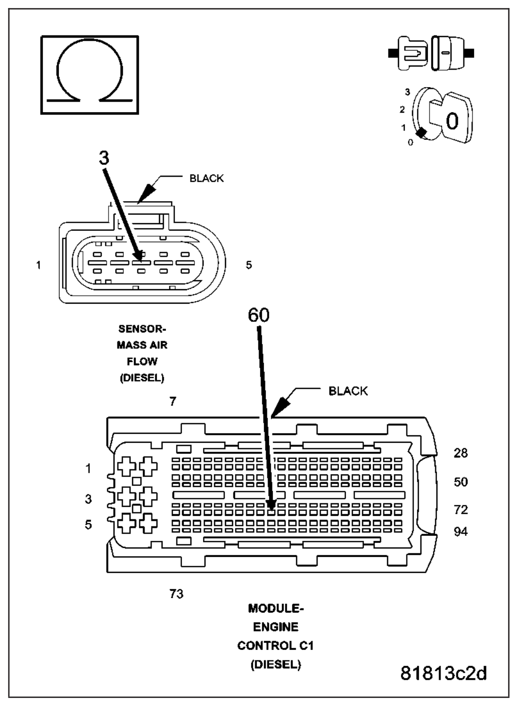
Turn the ignition off.

Disconnect the Mass Air Flow Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 3

No >> Repair the (K157) Mass Air Flow Sensor Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K957) Mass Air Flow Sensor Ground circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

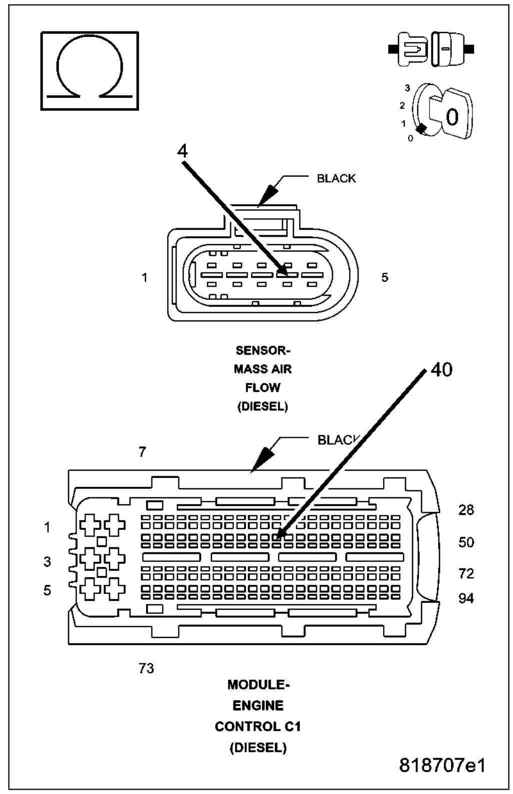
Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (K957) Mass Air Flow Sensor Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (F855) MASS AIR FLOW SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (F855) Mass Air Flow Sensor 5 Volt Supply circuit between the Mass Air Flow Sensor harness connector and the Engine Control Module (ECM) harness connector.

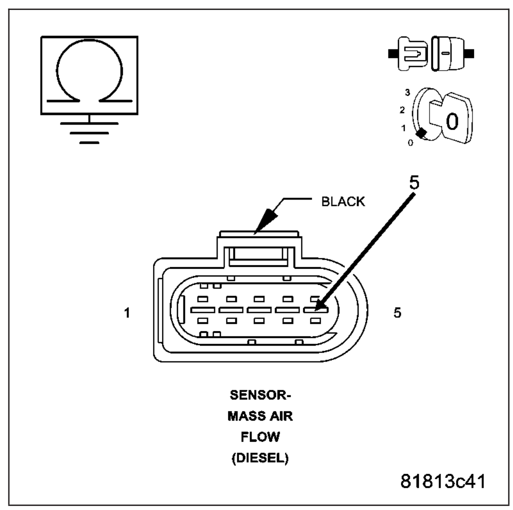
Is the resistance below 10.0 ohms?

Yes >> Go to 5

No >> Repair the (F855) Mass Air Flow Sensor 5 Volt Supply circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

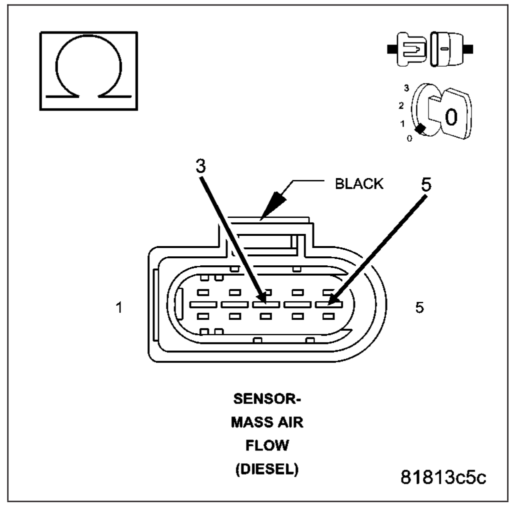
5. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 6



No >> Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO THE (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT

Measure the resistance between the (K157) Mass Air Flow Sensor Signal circuit and the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor harness connector.

Is the resistance above 1000.0 ohms?

Yes >> Go to 7

No >> Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to the (K957) Mass Air Flow Sensor Ground circuit.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. MASS AIR FLOW SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) connector.

Replace the Mass Air Flow Sensor in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 8

No >> Test Complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. ENGINE CONTROL MODULE (ECM)

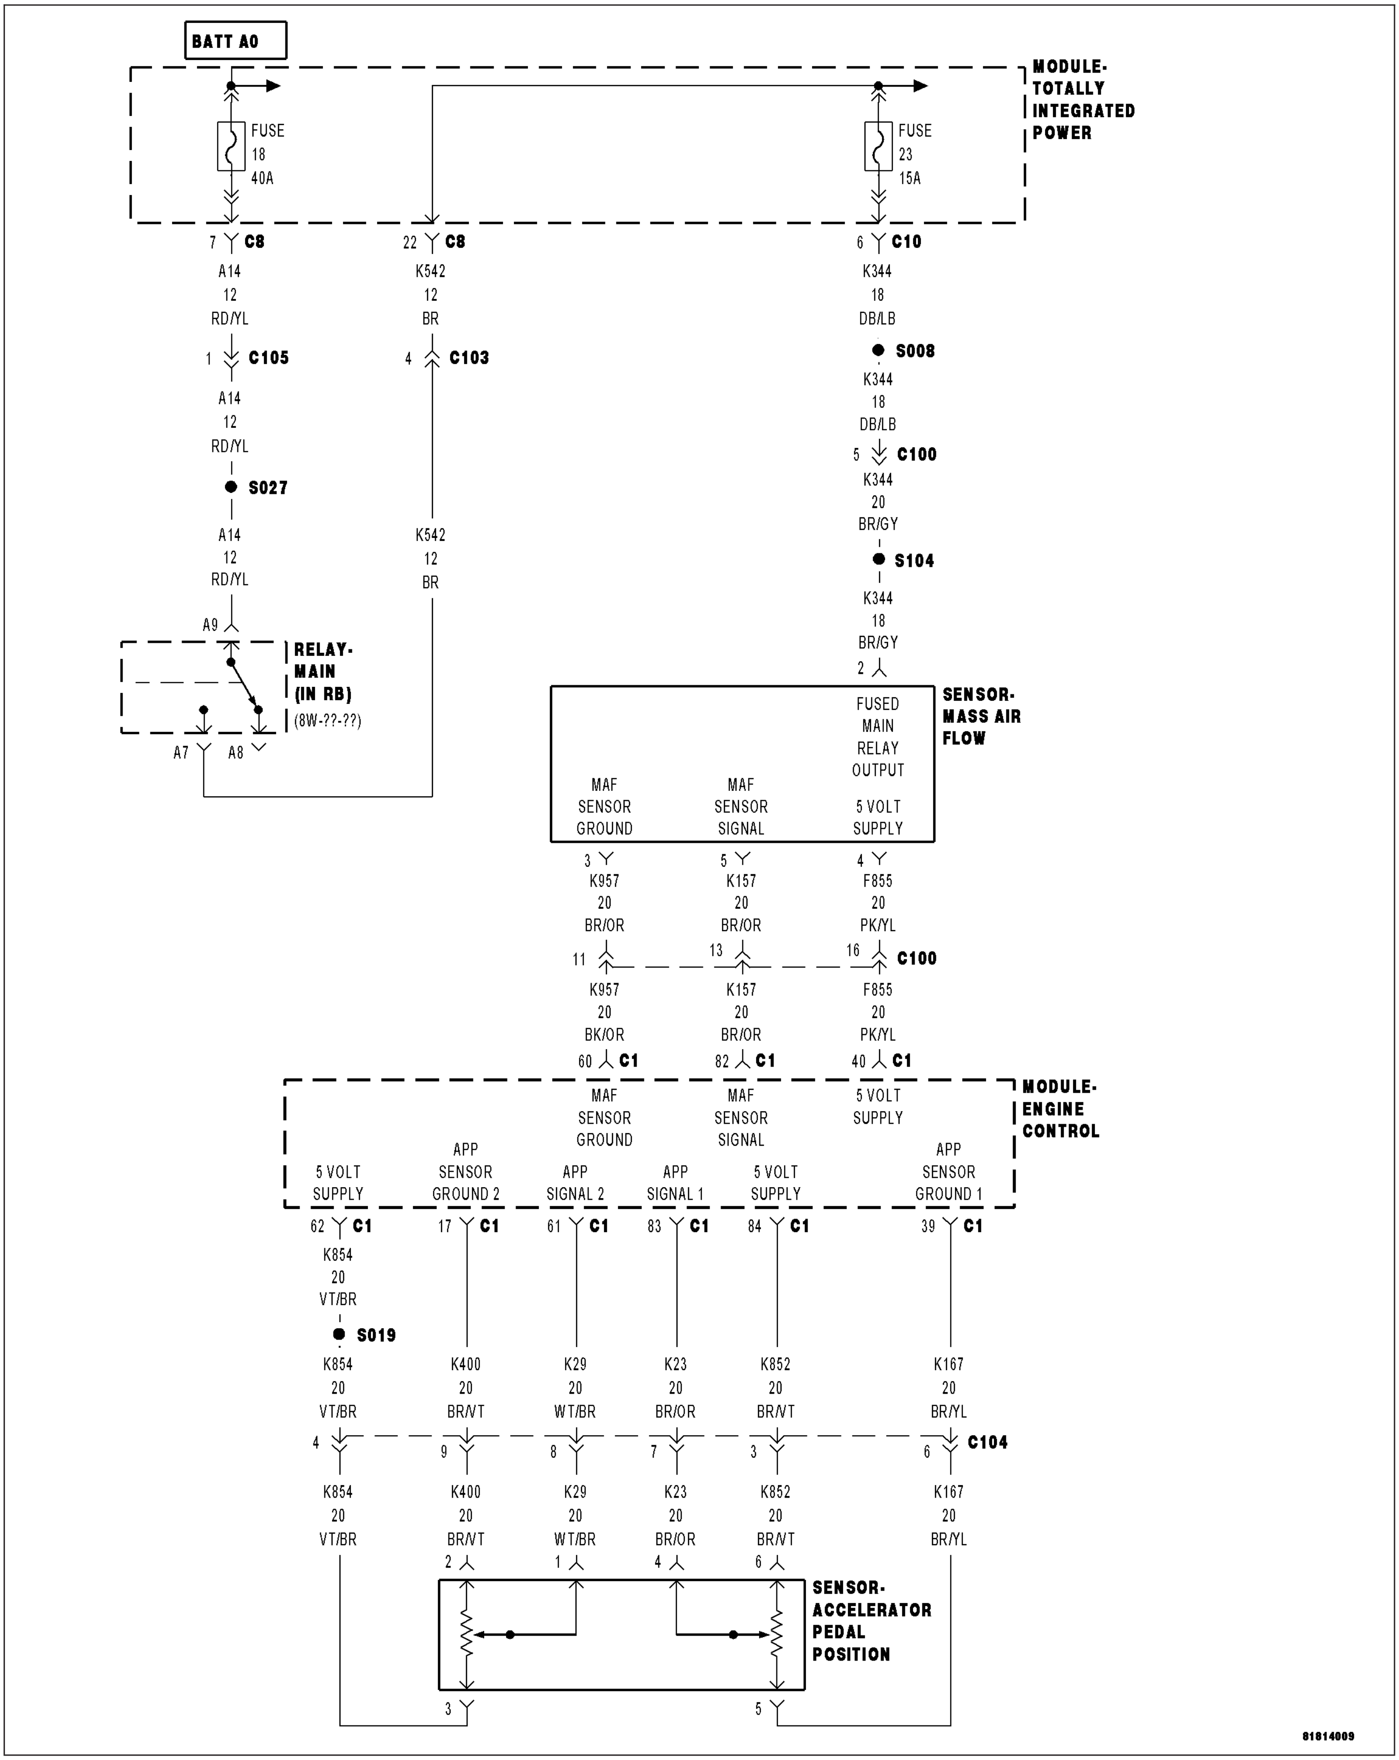
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0103-MASS AIR FLOW SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  No reference Voltage DTC’s present. With the engine running and engine speed below 5100 rpm..
- **Set Condition:**
  The (K157) Mass Air Flow Sensor Signal is above the valid operating range for 1.0 second.

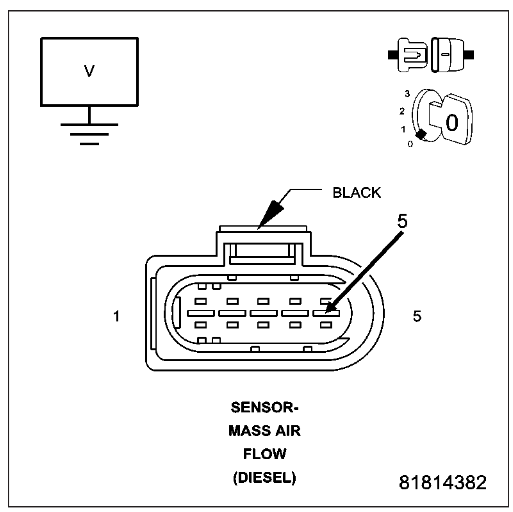
Possible Causes
INTERMITTENT DTC
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
MASS AIR FLOW SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, Clear DTCs in the Engine Control Module (ECM).
Start the engine and allow it to reach normal operating temperature.
With the scan tool, select View DTCs.



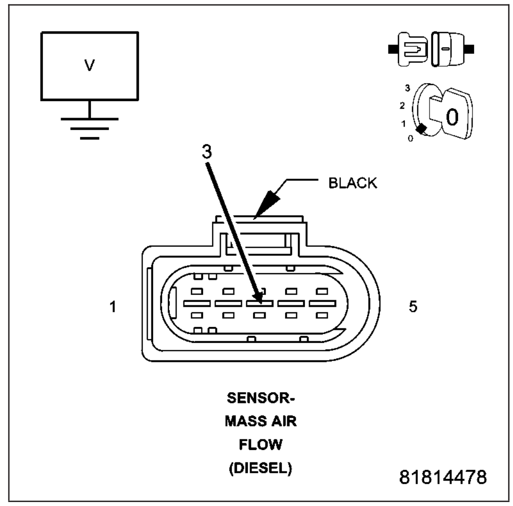
Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure.

2. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.
Disconnect the Mass Air Flow Sensor harness connector.
Turn the ignition on.
Measure the voltage of the (K157) Mass Air Flow Sensor Signal circuit in the Mass Air Flow Sensor harness connector.



Is there any voltage present?

Yes >> Repair the (K157) Mass Air Flow Sensor Signal circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

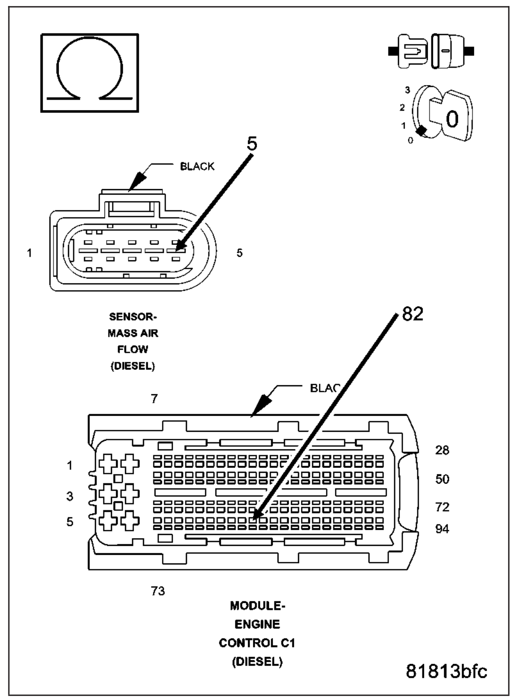
3. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K957) Mass Air Flow Sensor Ground circuit in the Mass Air Flow Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (K957) Mass Air Flow Sensor Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 4

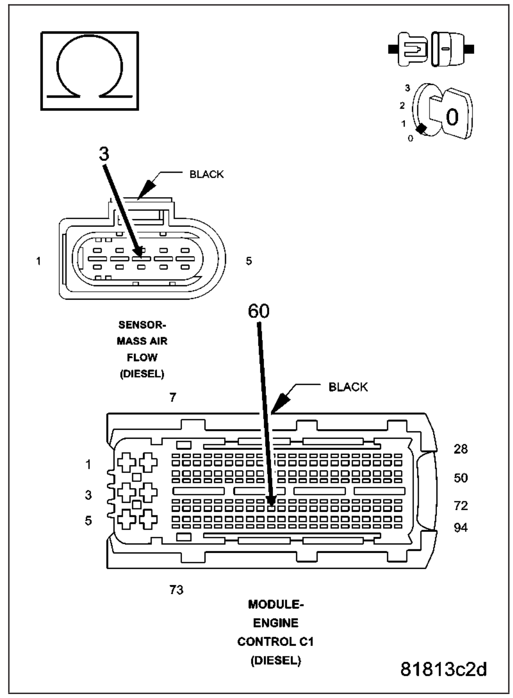
4. (K157) MASS AIR FLOW SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K157) Mass Air Flow Sensor Signal circuit between the Mass Air Flow Sensor connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 5

No >> Repair the (K157) Mass Air Flow Sensor Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K957) MASS AIR FLOW SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K957) Mass Air Flow Sensor Ground circuit between the Mass Air Flow Sensor connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 6

No >> Repair the (K957) Mass Air Flow Sensor Ground circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. MASS AIR FLOW SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) connector.

Replace the Mass Air Flow Sensor in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs.

Start the engine and allow it to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 7

No >> Test Complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

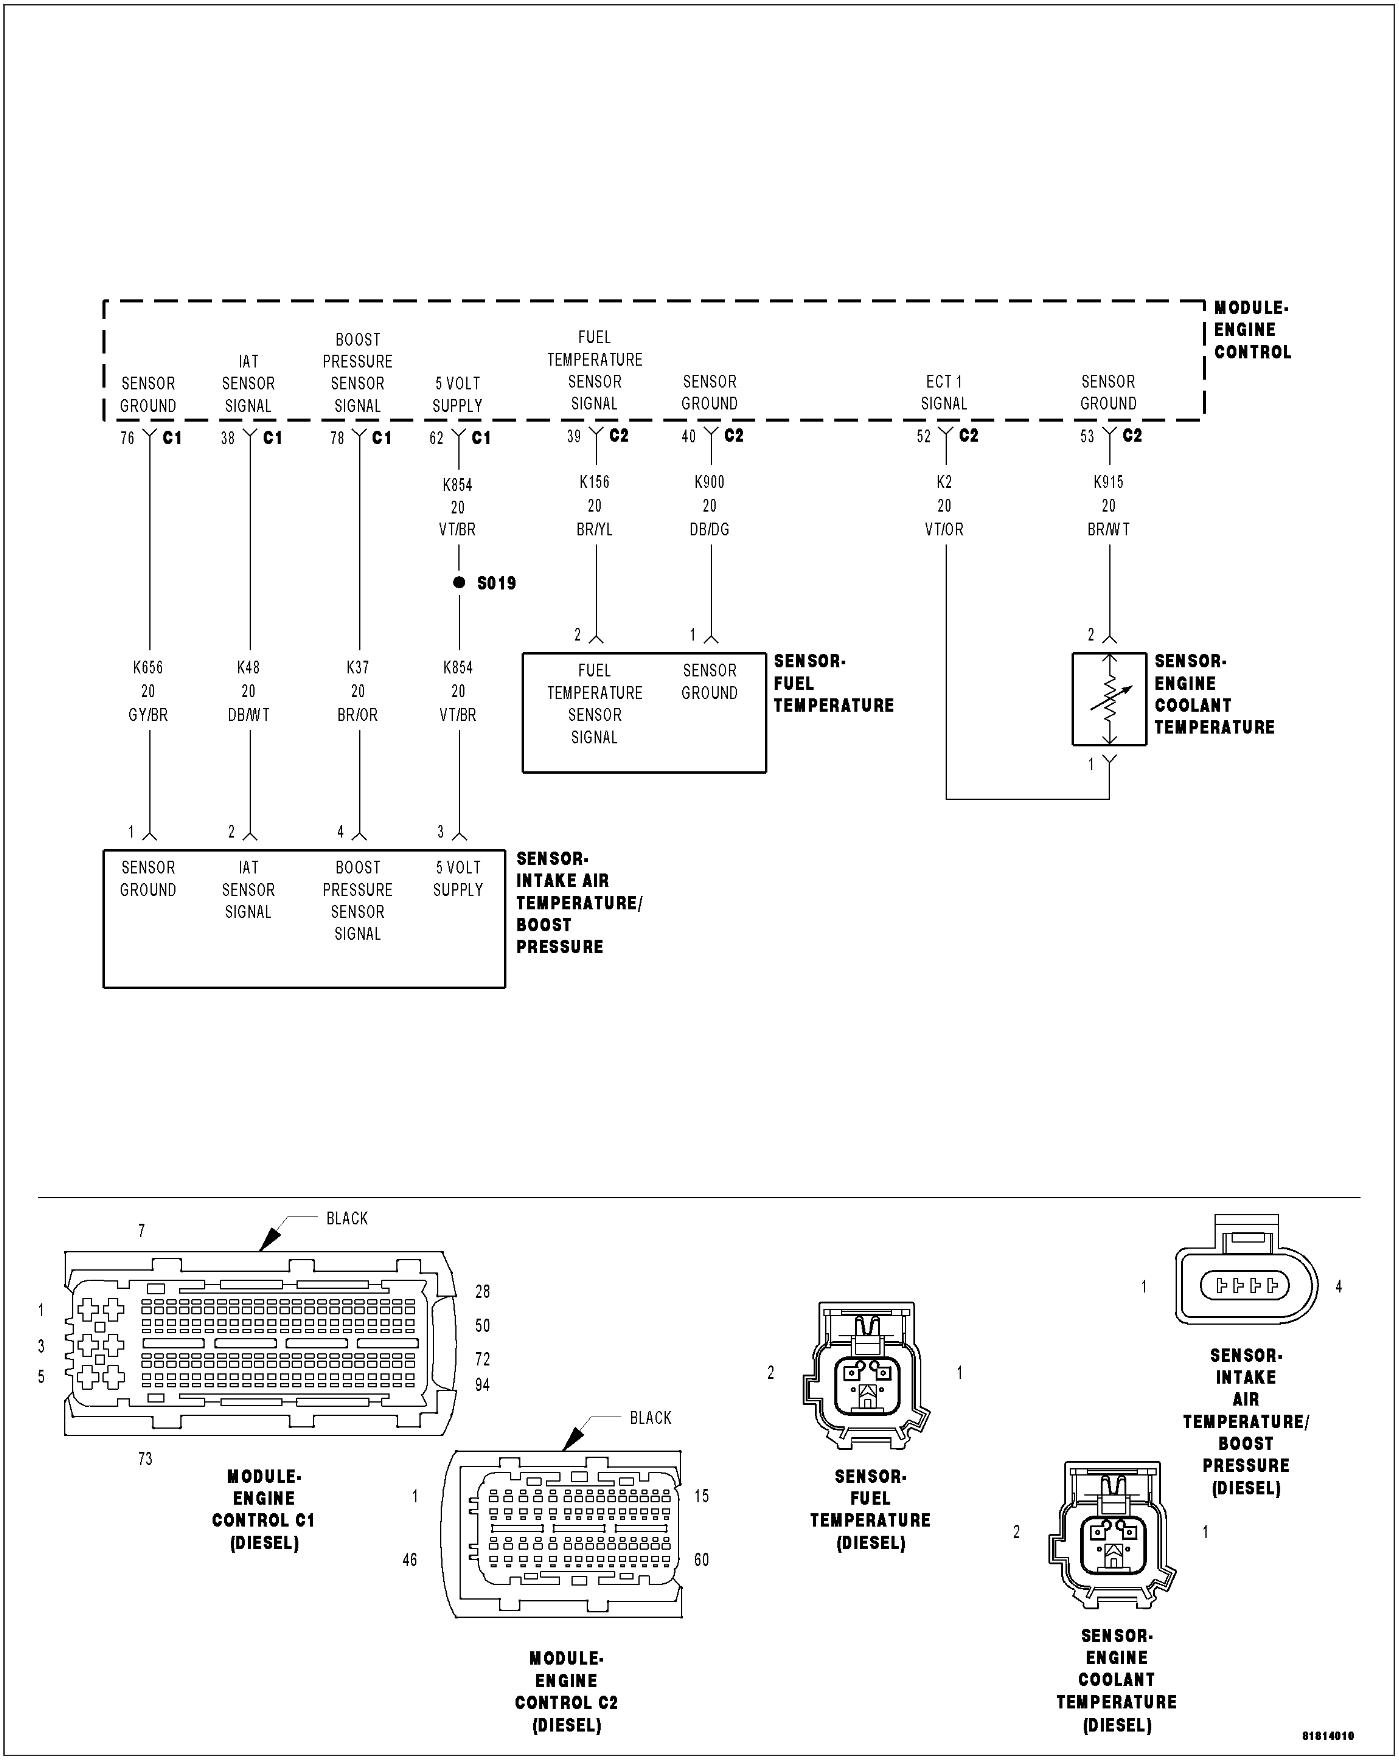
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Mass Air Flow Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0112-INTAKE AIR TEMPERATURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K48) Intake Air Temperature Sensor Signal circuit voltage is below 1.51 volts for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) INTAKE AIR TEMPERATURE SENSOR GROUND
INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

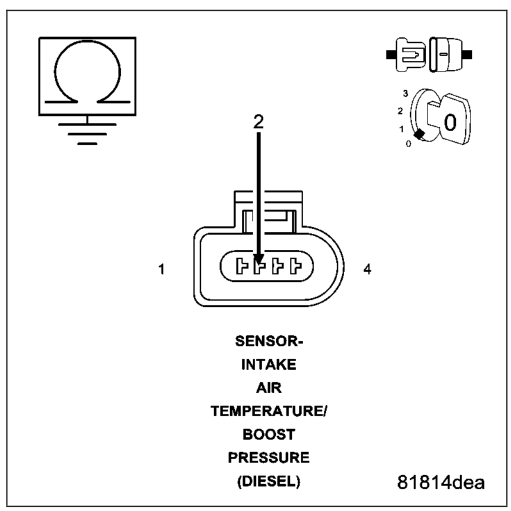
Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

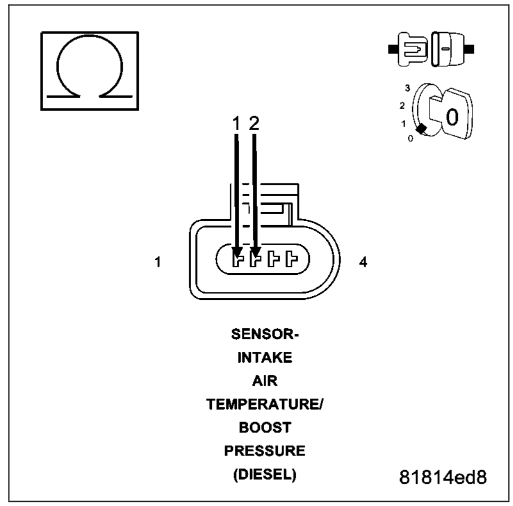
Turn the ignition off.

Disconnect the Intake Air Temperature/Boost Pressure Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K48) Intake Air Temperature Sensor Signal circuit in the Intake Air Temperature/Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 3

No >> Repair the (K48) Intake Air Temperature Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K48) Intake Air Temperature Sensor Signal circuit and the (K656) Intake Air Temperature Sensor Ground circuit in the Intake Air Temperature/Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 4

No >> Repair the (K48) Intake Air Temperature Sensor Signal circuit for a short to the (K656) Intake Air Temperature Sensor Ground circuit.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) connector.

Turn the ignition on.

With the scan tool, clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Intake Air Temperature Sensor high voltage or open circuit DTC with the Intake Air Temperature Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Intake Air Temperature/Boost Pressure Sensor in accordance with the service information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. ENGINE CONTROL MODULE (ECM)

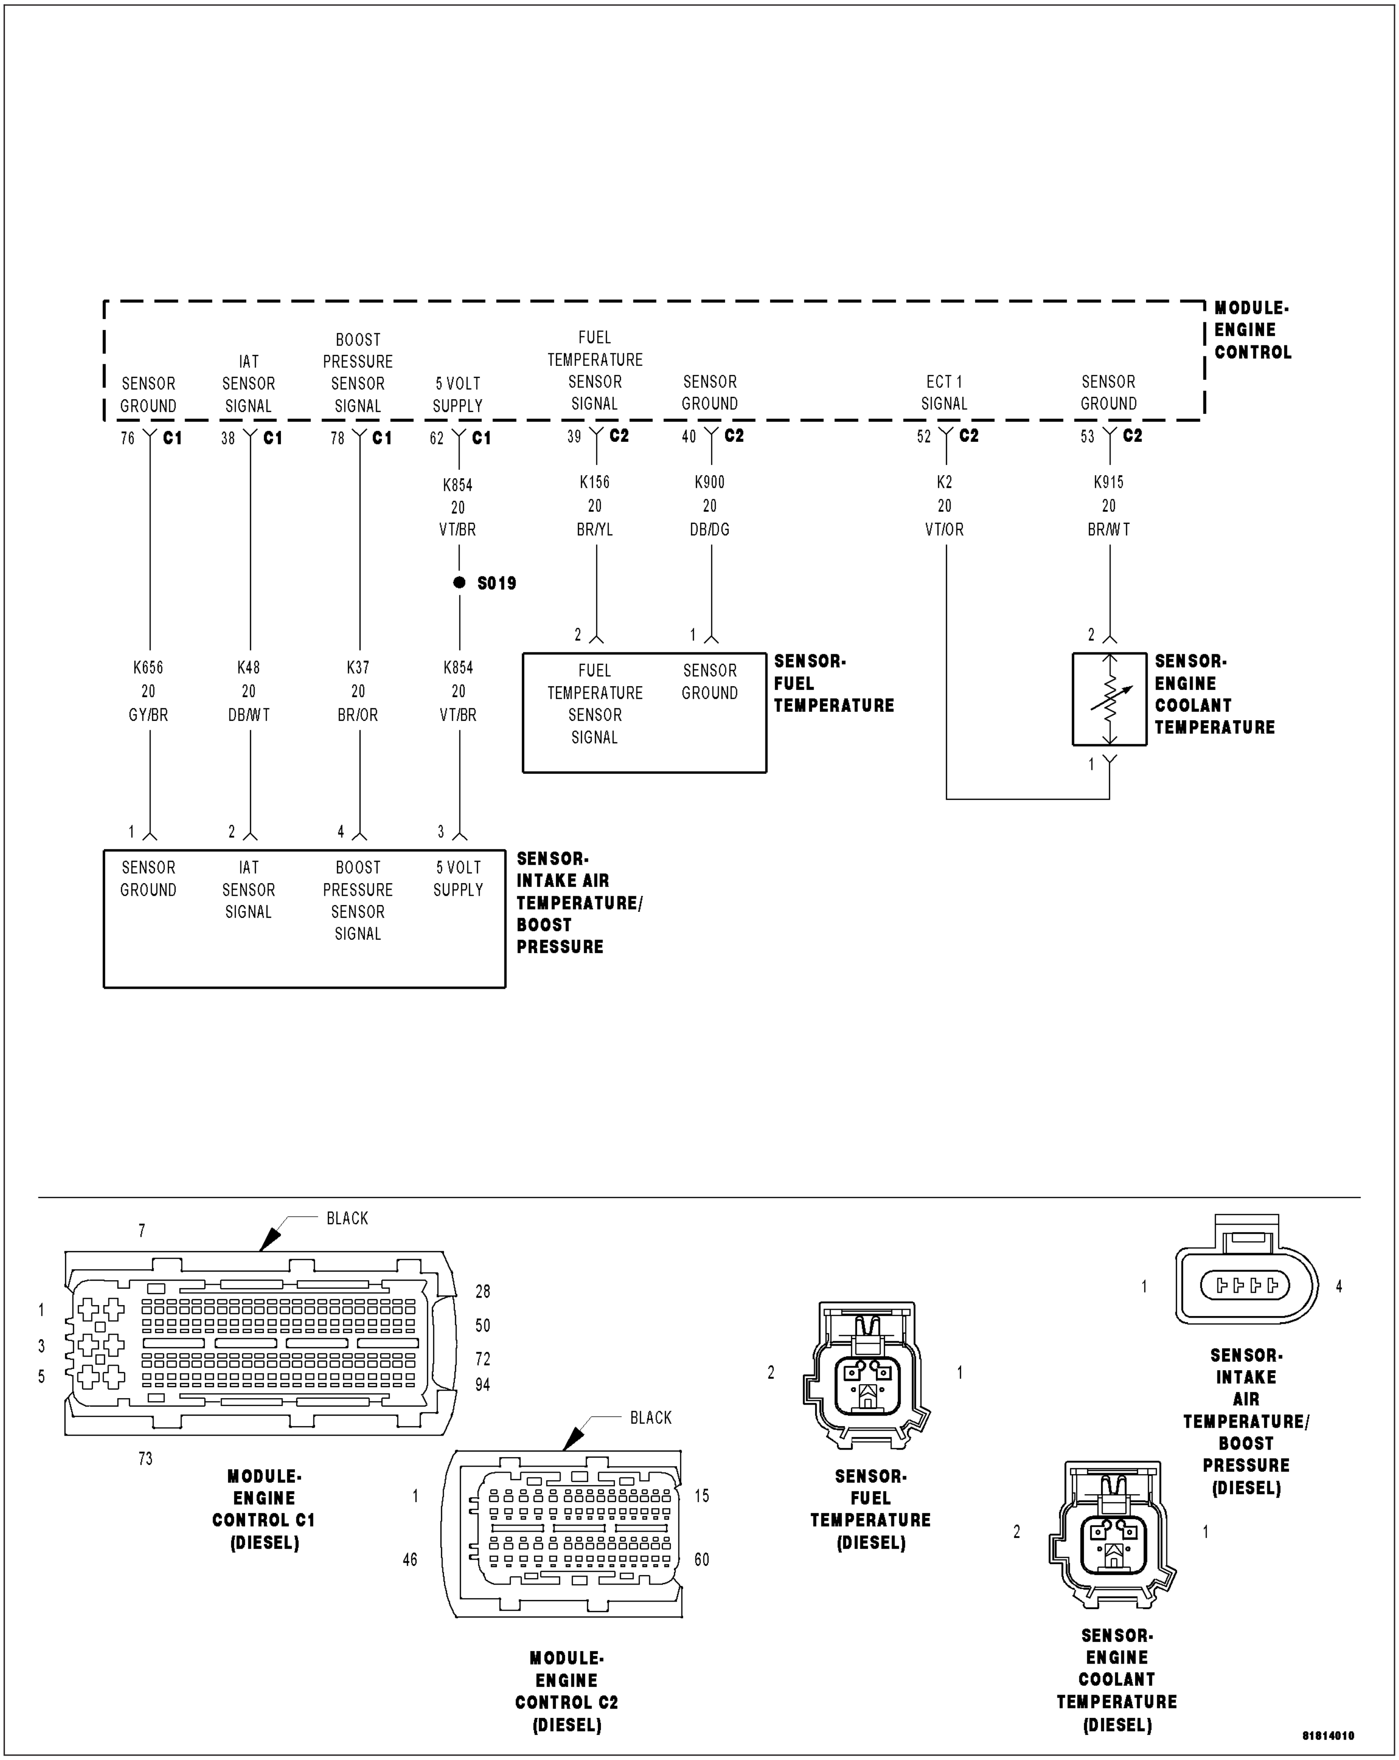
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Air Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0113-INTAKE AIR TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K48) Intake Air Temperature Sensor Signal circuit voltage is above 4.82 volts for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
INTAKE AIR TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

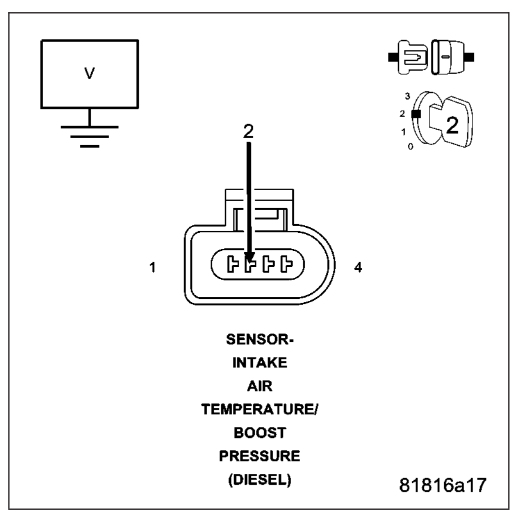
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Intake Air Temperature/Boost Pressure Sensor harness connector.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

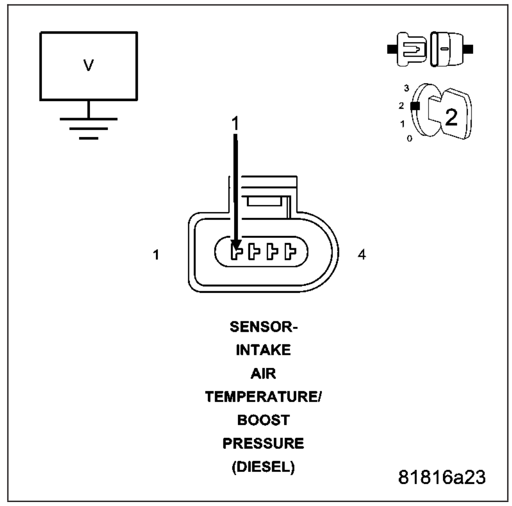
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K48) Intake Air Temperature Sensor Signal circuit in the Intake Air Temperature/Boost Pressure Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (K48) Intake Air Temperature Sensor Signal circuit for a short to voltage.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K656) Intake Air Temperature Sensor Ground circuit in the Intake Air Temperature/Boost Pressure Sensor harness connector.

81816a23

Is there any voltage present?

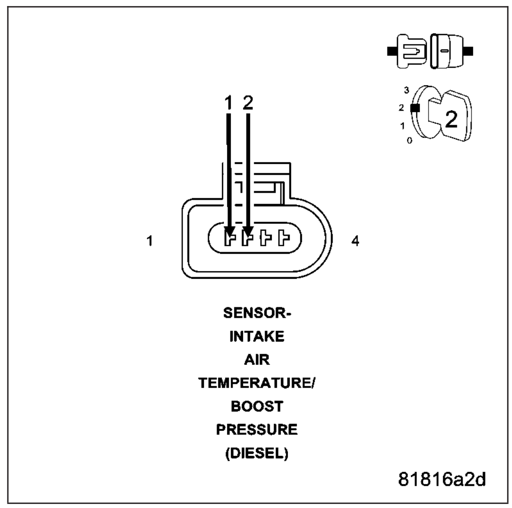
Yes >> Repair the (K656) Intake Air Temperature Sensor Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR

Turn the ignition off.



Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K656) Intake Air Temperature Sensor Ground circuit and the (K48) Intake Air Temperature Sensor Signal circuit in the Intake Air Temperature/Boost Pressure Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

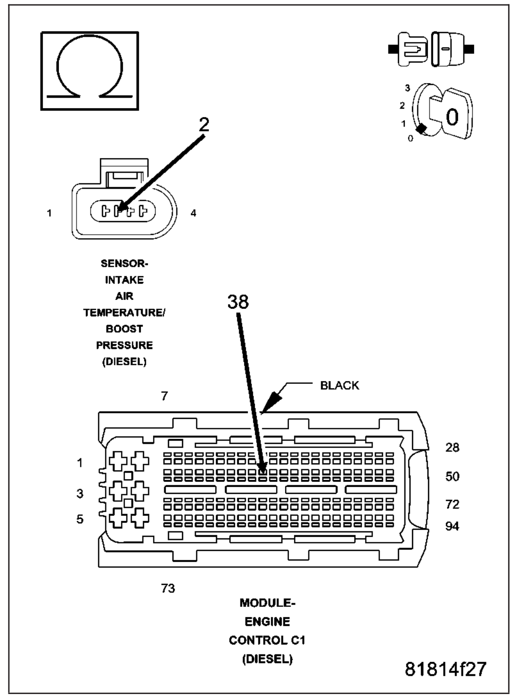
81816a2d

NOTE: The scan tool should display an Intake Air Temperature Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Intake Air Temperature/Boost Pressure Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 5

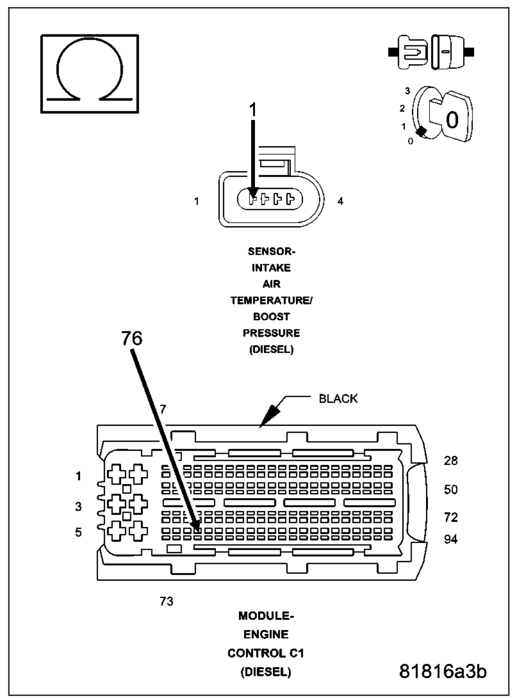
5. (K48) INTAKE AIR TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K48) Intake Air Temperature Sensor Signal circuit between the Intake Air Temperature/Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 6

No >> Repair the (K48) Intake Air Temperature Sensor Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K656) INTAKE AIR TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K656) Intake Air Temperature Sensor Ground circuit between the Intake Air Temperature/Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 7

No >> Repair the (K656) Intake Air Temperature Sensor Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

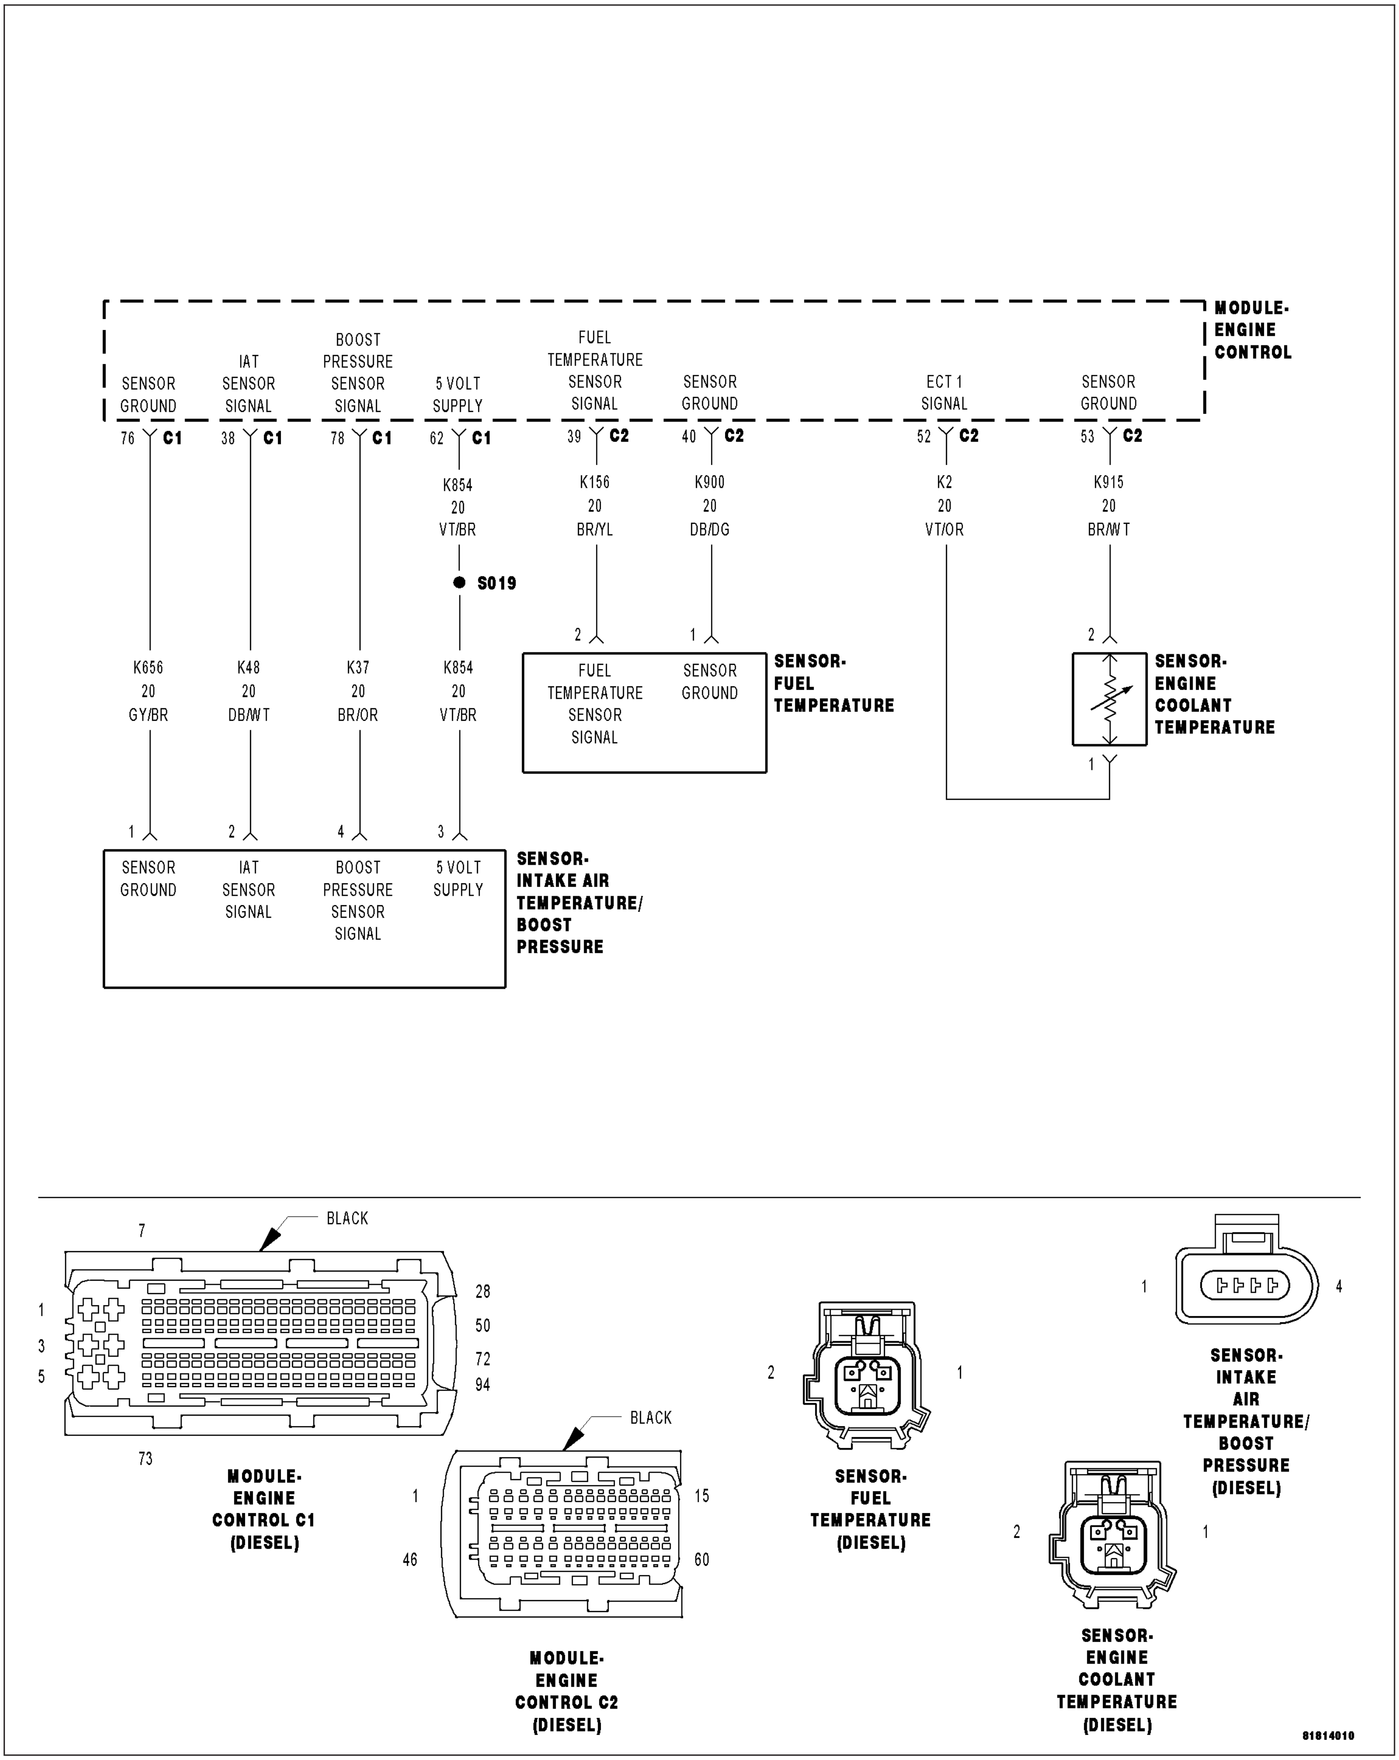
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Intake Air Temperature/Boost Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0117-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K2) Engine Coolant Temperature Sensor Signal circuit voltage is below 0.68 volt for 0.48 second.

Possible Causes
INTERMITTENT DTC
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K915) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT
ENGINE COOLANT TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

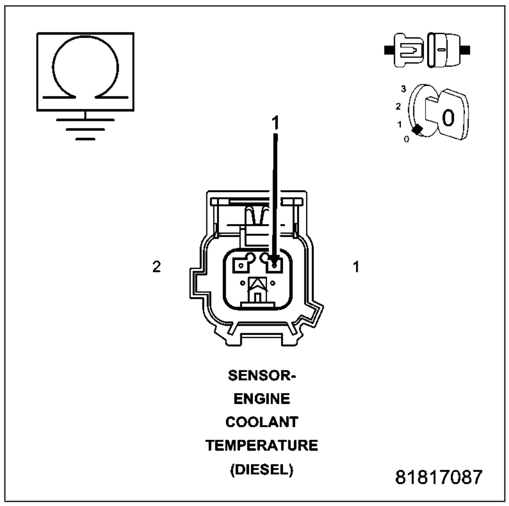
Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

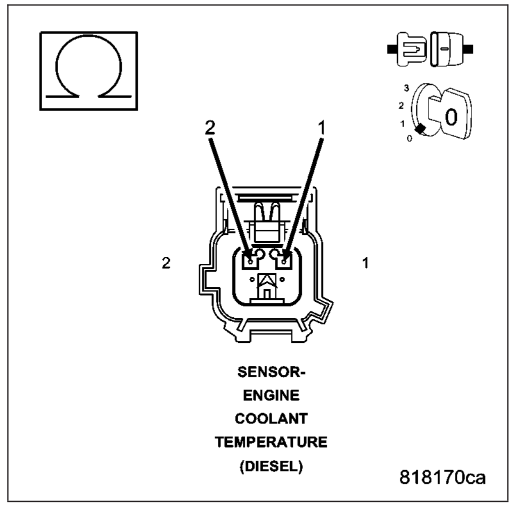
Turn the ignition off.

Disconnect the Engine Coolant Temperature Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 3

No >> Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K915) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K2) Engine Coolant Temperature Sensor Signal circuit and the (K915) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 4

No >> Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to the (K915) Engine Coolant Temperature Sensor Ground circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. ENGINE COOLANT TEMPERATURE SENSOR

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Engine Coolant Temperature Sensor high voltage or open circuit DTC with the connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Engine Coolant Temperature Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

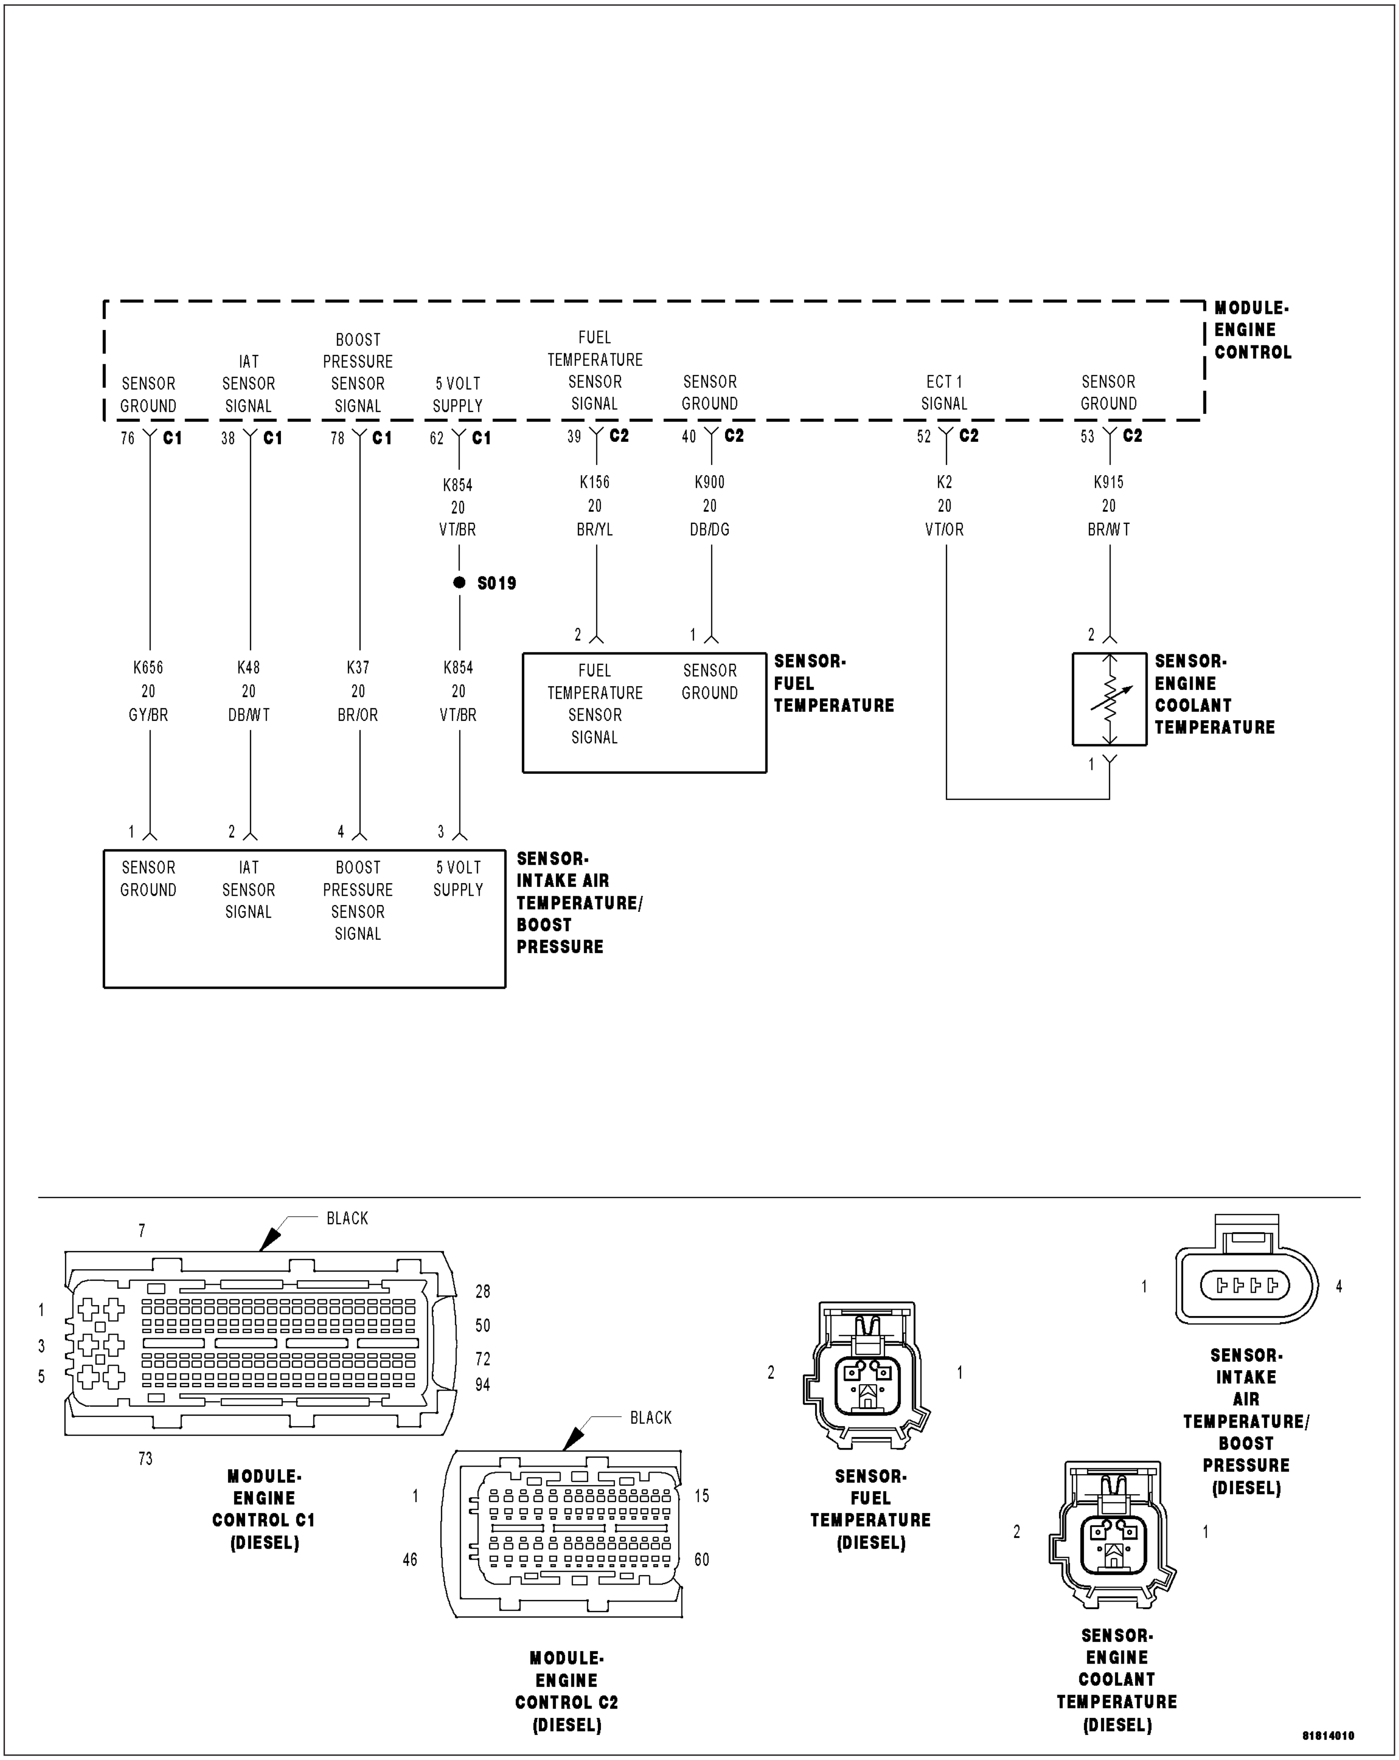
Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0118-ENGINE COOLANT TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K2) Engine Coolant Temperature Sensor Signal circuit voltage is above 4.75 volts for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K915) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K915) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ENGINE COOLANT TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

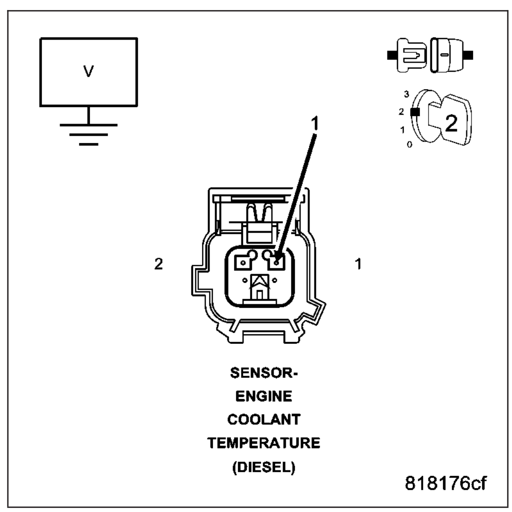
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Coolant Temperature Sensor connector.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

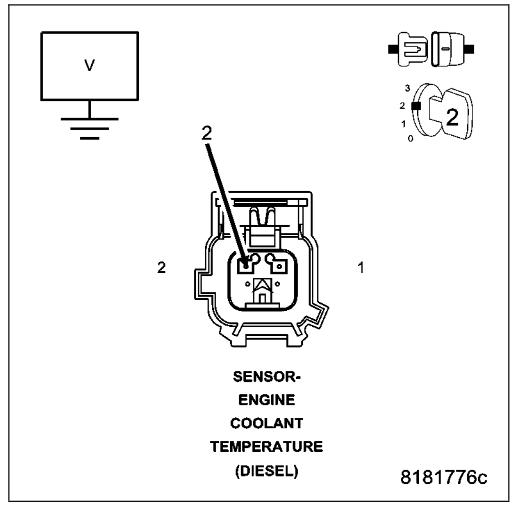
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for a short to voltage.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K915) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K915) Engine Coolant Temperature Sensor Ground circuit in the Engine Coolant Temperature Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (K915) Engine Coolant Temperature Sensor Ground circuit for a short to voltage.

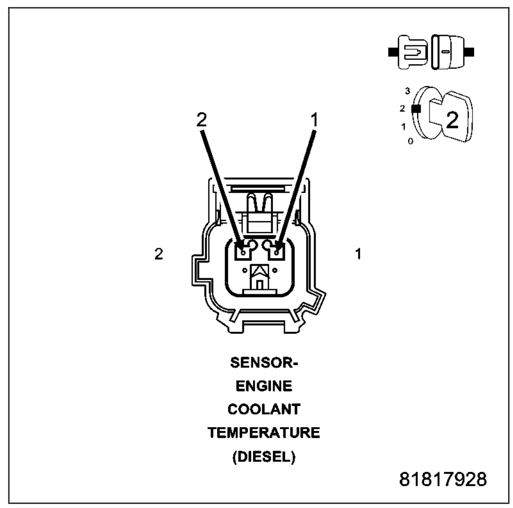
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. ENGINE COOLANT TEMPERATURE SENSOR

NOTE: Remove the jumper wire.

Turn the ignition off.



Connect the Engine Control Module (ECM) connector.

Connect a jumper wire between the (K915) Engine Coolant Temperature Sensor Ground circuit and the (K2) Engine Coolant Temperature Sensor Signal circuit in the Engine Coolant Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

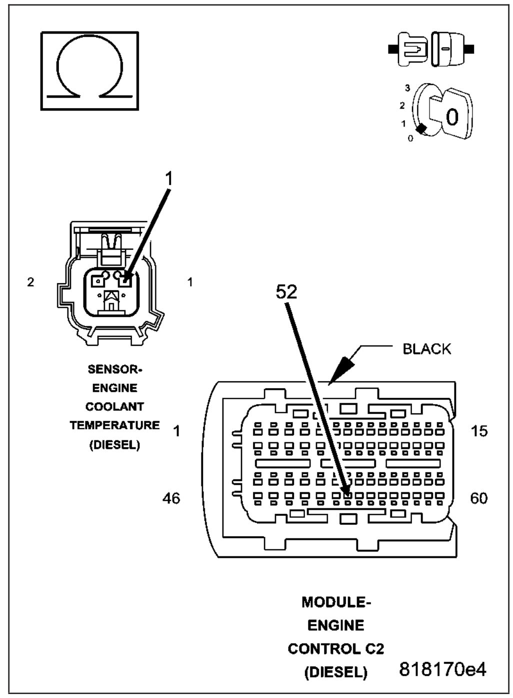
With the scan tool, select View DTCs.

NOTE: The scan tool should display an Engine Coolant Temperature Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Engine Coolant Temperature Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 5

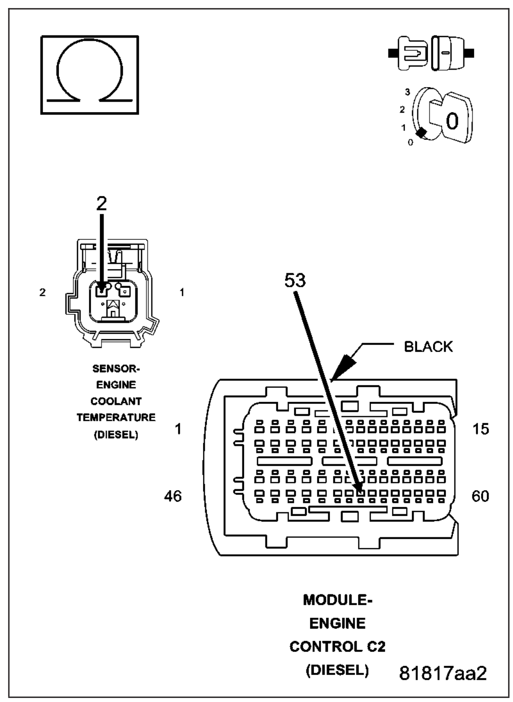
5. (K2) ENGINE COOLANT TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K2) Engine Coolant Temperature Sensor Signal circuit between the Engine Coolant Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 6

No >> Repair the (K2) Engine Coolant Temperature Sensor Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K915) ENGINE COOLANT TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K915) Engine Coolant Temperature Sensor Ground circuit between the Engine Coolant Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 7

No >> Repair the (K915) Engine Coolant Temperature Sensor Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Engine Coolant Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0128-THERMOSTAT RATIONALITY

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Engine temperature is at or below 19.9°C. With the engine running and no other ECT Sensor related DTC's present.
- **Set Condition:**
  Engine temperature does not increase by 10°C within 5 minutes.

Possible Causes
ENGINE COLD TOO LONG

Diagnostic Test

1. CHECK COOLING SYSTEM PERFORMANCE

NOTE: The best way to diagnose this DTC is to allow the vehicle to remain outside overnight in order to have a completely cold soaked engine.

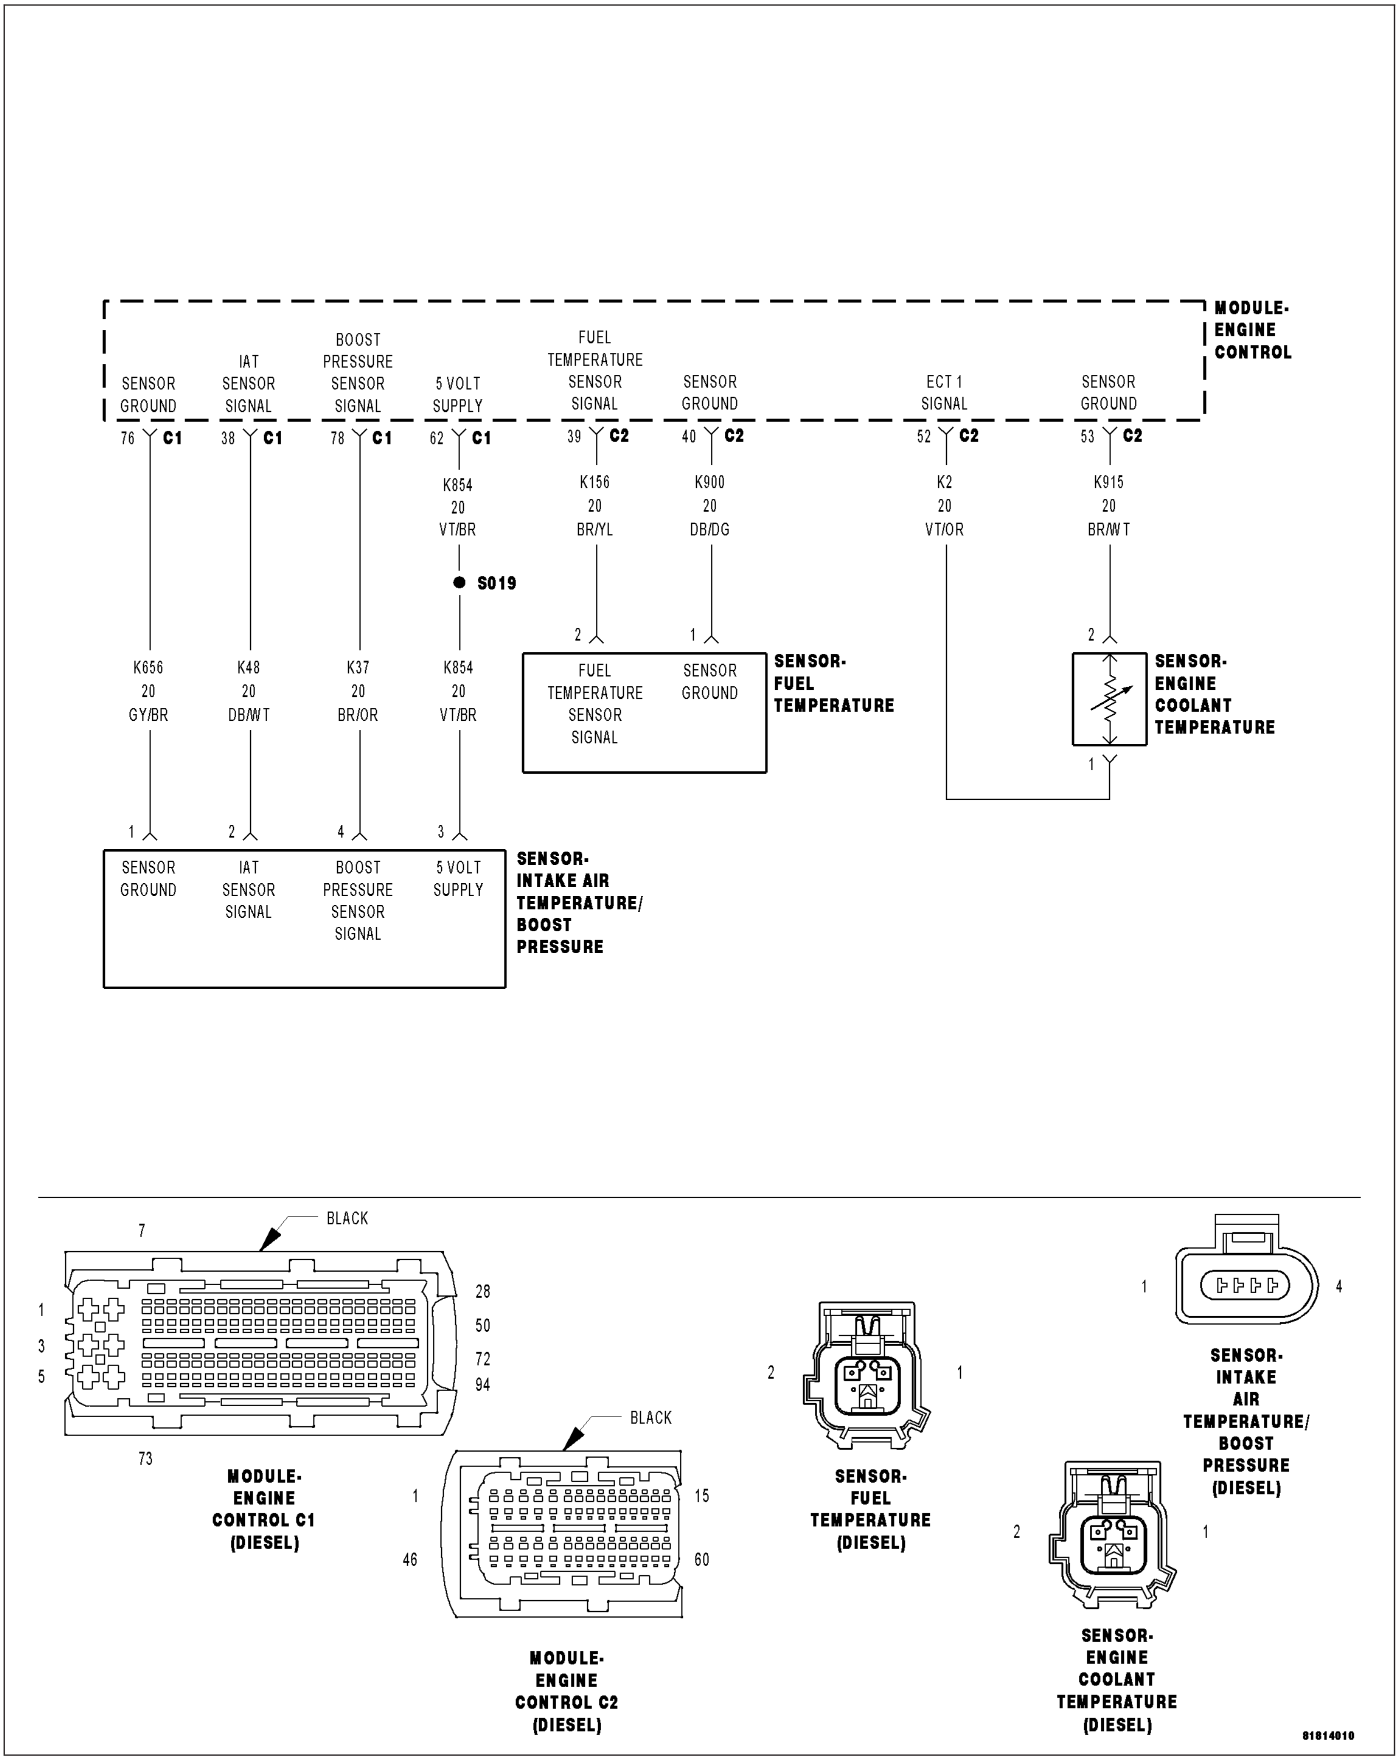
NOTE: Extremely cold outside ambient temperatures may cause this DTC to set.

Verify that the coolant level is correct.

Start the engine.

With the scan tool, set the engine RPM to 1500 and allow the engine to warm up for 10-15 minutes.

With the scan tool, monitor the Engine Coolant Temperature value during the warm up cycle. Make sure the transition of temperature change is smooth.



Did the engine temperature reach a minimum of 80° C (176° F)?

Yes >> Test Complete.

No >> Refer to the Service Information for cooling system performance diagnosis. The most probable cause is a Thermostat problem. Also, refer to any related TSBs.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0181–FUEL TEMPERATURE SENSOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
FUEL TEMPERATURE SENSOR - COLD
FUEL TEMPERATURE SENSOR - HOT
FUEL TEMPERATURE SENSOR CIRCUIT OPEN OR HIGH RESISTANCE
CONNECTOR OR TERMINAL PROBLEM
INTERMITTENT CONDITION

Diagnostic Test

1. CHECKING FUEL TEMPERATURE SENSOR CONNECTOR

Turn the ignition off.

Disconnect the Fuel Temperature Sensor harness connector.

Inspect the connector for poor terminal contact, corrosion, damage or other problems.

Is there any evidence of connector problems?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 2

2. FUEL TEMPERATURE SENSOR CIRCUITS OPEN OR HIGH RESISTANCE

Disconnect the ECM harness connectors.

Measure the resistance of both Fuel Temperature Sensor circuits between the Fuel Temperature Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for both measurements?

Yes >> Go To 3

No >> Repair the Fuel Temperature Sensor circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. FUEL TEMPERATURE SENSOR - COLD

NOTE: Allow the engine to completely cool to ambient temperature.

Connect the ECM harness connector.

Connect the Fuel Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, read and note the engine coolant temperature.

With the scan tool, read the Fuel Temperature and compare it to the engine coolant temperature reading.

Are the readings within 7°C (13°F) of each other?

Yes >> Go To 4

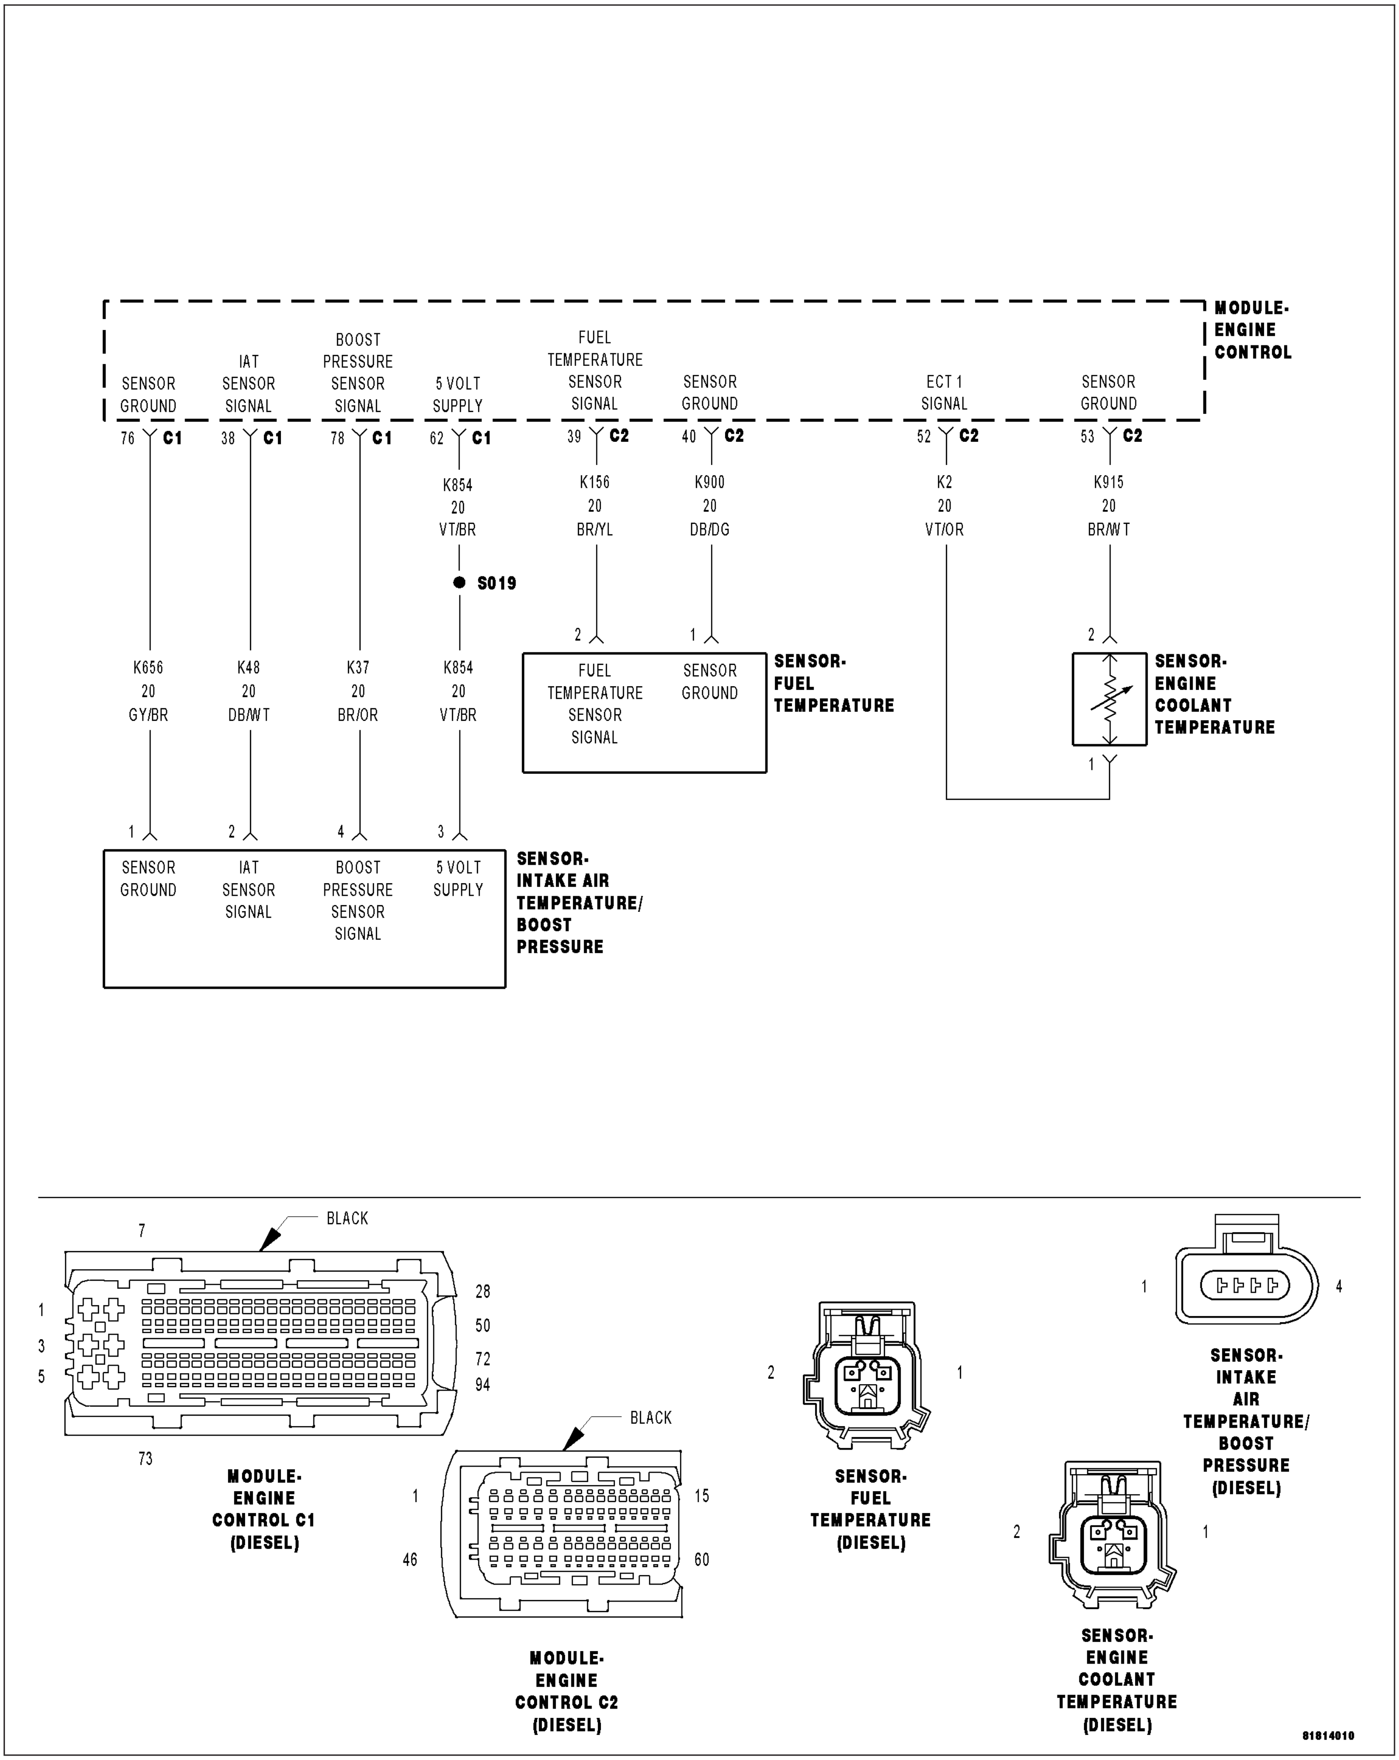
No >> Check the wiring and connectors associated with the Fuel Temperature Sensor for corrosion, damage or other problems. Repair as necessary. If no problems are found, replace the Fuel Temperature Sensor.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. FUEL TEMPERATURE SENSOR - HOT

Start the engine and bring the engine to operating temperature (thermostat open).

Turn the engine off and wait 15 minutes to allow the engine temperature to stabilize.

With the scan tool, read and note the engine coolant temperature.



With the scan tool, read the Fuel Temperature.

Are the readings within 7°C (13°F) of each other?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Check the wiring and connectors associated with the Fuel Temperature Sensor for corrosion, damage or other problems. Repair as necessary. If no problems are found, replace the Fuel Temperature Sensor. Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0182-FUEL TEMPERATURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K156) Fuel Temperature Sensor Signal circuit voltage is below 0.41 volts.

Possible Causes
INTERMITTENT DTC
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K900) FUEL TEMPERATURE SENSOR GROUND
FUEL TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL TEMPERATURE SENSOR

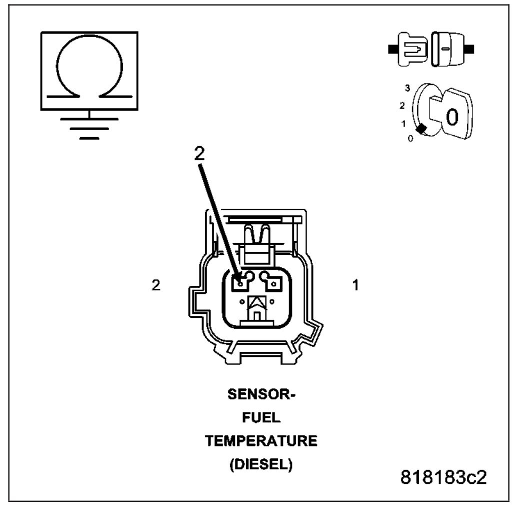
Turn the ignition off.

Disconnect the Fuel Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, clear DTCs.

With the scan tool, select View DTCs.



NOTE: The scan tool should display a Fuel Temperature Sensor High voltage or open circuit DTC with the Fuel Temperature Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Fuel Temperature Sensor in accordance with the service information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

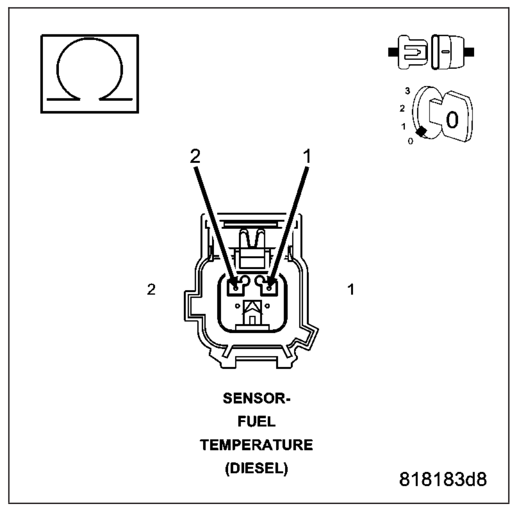
No >> Go to 3

3. (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K156) Fuel Temperature Sensor Signal circuit in the Fuel Temperature Sensor harness connector.



Is the resistance above 1000 ohms?

Yes >> Go to 4

No >> Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (K900) FUEL TEMPERATURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K156) Fuel Temperature Sensor Signal circuit and the (K900) Fuel Temperature Sensor Ground circuit in the Fuel Temperature Sensor harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 5

No >> Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to the (K900) Fuel Temperature Sensor Ground circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

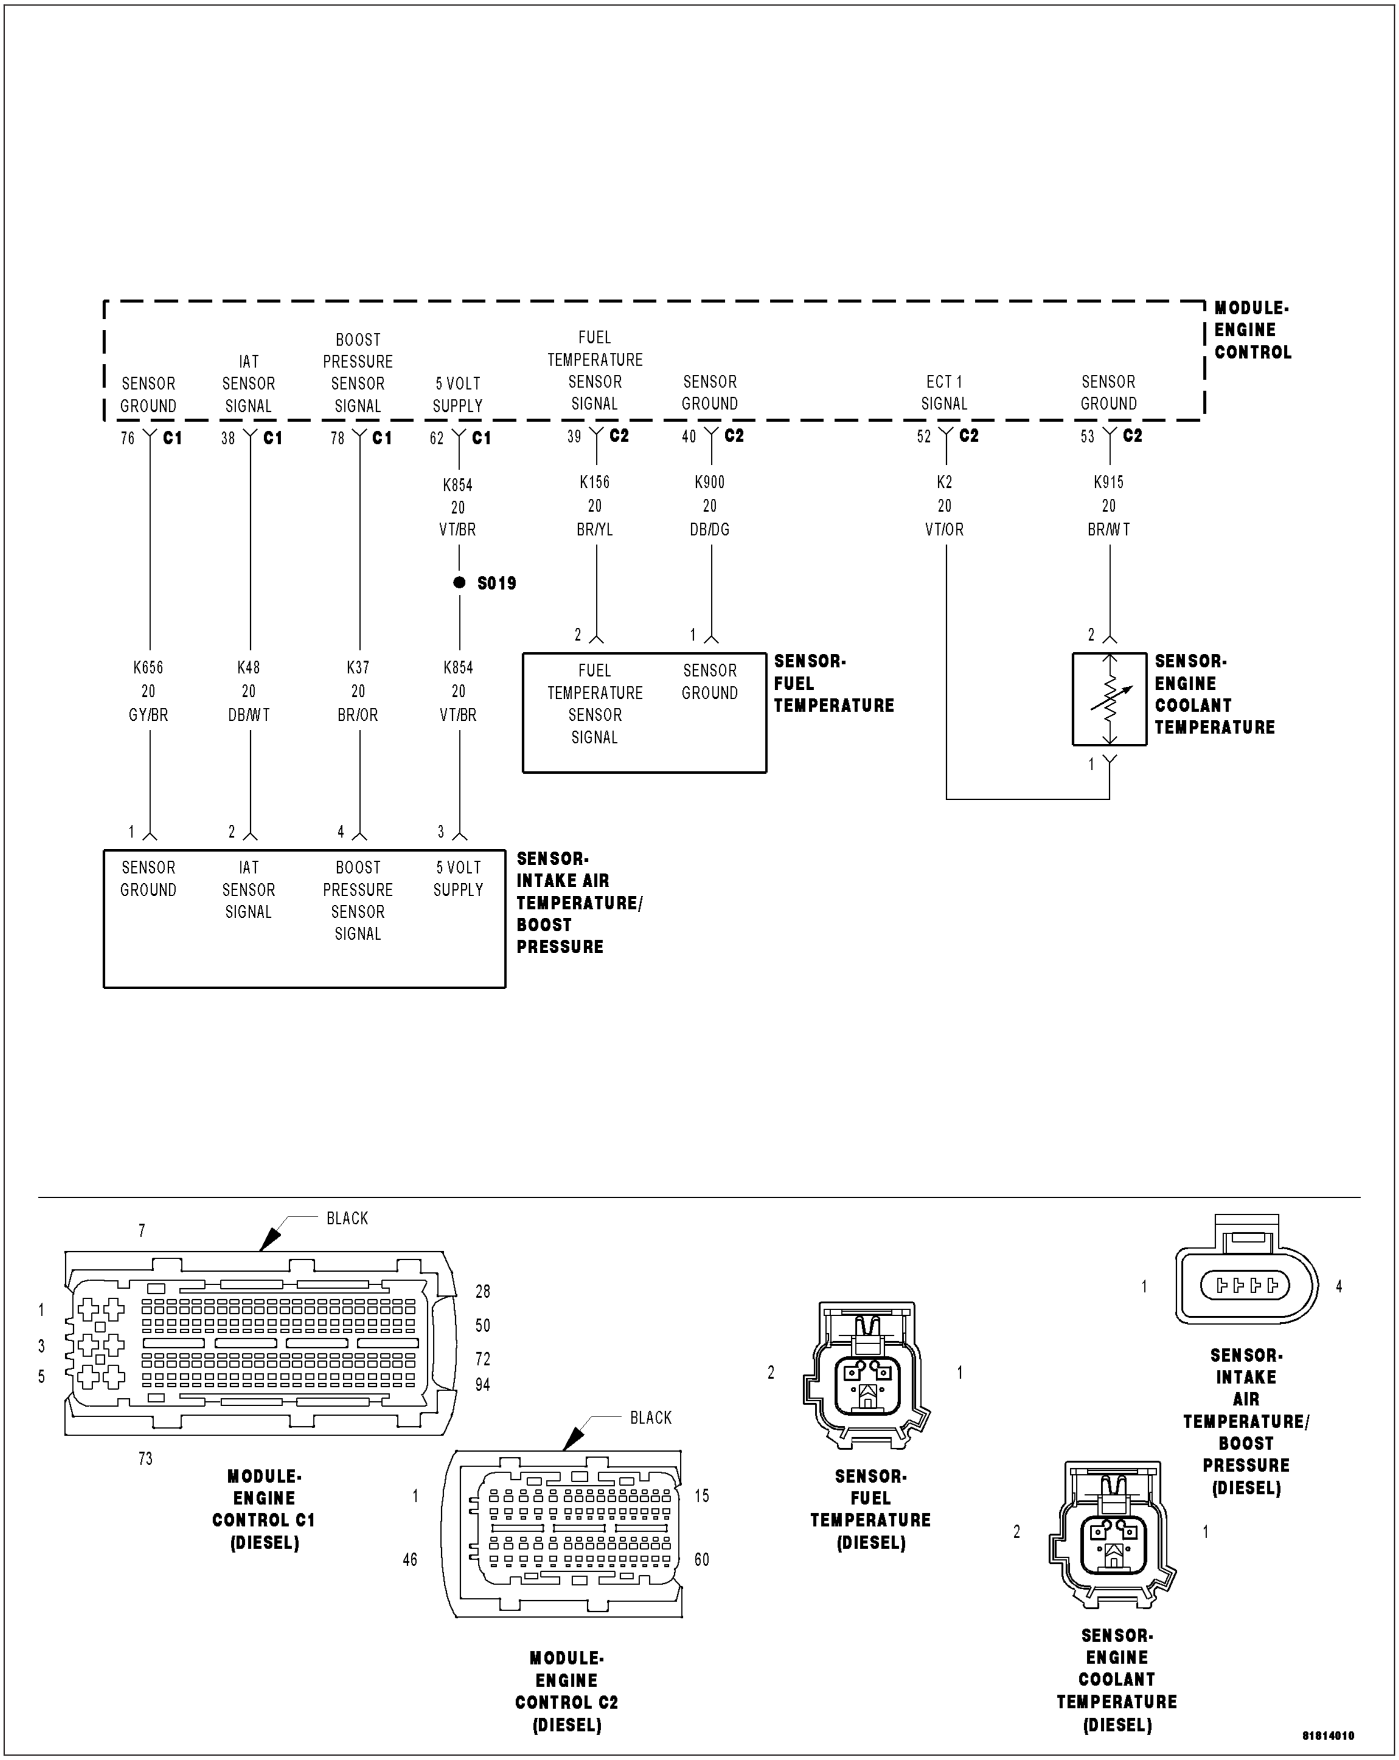
Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0183-FUEL TEMPERATURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K156) Fuel Temperature Sensor Signal circuit voltage is above 4.98 volts.

Possible Causes
INTERMITTENT DTC
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K900) FUEL TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K900) FUEL TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
FUEL TEMPERATURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

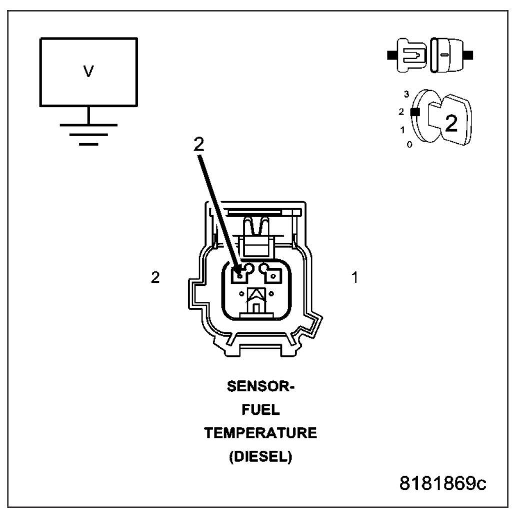
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K156) FUEL TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Temperature Sensor harness connector.



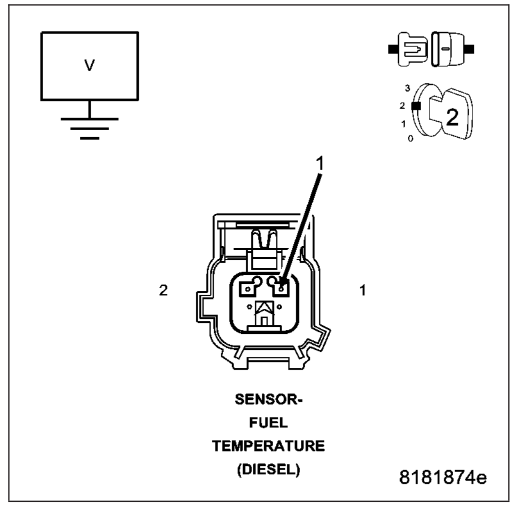
Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K156) Fuel Temperature Sensor Signal circuit in the Fuel Temperature Sensor harness connector.



Is there any voltage present?

Yes >> Repair the (K156) Fuel Temperature Sensor Signal circuit for a short to voltage.

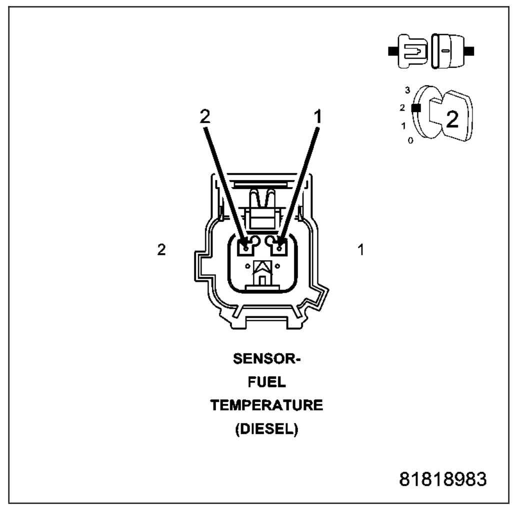
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K900) FUEL TEMPERATURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K900) Fuel Temperature Sensor Ground circuit in the Fuel Temperature Sensor harness connector.



Is there any voltage present?

Yes >> Repair the (K900) Fuel Temperature Sensor Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. FUEL TEMPERATURE SENSOR

NOTE: Remove the jumper wire.

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K900) Fuel Temperature Sensor Ground circuit and the (K156) Fuel Temperature Sensor Signal circuit in the Fuel Temperature Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

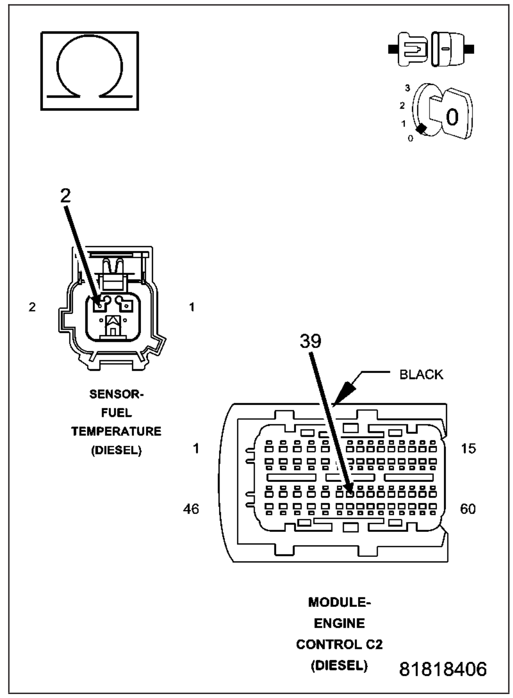
With the scan tool, select View DTCs.

NOTE: The scan tool should display a Fuel Temperature Sensor Low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Fuel Temperature Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 5

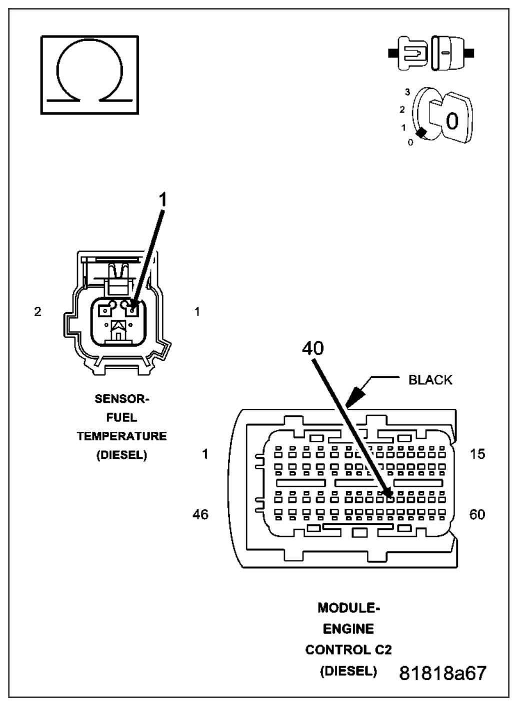
5. (K156) FUEL TEMPERATURE SENSOR SIGNAL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) connector.

Measure the resistance of the (K156) Fuel Temperature Sensor Signal circuit between the Fuel Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 6

No >> Repair the (K156) Fuel Temperature Sensor Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K900) FUEL TEMPERATURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K900) Fuel Temperature Sensor Ground circuit between the Fuel Temperature Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 7

No >> Repair the (K900) Fuel Temperature Sensor Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

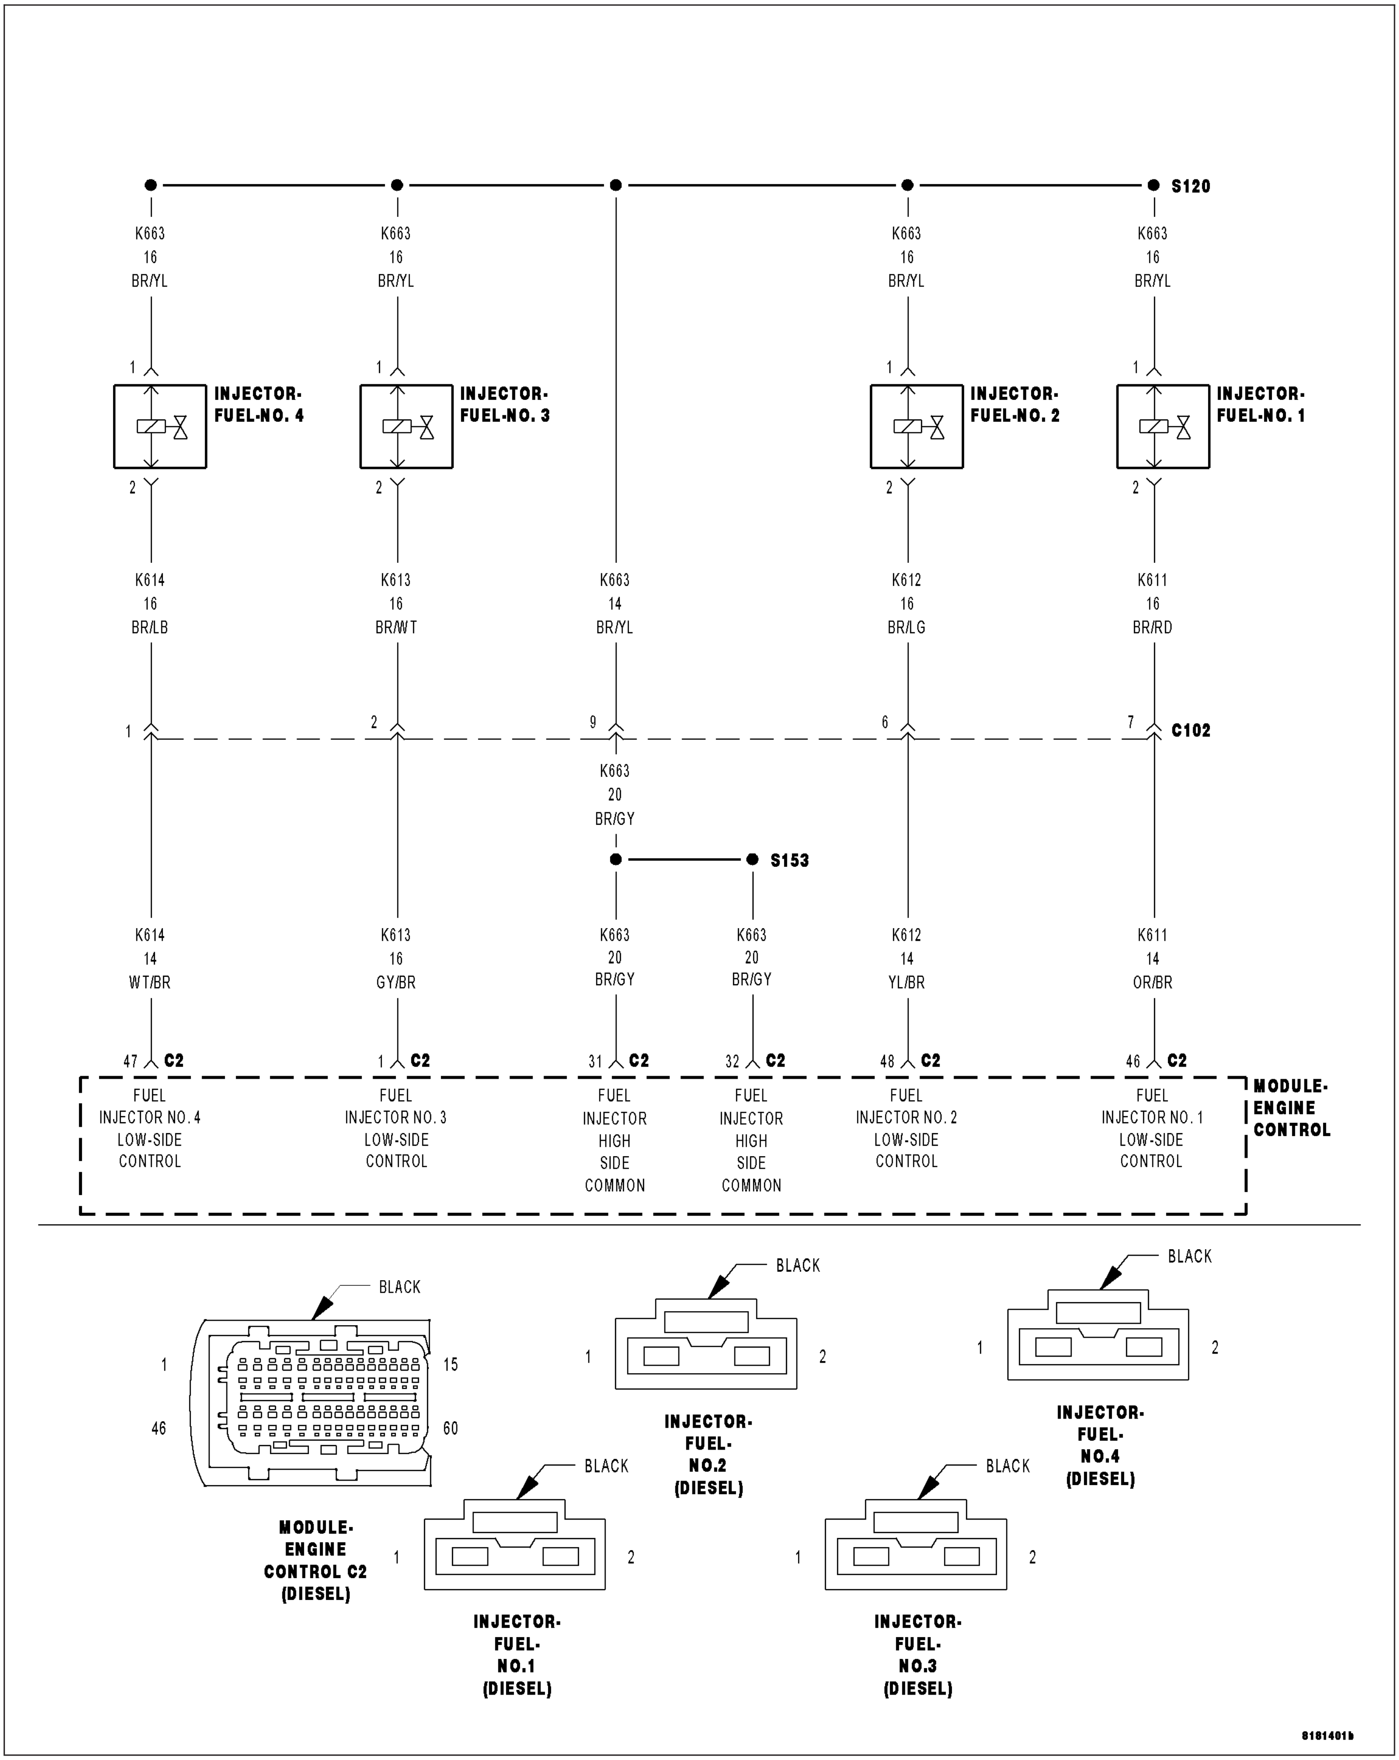
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Temperature Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0201-FUEL INJECTOR 1 CIRCUIT / OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects an open or short in the Fuel Injector 1 circuit.

Possible Causes
INTERMITTENT DTC
(K663) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K663) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K663) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT
(K663) FUEL INJECTOR 1 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR 1

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module.

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

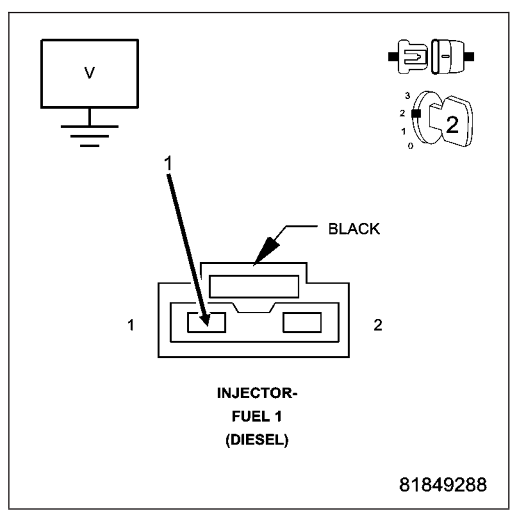
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Injector 1 harness connector.



Disconnect the Engine Control Module harness connectors.

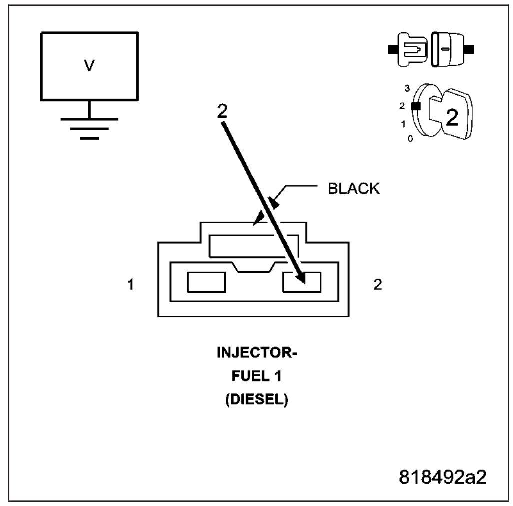
Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 1 harness connector.

Is there any voltage present?



Yes >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

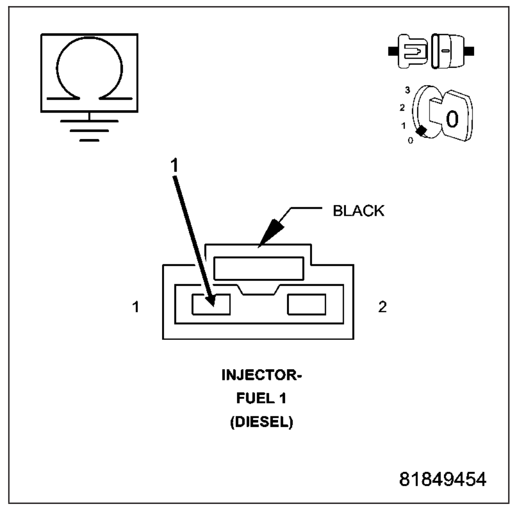
NOTE: The jumper wire should still be in place.

Measure the voltage of the (K611) Fuel Injector 1 Low-Side Control circuit in the Fuel Injector 1 harness connector.

Is there any voltage present?

Yes >> Repair the (K611) Fuel Injector 1 Low-Side Control circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 4

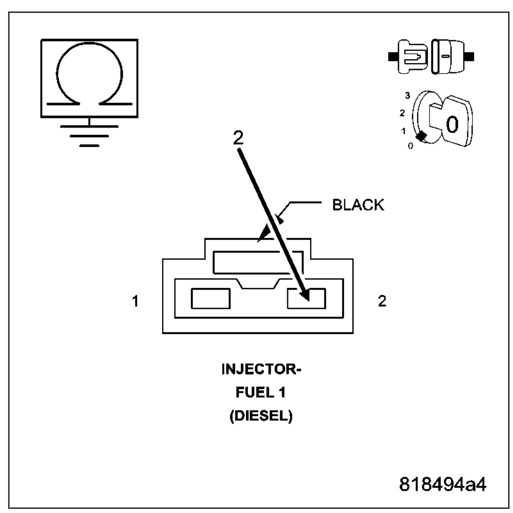
4. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire in the Main Relay Connector.

Measure the resistance between ground and the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 1 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 5

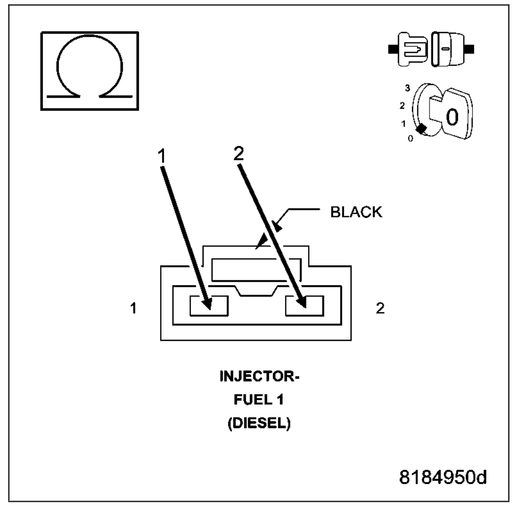
No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K611) Fuel Injector 1 Low-Side Control circuit in the Fuel Injector 1 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 6

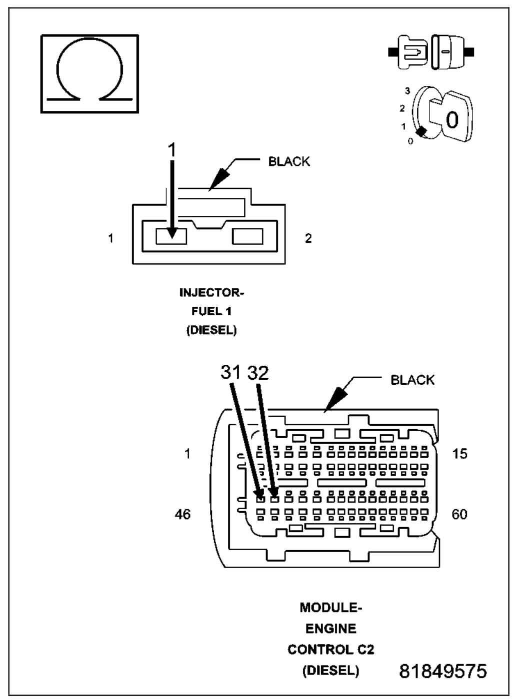
No >> Repair the (K611) Fuel Injector 1 Low-Side Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO (K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K663) Fuel Injector High-Side Common circuit and the (K611) Fuel Injector 1 Low-Side Control circuit in the Fuel Injector 1 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 7

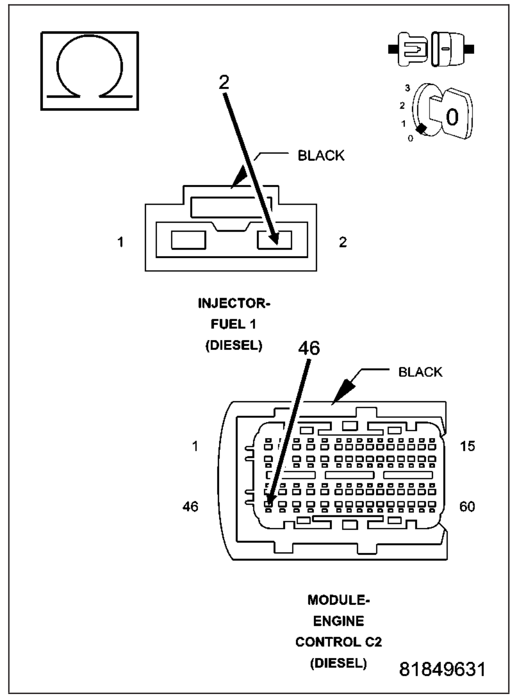
No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to the (K611) Fuel Injector 1 Low-Side Control circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K663) Fuel Injector High-Side Common circuit between the Fuel Injector 1 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 8

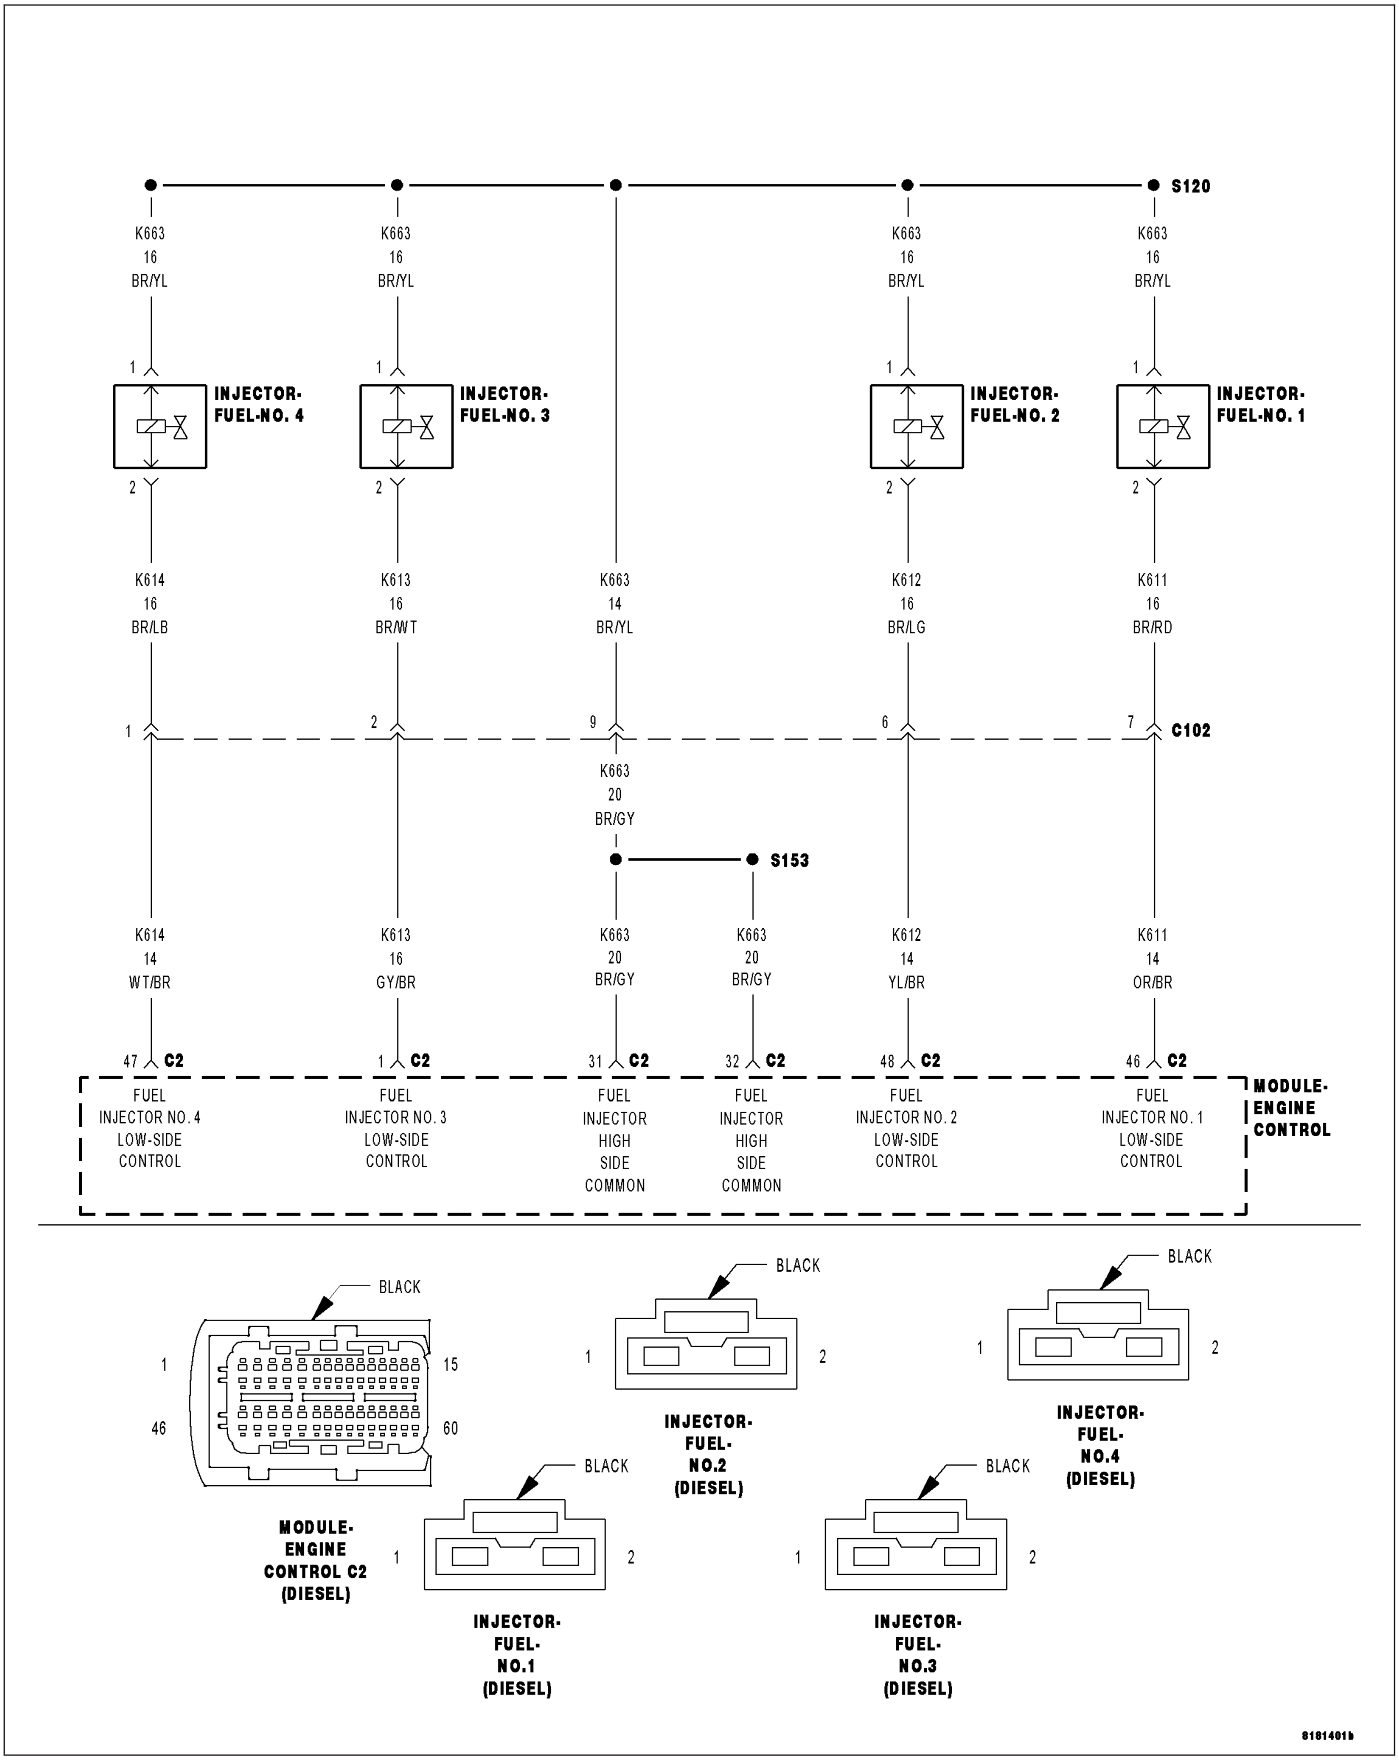
No >> Repair the (K663) Fuel Injector High-Side Common circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (K611) FUEL INJECTOR 1 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K611) Fuel Injector 1 Low-Side Control circuit between the Fuel Injector 1 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace Fuel Injector 1 in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K611) Fuel Injector 1 Low-Side Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0202-FUEL INJECTOR 2 CIRCUIT / OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects an open or short in the Fuel Injector 2 circuit.

Possible Causes
INTERMITTENT DTC
(K663) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K663) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K663) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT
(K663) FUEL INJECTOR 2 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR 2

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

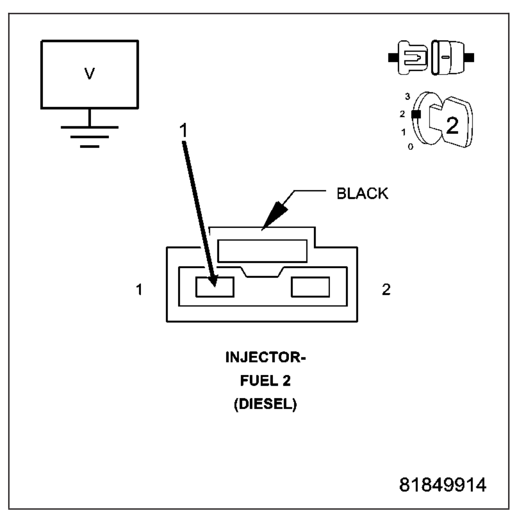
1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module.

Attempt to start the engine and test drive the vehicle.



With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Injector 2 harness connector.

Disconnect the Engine Control Module harness connectors.

Remove the Main Relay.

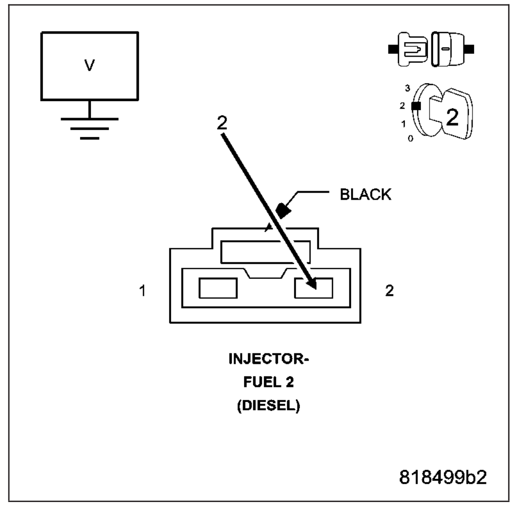
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 2 harness connector.

Is there any voltage present?

Yes >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to voltage.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

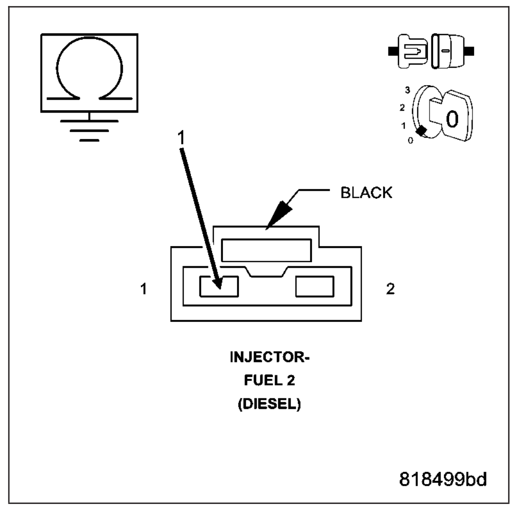
NOTE: The jumper wire should still be in place.

Measure the voltage of the (K612) Fuel Injector 2 Low-Side Control circuit in the Fuel Injector 2 harness connector.

Is there any voltage present?

Yes >> Repair the (K612) Fuel Injector 2 Low-Side Control circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 4

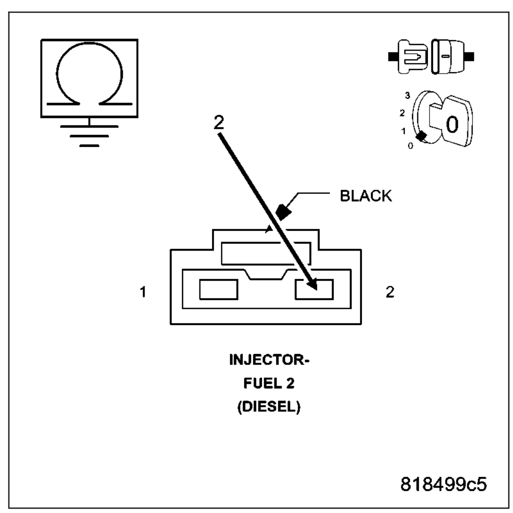
4. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire in the Main Relay Connector.

Measure the resistance between ground and the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 2 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 5

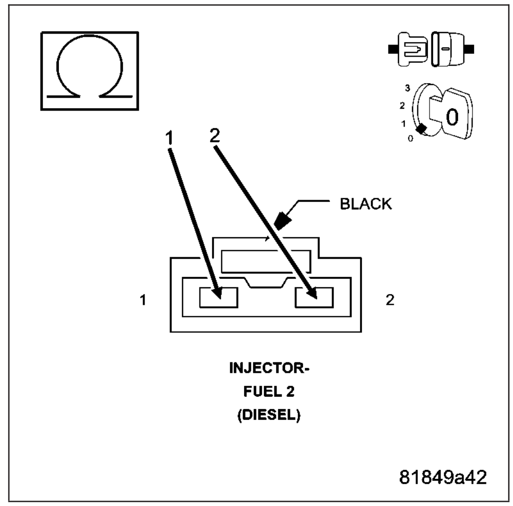
No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K612) Fuel Injector 2 Low-Side Control circuit in the Fuel Injector 2 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 6

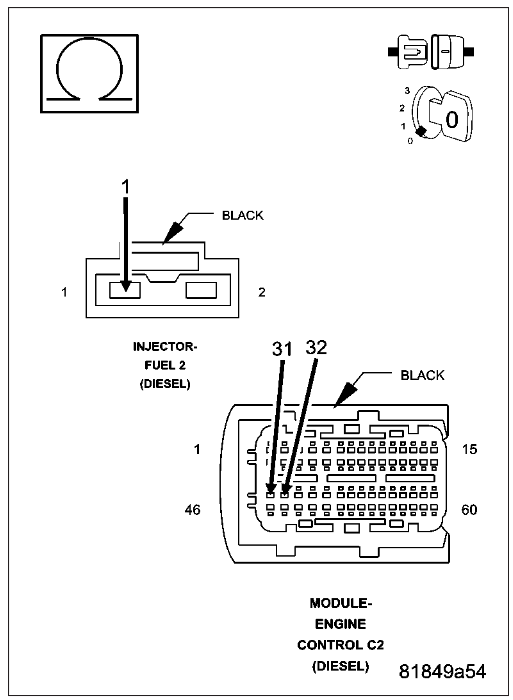
No >> Repair the (K612) Fuel Injector 2 Low-Side Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO (K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K663) Fuel Injector High-Side Common circuit and the (K612) Fuel Injector 2 Low-Side Control circuit in the Fuel Injector 2 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 7

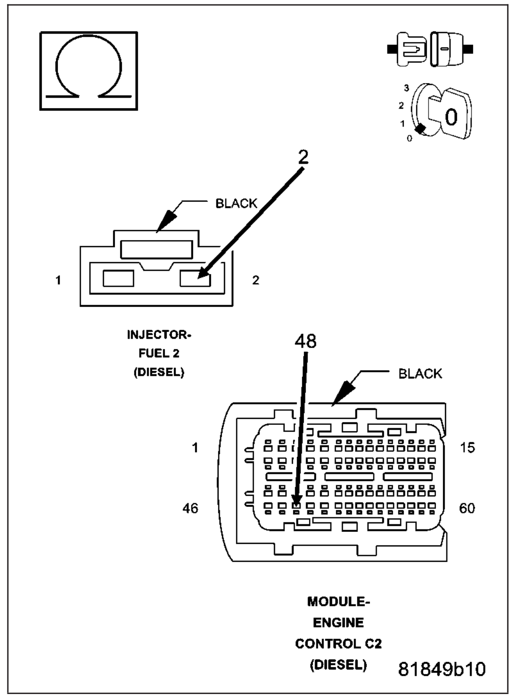
No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to the (K612) Fuel Injector 2 Low-Side Control circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K663) Fuel Injector High-Side Common circuit between the Fuel Injector 2 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 8

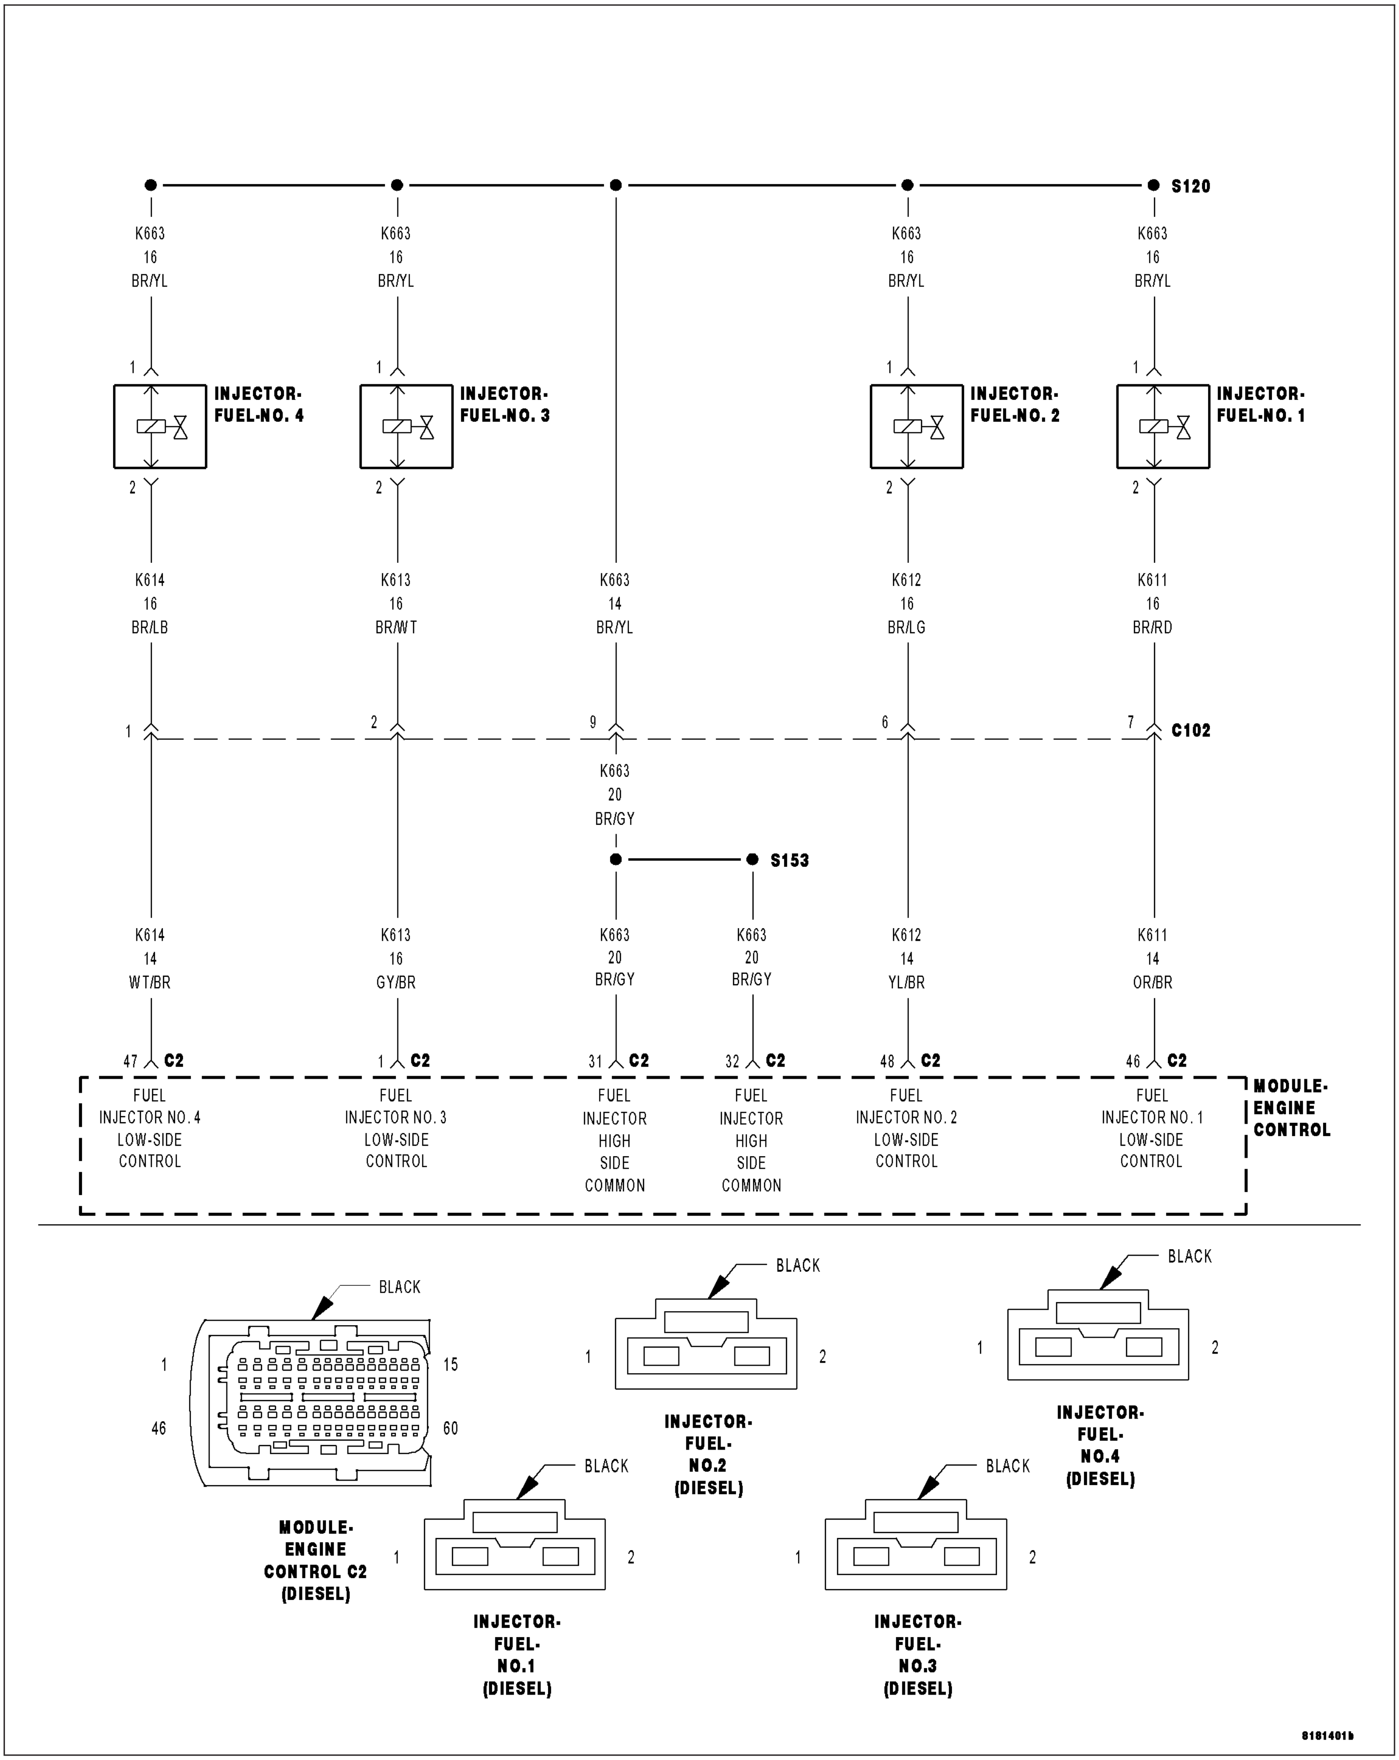
No >> Repair the (K663) Fuel Injector High-Side Common circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (K612) FUEL INJECTOR 2 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K612) Fuel Injector 2 Low-Side Control circuit between the Fuel Injector 2 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace Fuel Injector 2 in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K612) Fuel Injector 2 Low-Side Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0203-FUEL INJECTOR 3 CIRCUIT / OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects an open or short in the Fuel Injector 3 circuit.

Possible Causes
INTERMITTENT DTC
(K663) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K663) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K663) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT
(K663) FUEL INJECTOR 3 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR 3

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module.

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

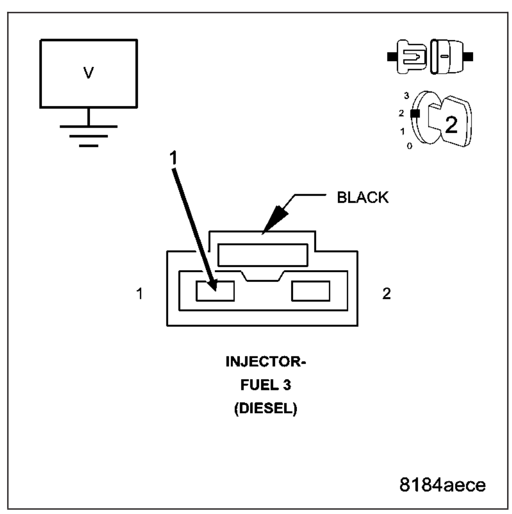
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Injector 3 harness connector.



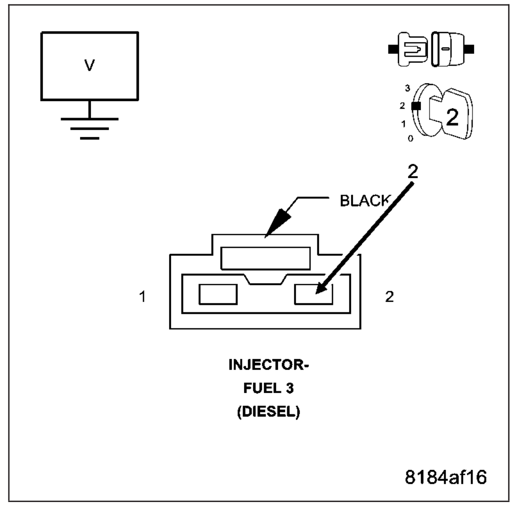
Disconnect the Engine Control Module harness connectors.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 3 harness connector.



Is there any voltage present?

Yes >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to voltage.

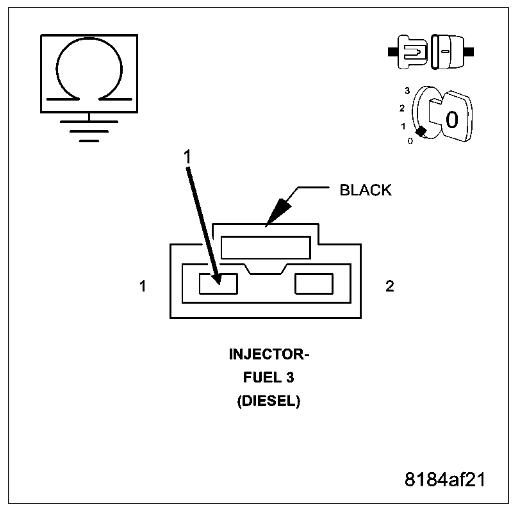
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K613) Fuel Injector 3 Low-Side Control circuit in the Fuel Injector 3 harness connector.



Is there any voltage present?

Yes >> Repair the (K613) Fuel Injector 3 Low-Side Control circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

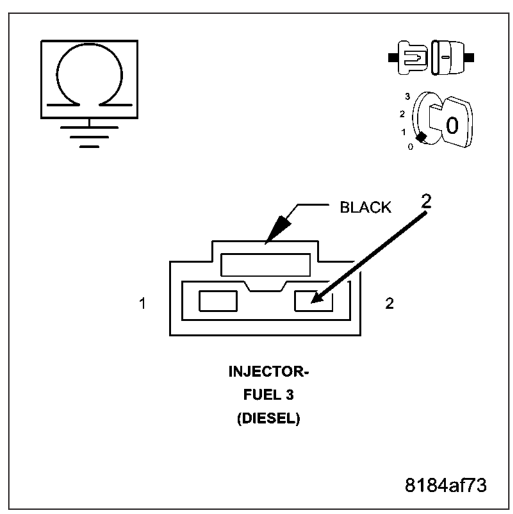
No >> Go to 4

4. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire in the Main Relay Connector.

Measure the resistance between ground and the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 3 harness connector.



Is the resistance above 1000 ohms?

Yes >> Go to 5

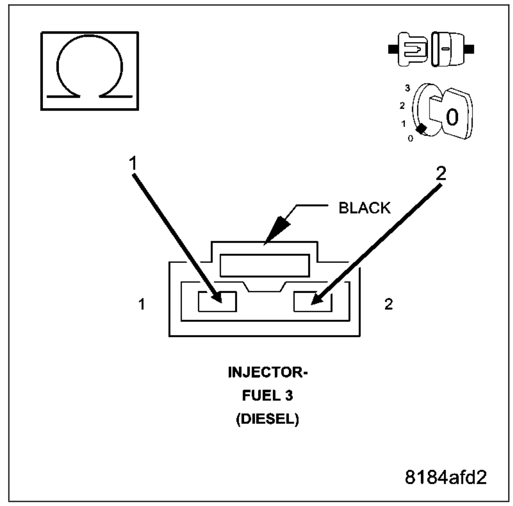
No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K613) Fuel Injector 3 Low-Side Control circuit in the Fuel Injector 3 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 6

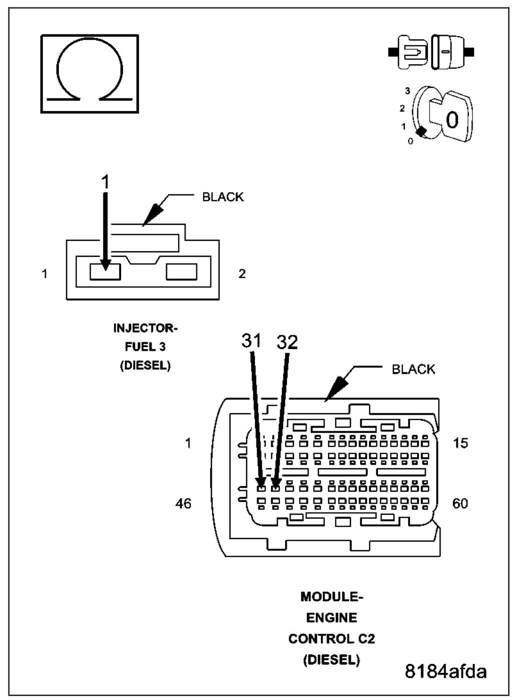
No >> Repair the (K613) Fuel Injector 3 Low-Side Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO (K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K663) Fuel Injector High-Side Common circuit and the (K613) Fuel Injector 3 Low-Side Control circuit in the Fuel Injector 3 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 7

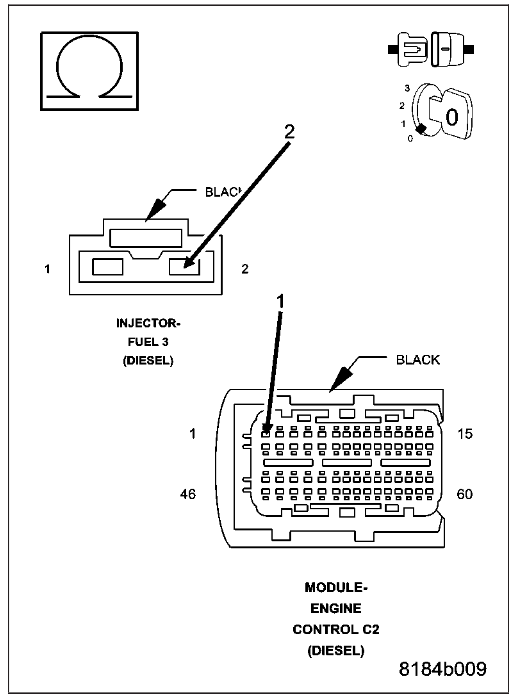
No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to the (K613) Fuel Injector 3 Low-Side Control circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K663) Fuel Injector High-Side Common circuit between the Fuel Injector 3 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 8

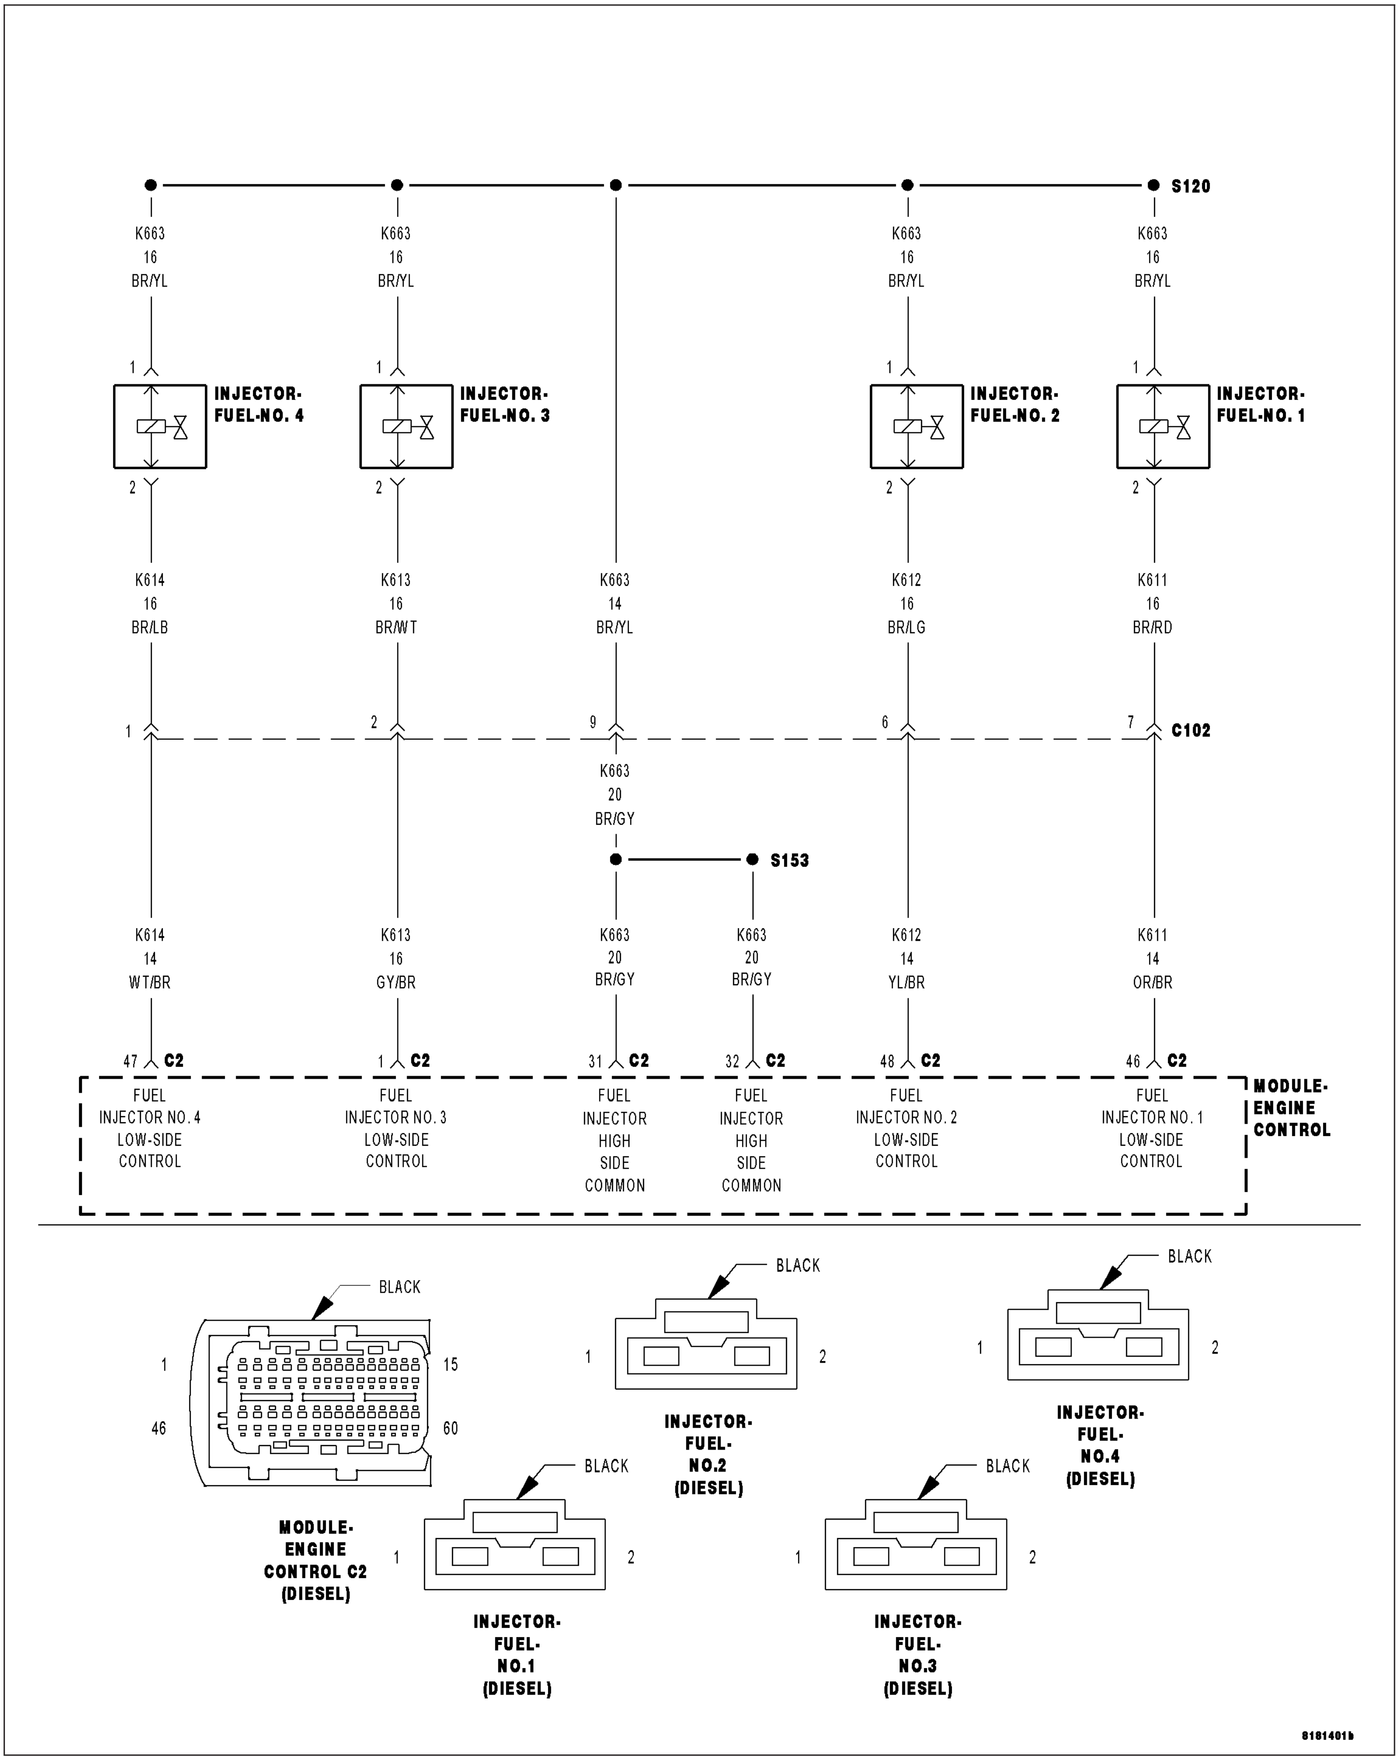
No >> Repair the (K663) Fuel Injector High-Side Common circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (K613) FUEL INJECTOR 3 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K613) Fuel Injector 3 Low-Side Control circuit between the Fuel Injector 3 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace Fuel Injector 3 in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K613) Fuel Injector 3 Low-Side Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0204-FUEL INJECTOR 4 CIRCUIT / OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects an open or short in the Fuel Injector 4 circuit.

Possible Causes
INTERMITTENT DTC
(K663) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K663) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
(K663) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT SHORTED TO (K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT
(K663) FUEL INJECTOR 4 HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR 4

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

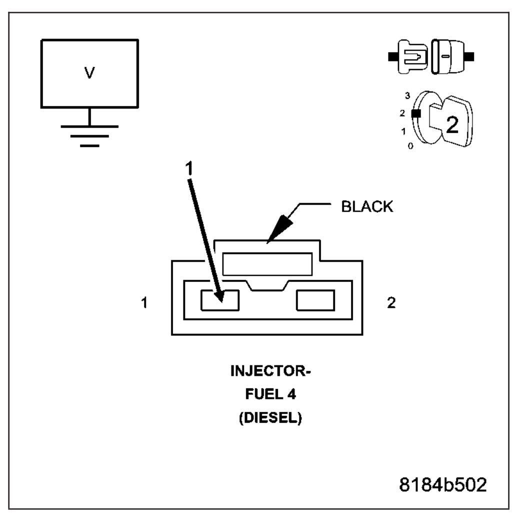
1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module.

Attempt to start the engine and test drive the vehicle.



With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Fuel Injector 4 harness connector.

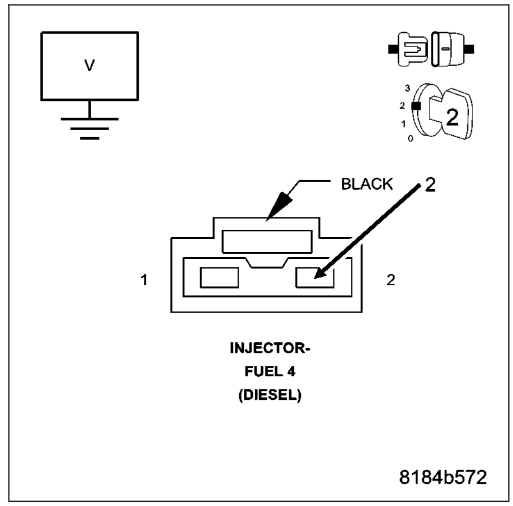
Disconnect the Engine Control Module harness connectors.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 4 harness connector.



Is there any voltage present?

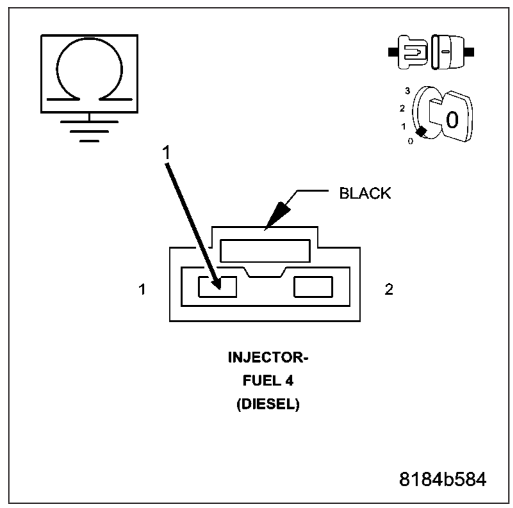
Yes >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.



Measure the voltage of the (K614) Fuel Injector 4 Low-Side Control circuit in the Fuel Injector 4 harness connector.

Is there any voltage present?

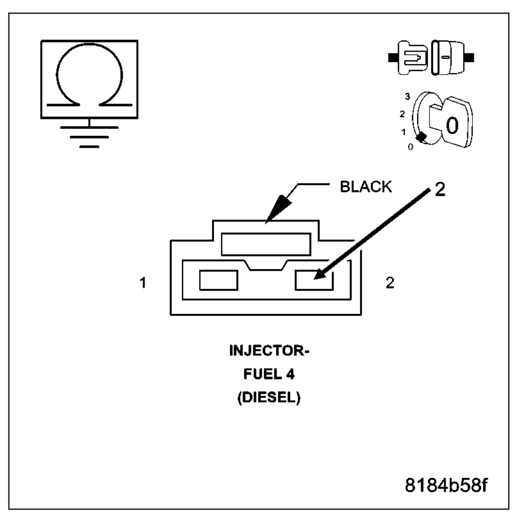
Yes >> Repair the (K614) Fuel Injector 4 Low-Side Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Remove the jumper wire in the Main Relay Connector.



Measure the resistance between ground and the (K663) Fuel Injector High-Side Common circuit in the Fuel Injector 4 harness connector.

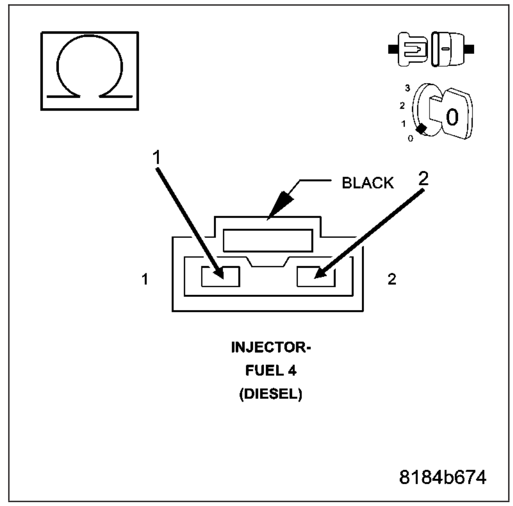
Is the resistance above 1000 ohms?

Yes >> Go to 5

No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K614) Fuel Injector 4 Low-Side Control circuit in the Fuel Injector 4 harness connector.



Is the resistance above 1000 ohms?

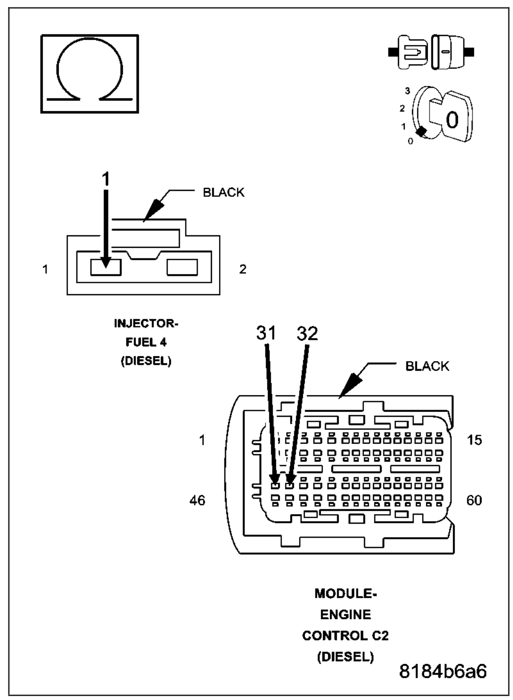
Yes >> Go to 6

No >> Repair the (K614) Fuel Injector 4 Low-Side Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT SHORTED TO (K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the (K663) Fuel Injector High-Side Common circuit and the (K614) Fuel Injector 4 Low-Side Control circuit in the Fuel Injector 4 harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 7

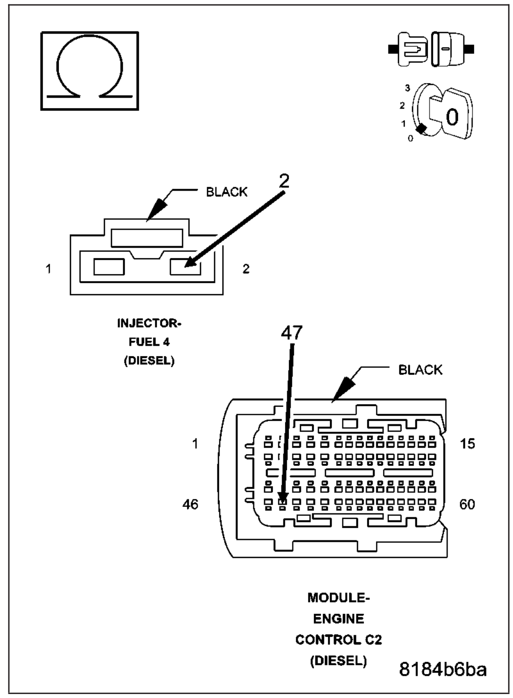
No >> Repair the (K663) Fuel Injector High-Side Common circuit for a short to the (K614) Fuel Injector 4 Low-Side Control circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (K663) FUEL INJECTOR HIGH-SIDE COMMON CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K663) Fuel Injector High-Side Common circuit between the Fuel Injector 4 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 8

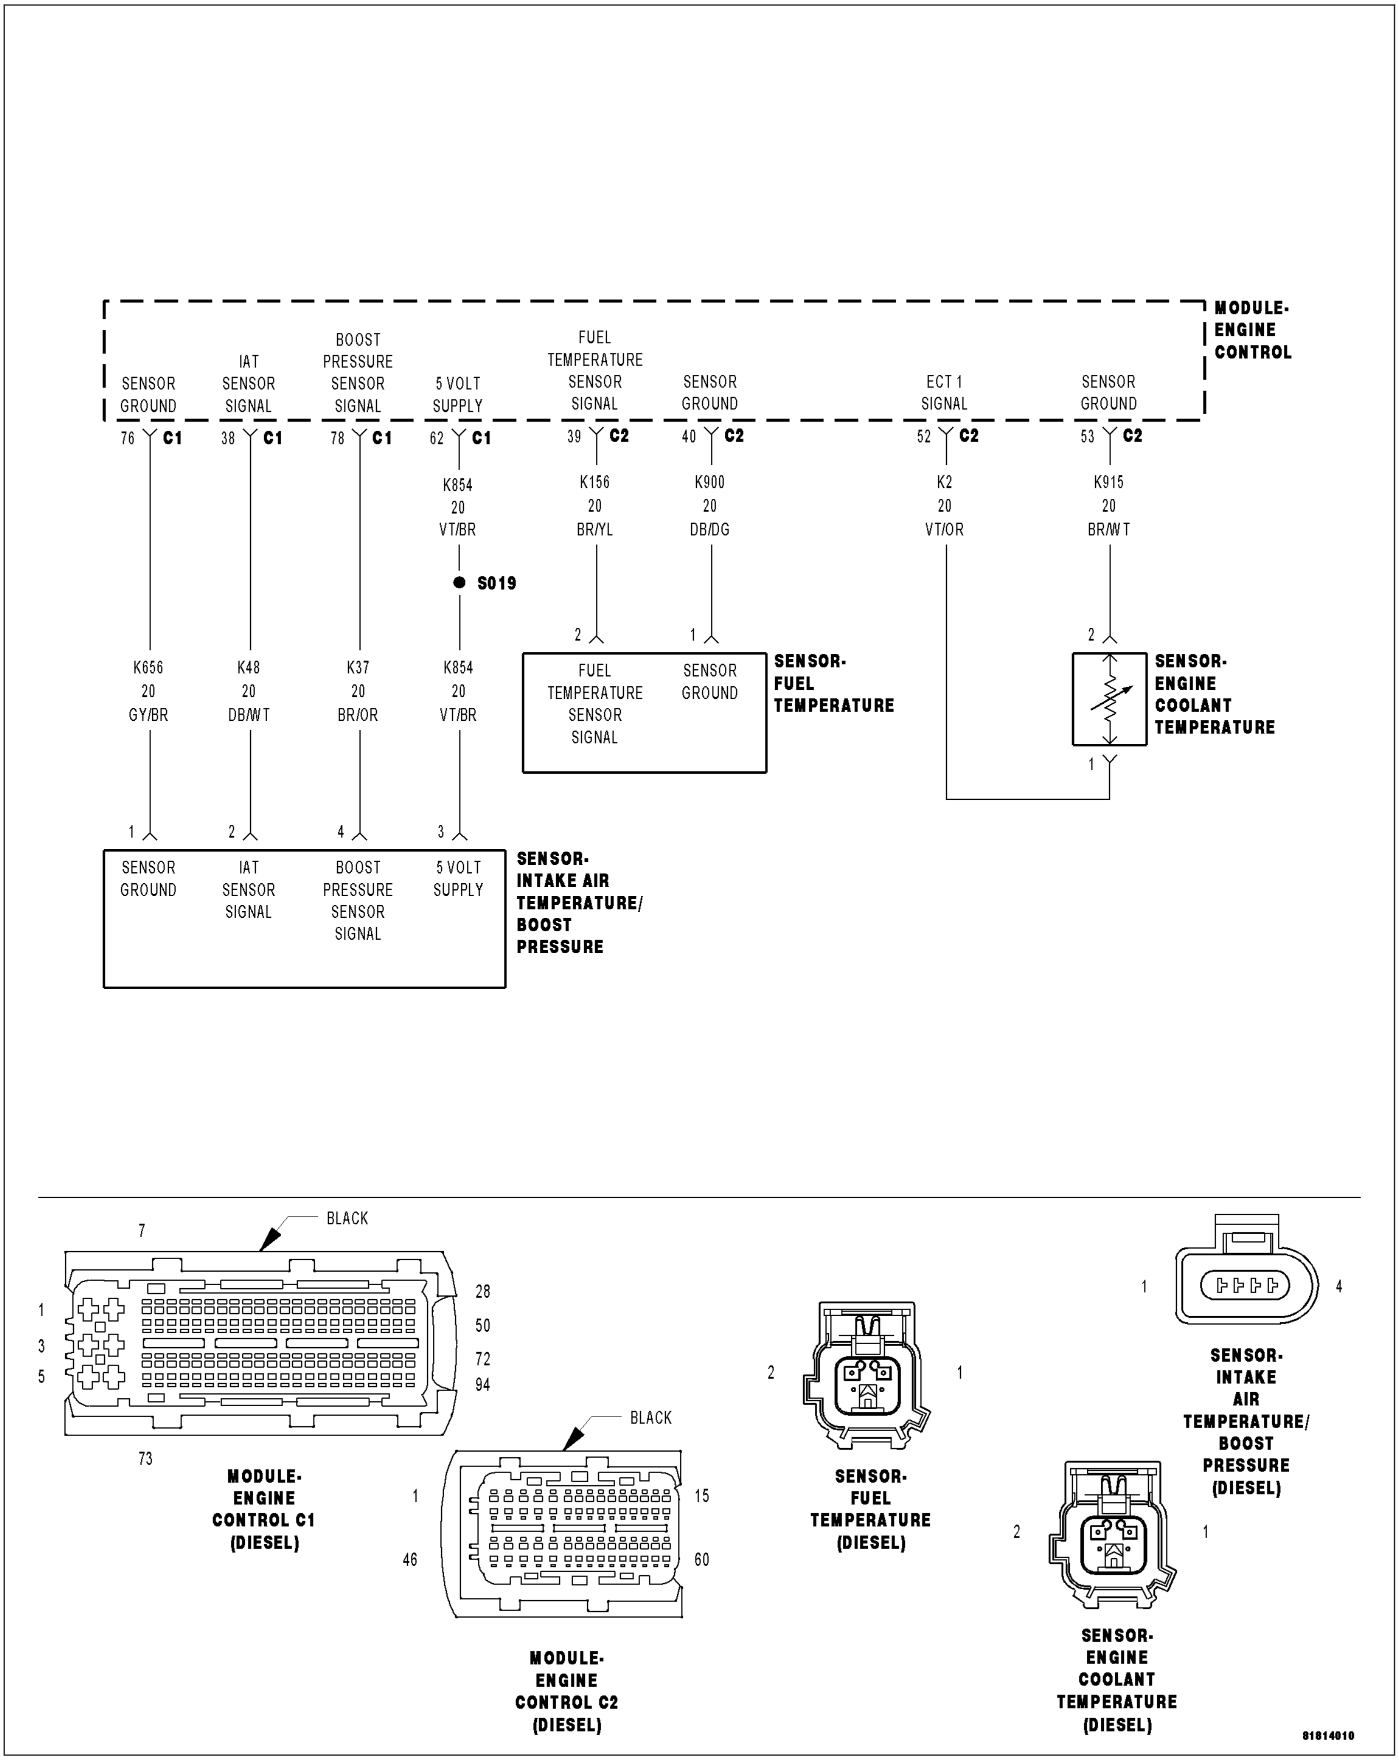
No >> Repair the (K663) Fuel Injector High-Side Common circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (K614) FUEL INJECTOR 4 LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K614) Fuel Injector 4 Low-Side Control circuit between the Fuel Injector 4 harness connector and the Engine Control Module harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace Fuel Injector 4 in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K614) Fuel Injector 4 Low-Side Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0234-TURBOCHARGER OVERBOOST CONDITION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and the ECM attempting to govern turbocharger boost pressure.
- **Set Condition:**
  The Intake Air Temperature/Boost Pressure Sensor indicates actual turbocharger boost is greater than the ECM setpoint for 6.5 seconds.

Possible Causes
INTERMITTENT DTC
INTAKE AIR RESTRICTION
INTAKE AIR LEAK
VACUUM HOSES/TUBES
BOOST PRESSURE ACTUATOR
TURBOCHARGER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK FOR INTAKE AND EXHAUST SYSTEM RESTRICTIONS

NOTE: Damaged, restricted or poorly connected intake and turbocharger related tubes can cause this DTC to set.

Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections.

Inspect the complete exhaust system for damaged, bent or clogged pipes that can cause exhaust system restrictions and excessive backpressure.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect the Intake Air Temp/Boost Pressure Sensor harness connector.

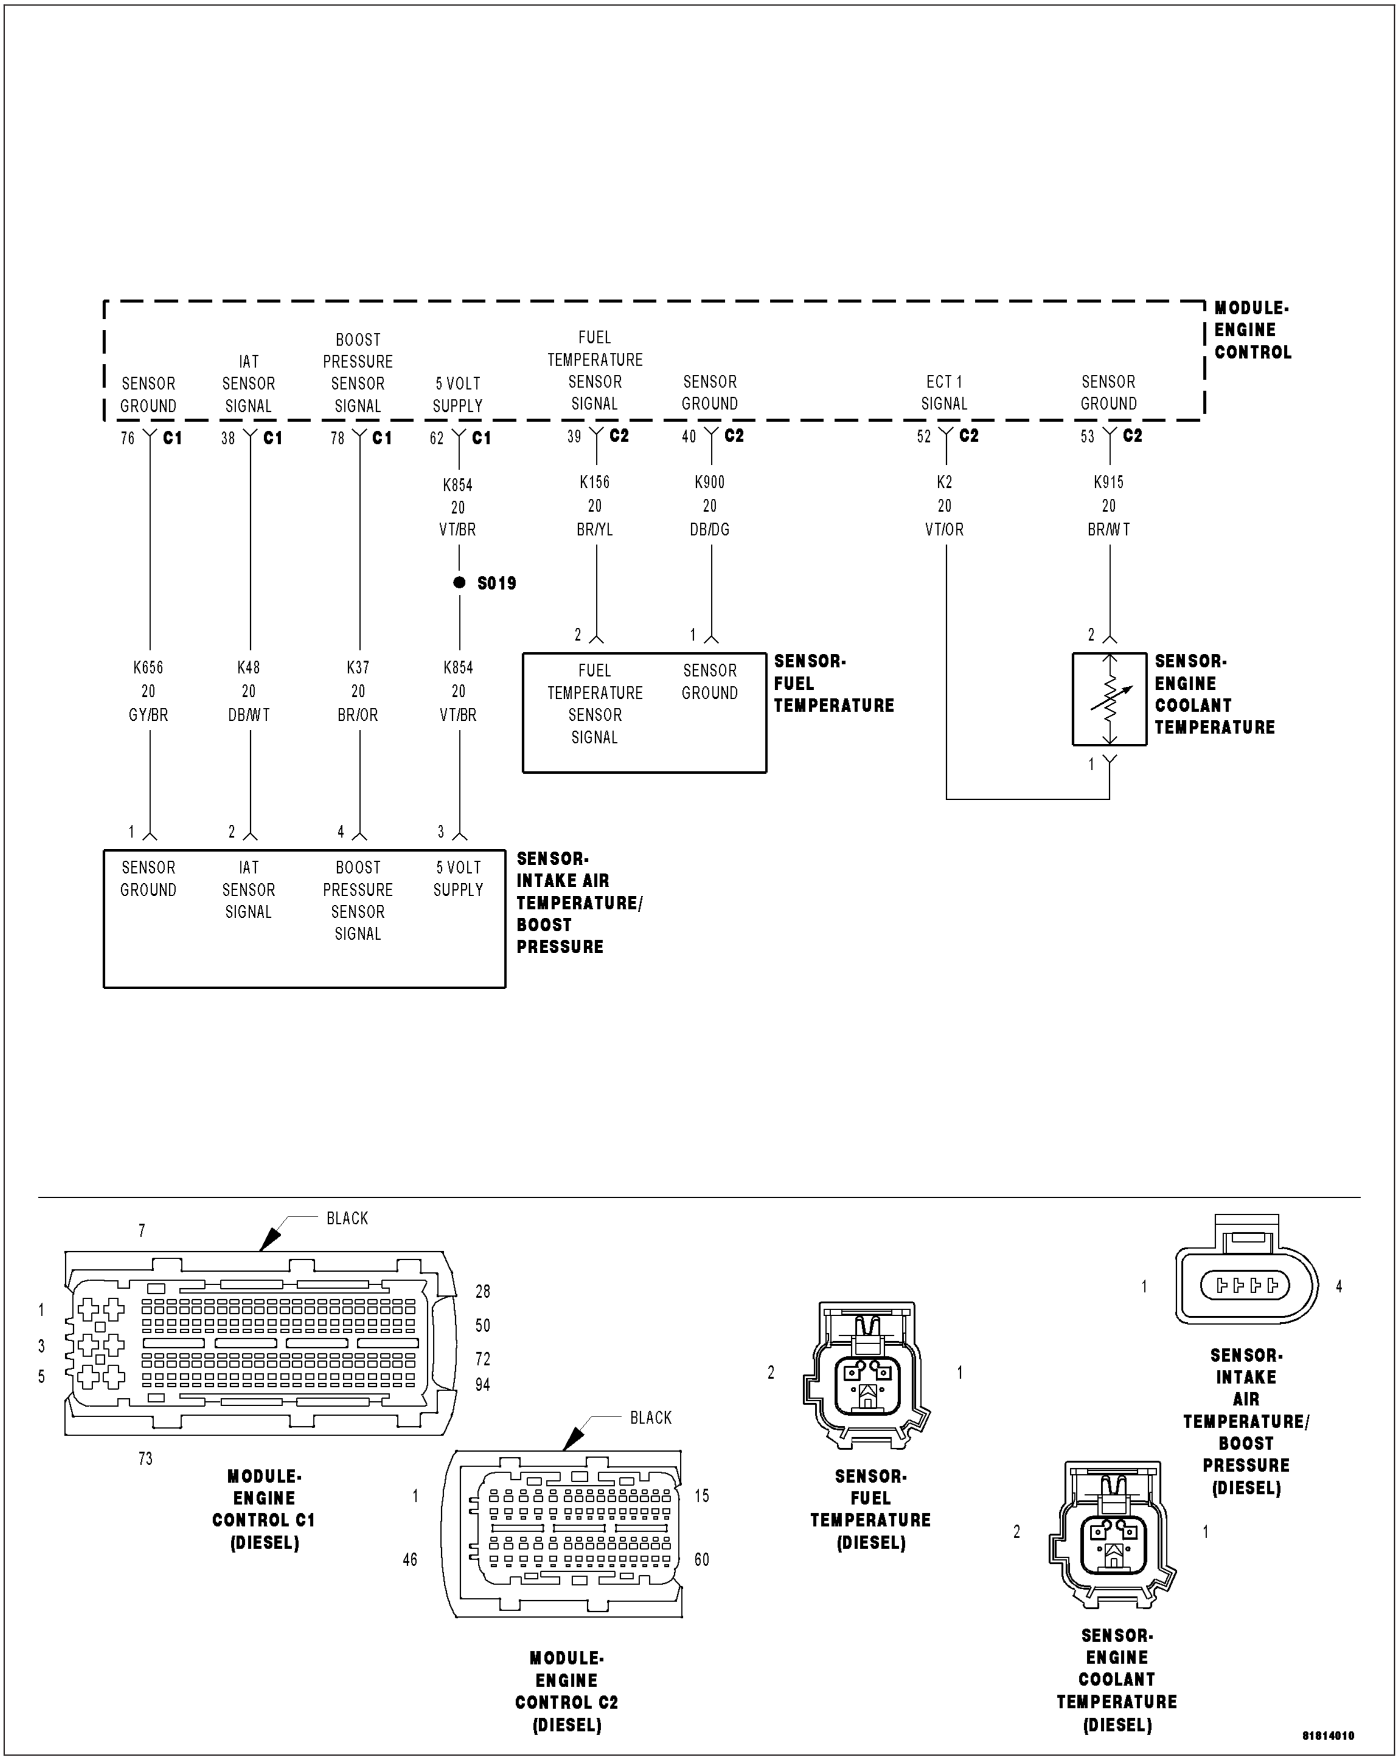
Measure the resistance of the each of the Boost Pressure Sensor circuits (3 circuits) between the Intake Air Temp/Boost Pressure Sensor and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> 4

No >> Repair the Boost Pressure Sensor circuit(s) that measure above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. CHECK THE BOOST PRESSURE SYSTEM



Refer to the CHECKING THE BOOST PRESSURE SYSTEM to check the boost pressure supply hoses, Boost Actuator and Turbocharger boost output.

With the scan tool, select View DTCs.

View repair.

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0236-BOOST PRESSURE SENSOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Once per ignition cycle before engine crank. No other Atmospheric Pressure Sensor DTC's present. No other Boost Pressure Sensor DTC's present.
- **Set Condition:**
  The Intake Air Temperature/Boost Pressure Sensor signal differs from the Atmospheric Pressure Sensor signal by 150 hpa or greater.

Possible Causes
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN
(K656) BOOST PRESSURE SENSOR GROUND CIRCUIT OPEN
(K854) BOOST PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT OPEN
INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

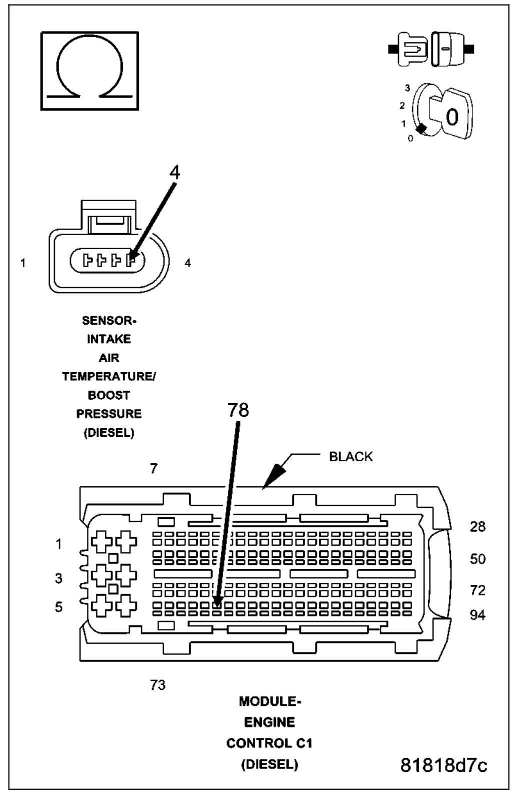
Turn the ignition off, wait 30 seconds, then start and idle the engine for at least 30 seconds.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN

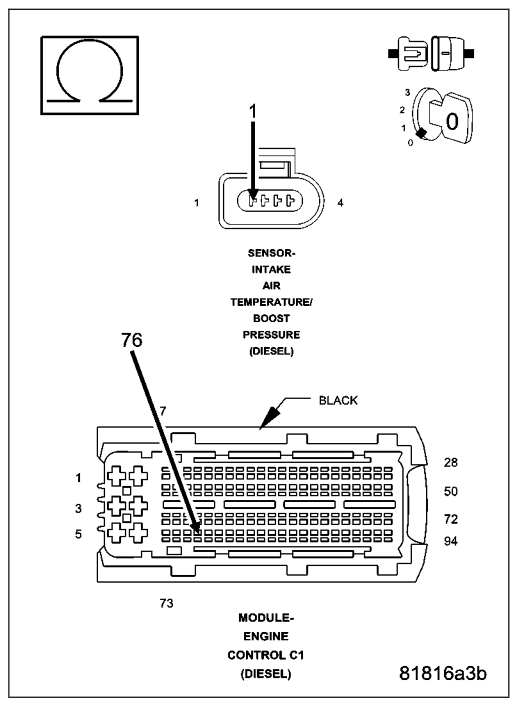
Turn the ignition off.

Disconnect the Intake Air Temp/Boost Pressure Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 3

No >> Repair the (K37) Boost Pressure Sensor Signal circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT OPEN

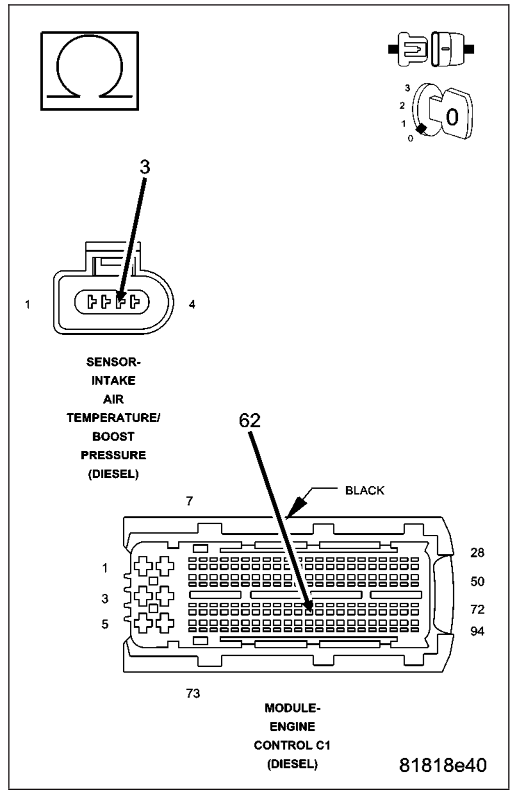
Measure the resistance of the (K656) Boost Pressure Sensor Ground circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the Boost Pressure Sensor Ground circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).



4. (K854) BOOST PRESSURE SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

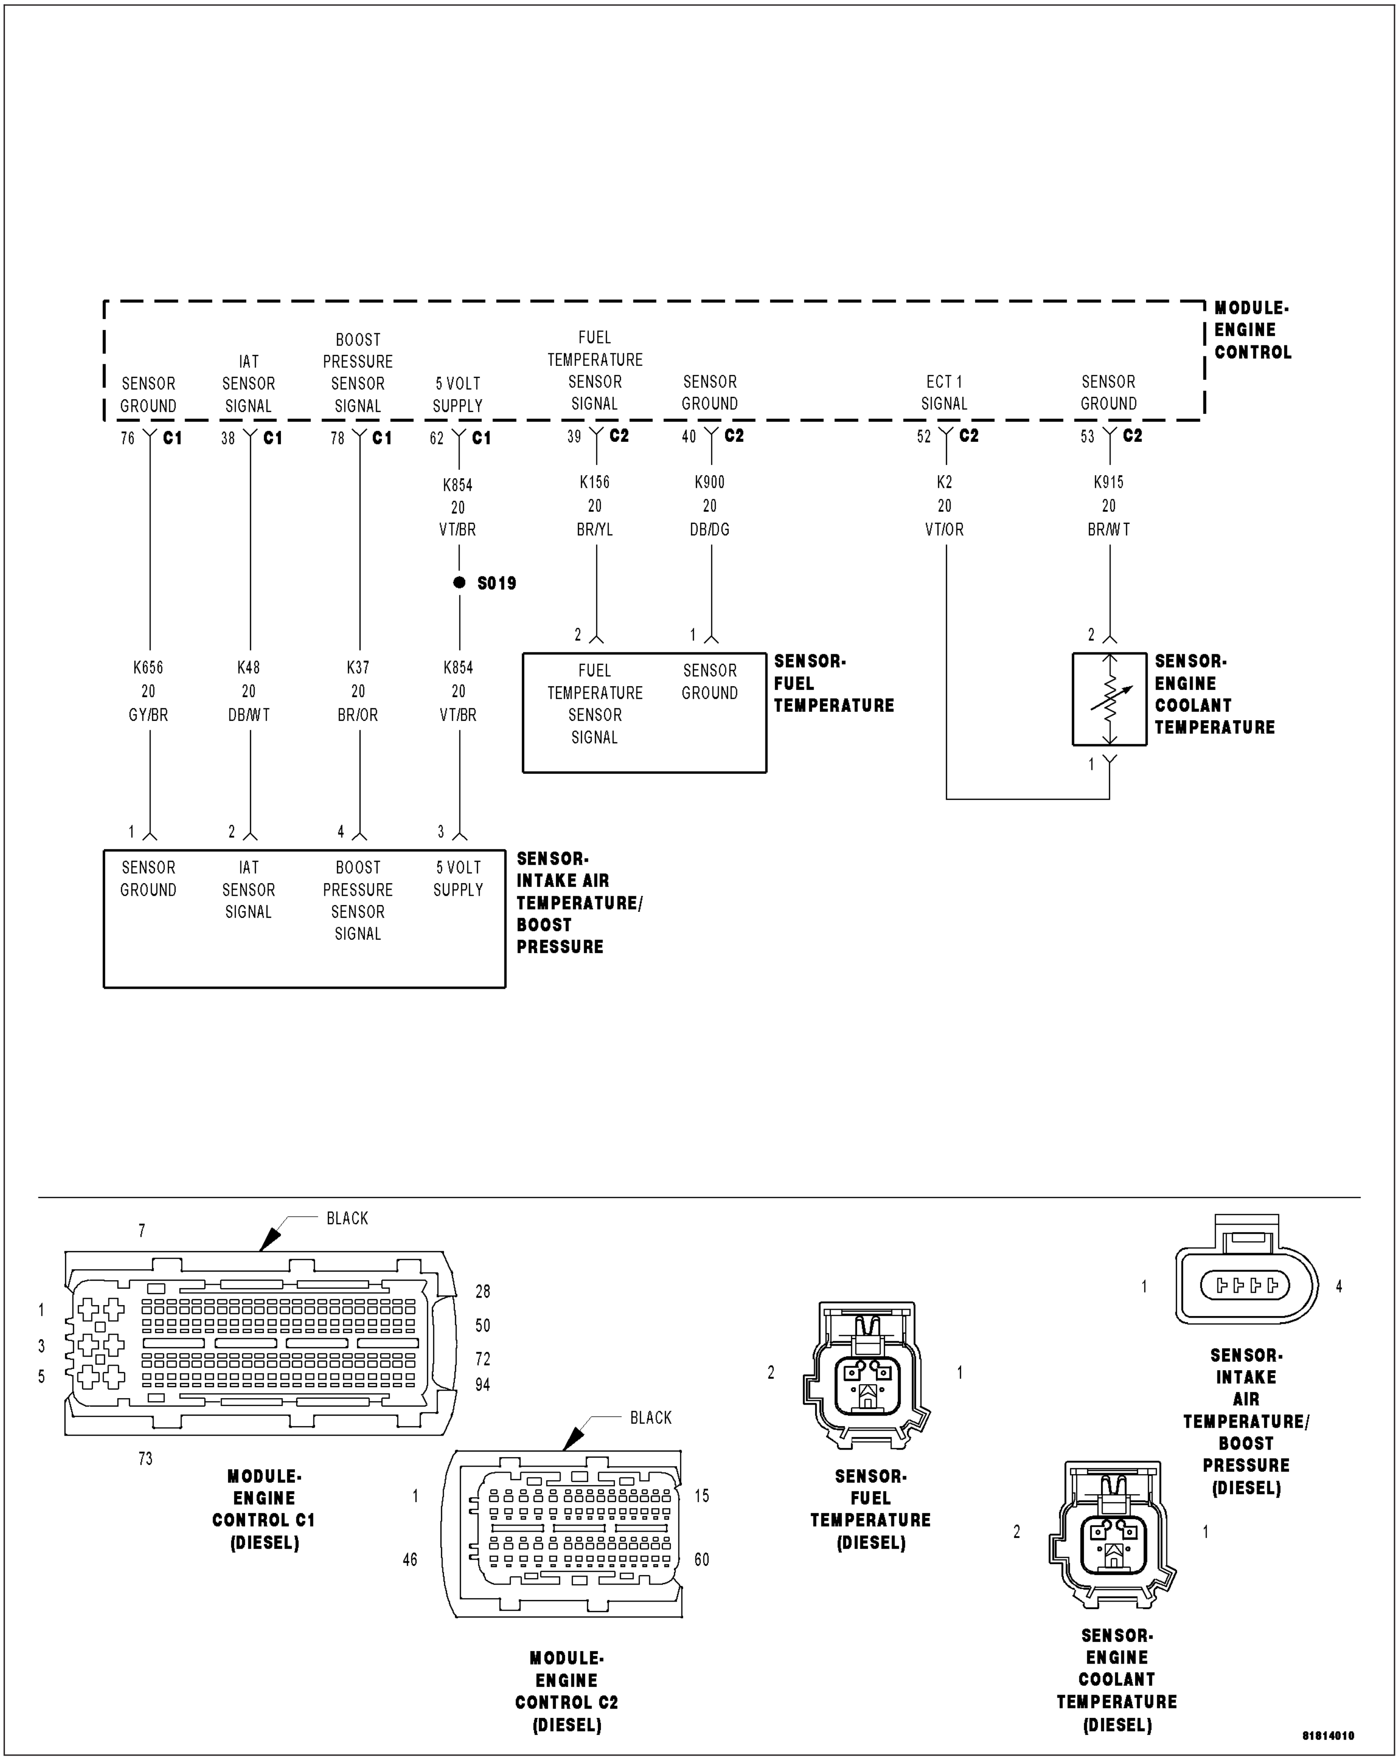
Measure the resistance of the (K854) Boost Pressure Sensor 5-Volt Supply circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 5

No >> Repair the (K854) Boost Pressure Sensor 5-Volt Supply circuit for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR



Replace the Intake Air Temperature/Boost Pressure Sensor.
Turn the ignition on.
With the scan tool, erase ECM DTCs.
Test drive the vehicle, pausing several times to cycle the ignition.
Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> The repair is complete.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0237-TURBO BOOST PRESSURE SENSOR CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

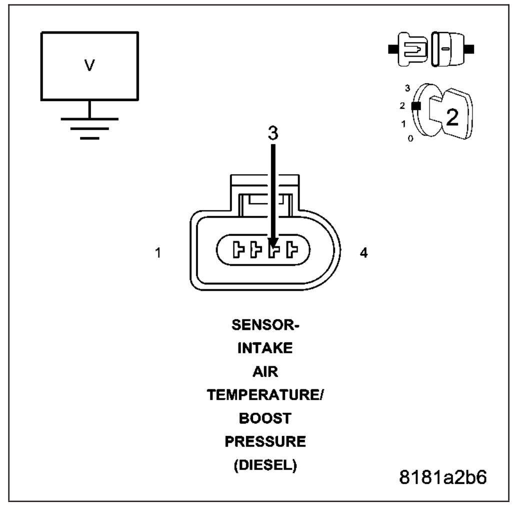
- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K37) Boost Pressure Sensor Signal circuit voltage is below 0.68 volt for 0.48 second.

Possible Causes
INTERMITTENT DTC
(K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
(K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND
(K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE



Ignition on, engine not running.
With the scan tool, Clear DTCs in the Engine Control Module (ECM).
Monitor the scan tool for at least two minutes.
Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
Start the engine.
Allow the engine to reach normal operating temperature.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

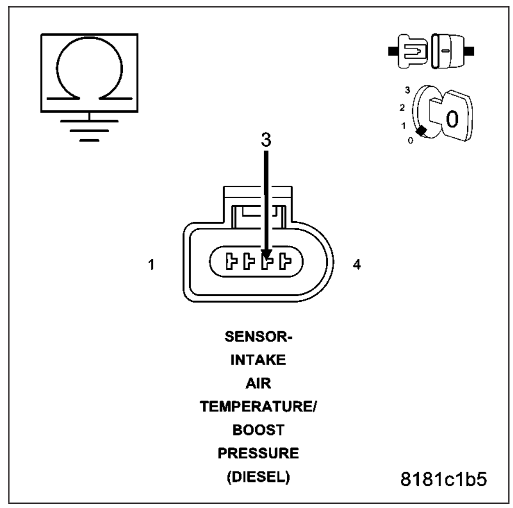
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Intake Air Temp/Boost Pressure Sensor harness connector.

Turn the ignition on.



Measure the voltage of the (K854) Boost Pressure Sensor 5 Volt Supply circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Is the voltage above 4.5 volts?

Yes >> Go to 6

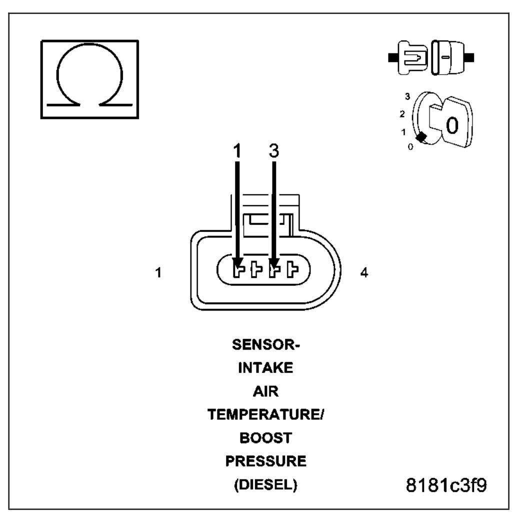
No >> Go to 3

3. (K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K854) Boost Pressure Sensor 5 Volt Supply circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.



Is the resistance above 1000 ohms?

Yes >> Go to 4

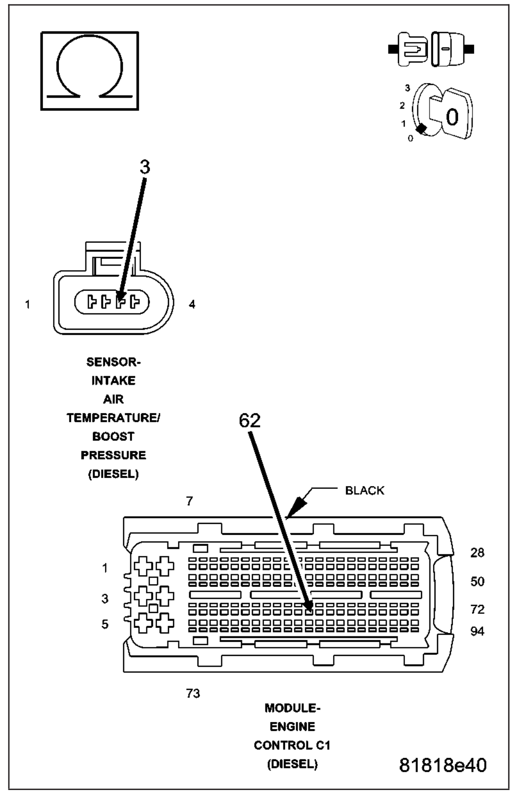
No >> Repair the (K854) Boost Pressure Sensor 5 Volt Supply circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K854) Boost Pressure Sensor 5 Volt Supply circuit and the (K656) Boost Pressure Sensor Ground circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 5

No >> Repair the (K854) Boost Pressure Sensor 5 Volt Supply circuit for a short to the (K656) Boost Pressure Sensor Ground circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K854) Boost Pressure Sensor 5 Volt Supply circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 10

No >> Repair the (K854) Boost Pressure Sensor 5 Volt Supply circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR

With the scan tool, Clear DTCs.

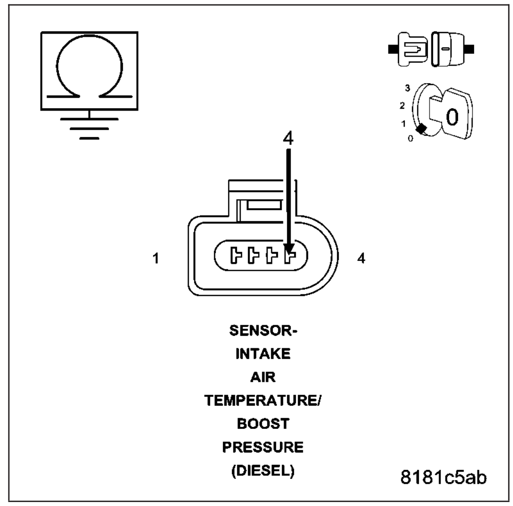
With the scan tool, select View DTCs.

NOTE: The scan tool should display a Boost Pressure Sensor high voltage or open DTC with the Boost Pressure Sensor connector disconnected.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Intake Air Temp/Boost Pressure Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 7

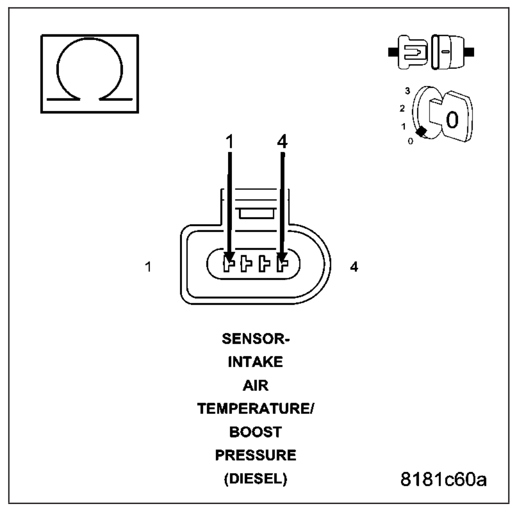
7. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K37) Boost Pressure Sensor Signal circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 8

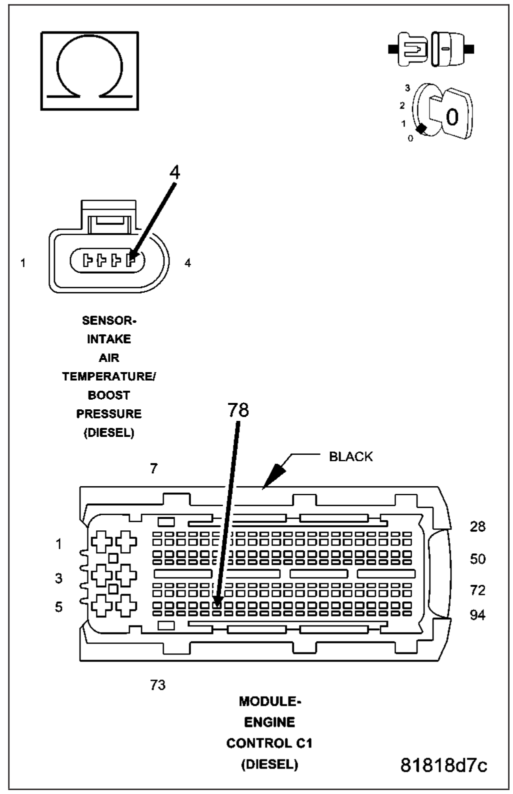
No >> Repair the (K37) Boost Pressure Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT

Measure the resistance between the (K37) Boost Pressure Sensor Signal circuit and the (K656) Boost Pressure Sensor Ground circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 9

No >> Repair the (K37) Boost Pressure Sensor Signal circuit for a short to the (K656) Boost Pressure Sensor Ground circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 10

No >> Repair the (K37) Boost Pressure Sensor Signal circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. ENGINE CONTROL MODULE (ECM)

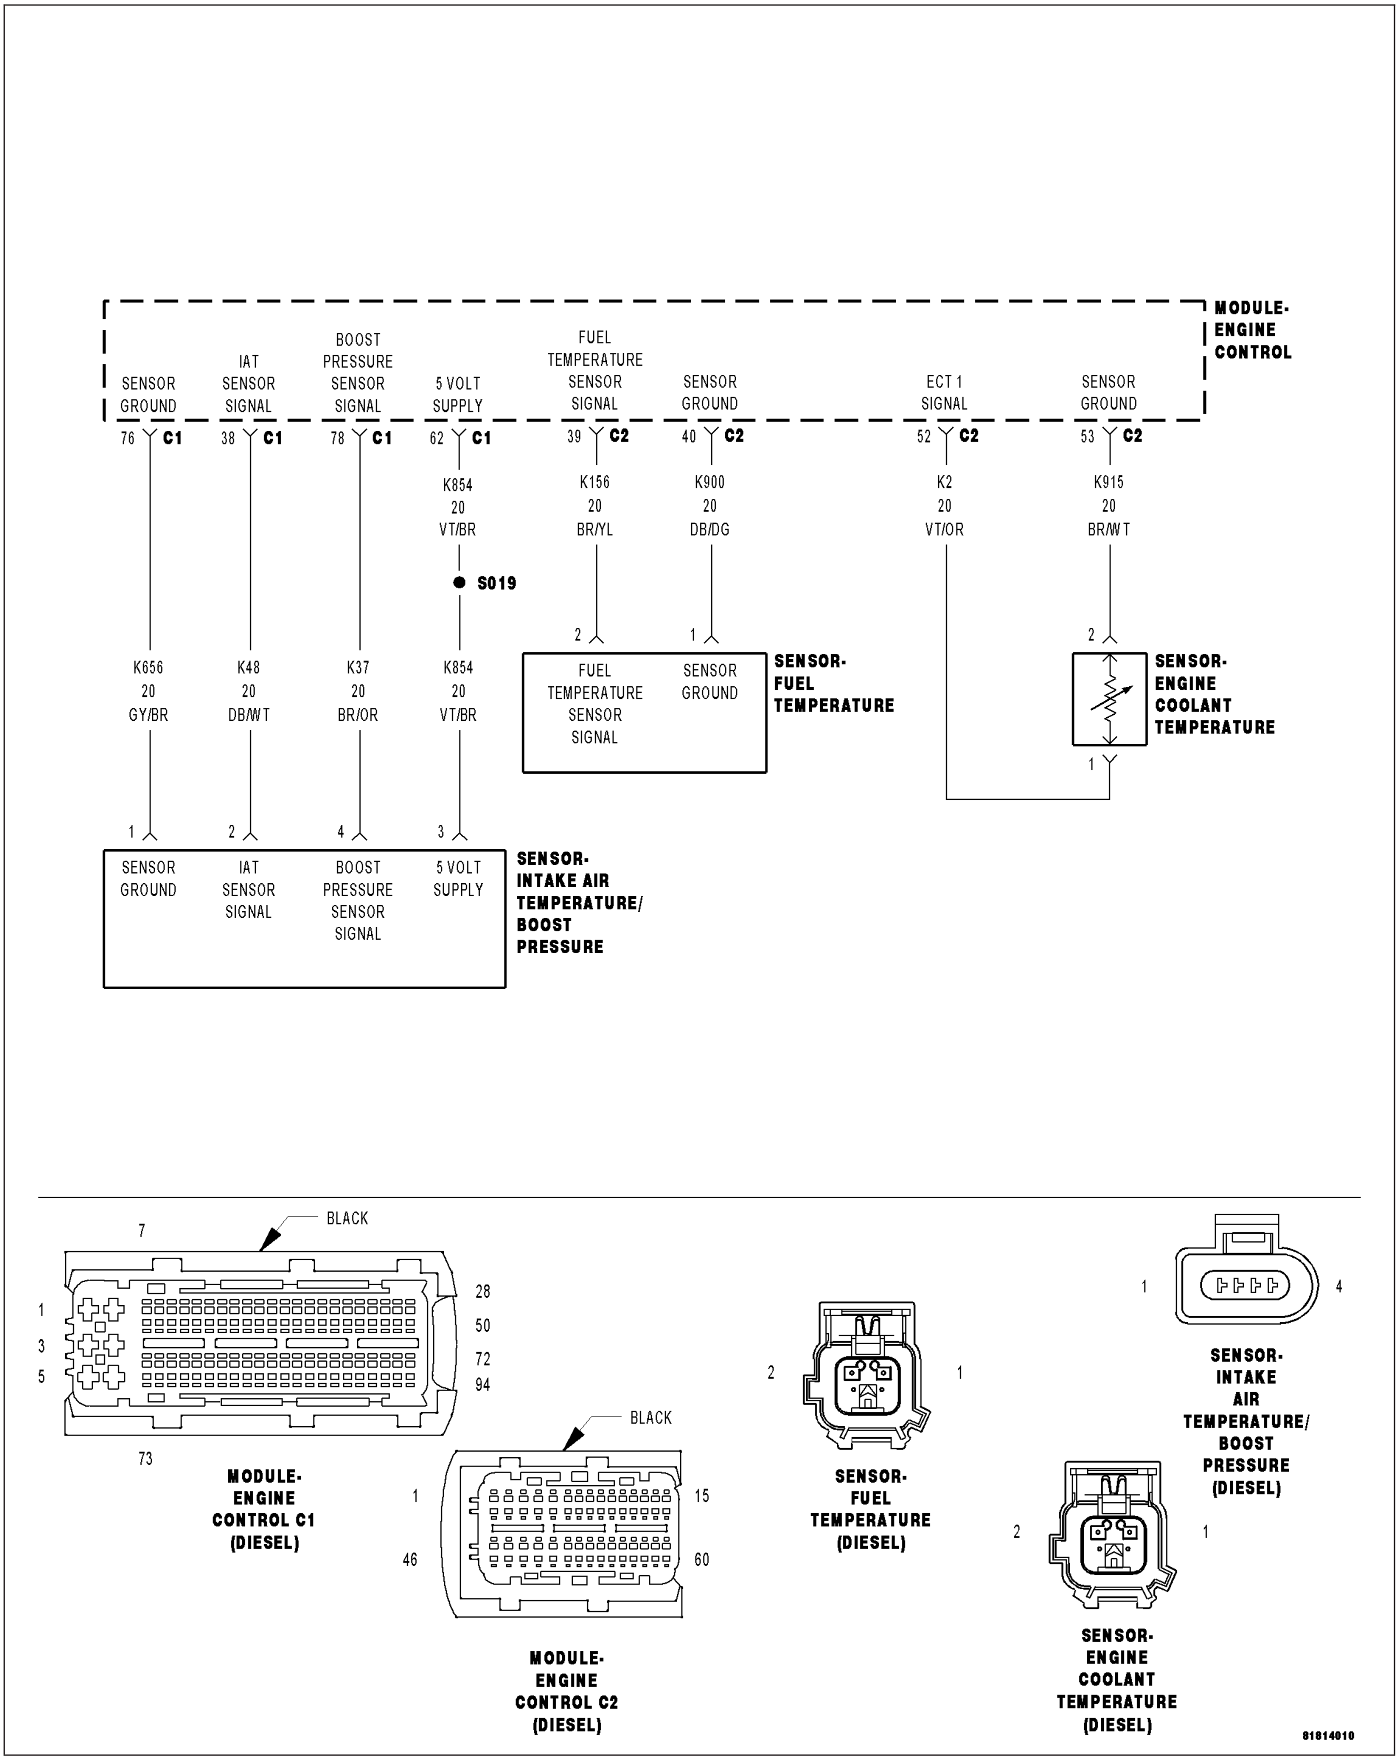
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0238-TURBO BOOST PRESSURE SENSOR CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The (K37) Boost Pressure Sensor Signal circuit voltage is above 4.85 volts for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K656) BOOST PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K656) BOOST PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
BOOST PRESSURE SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

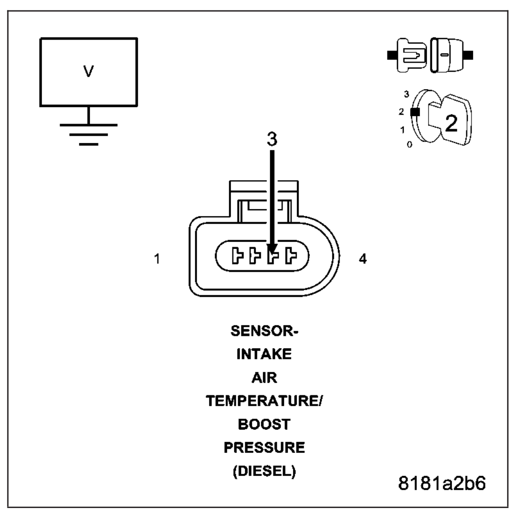
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Intake Air Temp/Boost Pressure Sensor harness connector.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

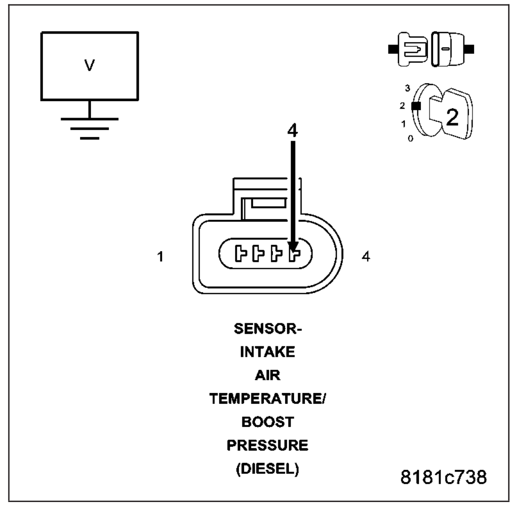
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K854) Boost Pressure Sensor 5 Volt Supply circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (K854) Boost Pressure Sensor 5 Volt Supply circuit for a short to voltage.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

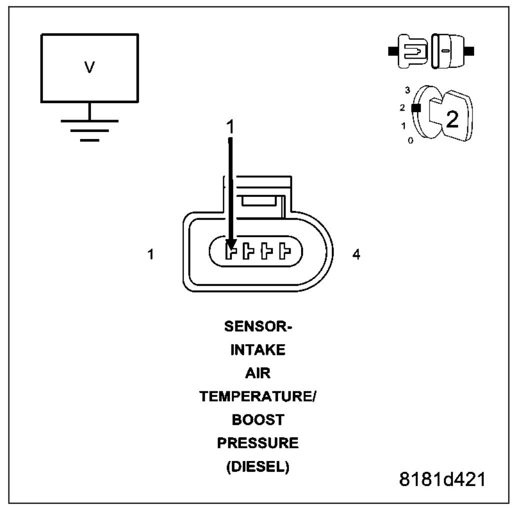
No >> Go to 3

3. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K37) Boost Pressure Sensor Signal circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Is there any voltage present?



Yes >> Repair the (K37) Boost Pressure Sensor Signal circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of the (K656) Boost Pressure Sensor Ground circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Is there any voltage present?

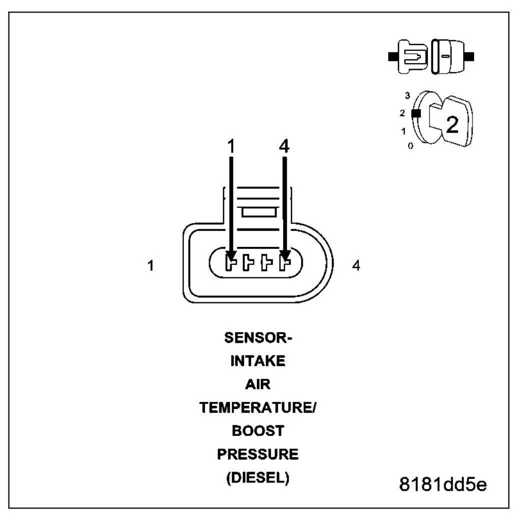
Yes >> Repair the (K656) Boost Pressure Sensor Ground circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. BOOST PRESSURE SENSOR

Turn the ignition off.

Remove the jumper wire and install the Main Relay.



Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K656) Boost Pressure Sensor Ground circuit and the (K37) Boost Pressure Sensor Signal circuit in the Intake Air Temp/Boost Pressure Sensor harness connector.

Turn the ignition on.

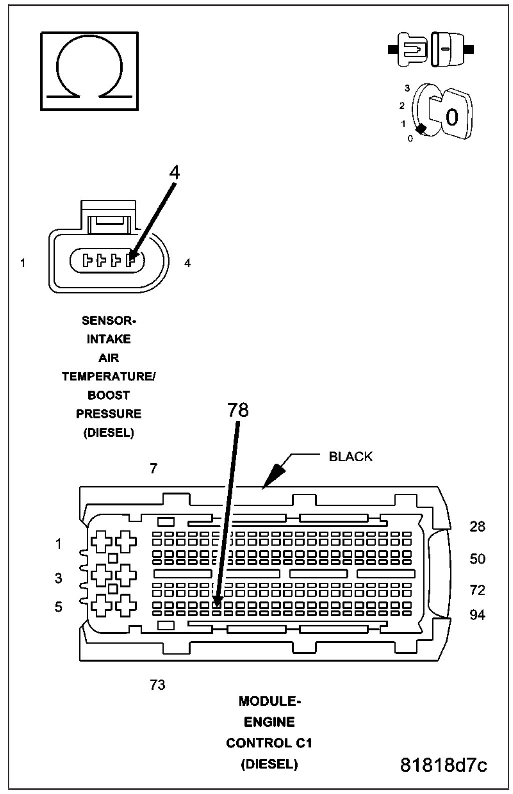
With the scan tool, Clear DTCs.

With the scan tool, select View DTCs.

NOTE: The scan tool should display a Boost Pressure Sensor low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC(s) as described above?

Yes >> Replace the Intake Air Temp/Boost Pressure Sensor in accordance with the Service Information. Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 6

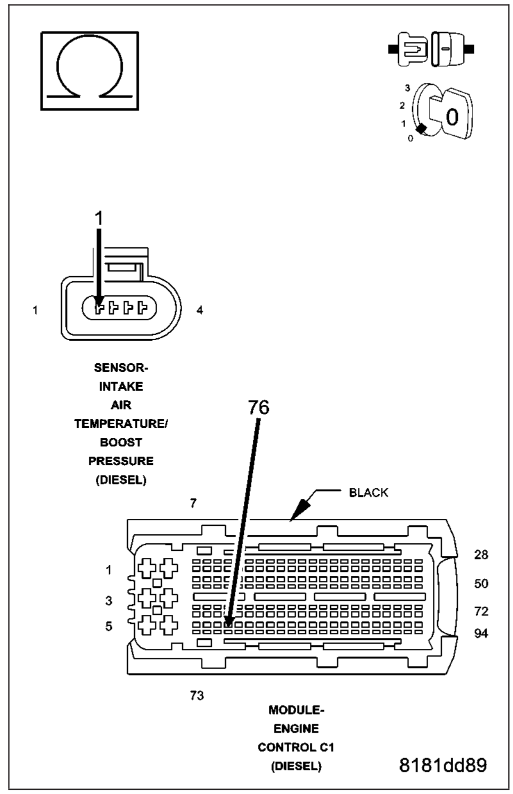
6. (K37) BOOST PRESSURE SENSOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K37) Boost Pressure Sensor Signal circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 7

No >> Repair the (K37) Boost Pressure Sensor Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (K656) BOOST PRESSURE SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K656) Boost Pressure Sensor Ground circuit between the Intake Air Temp/Boost Pressure Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 8

No >> Repair the (K656) Boost Pressure Sensor Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Boost Pressure Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0263-CYLINDER 1 CONTRIBUTION/BALANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The Engine Control Module (ECM) detects multiple misfires from cylinder #1.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.

Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0266-CYLINDER 2 CONTRIBUTION/BALANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from cylinder #2.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.

Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0269-CYLINDER 3 CONTRIBUTION/BALANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from cylinder #3.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.

Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0272-CYLINDER 4 CONTRIBUTION/BALANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from cylinder #4.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

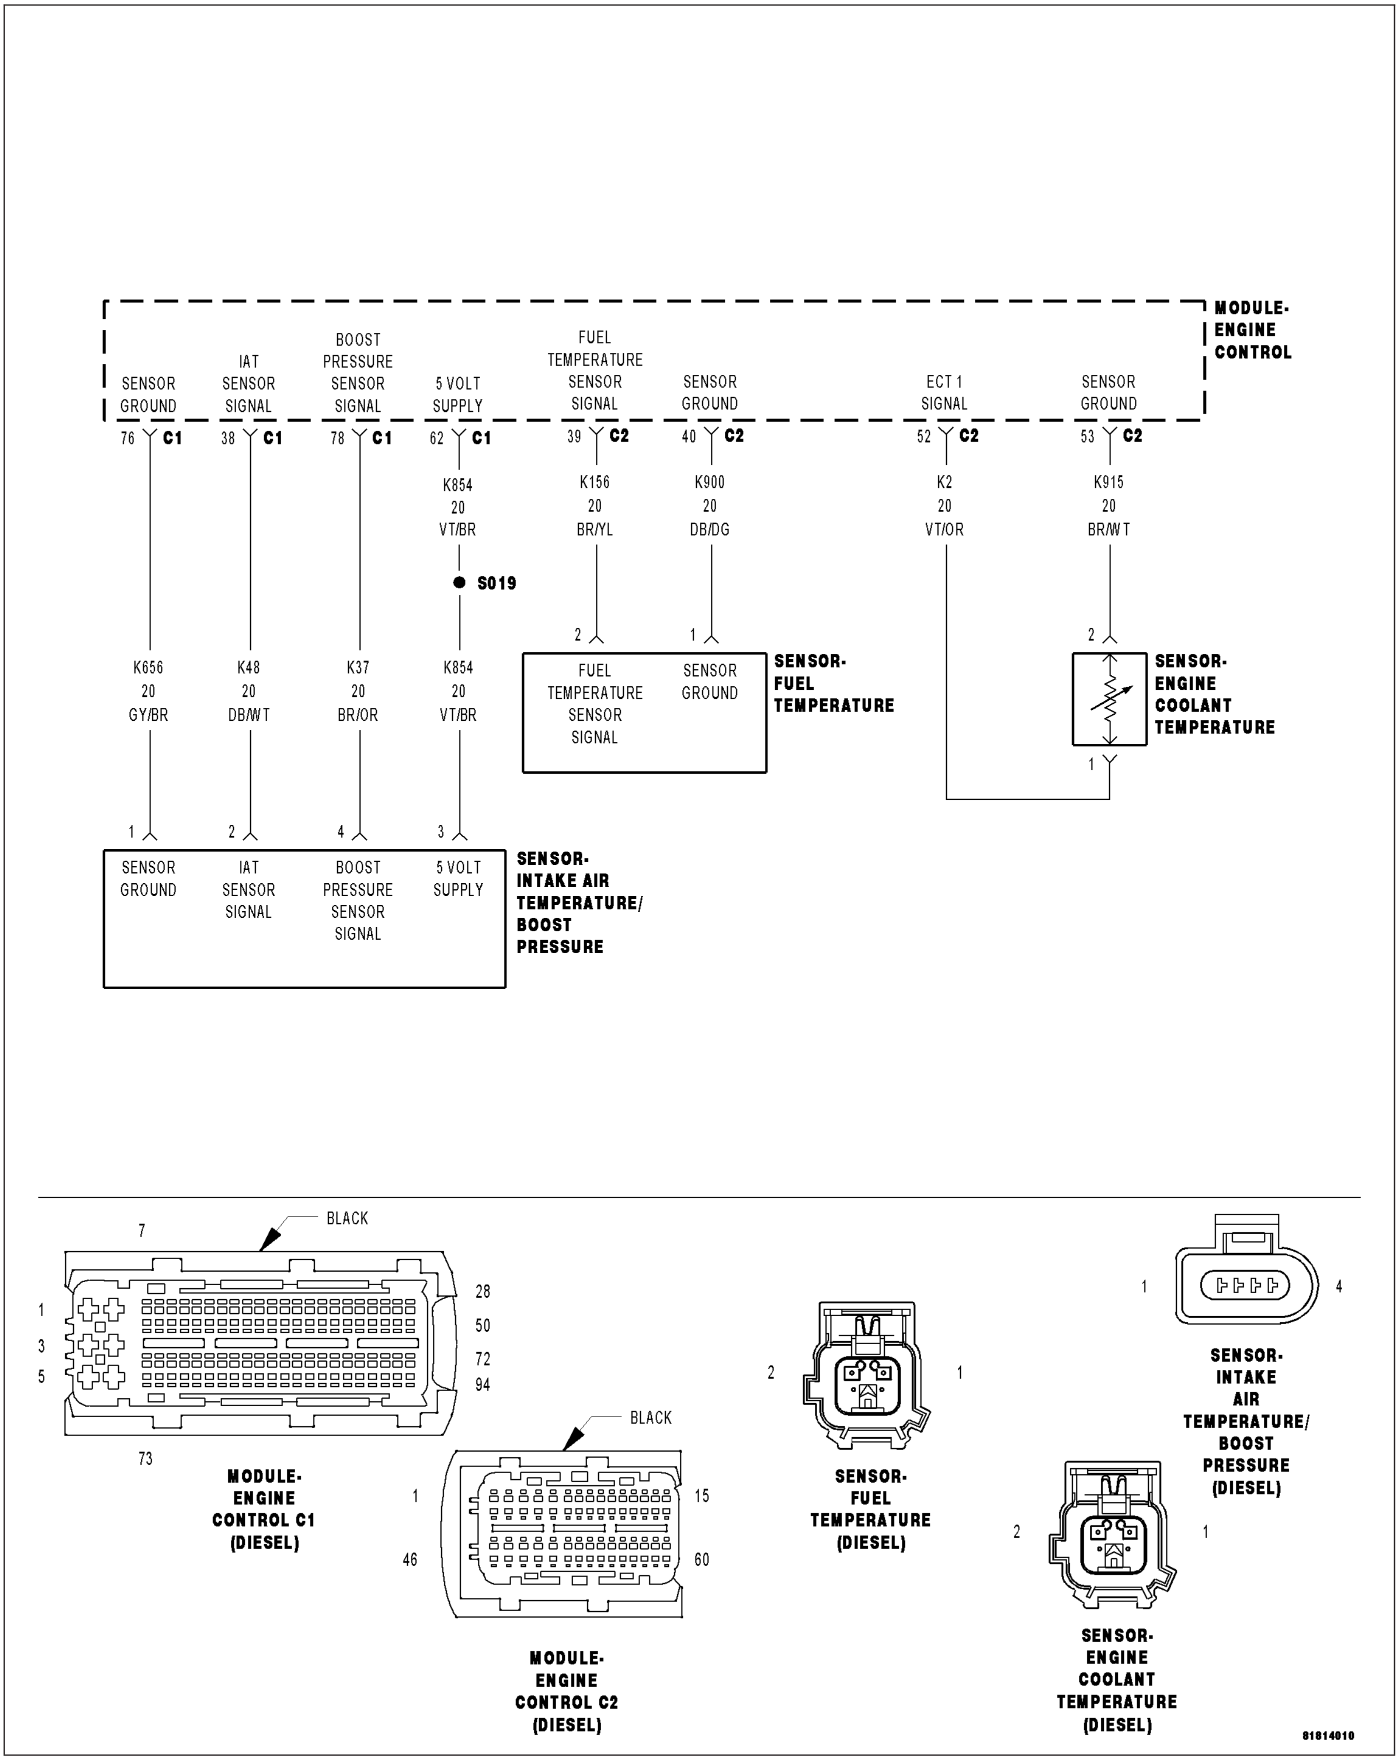
No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.



Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0299-TURBOCHARGER UNDERBOOST CONDITION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and the ECM attempting to govern turbocharger boost pressure.
- **Set Condition:**
  The Intake Air Temperature/Boost Pressure Sensor indicates actual turbocharger boost is less than the ECM setpoint for 6.5 seconds.

Possible Causes
INTERMITTENT DTC
CLOGGED AIR FILTER
INTAKE AIR RESTRICTION
INTAKE AIR LEAK
VACUUM HOSES/TUBES
BOOST PRESSURE ACTUATOR
TURBOCHARGER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK THE AIR FILTER

Turn the ignition off.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause air flow restriction.

Were any of these problems found?

Yes >> Replace the Air Filter element
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. CHECK FOR INTAKE AND EXHAUST SYSTEM RESTRICTIONS

NOTE: Damaged, restricted or poorly connected intake and turbocharger related tubes can cause this DTC to set.

Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections.

Inspect the complete exhaust system for damaged, bent or clogged pipes that can cause exhaust system restrictions and excessive backpressure.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect the Intake Air Temp/Boost Pressure Sensor harness connector.

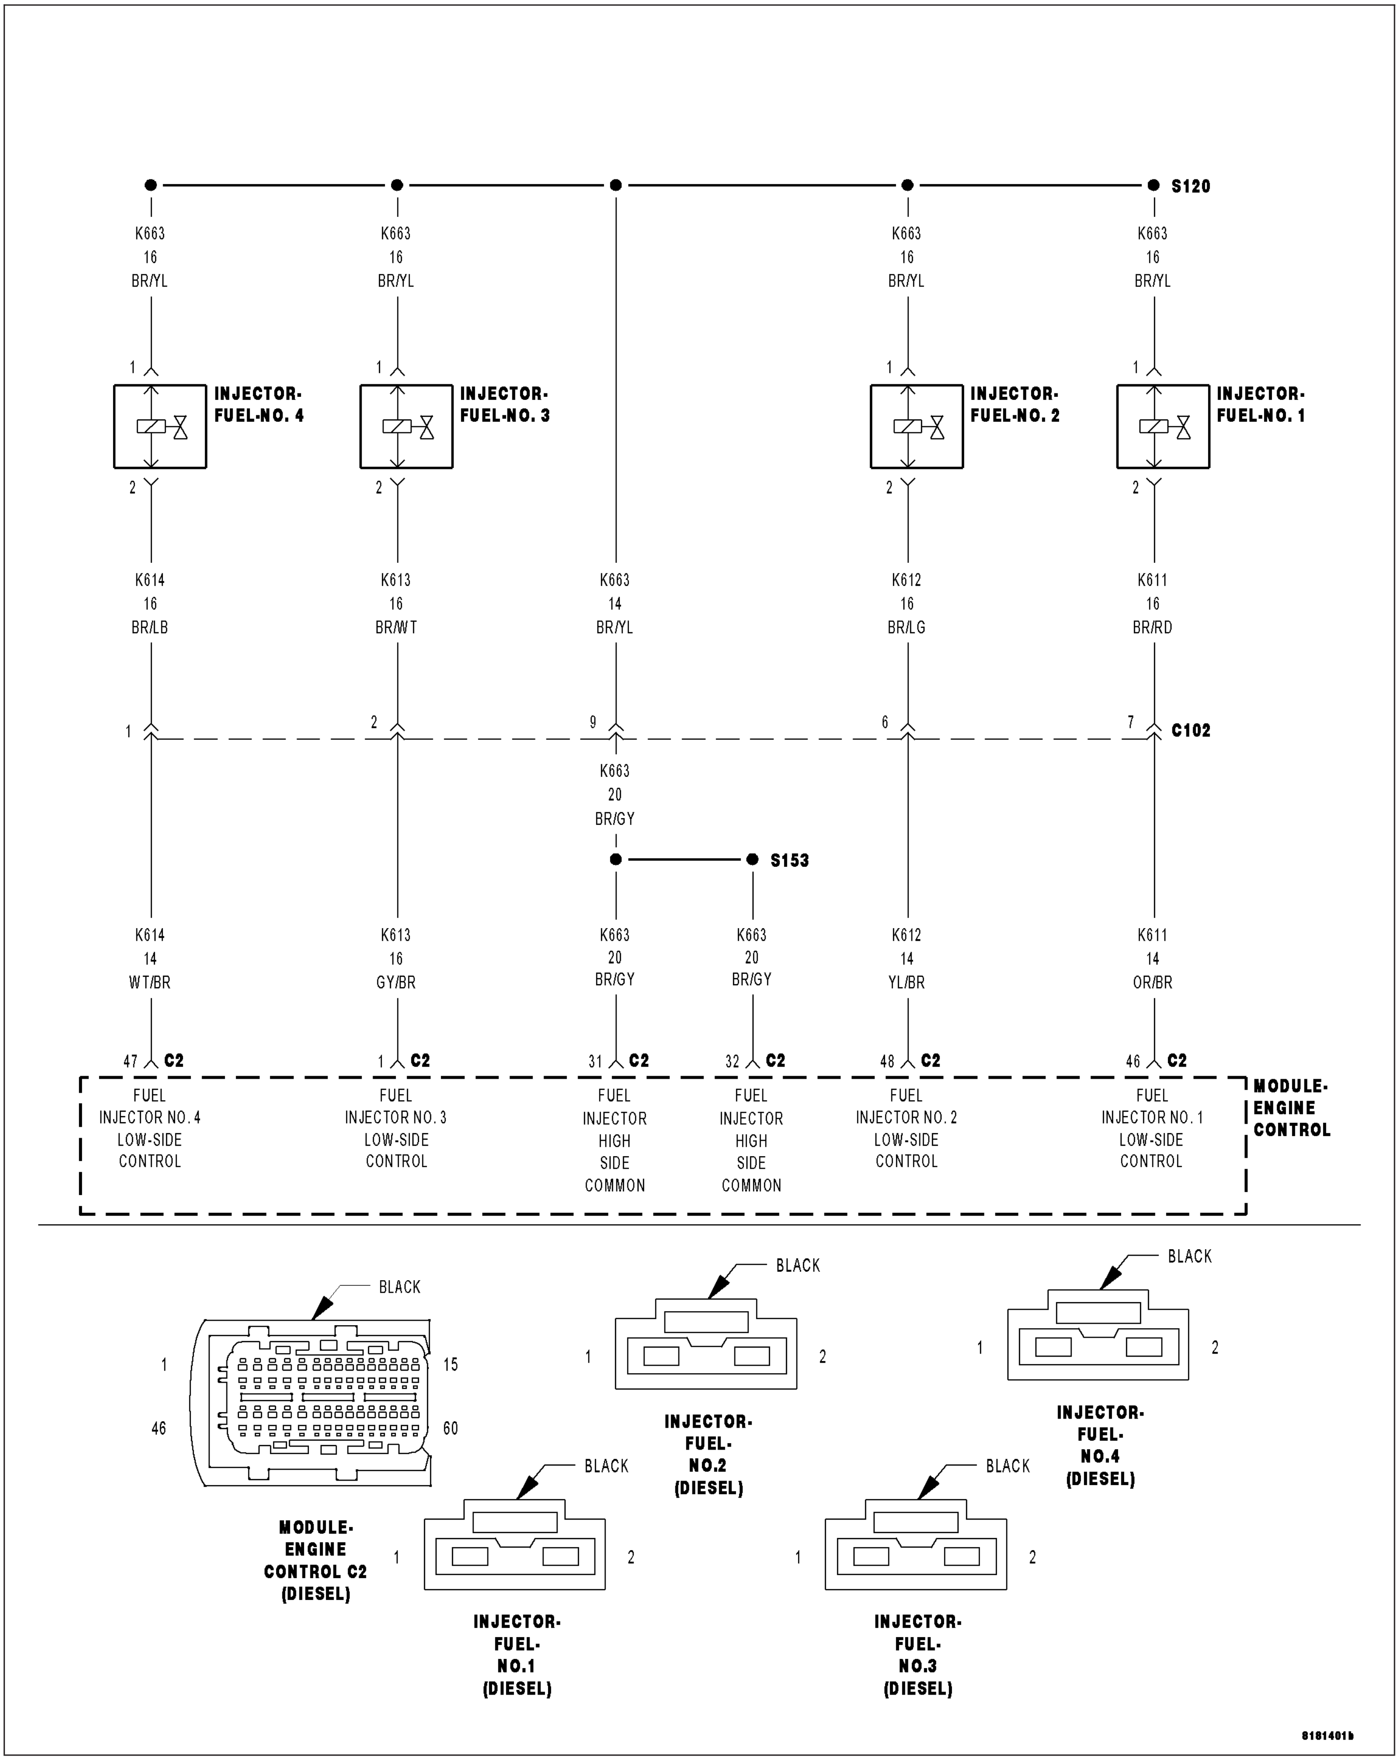
Measure the resistance of the each of the Boost Pressure Sensor circuits (3 circuits) between the Intake Air Temp/Boost Pressure Sensor and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> 5

No >> Repair the Boost Pressure Sensor circuit(s) that measure above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. CHECK THE BOOST PRESSURE SYSTEM



Refer to the CHECKING THE BOOST PRESSURE SYSTEM to check the boost pressure supply hoses, Boost Actuator and Turbocharger boost output.

With the scan tool, select View DTCs.

View repair.

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0300-MISFIRE DETECTED

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from one or more cylinders.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR
FUEL SUPPLY CONTAMINATION
LOW SIDE FUEL PRESSURE
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

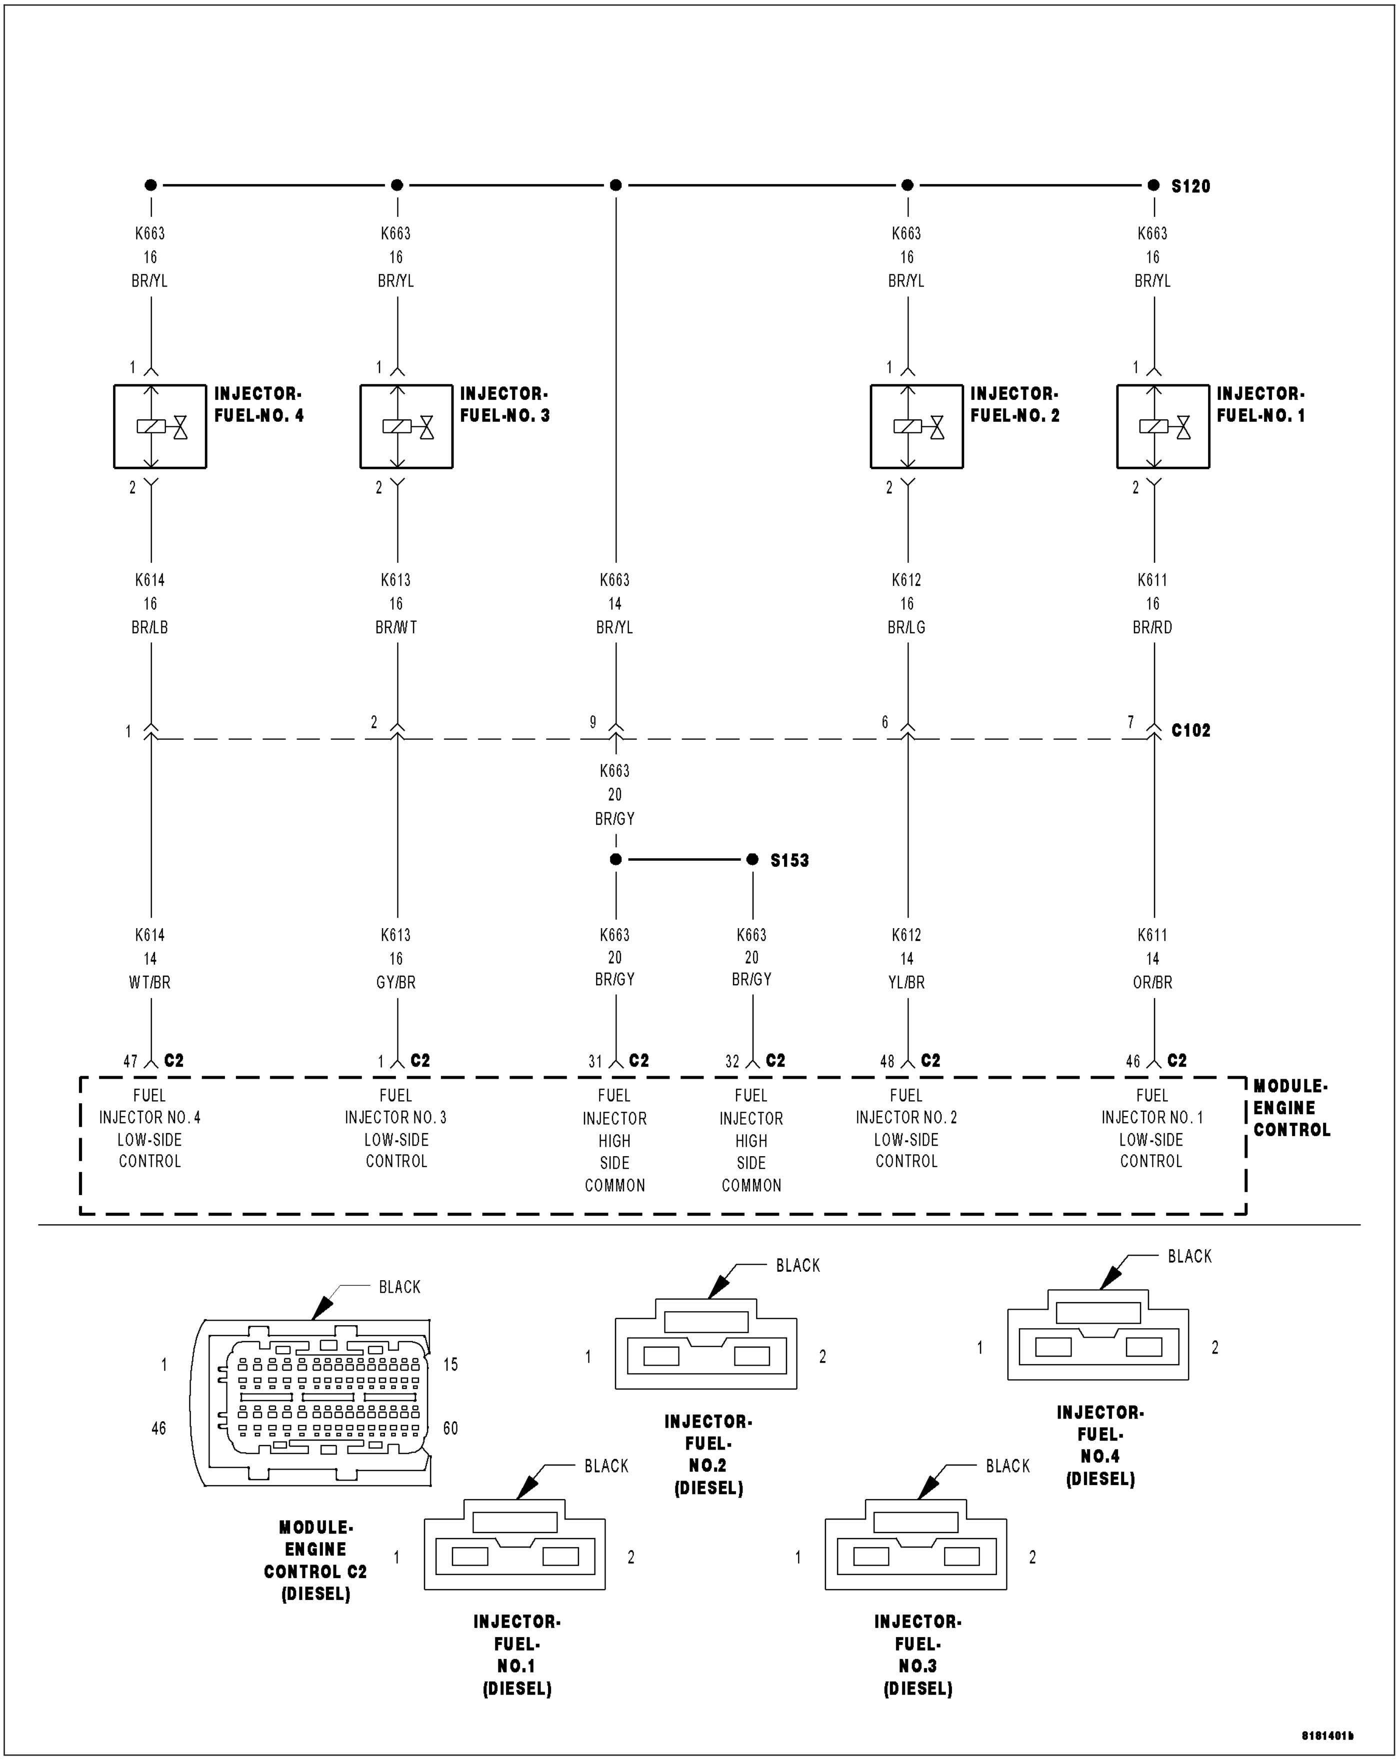
No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.



Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0301-MISFIRE DETECTED CYLINDER #1

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from cylinder #1.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

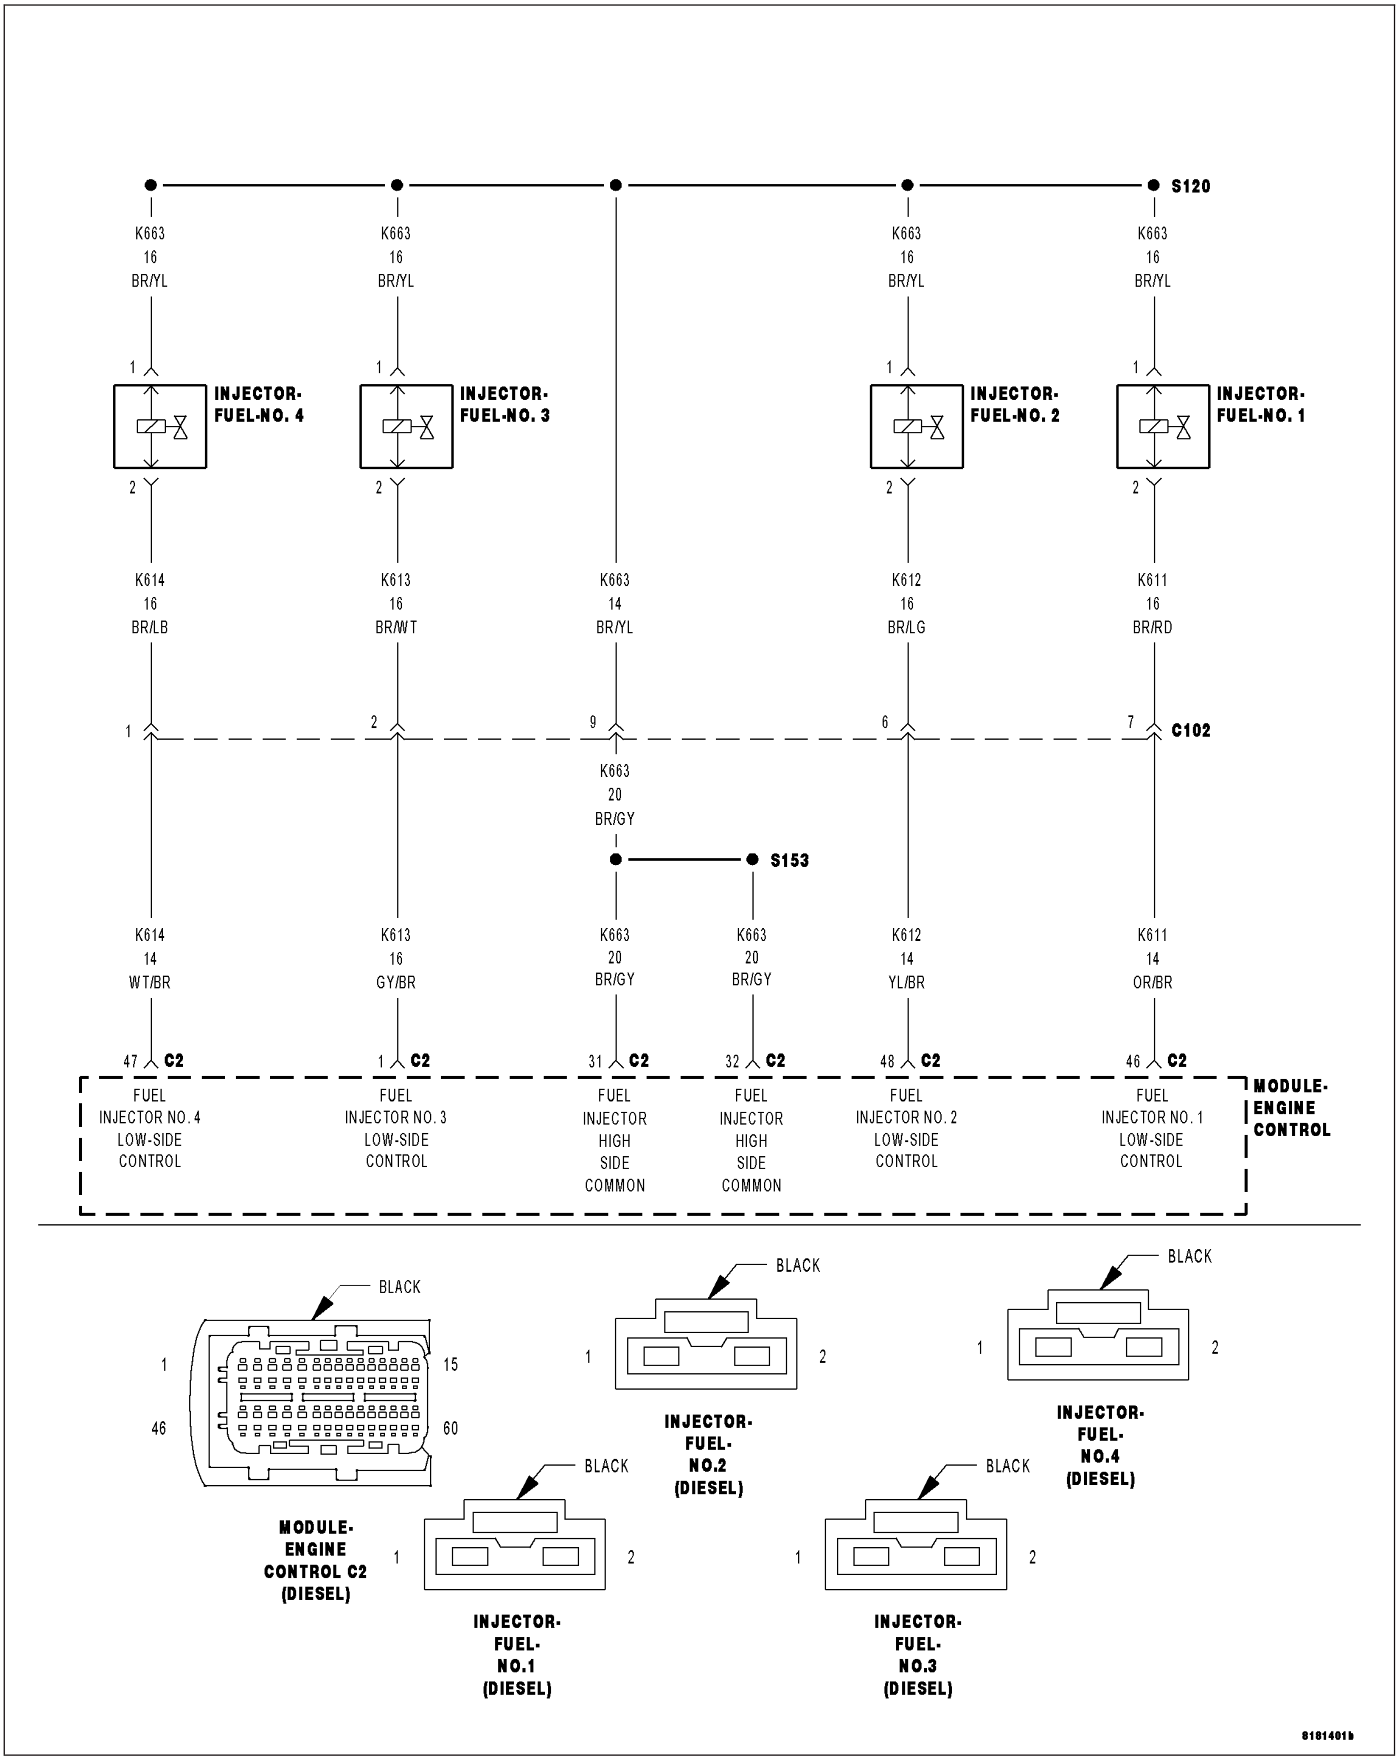
No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.



Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0302-MISFIRE DETECTED CYLINDER #2

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from cylinder #2.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

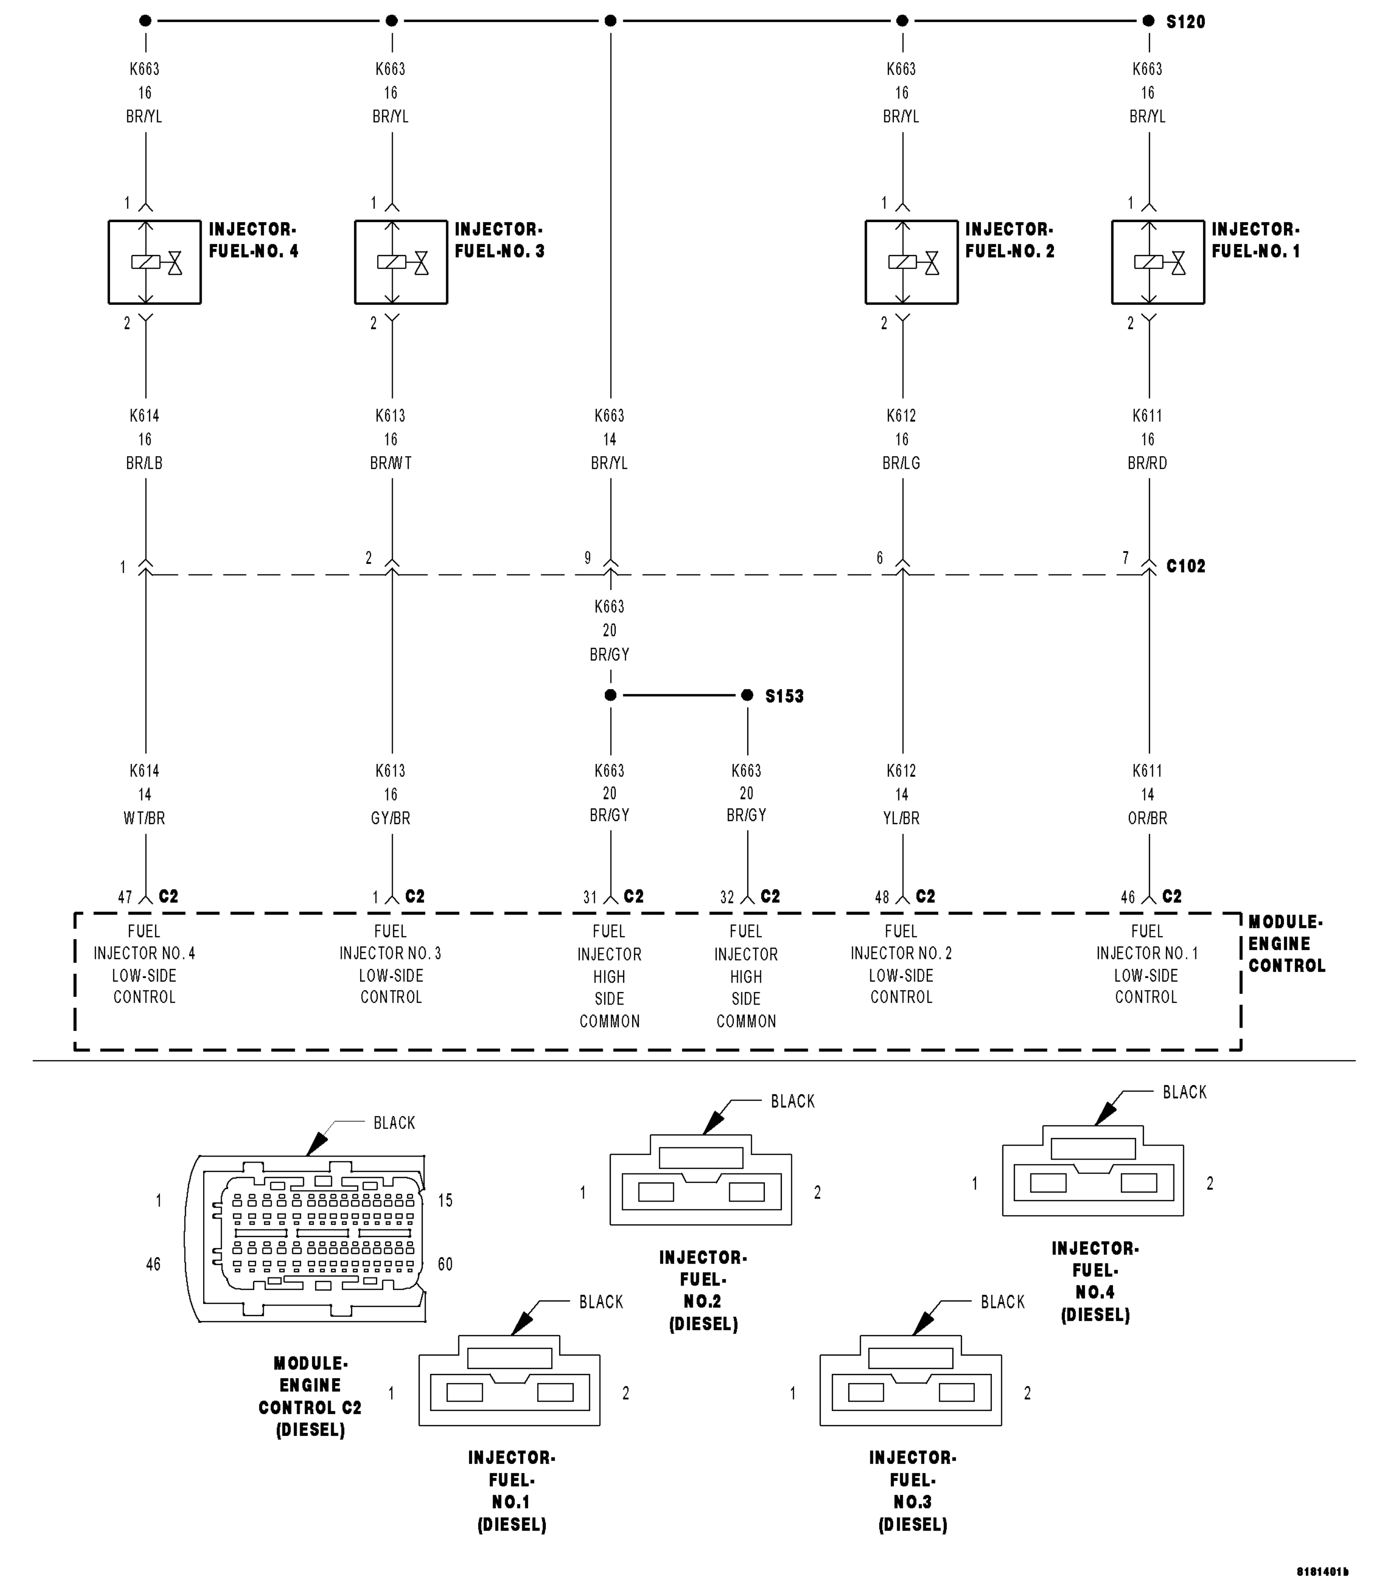
No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.



Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0303-MISFIRE DETECTED CYLINDER #3

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from cylinder #3.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

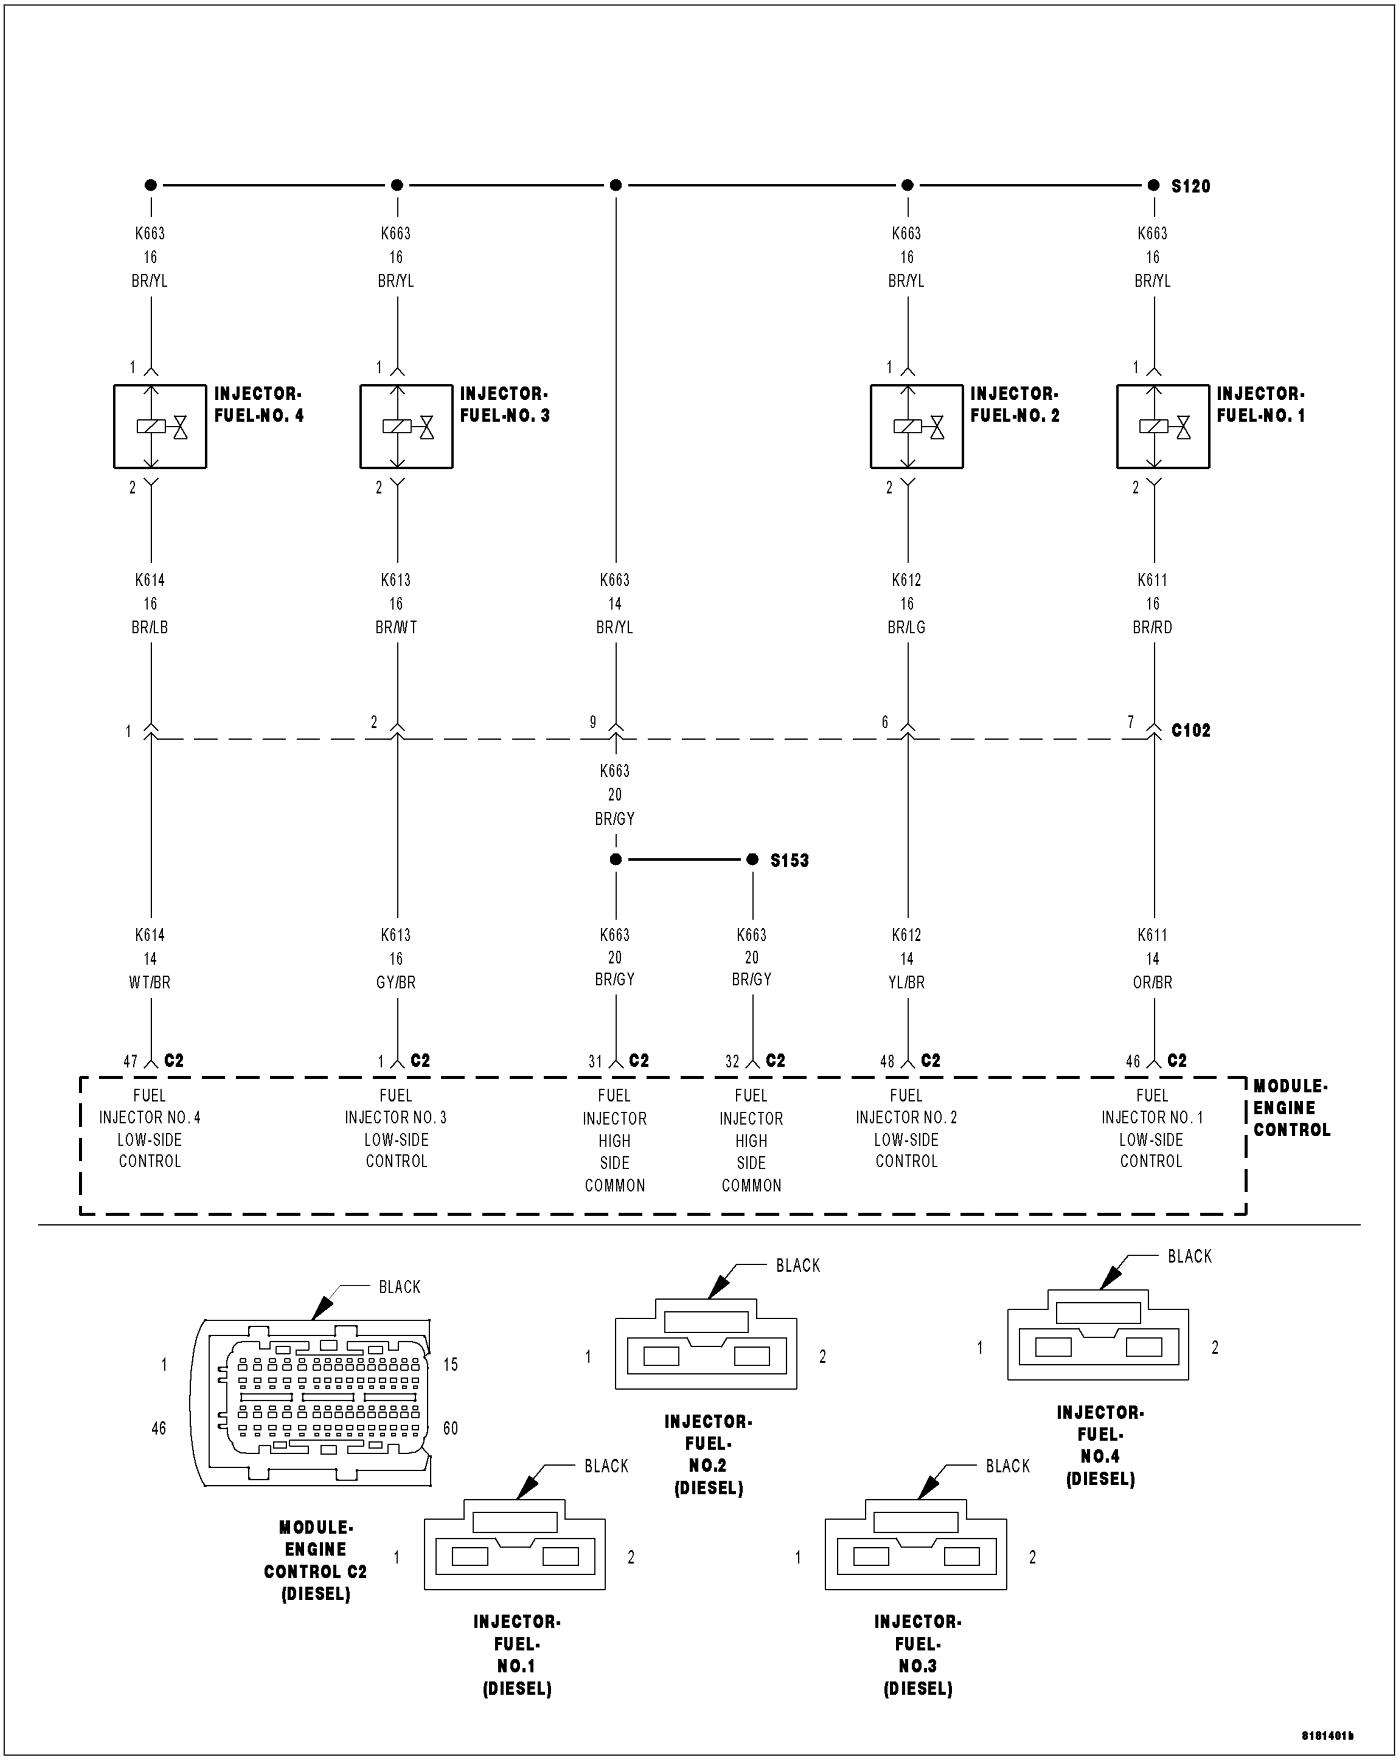
No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.



Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0304-MISFIRE DETECTED CYLINDER #4

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects multiple misfires from cylinder #4.

Possible Causes
ENGINE COMPRESSION
FUEL INJECTOR QUANTITY
FUEL SUPPLY CONTAMINATION
INJECTOR LEAKAGE
INTERMITTENT CONDITION

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, erase ECM DTCs.

Test drive the vehicle and attempt to duplicate the problem.

With the scan tool, read ECM DTC's.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL CONTAMINATION

Refer to the Service Information and inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 3

3. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. ENGINE COMPRESSION

Ignition on, engine off.

Refer to the Service Information and perform the Cylinder Compression Test.

Is the cylinder compression within specification for all cylinders?

Yes >> Go To 5

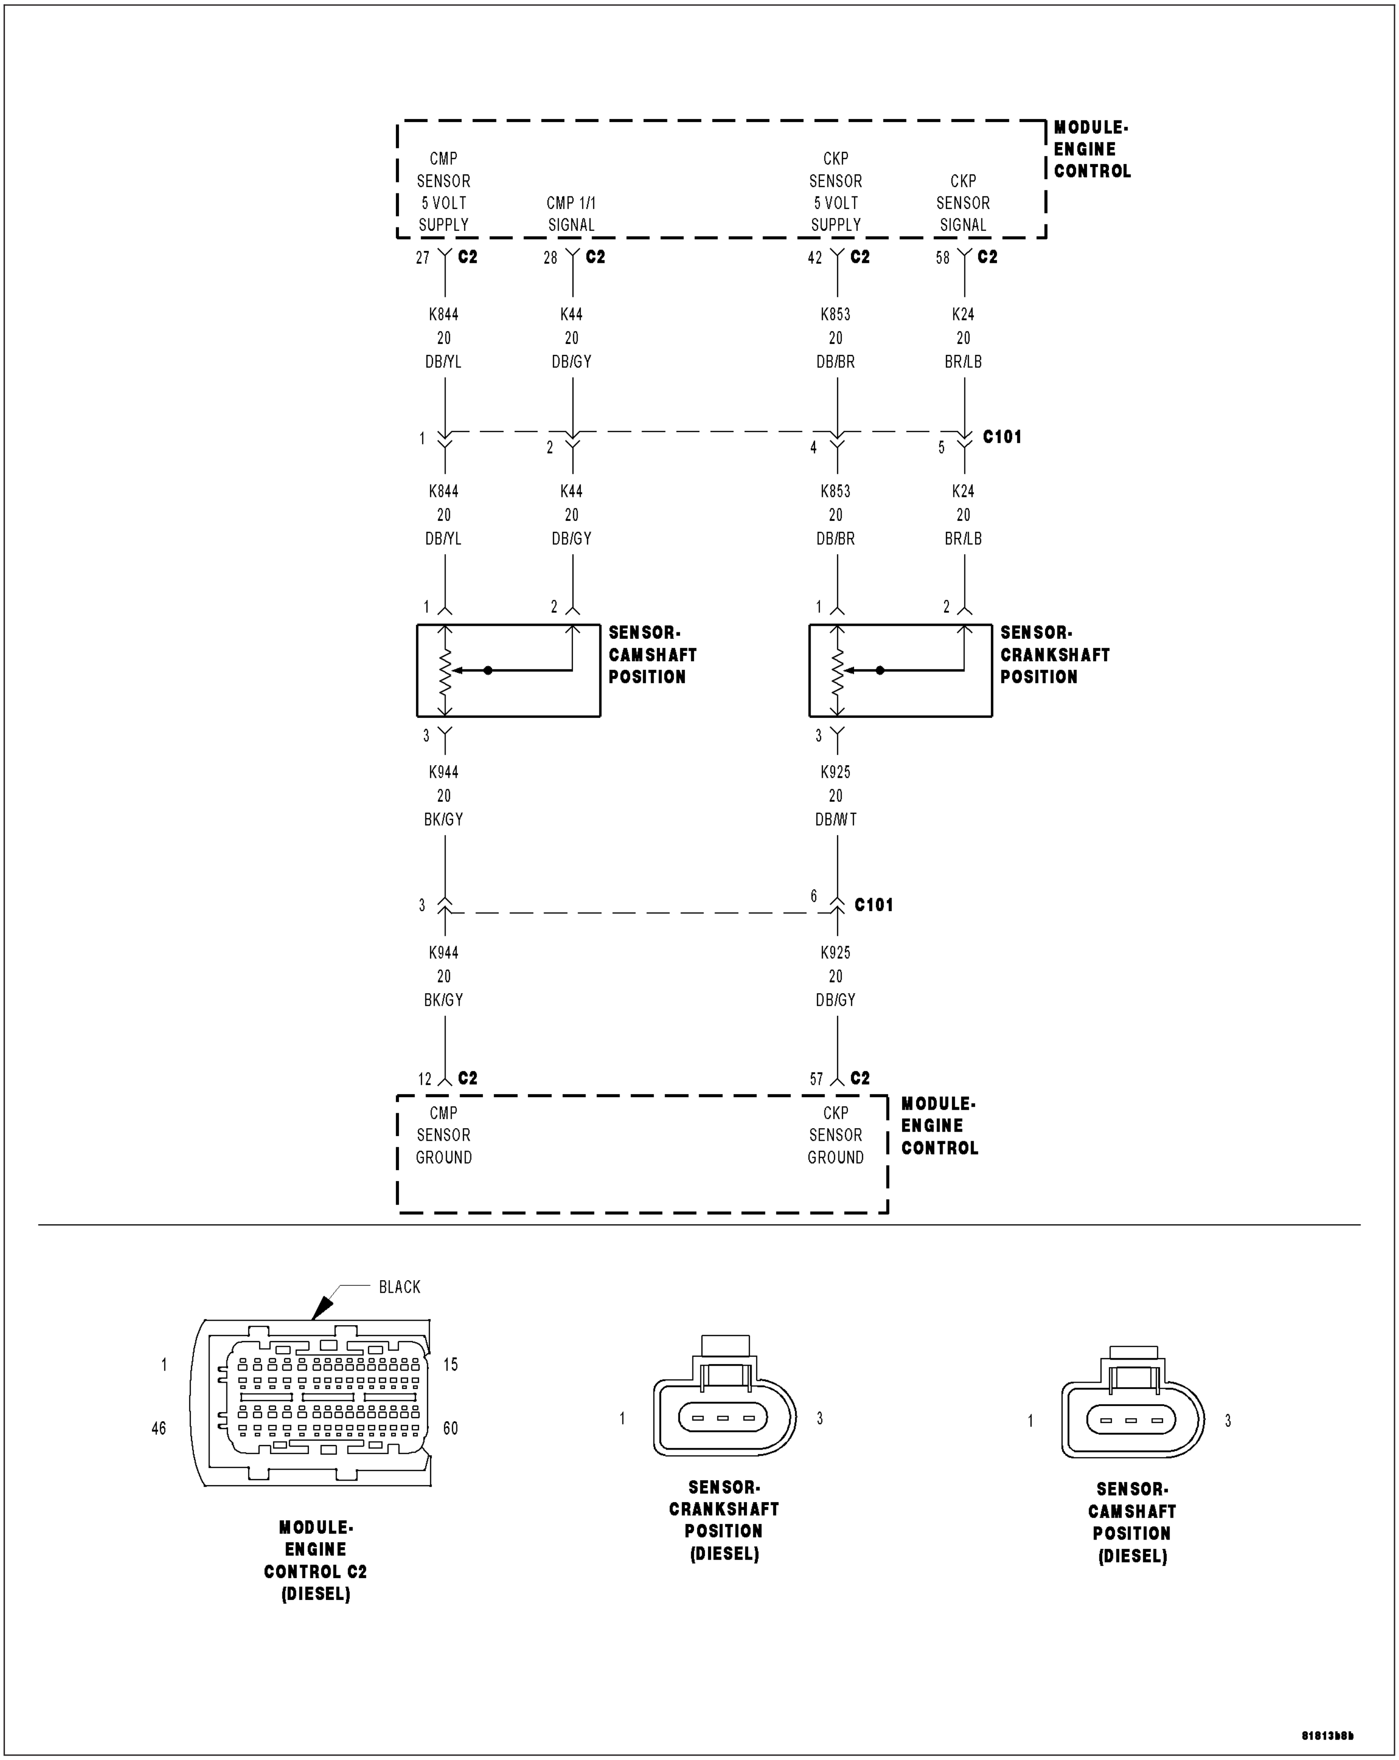
No >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. FUEL INJECTOR CIRCUIT RESISTANCE

Turn the ignition off.

Disconnect the ECM harness connectors.

Disconnect each Fuel Injector harness connector.



Measure the resistance of each of the Fuel Injector Control circuits between the Fuel Injector and ECM harness connectors.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Replace the Fuel Injector(s) as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the Fuel Injector circuit(s) that measured above 10.0 ohms for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0335-CRANKSHAFT POSITION SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine cranking or running. Engine speed above 50 rpm. No Sensor Supply DTC's present.
- **Set Condition:**
  The Engine Control Module (ECM) does not receive a signal from the Crankshaft Position Sensor when the Camshaft Position Sensor indicates engine rpm.

Possible Causes
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT OPEN
(K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
CHECKING (K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT
DAMAGED CKP SENSOR OR CRANKSHAFT
ECM
(K925) CKP SENSOR GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
(K24) CKP SENSOR SIGNAL CIRCUIT OPEN
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K24) CKP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
CRANKSHAFT POSITION SENSOR
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT
(K24) CKP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If DTC P0652 or P0653 is present with this DTC, diagnose DTCs P0652 or P0653 before diagnosing this DTC.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Go To 2

2. TEST DRIVE

With the scan tool, erase the ECM DTCs.

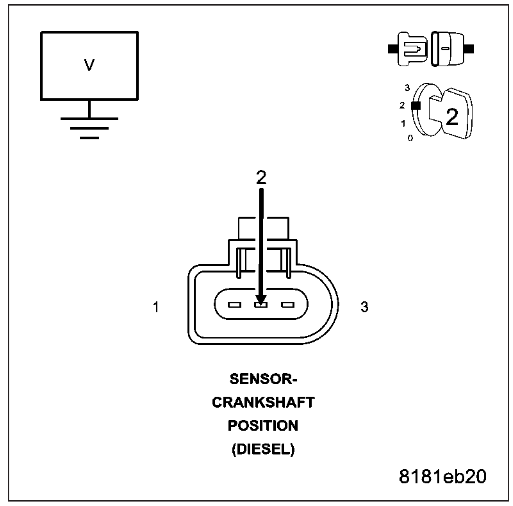
Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



3. CHECKING (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.
Go To 4

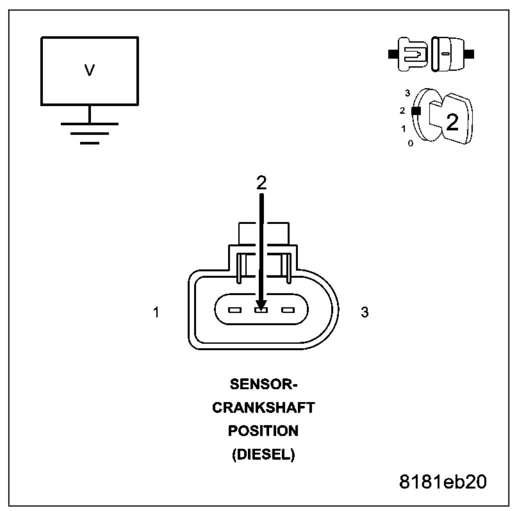
Voltage is between 4.7 and 5.4 volts.
Go To 5

Voltage is below 4.7 volts.
Go To 12

4. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.



Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

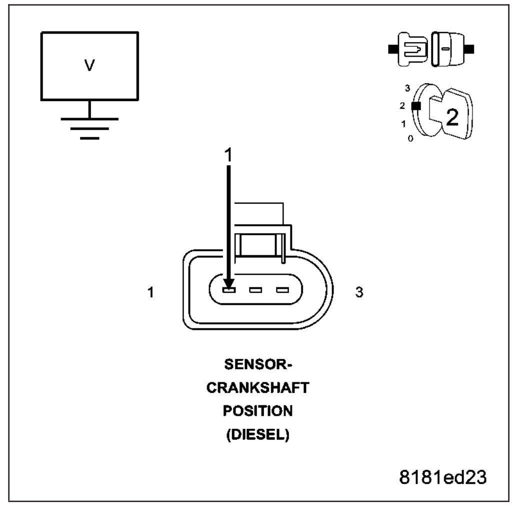
Turn the ignition on.

Measure the voltage of the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Measure the voltage of the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the voltage below 1.0 volt for each measurement?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the CKP Sensor circuit(s) that measured above 1.0 volt for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. CHECKING (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

Measure the voltage of the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

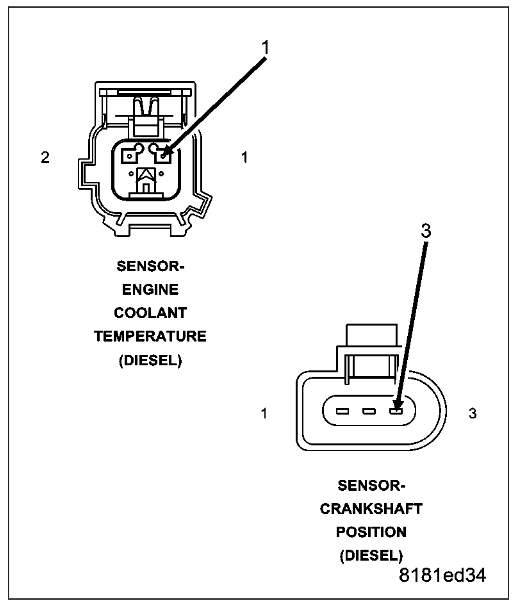
Select the appropriate voltage reading.

Voltage is above 5.4 volts.
Repair the (K853) CKP 5-Volt Supply circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Voltage is between 4.7 and 5.4 volts.
Go To 6

Voltage is below 4.7 volts.
Go To 9

6. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN



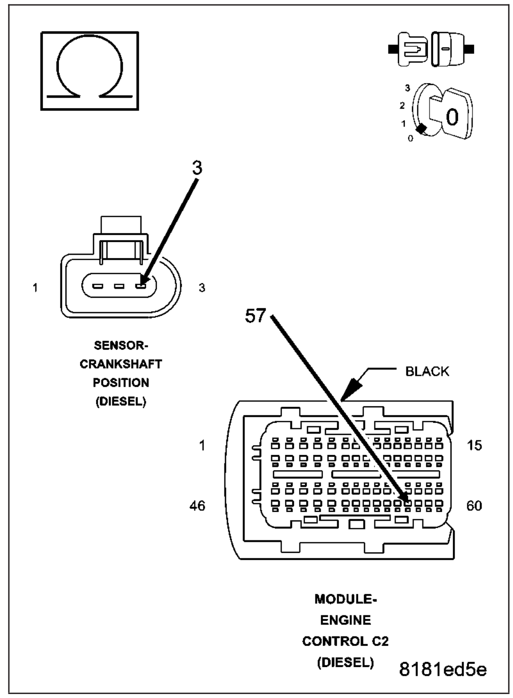
Turn the ignition off.

Connect one end of a jumper wire to the (K2) ECT Sensor signal circuit in the ECT Sensor harness connector.

Connect the other end of the jumper wire to the (K925) CKP Sensor Ground circuit in the Crankshaft Position Sensor harness connector.

Turn the ignition on.

With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.



Is the voltage below 0.5 volt?

Yes >> Go To 8

No >> Go To 7

7. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the ECM harness connector.

Measure the resistance of the (K925) CKP Sensor Ground circuit between the CKP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace and program the ECM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K925) CKP Sensor Ground circuit for an open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. DAMAGED CRANKSHAFT POSITION SENSOR OR CRANKSHAFT

Remove the CKP Sensor.

Inspect the CKP Sensor for conditions such as loose mounting screws, damage, or cracks.

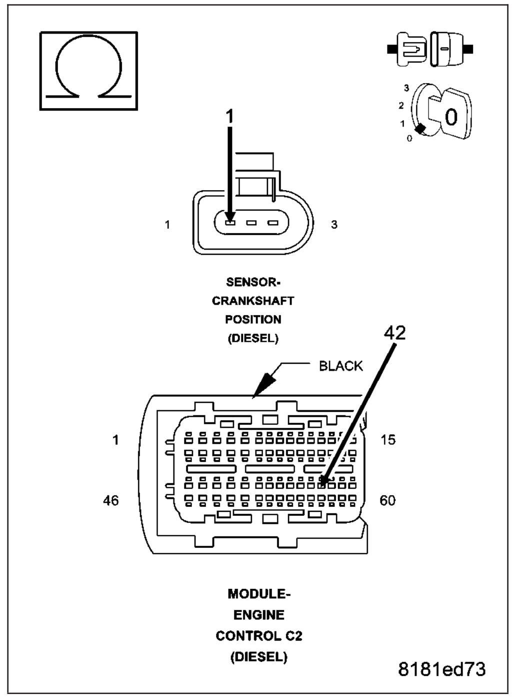
Inspect the Crankshaft for conditions such as damage, debris or cracked teeth.

Is there any evidence of these conditions?

Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Crankshaft Position Sensor in accordance with the Service Information.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

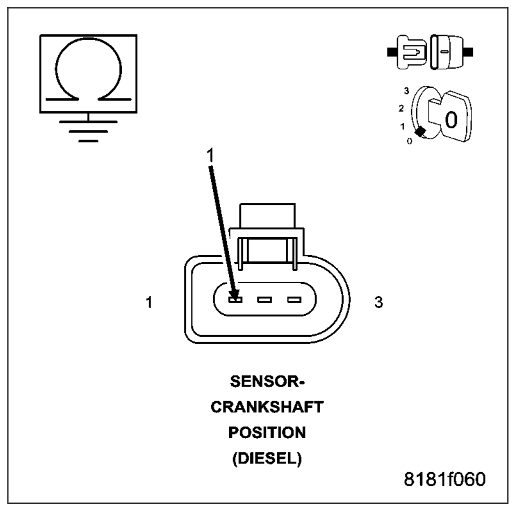
9. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Disconnect the ECM harness connector.

Measure the resistance of the (K853) CKP Sensor 5-Volt Supply circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 10

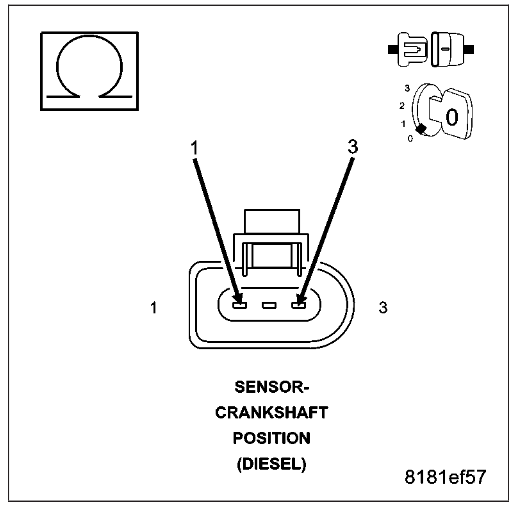
No >> Repair the (K853) CKP Sensor 5-Volt Supply circuit for an open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 11

No >> Repair the (K853) CKP Sensor 5-Volt Supply circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

11. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

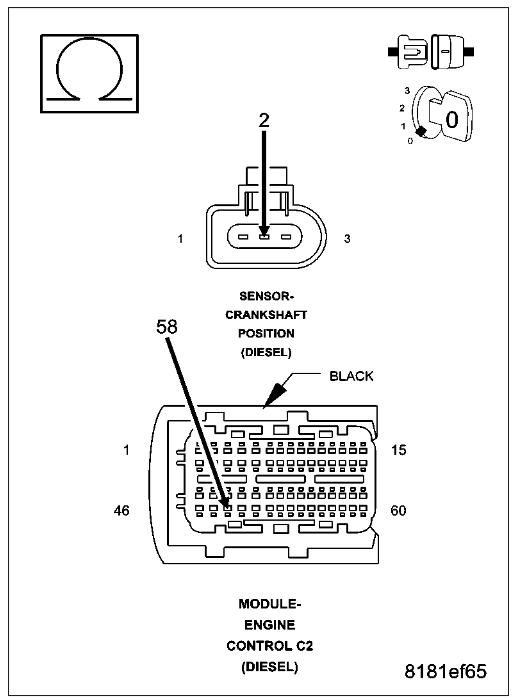
Measure the resistance between the (K853) CKP Sensor 5-Volt Supply circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K853) CKP Sensor 5-Volt Supply circuit and (K925) CKP Sensor Ground circuits for a short together.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

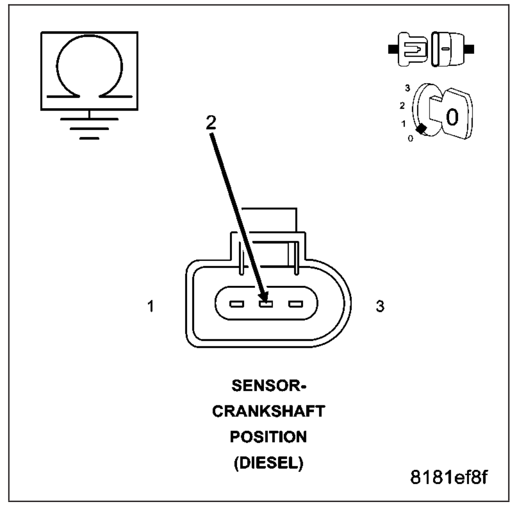
12. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off

Disconnect the ECM harness connector.

Measure the resistance of the (K24) CKP Sensor Signal circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 13

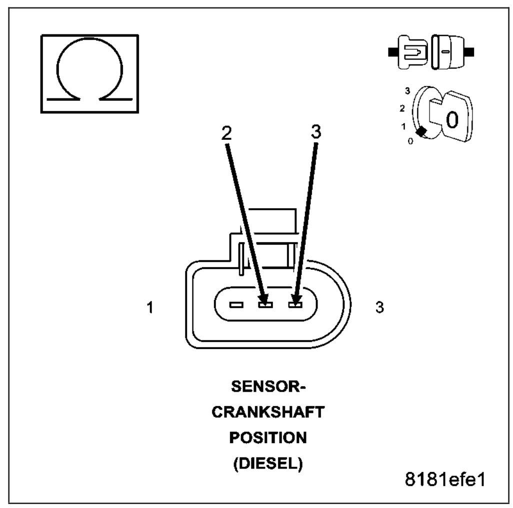
No >> Repair the (K24) CKP Sensor Signal circuit for an open

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

13. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 14

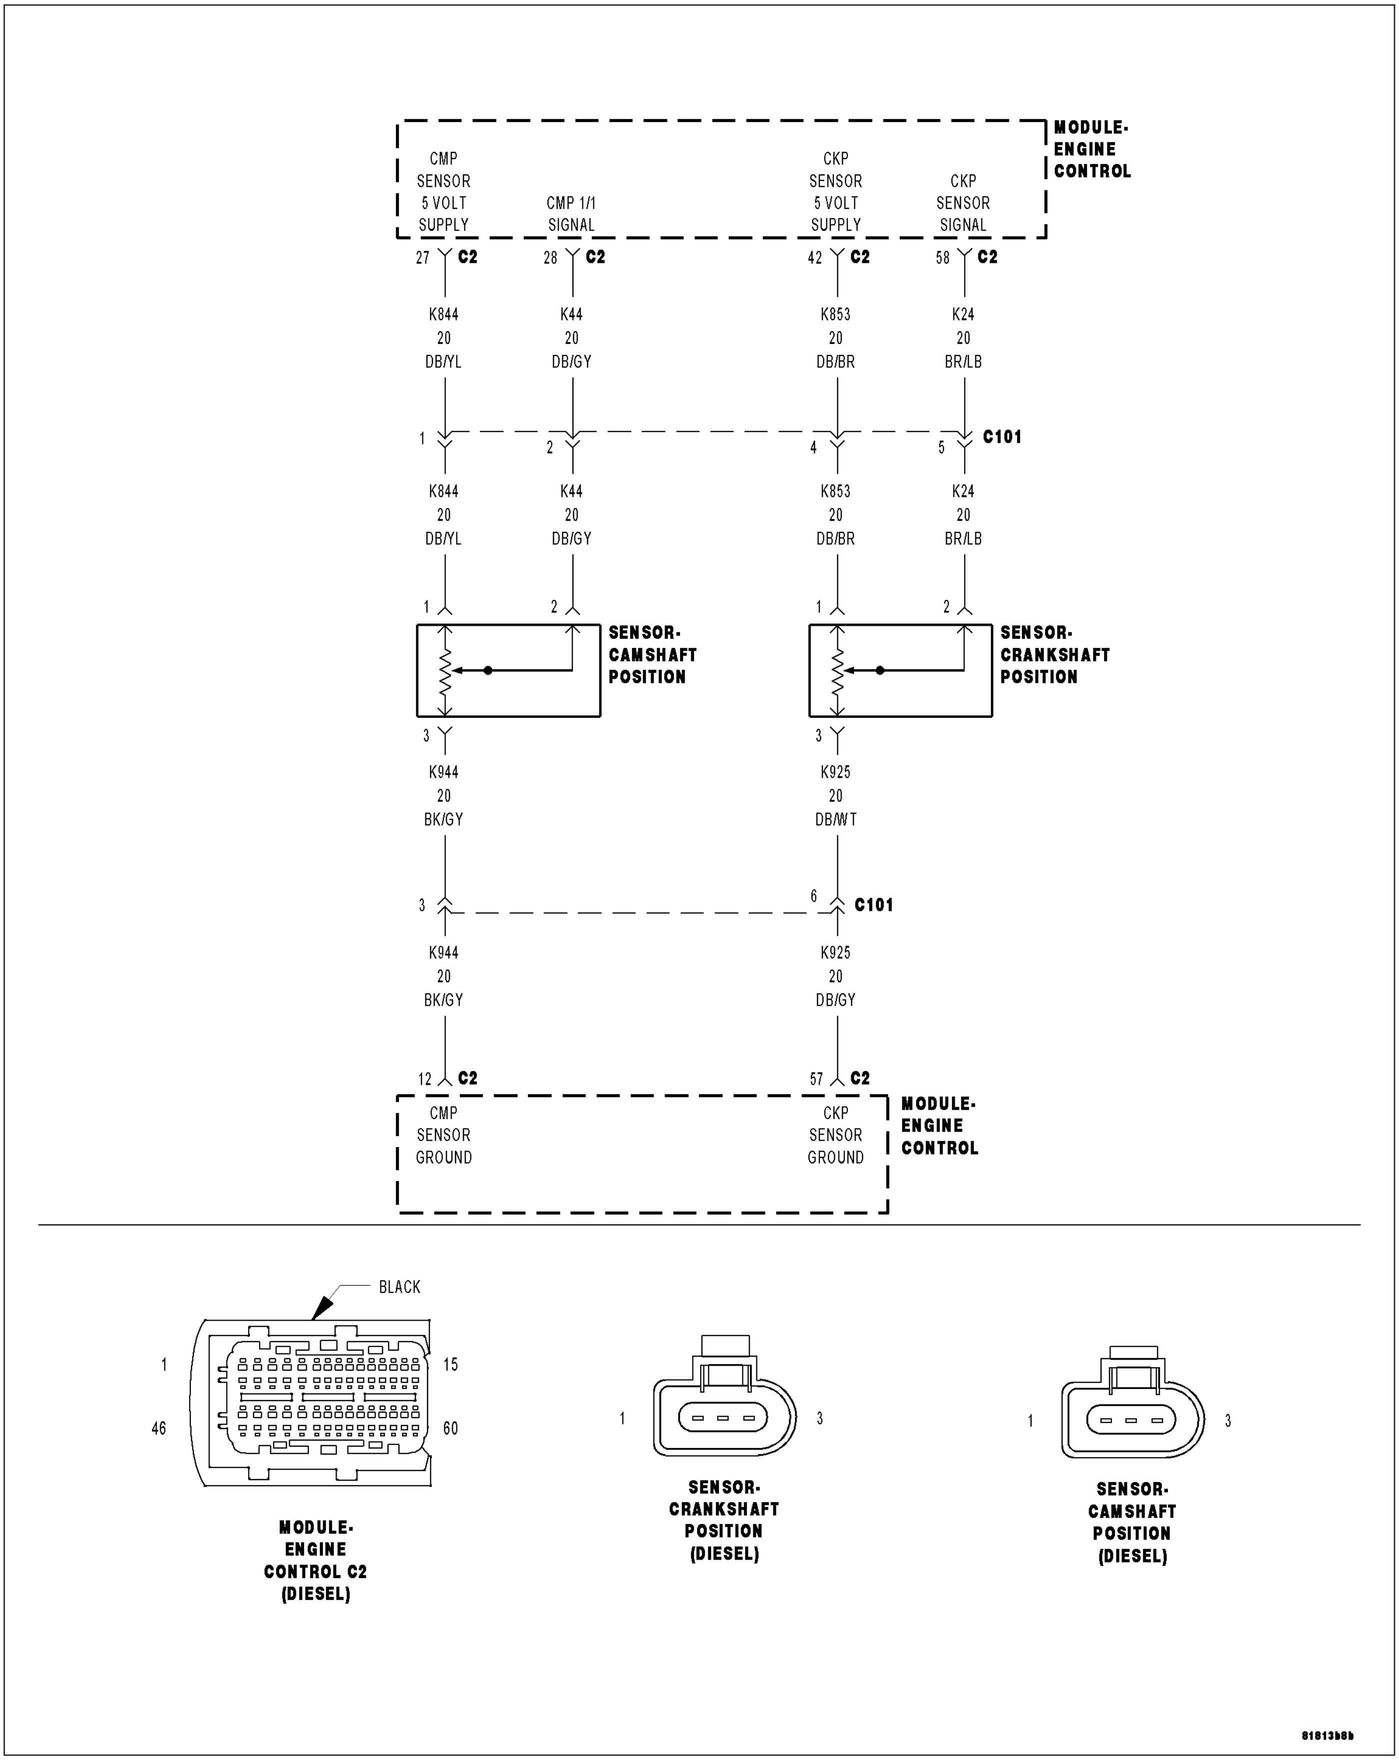
No >> Repair the (K24) CKP Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

14. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Measure the resistance between the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit for a short together.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0339-CRANKSHAFT POSITION SENSOR INTERMITTENT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine cranking or running. Engine speed above 50 rpm. No Sensor Supply DTC's present.
- **Set Condition:**
  The Engine Control Module (ECM) does not receive a signal from the Crankshaft Position Sensor when the Camshaft Position Sensor indicates engine rpm.

Possible Causes
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT OPEN
(K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
CHECKING (K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT
DAMAGED CKP SENSOR OR CRANKSHAFT
ECM
(K925) CKP SENSOR GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
(K24) CKP SENSOR SIGNAL CIRCUIT OPEN
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K24) CKP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
CRANKSHAFT POSITION SENSOR
(K853) CKP SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT
(K24) CKP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If DTC P0652 or P0653 is present with this DTC, diagnose DTCs P0652 or P0653 before diagnosing this DTC.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Go To 2

2. TEST DRIVE

With the scan tool, erase the ECM DTCs.

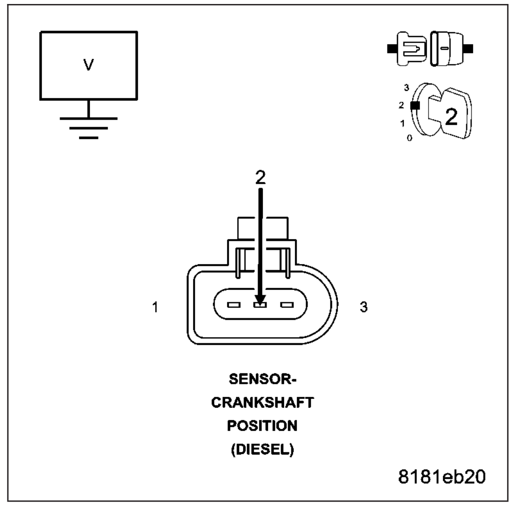
Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



3. CHECKING (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Select the appropriate voltage reading.

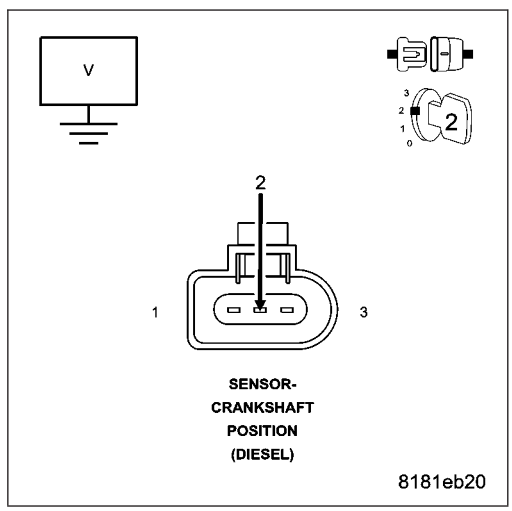
Voltage is above 5.4 volts.
Go To 4

Voltage is between 4.7 and 5.4 volts.
Go To 5

Voltage is below 4.7 volts.
Go To 12

4. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.



Disconnect the ECM harness connectors.

Remove the Main Relay.

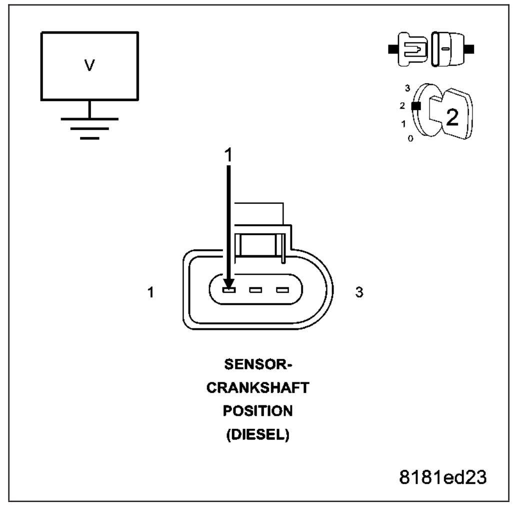
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (K24) CKP Position Sensor Signal circuit at the CKP Sensor harness connector.

Is the voltage below 1.0 volt?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K24) Crankshaft Position Sensor Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. CHECKING (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

Measure the voltage of the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

Repair the (K853) CKP 5-Volt Supply circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Voltage is between 4.7 and 5.4 volts.

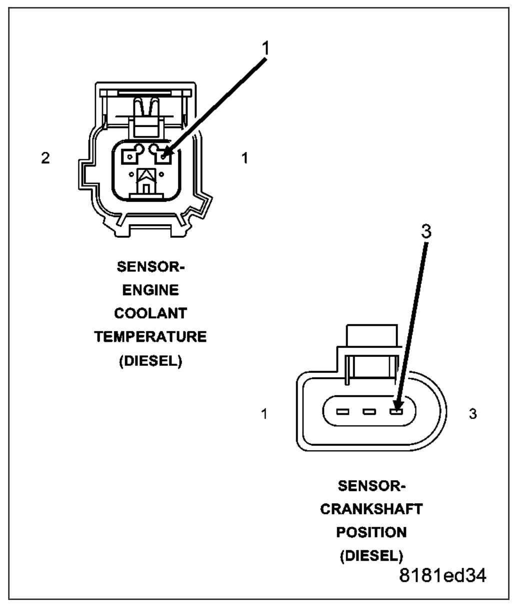
Go To 6

Voltage is below 4.7 volts.

Go To 9

6. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.



Disconnect the ECT Sensor harness connector.

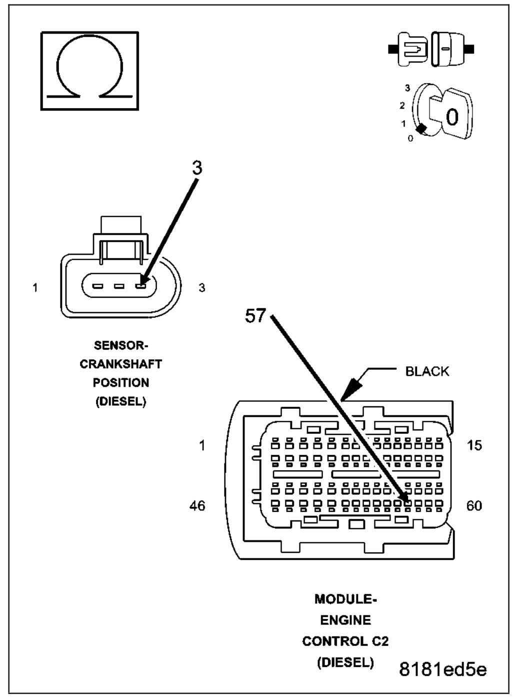
Connect one end of a jumper wire to the (K2) ECT Sensor signal circuit in the ECT Sensor harness connector.

Connect the other end of the jumper wire to the (K925) CKP Sensor Ground circuit in the Crankshaft Position Sensor harness connector.

Turn the ignition on.

With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.

Is the voltage below 0.5 volt?



Yes >> Go To 8

No >> Go To 7

7. (K925) CRANKSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (K925) CKP Sensor Ground circuit between the CKP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace and program the ECM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K925) CKP Sensor Ground circuit for an open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. DAMAGED CRANKSHAFT POSITION SENSOR OR CRANKSHAFT

Turn the ignition off.

Remove the CKP Sensor.

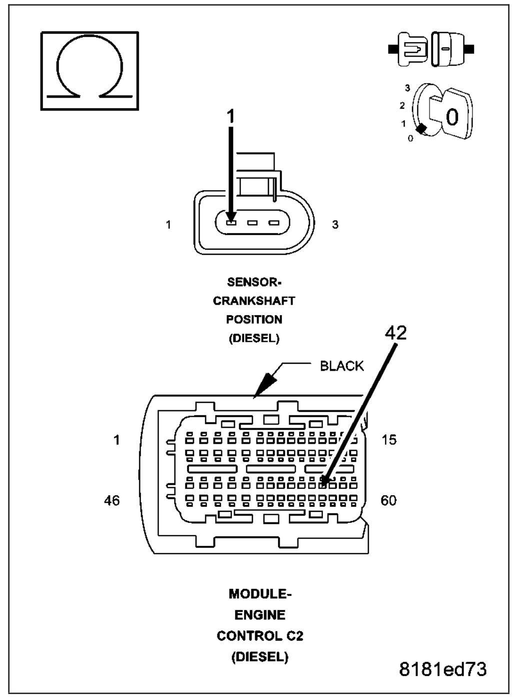
Inspect the CKP Sensor for conditions such as loose mounting screws, damage, or cracks.

Inspect the Crankshaft for conditions such as damage, debris or cracked teeth.

Is there any evidence of these conditions?

Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Replace the Crankshaft Position Sensor in accordance with the Service Information.

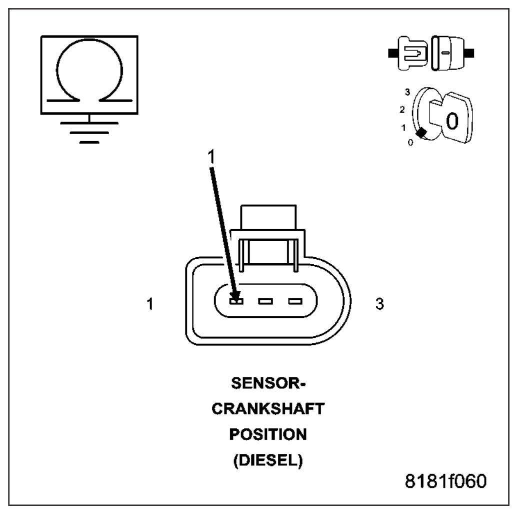
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (K853) CKP Sensor 5-Volt Supply circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 10

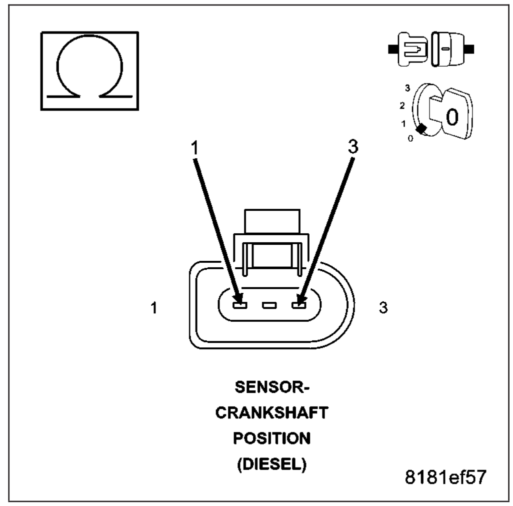
No >> Repair the (K853) CKP Sensor 5-Volt Supply circuit for an open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K853) CKP Sensor 5-Volt Supply circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 11

No >> Repair the (K853) CKP Sensor 5-Volt Supply circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

11. (K853) CRANKSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

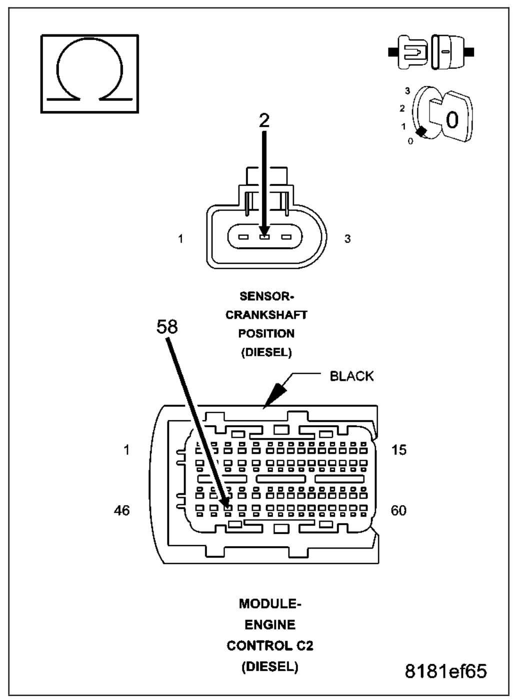
Measure the resistance between the (K853) CKP Sensor 5-Volt Supply circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K853) CKP Sensor 5-Volt Supply circuit and (K925) CKP Sensor Ground circuits for a short together.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

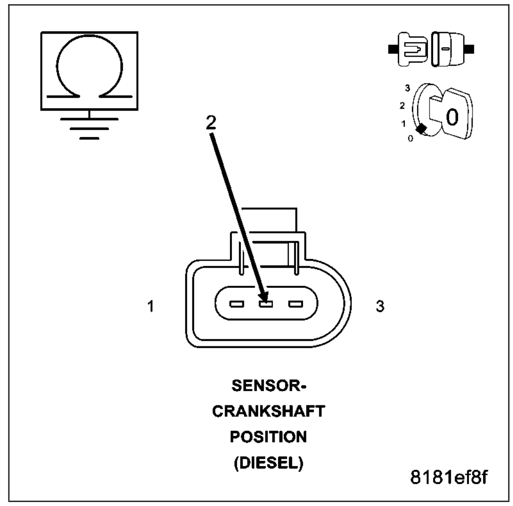
12. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

Turn the ignition off.

Disconnect the ECM harness connector.

Measure the resistance of the (K24) CKP Sensor Signal circuit between the ECM harness connector and the CKP Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 13

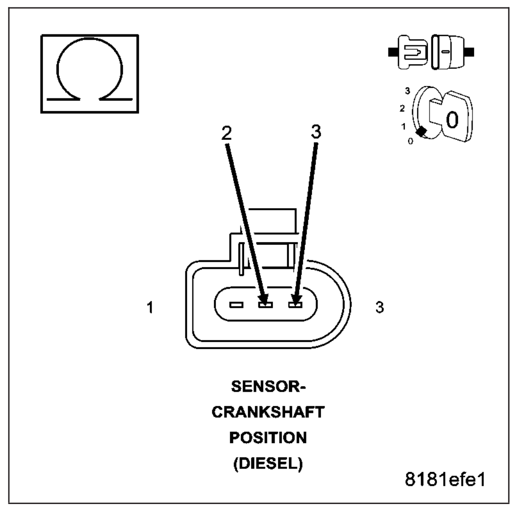
No >> Repair the (K24) CKP Sensor Signal circuit for an open

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

13. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K24) CKP Sensor Signal circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 14

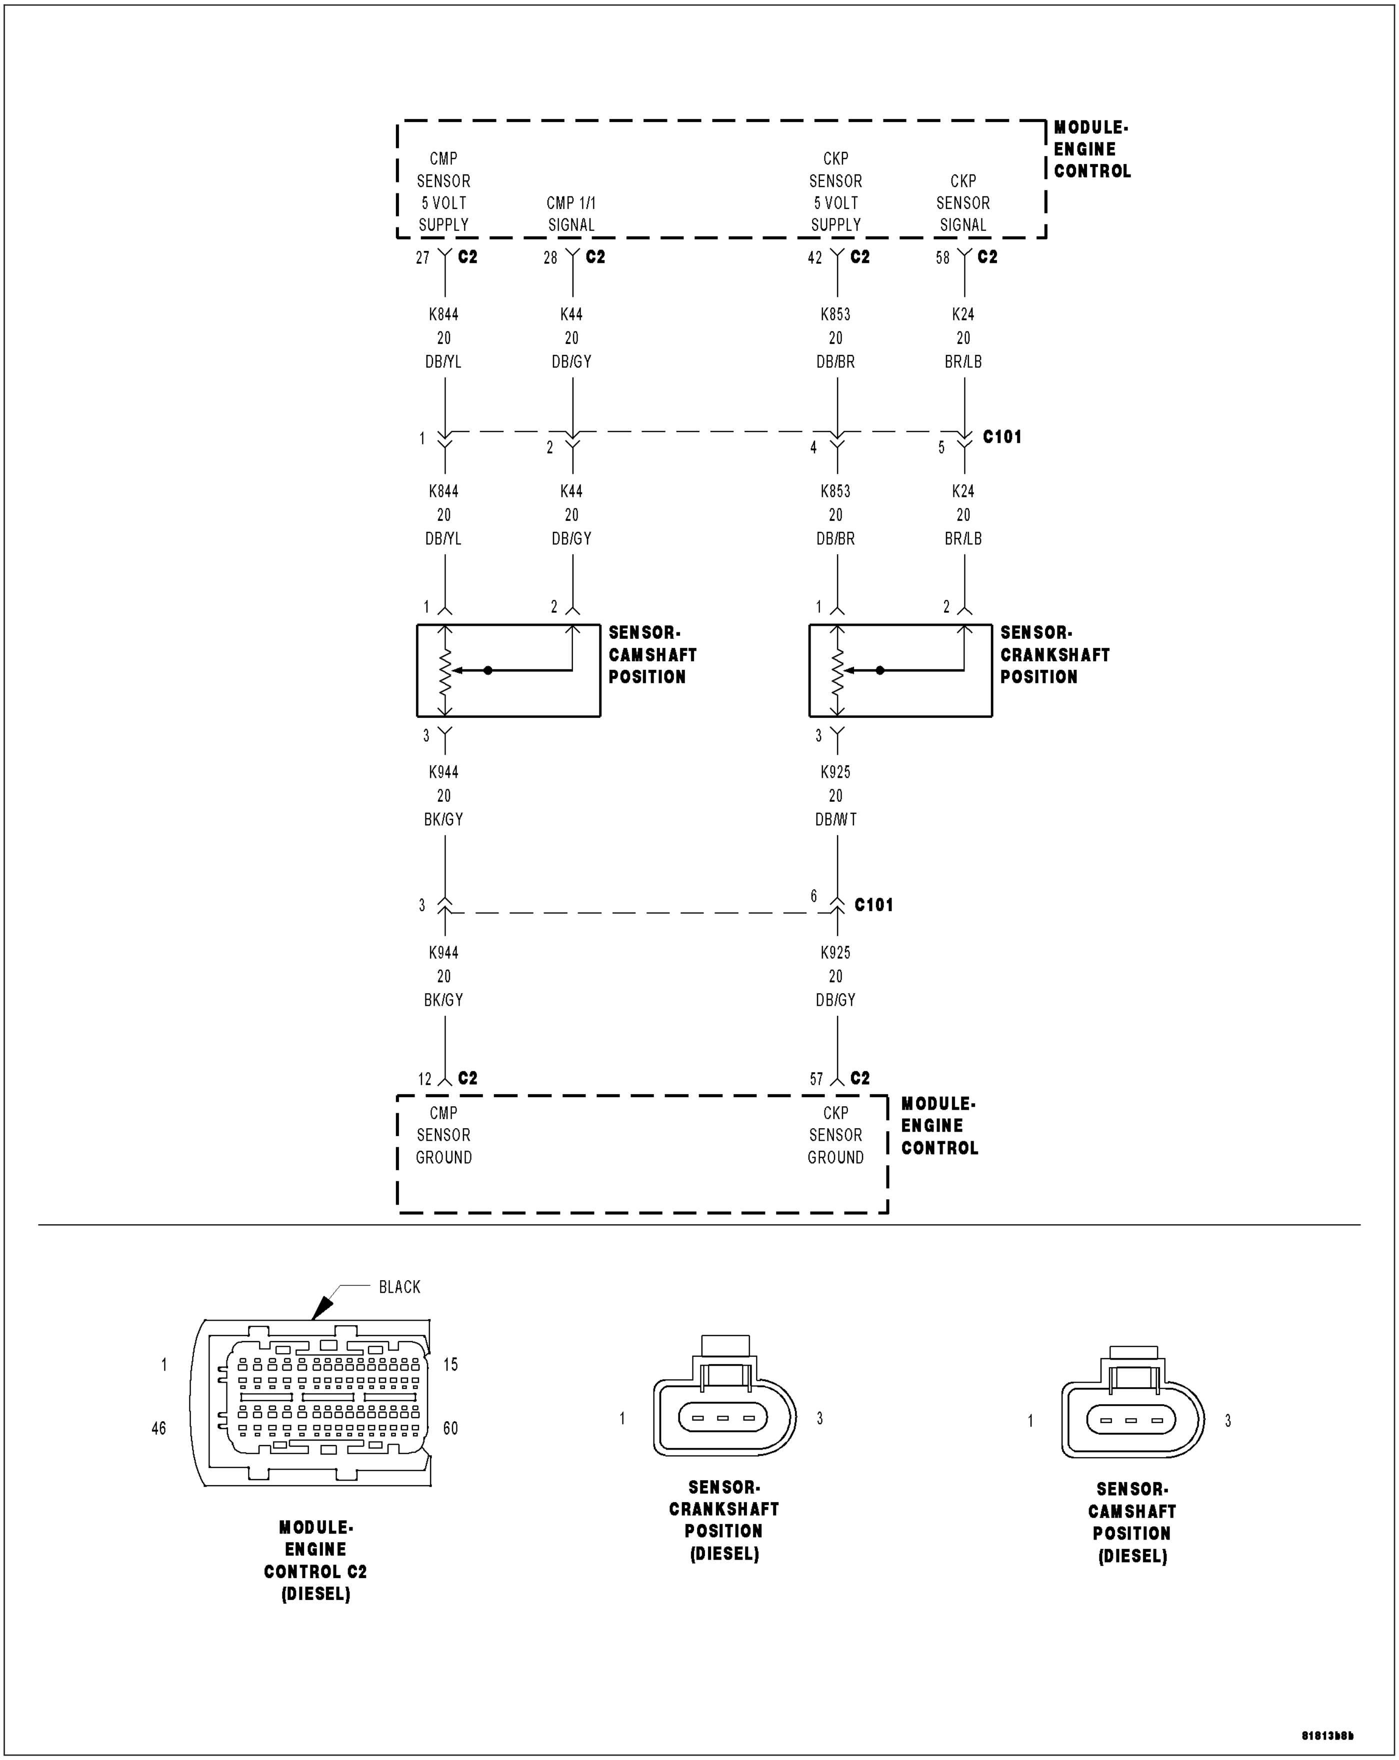
No >> Repair the (K24) CKP Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

14. (K24) CRANKSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K925) CKP SENSOR GROUND CIRCUIT

Measure the resistance between the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit at the CKP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K24) CKP Sensor Signal circuit and the (K925) CKP Sensor Ground circuit for a short together.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0340-CAMSHAFT POSITION SENSOR CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine cranking or running. Engine speed above 50 rpm. No Sensor Supply DTC's present.
- **Set Condition:**
  The Engine Control Module (ECM) does not receive a signal from the Camshaft Position Sensor when the Crankshaft Position Sensor indicates engine rpm.

Possible Causes
(K844) CMP 5-VOLT SUPPLY CIRCUIT OPEN
(K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
CHECKING (K844) CMP 5-VOLT SUPPLY CIRCUIT
DAMAGED CMP SENSOR OR CAMSHAFT
ECM
(K944) CMP SENSOR GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
(K44) CMP SENSOR SIGNAL CIRCUIT OPEN
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
CAMSHAFT POSITION SENSOR
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If DTC P0642 or P0643 is present with this DTC, diagnose DTCs P0642 or P0643 before diagnosing this DTC.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Go To 2

2. TEST DRIVE

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

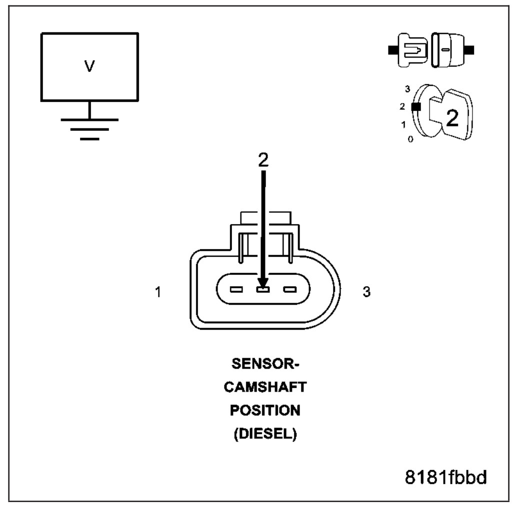
Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



3. CHECKING (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Camshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.
Go To 4

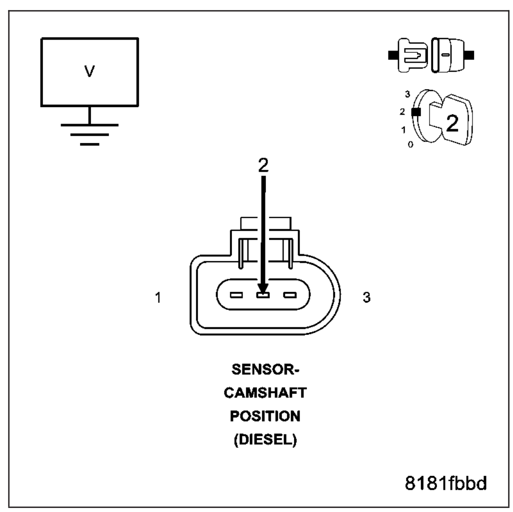
Voltage is between 4.7 and 5.4 volts.
Go To 5

Voltage is below 4.7 volts.
Go To 12

4. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.



Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

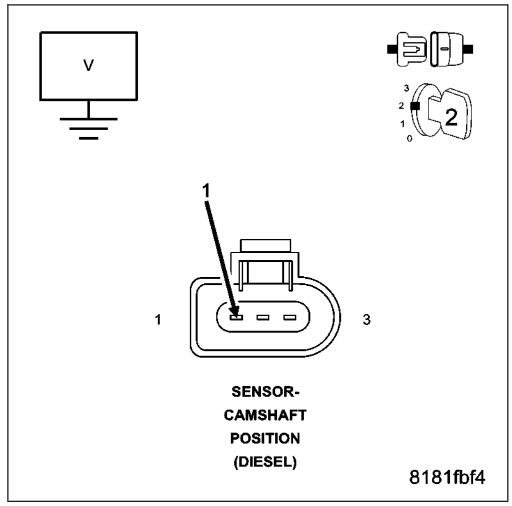
Turn the ignition on.

Measure the voltage of the (K44) CMP Position Sensor Signal circuit at the CMP Sensor harness connector.

Measure the voltage of the (K944) CMP Position Sensor Ground circuit at the CMP Sensor harness connector.

Is the voltage below 1.0 volt for each measurement?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the CKP Sensor circuit(s) that measured above 1.0 volt for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. CHECKING (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

Measure the voltage of the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

Repair the (K844) CMP 5-Volt Supply circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

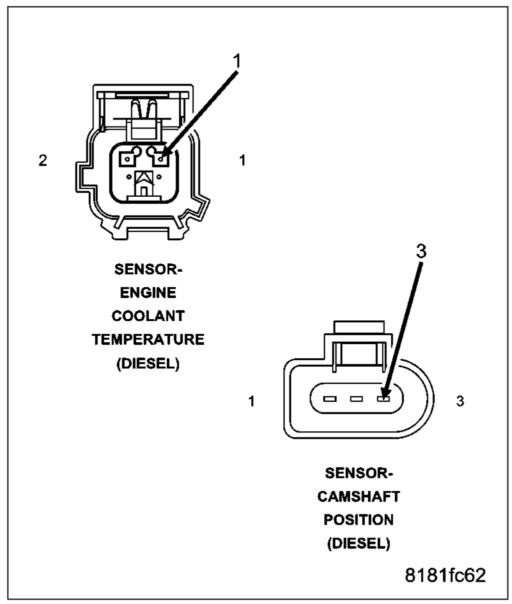
Voltage is between 4.7 and 5.4 volts.

Go To 6

Voltage is below 4.7 volts.

Go To 9

6. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN



Turn the ignition on.

Disconnect the ECT Sensor harness connector.

Connect one end of a jumper wire to the (K2) ECT Sensor signal circuit in the ECT Sensor harness connector.

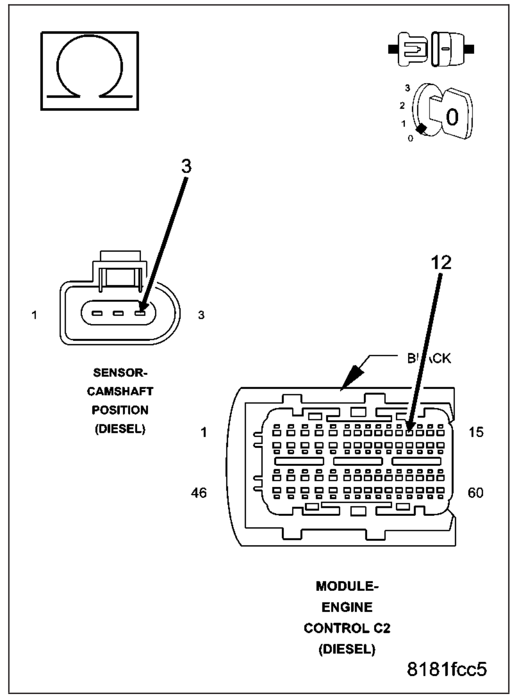
Connect the other end of the jumper wire to the (K944) CMP Sensor Ground circuit in the Camshaft Position Sensor harness connector.

With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.

Is the voltage below 0.5 volt?

Yes >> Go To 8

No >> Go To 7



7. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the CMP Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (K944) CMP Sensor Ground circuit between the CMP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace and program the ECM in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K944) CMP Sensor Ground circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. DAMAGED CAMSHAFT POSITION SENSOR OR CAMSHAFT

Turn the ignition off.

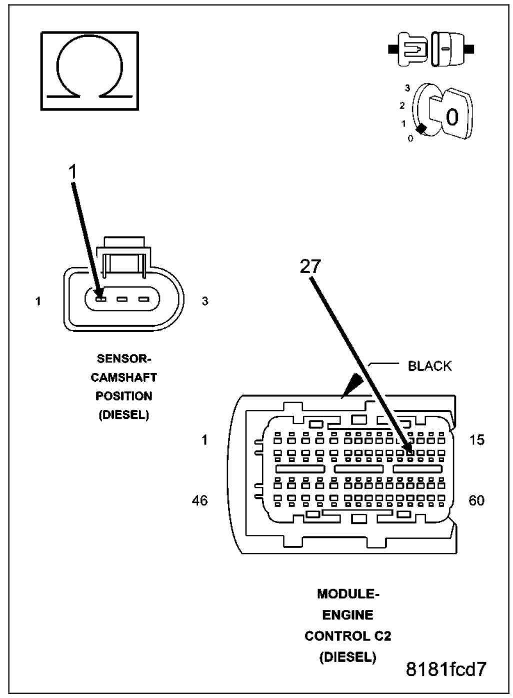
Remove the CMP Sensor.

Inspect the CMP Sensor for conditions such as loose mounting screws, damage, or cracks.

Inspect the camshaft for conditions such as damage, debris or cracked teeth.

Is there any evidence of these conditions?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Replace the Camshaft Position Sensor in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

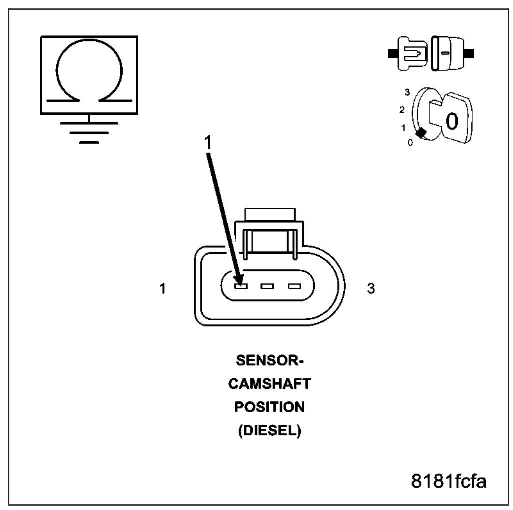
9. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance of the (K844) CMP 5-Volt Supply circuit between the ECM harness connector and the CMP Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 10

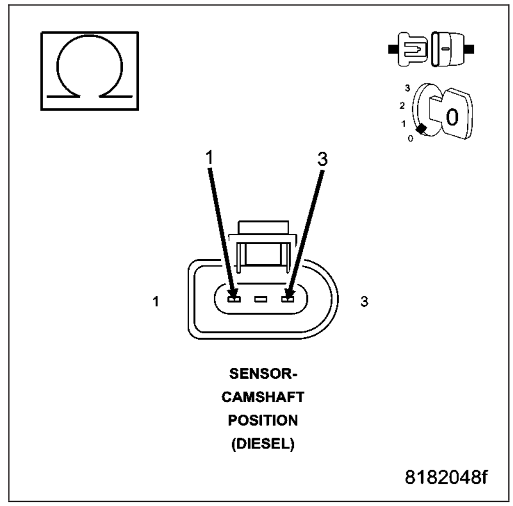
No >> Repair the (K844) CMP 5-Volt Supply circuit for an open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 11

No >> Repair the (K844) CMP Sensor 5-Volt Supply circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

11. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT

Measure the resistance between the (K844) CMP Sensor 5-Volt Supply circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

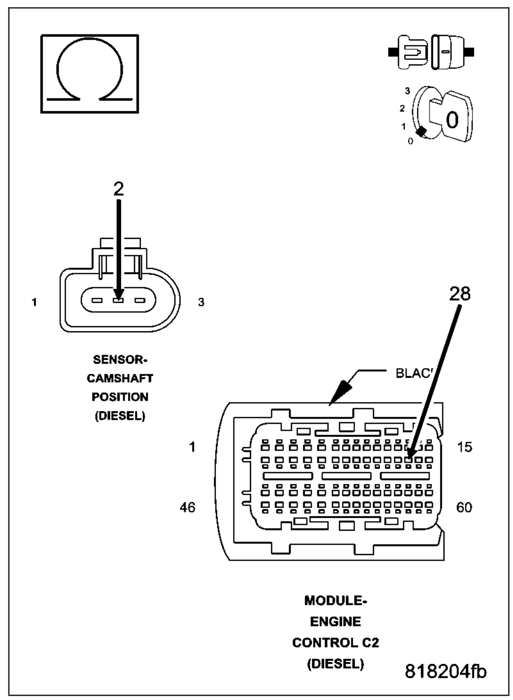
Is the resistance above 1000 ohms?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K844) CMP Sensor 5-Volt Supply circuit and (K944) CMP Sensor Ground circuits for a short together.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



12. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

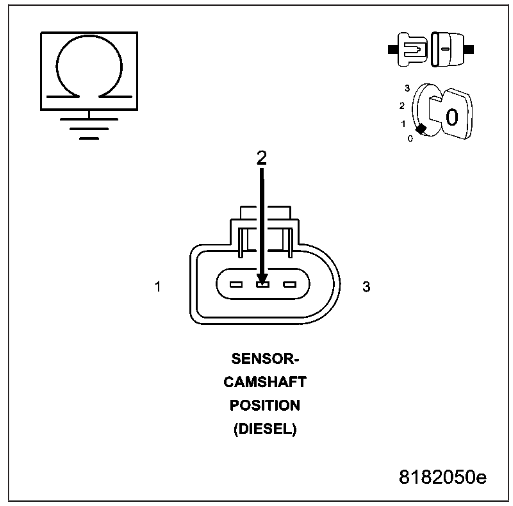
Turn the ignition off.

Disconnect the CMP Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (K44) CMP Sensor Signal circuit between the ECM harness connector and the CMP Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 13

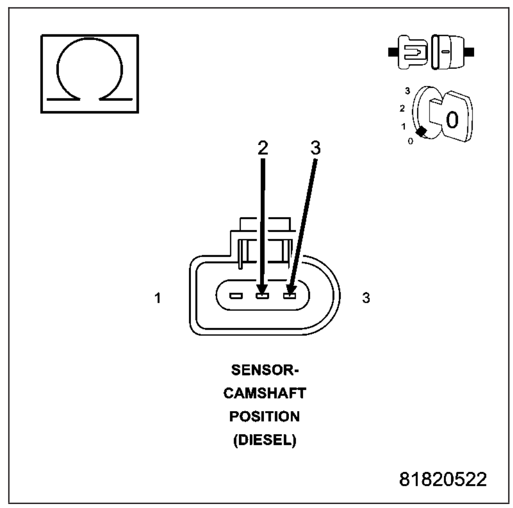
No >> Repair the (K44) CMP Sensor Signal circuit for an open

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

13. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 14

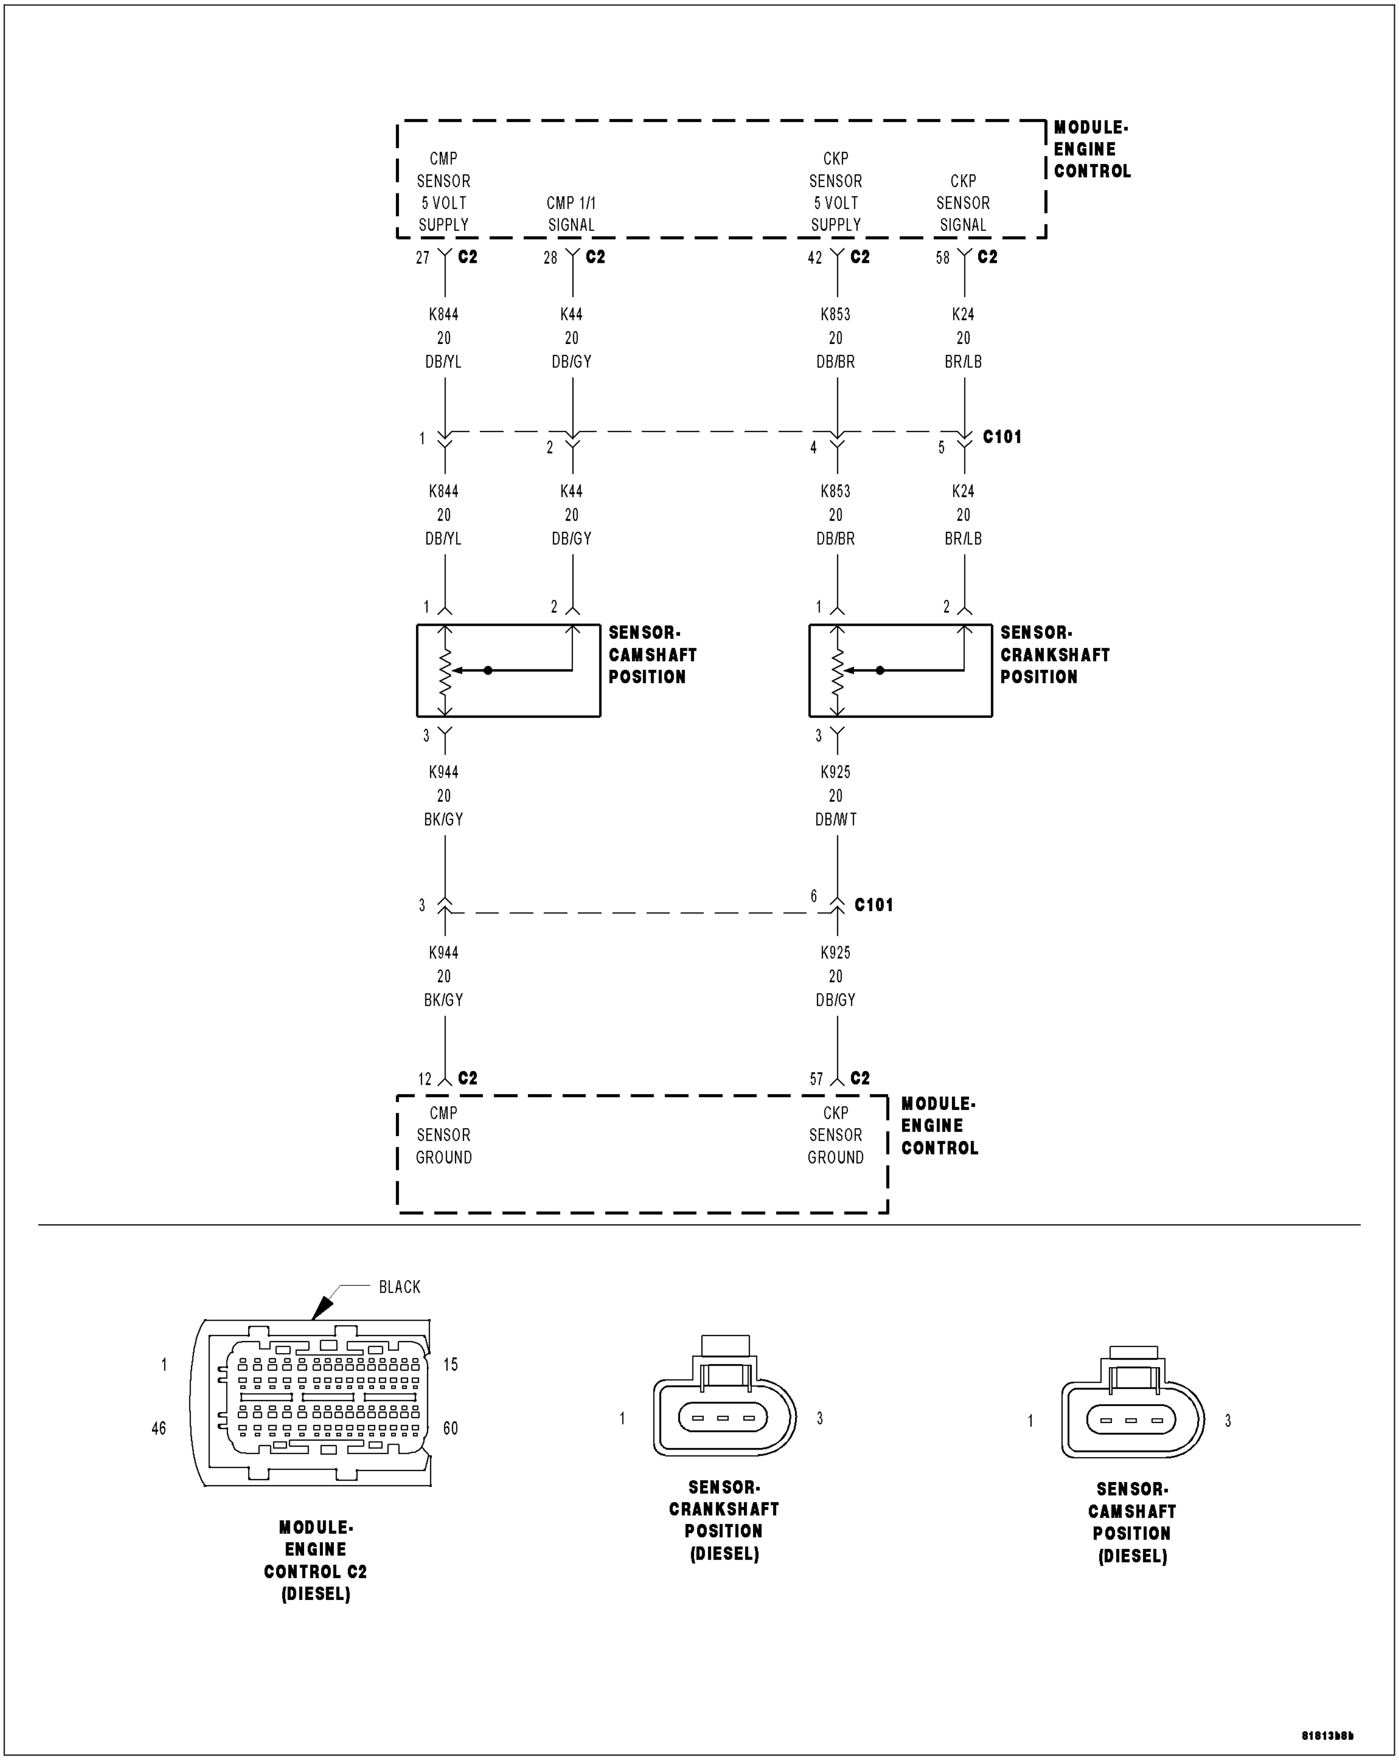
No >> Repair the (K44) CMP Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

14. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT

Measure the resistance between the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit for a short together.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0344-CAMSHAFT POSITION SENSOR INTERMITTENT — BANK 1 SENSOR 1

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine cranking or running. Engine speed above 50 rpm. No Sensor Supply DTC's present.
- **Set Condition:**
  The Engine Control Module (ECM) does not receive a signal from the Camshaft Position Sensor when the Crankshaft Position Sensor indicates engine rpm.

Possible Causes
(K844) CMP 5-VOLT SUPPLY CIRCUIT OPEN
(K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
CHECKING (K844) CMP 5-VOLT SUPPLY CIRCUIT
DAMAGED CMP SENSOR OR CAMSHAFT
ECM
(K944) CMP SENSOR GROUND CIRCUIT OPEN
INTERMITTENT CONDITION
(K44) CMP SENSOR SIGNAL CIRCUIT OPEN
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
CAMSHAFT POSITION SENSOR
(K844) CMP 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT
(K44) CMP SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CMP SENSOR GROUND CIRCUIT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

NOTE: If DTC P0642 or P0643 is present with this DTC, diagnose DTCs P0642 or P0643 before diagnosing this DTC.

NOTE: The Timing Belt/Chain must be correctly installed and operational before diagnosis can be made. Refer to the Service Information to ensure the timing belt is properly installed.

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

Attempt to start the engine cranking the engine for at least 7 seconds.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Go To 2

2. TEST DRIVE

Turn the ignition on.

With the scan tool, erase the ECM DTCs.

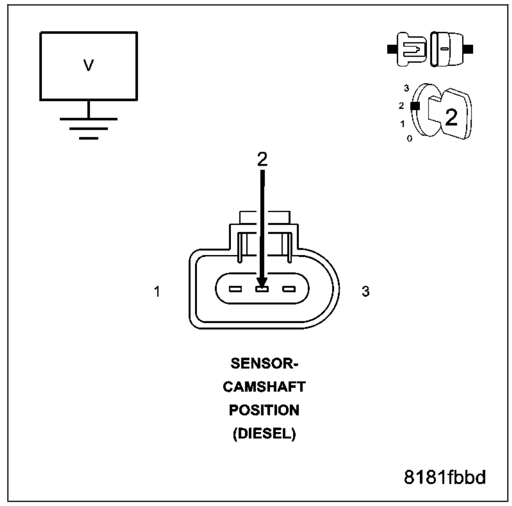
Test drive the vehicle.

With the scan tool, read the ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go To 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



3. CHECKING (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT

Turn the ignition off.

Disconnect the Camshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

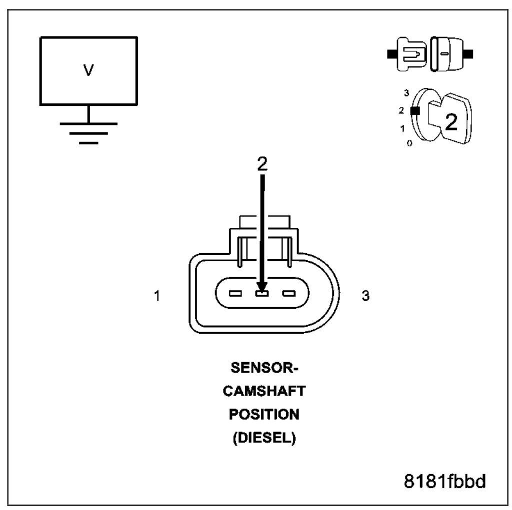
Voltage is above 5.4 volts.
Go To 4

Voltage is between 4.7 and 5.4 volts.
Go To 5

Voltage is below 4.7 volts.
Go To 12

4. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.



Disconnect the ECM harness connectors.

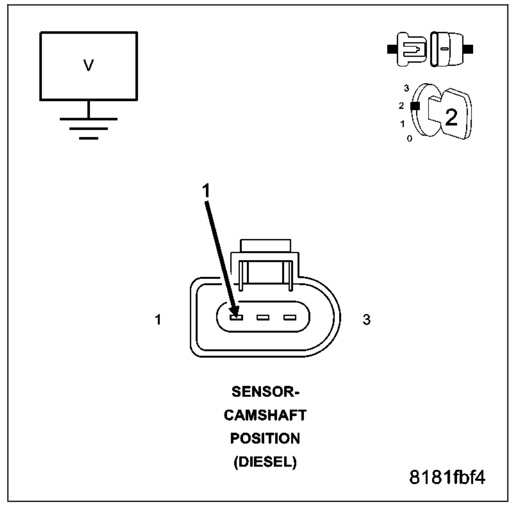
Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (K44) CMP Position Sensor Signal circuit at the CMP Sensor harness connector.

Is the voltage below 1.0 volt?



Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K44) Camshaft Position Sensor Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. CHECKING (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT

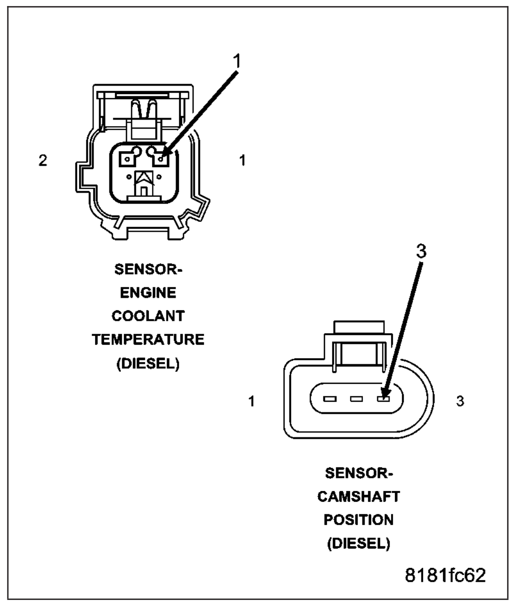
Measure the voltage of the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Select the appropriate voltage reading.

Voltage is above 5.4 volts.

Repair the (K844) CMP 5-Volt Supply circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



Voltage is between 4.7 and 5.4 volts.

Go To 6

Voltage is below 4.7 volts.

Go To 9

6. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the ECT Sensor harness connector.

Connect one end of a jumper wire to the (K2) ECT Sensor signal circuit in the ECT Sensor harness connector.

Connect the other end of the jumper wire to the (K944) CMP Sensor Ground circuit in the Camshaft Position Sensor harness connector.

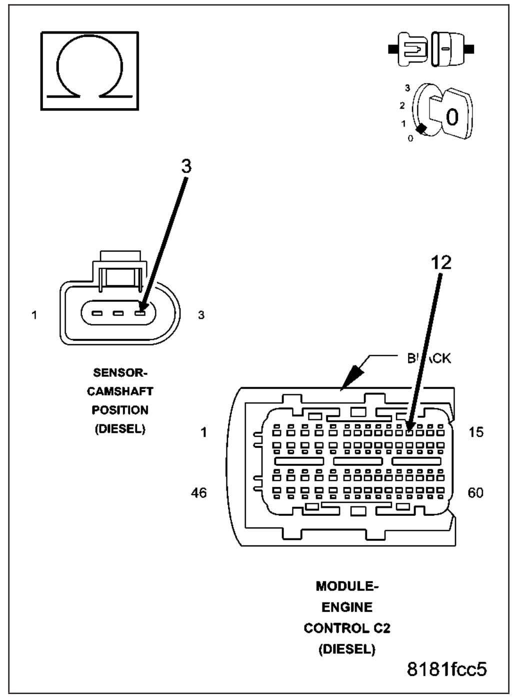
Turn the ignition on.

With the scan tool in Engine, Sensors, read the Engine Coolant Temp volts.

Is the voltage below 0.5 volt?

Yes >> Go To 8

No >> Go To 7



7. (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the CMP Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (K944) CMP Sensor Ground circuit between the CMP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace and program the ECM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K944) CMP Sensor Ground circuit for an open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. DAMAGED CAMSHAFT POSITION SENSOR OR CAMSHAFT

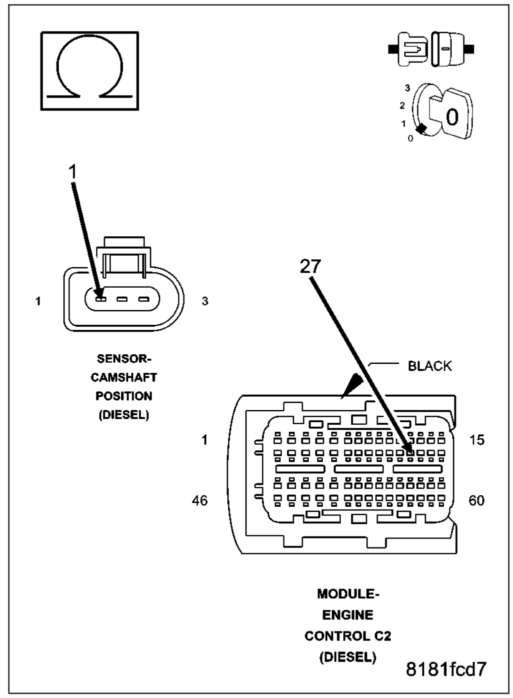
Turn the ignition off.

Remove the CMP Sensor.

Inspect the CMP Sensor for conditions such as loose mounting screws, damage, or cracks.

Inspect the camshaft for conditions such as damage, debris or cracked teeth.

Is there any evidence of these conditions?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Camshaft Position Sensor in accordance with the Service Information.

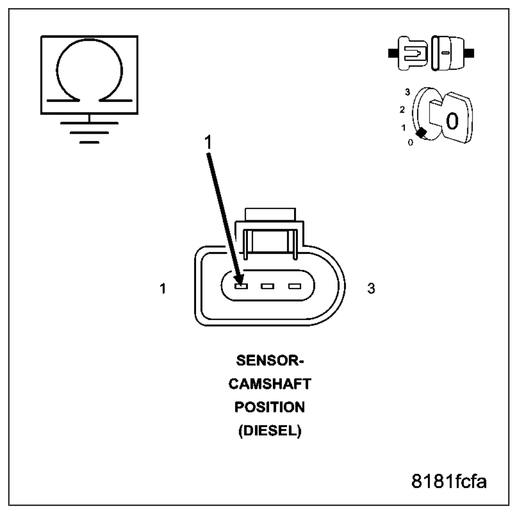
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT OPEN

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance of the (K844) CMP 5-Volt Supply circuit between the ECM harness connector and the CMP Sensor harness connector.



Is the resistance below 10.0 ohms?

Yes >> Go To 10

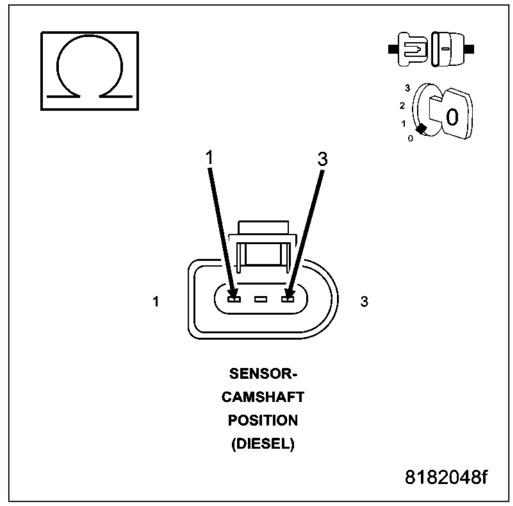
No >> Repair the (K844) CMP 5-Volt Supply circuit for an open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K844) CMP Sensor 5-Volt Supply circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 11

No >> Repair the (K844) CMP Sensor 5-Volt Supply circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

11. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT

Measure the resistance between the (K844) CMP Sensor 5-Volt Supply circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

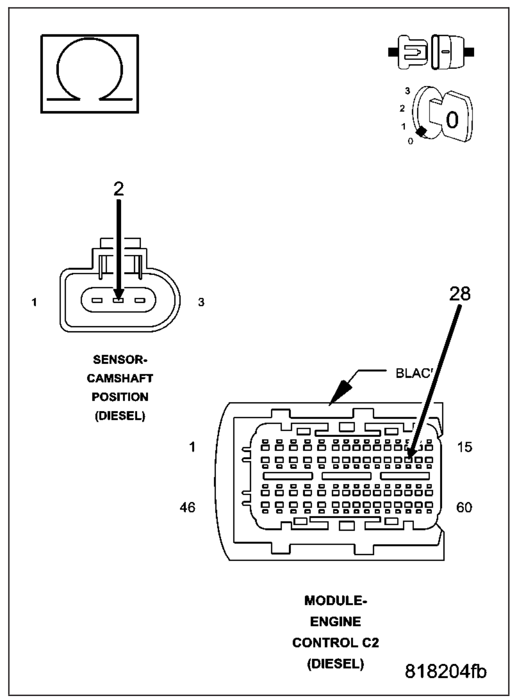
Is the resistance above 1000 ohms?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K844) CMP Sensor 5-Volt Supply Circuit and (K944) CMP Sensor Ground circuits for a short together.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



12. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT OPEN

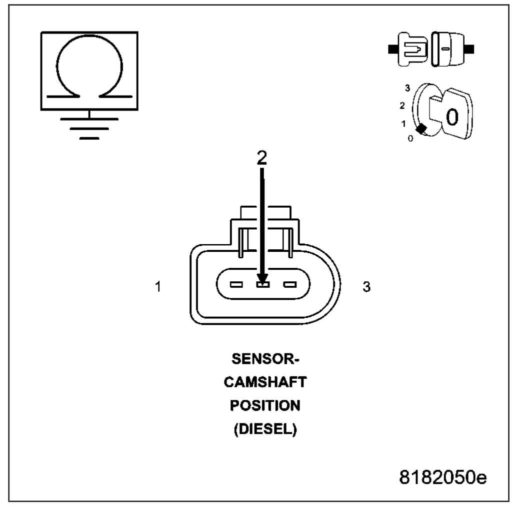
Turn the ignition off.

Disconnect the CMP Sensor harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (K44) CMP Sensor Signal circuit between the ECM harness connector and the CMP Sensor harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 13

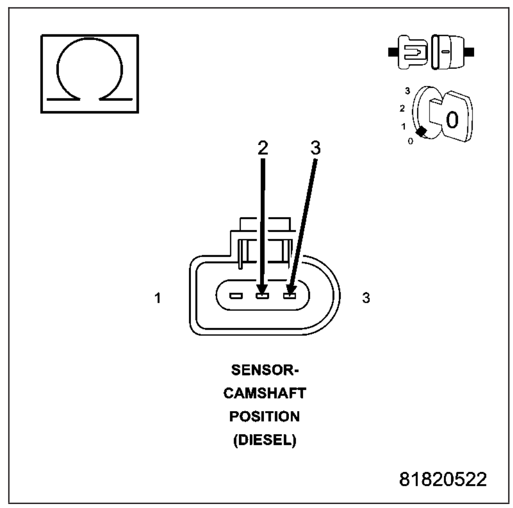
No >> Repair the (K44) CMP Sensor Signal circuit for an open

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

13. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K44) CMP Sensor Signal circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 14

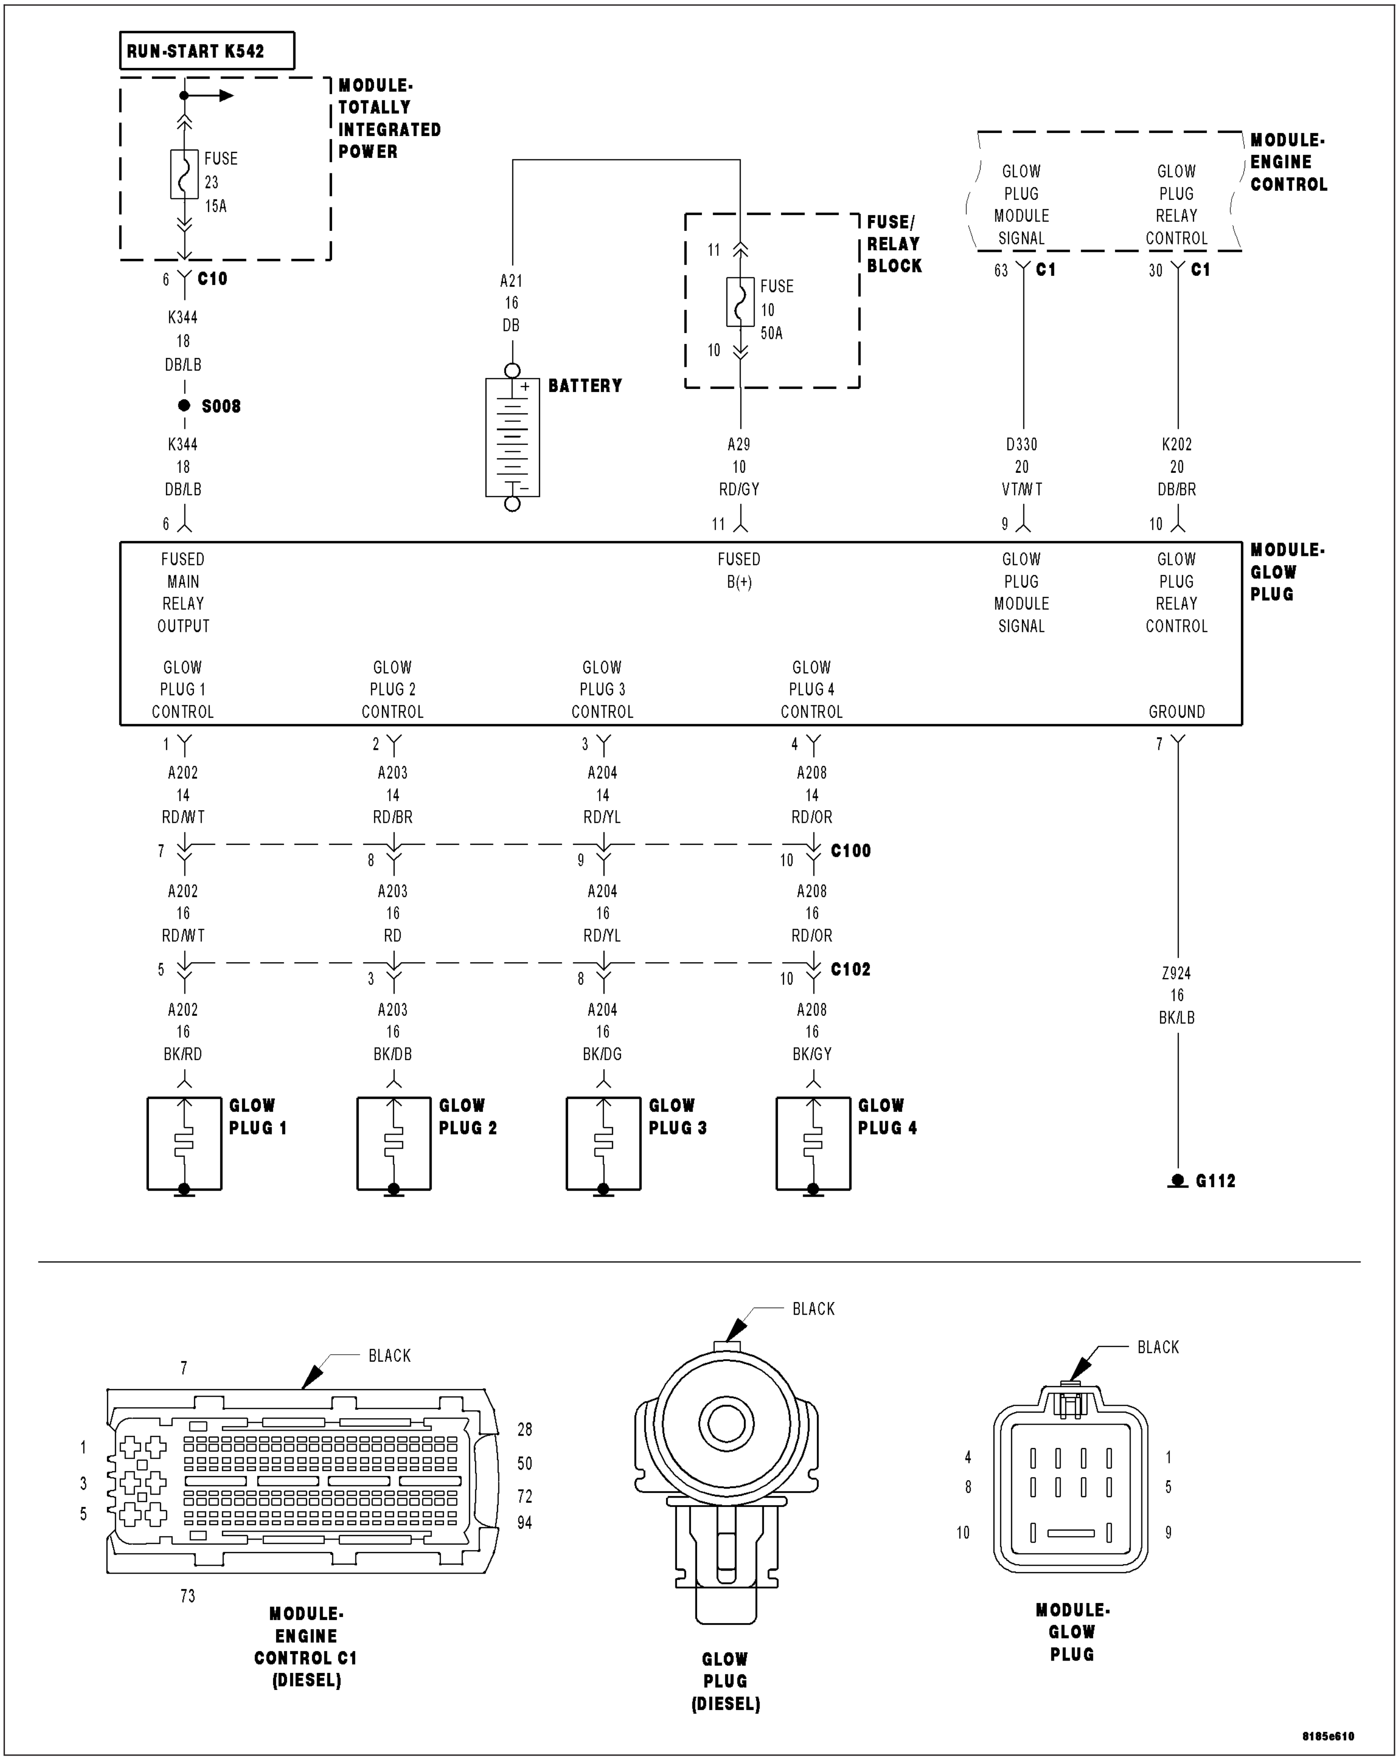
No >> Repair the (K44) CMP Sensor Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

14. (K44) CAMSHAFT POSITION SENSOR SIGNAL CIRCUIT SHORTED TO THE (K944) CAMSHAFT POSITION SENSOR GROUND CIRCUIT

Measure the resistance between the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit at the CMP Sensor harness connector.

Is the resistance above 1000 ohms?



Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K44) CMP Sensor Signal circuit and the (K944) CMP Sensor Ground circuit for a short together.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0383-GLOW PLUG CONTROL MODULE CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects an open or short to ground on the (K202) Glow Plug Module Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND
(K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GLOW PLUG MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Glow Plugs.

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

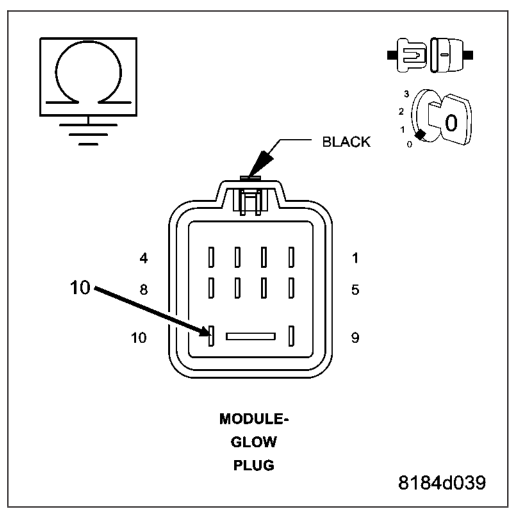
Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND

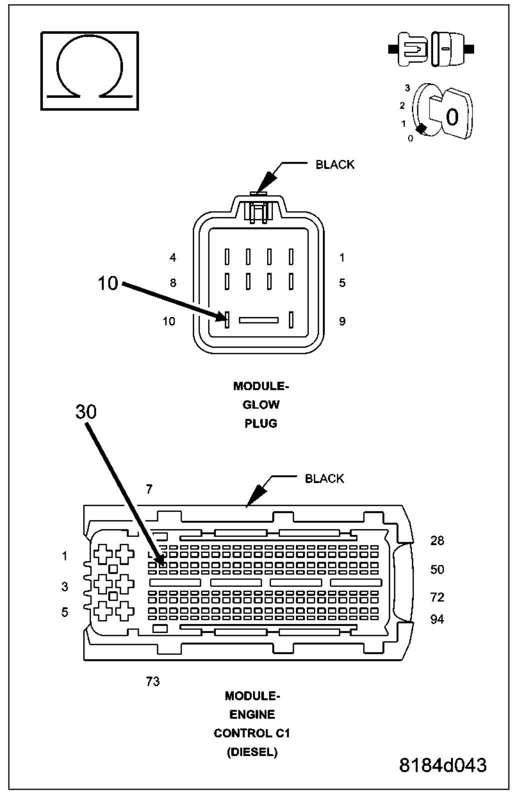
Turn the ignition off.

Disconnect the Glow Plug Module harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K202) Glow Plug Module Control circuit in the Glow Plug Module harness connector.

Is the resistance below 1000.0 ohms?



Yes >> Repair the (K202) Glow Plug Module Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K202) Glow Plug Module Control circuit between the Glow Plug Module harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace the Glow Plug Control Module.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K202) Glow Plug Module Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0401- EGR SYSTEM PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects and EGR flow problem for 8.0 seconds

Possible Causes
INTERMITTENT CONDITION
EGR VALVE
INTAKE OR EXHAUST SYSTEM PROBLEM

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

With the scan tool, erase ECM DTC's

Test drive the vehicle.

With the scan tool, read ECM DTC's

Did this DTC set again?

Yes >> Refer to symptom CHECKING THE EGR SYSTEM for further diagnosis.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0402- EGR EXCESSIVE FLOW DETECTED

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects an EGR flow problem for 8.0 seconds

Possible Causes
INTERMITTENT CONDITION
EGR VALVE
INTAKE OR EXHAUST SYSTEM PROBLEM

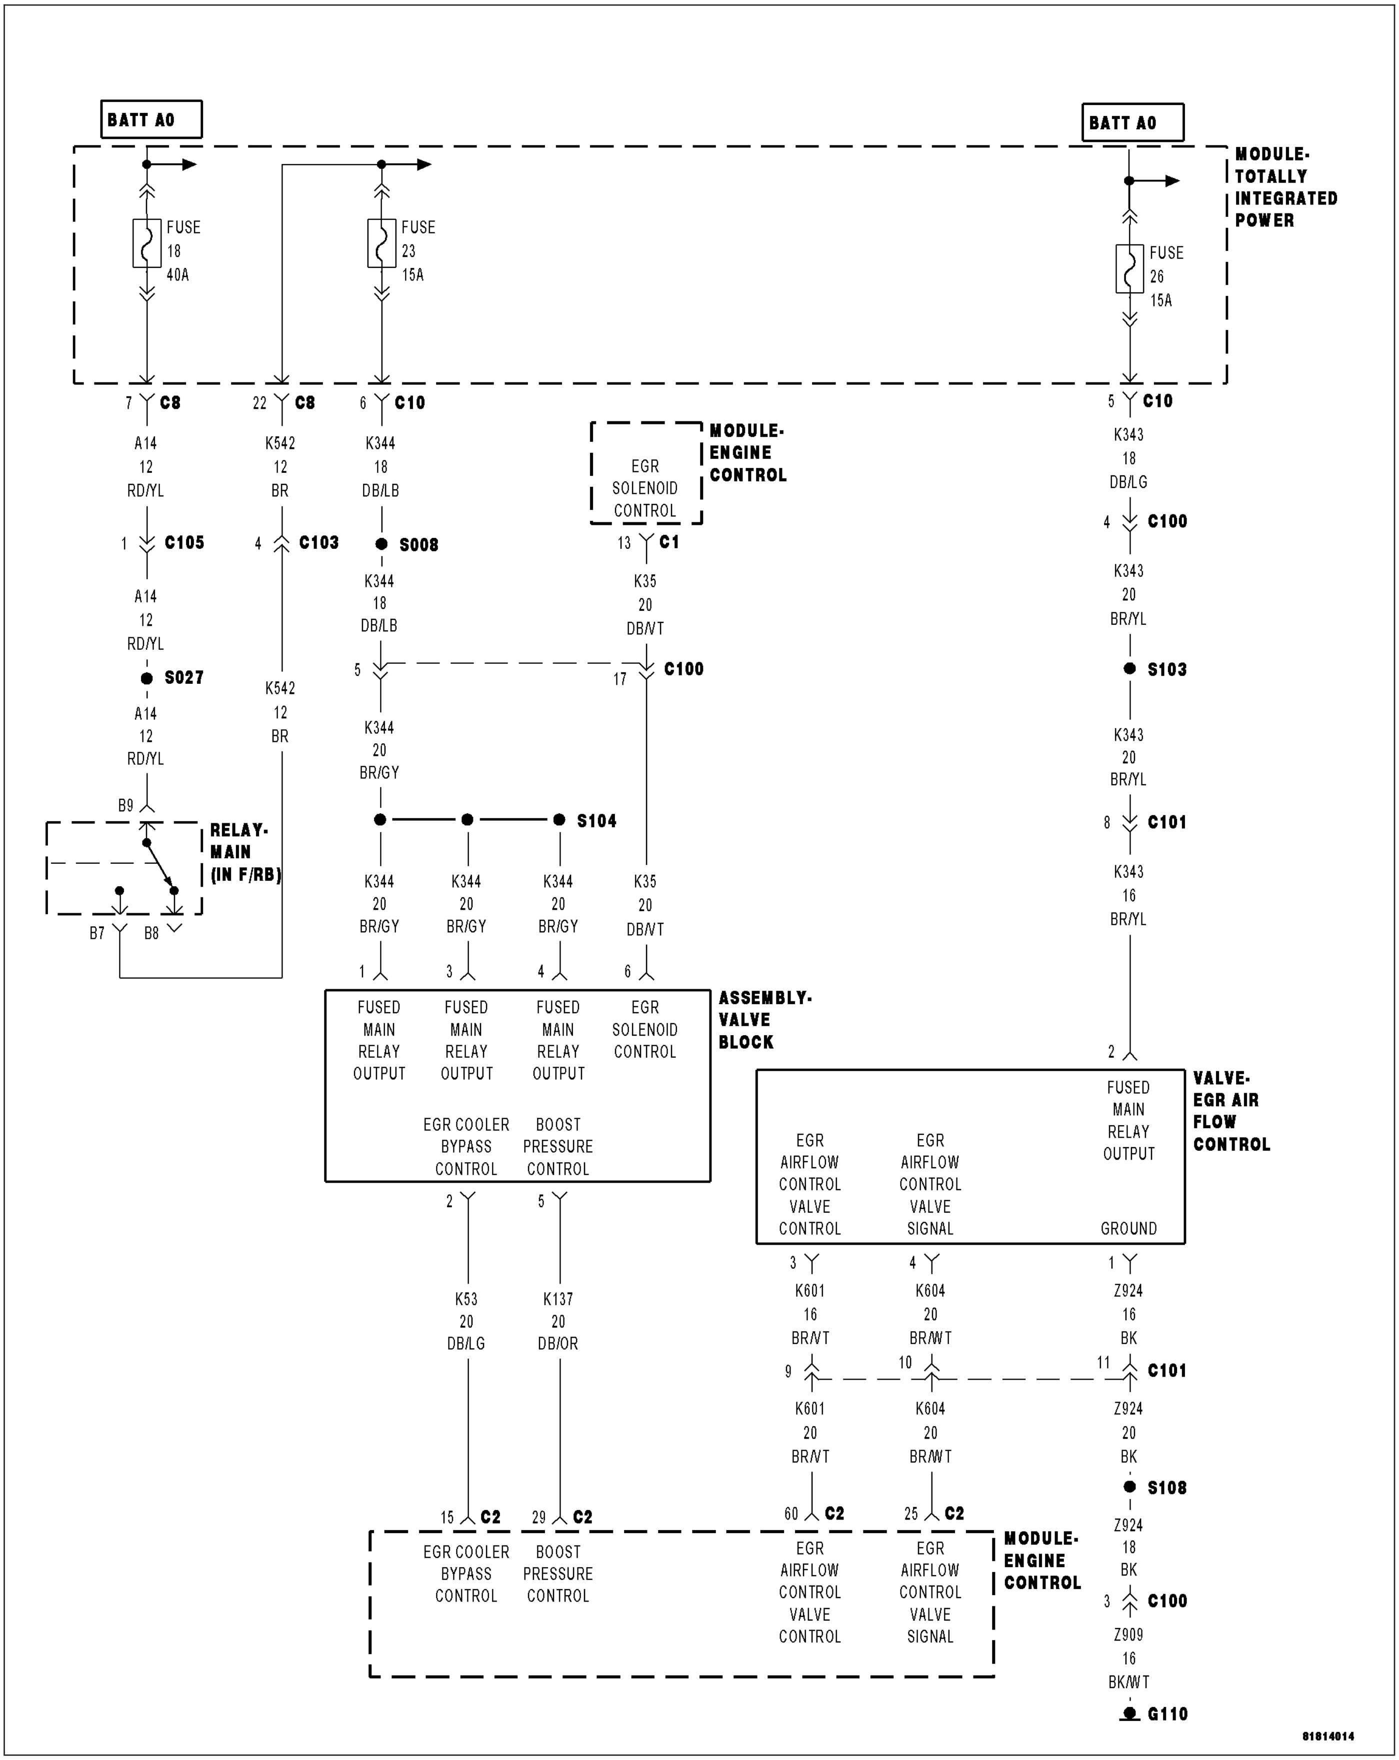
Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. VERIFY ACTIVE DTC

With the scan tool, erase ECM DTC's

Test drive the vehicle.



With the scan tool, read ECM DTC's

Did this DTC set again?

Yes >> Refer to symptom CHECKING THE EGR SYSTEM for further diagnosis.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0403-EGR SOLENOID CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the EGR Solenoid command off.
- **Set Condition:**
  The ECM does not detect voltage on the (K35) EGR Solenoid Control circuit for 2.0 seconds.

Possible Causes
INTERMITTENT DTC
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
EGR VALVE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Exhaust Gas Recirc Positioner.

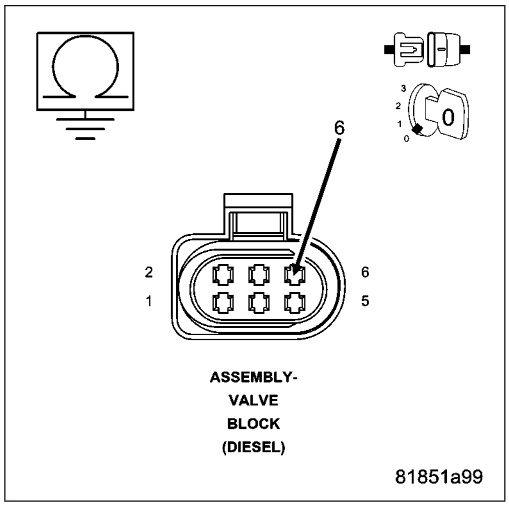
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

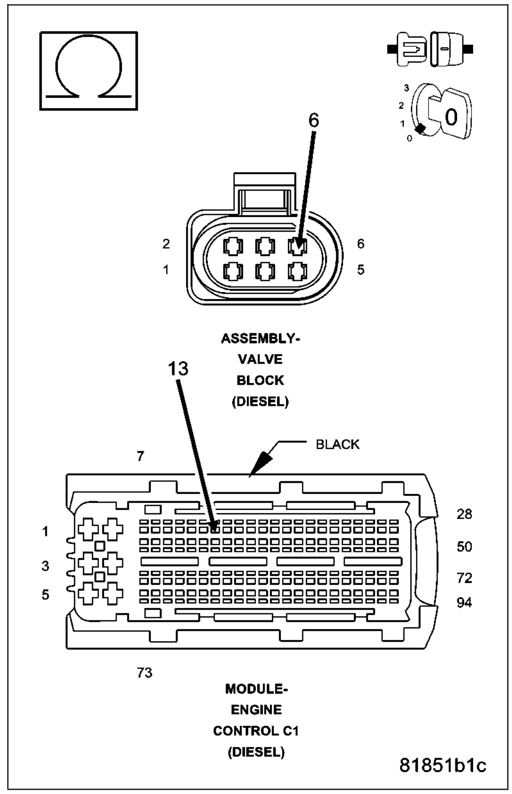
Turn the ignition off.

Disconnect the Valve Block Assembly harness connector.

Disconnect the Engine Control Module (ECM) connector.

Measure the resistance between ground and the (K35) EGR Solenoid Control circuit in the Valve Block Assembly harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 3

No >> Repair the (K35) EGR Solenoid Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

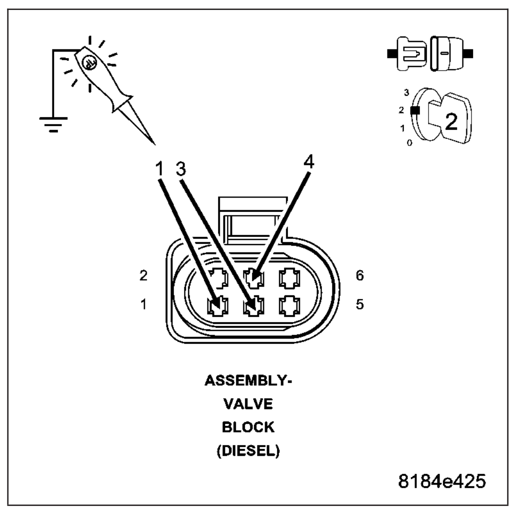
3. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K35) EGR Solenoid Control circuit between the Valve Block Assembly harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (K35) EGR Solenoid Control circuit for an open circuit or high resistance.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Connect the Engine Control Module (ECM) connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Outputs circuit at the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright for each circuit?

Yes >> Go to 5

No >> Repair the (K344) Fused Main Relay Output circuit(s) for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. EGR VALVE

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Exhaust Gas Recirc Positioner to 100%.

Using a 12 volt test light connected to 12 volts, check the (K35) EGR Solenoid Control circuit in the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright?

Yes >> Replace the EGR Valve in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

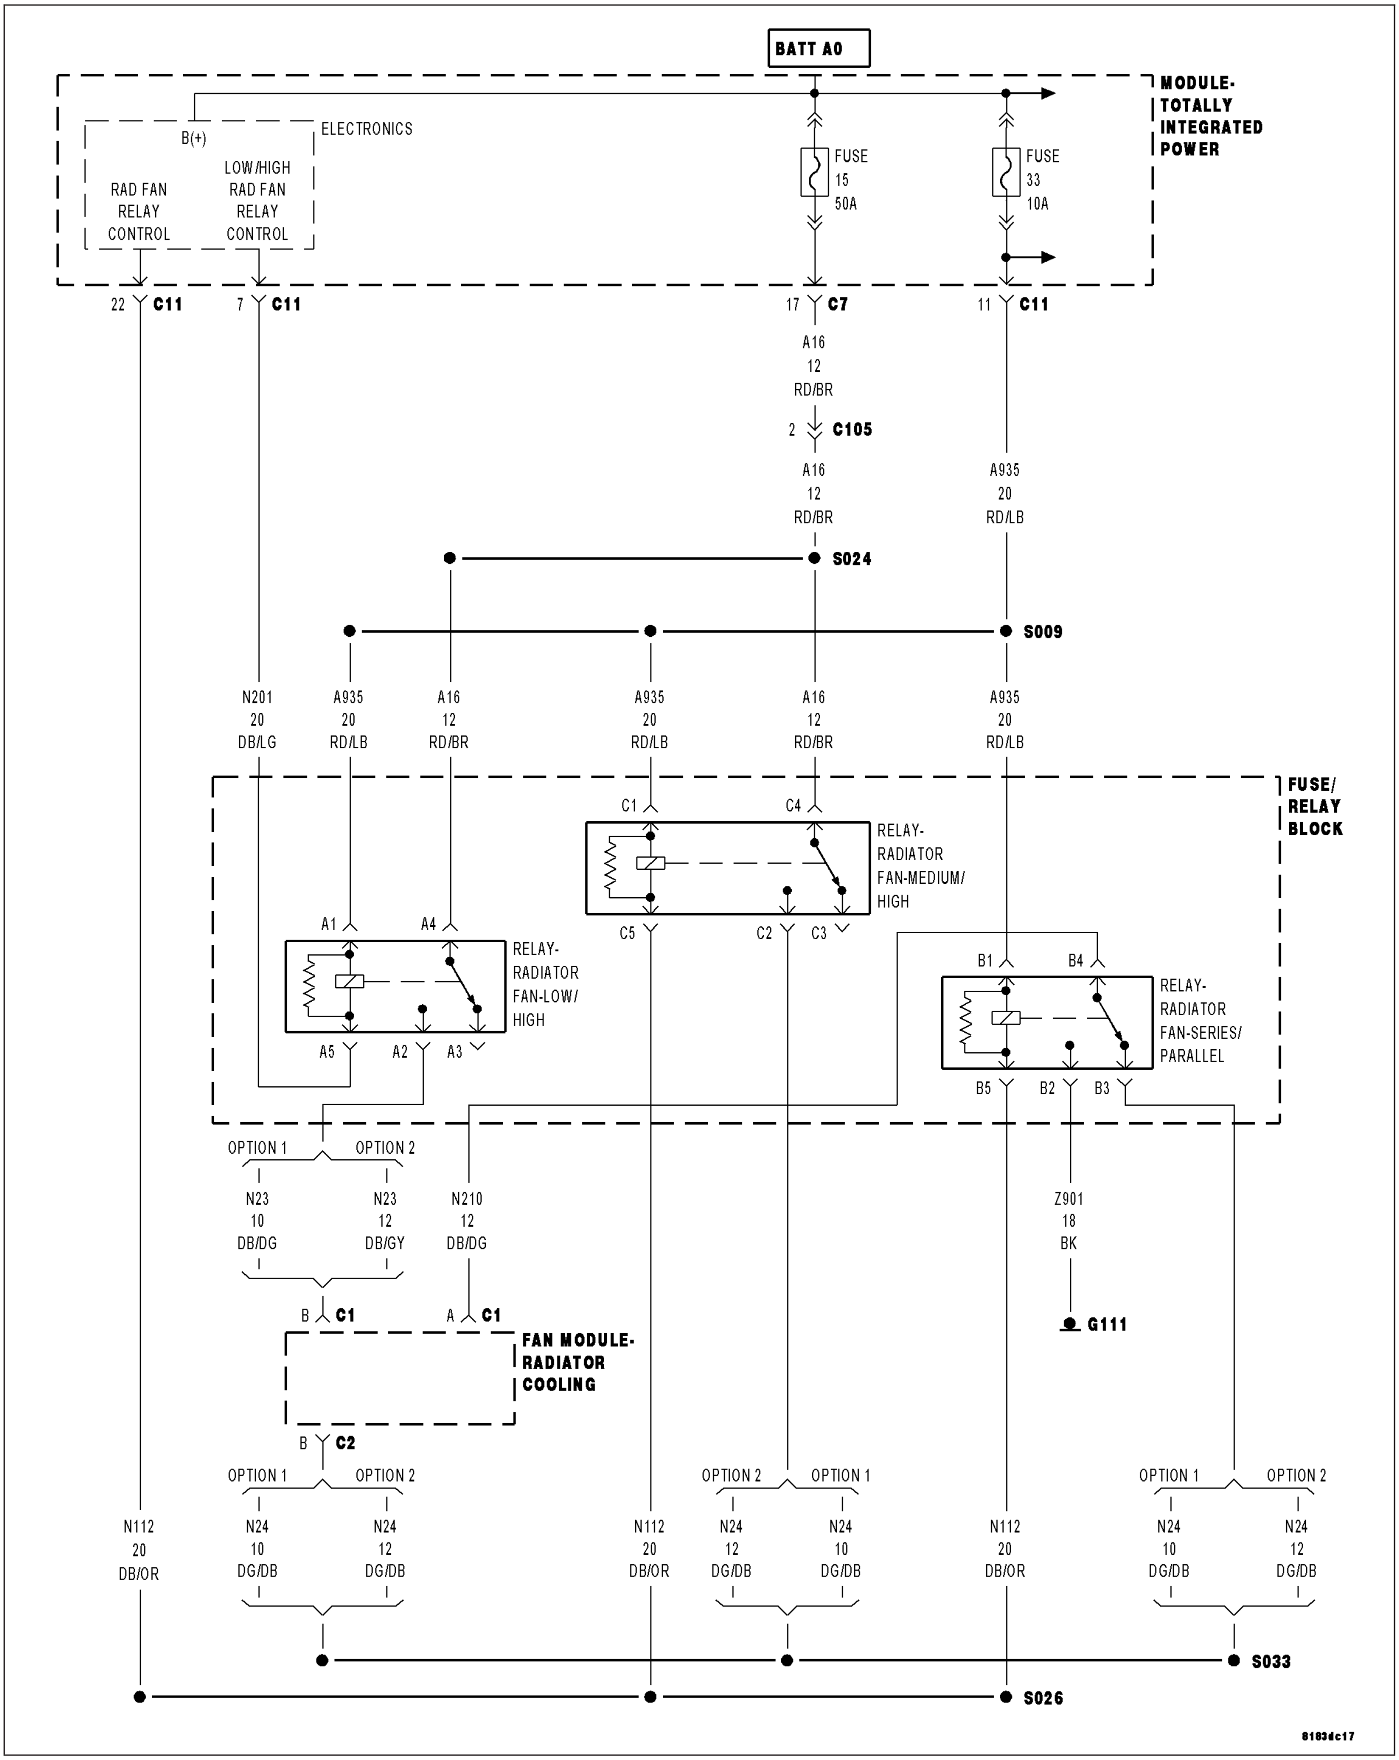
No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0480-COOLING FAN 1 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  The ECM receives a CAN Bus message from the TIPM indicating an open or shorted circuit on the Radiator Fan Relay Control circuit.

Possible Causes
(A935) FUSED (B+) FEED CIRCUIT
(N112) RADIATOR FAN CONTROL RELAY CONTROL CIRCUIT
(N201) LOW/HIGH RADIATOR FAN CONTROL RELAY CONTROL CIRCUIT OPEN
(N201) LOW/HIGH RADIATOR FAN CONTROL RELAY CIRCUIT SHORT TO GROUND
RADIATOR FAN CONTROL RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. RADIATOR FAN CONTROL RELAY OPERATION

NOTE: When actuating the radiator fan relays, the Radiator Fan(s) may have a delay in operation and ramp up slowly.

Ignition on, engine not running.

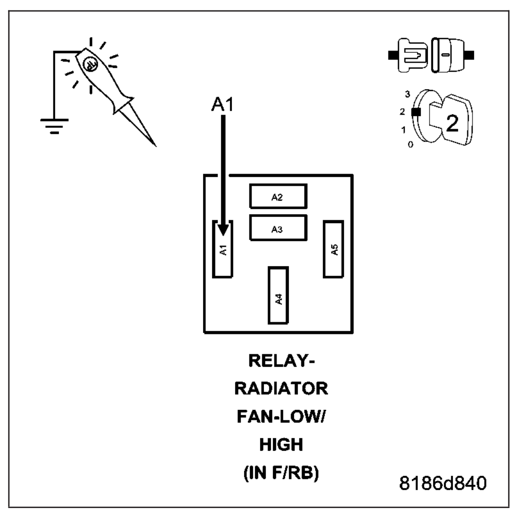
With a scan tool, select Radiator Cooling Fan Relay #1 Control State to actuate the Radiator Fan Control Relay.

Is the Cooling Fan Relay operating?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (A935) FUSED B+ CIRCUIT

Turn the ignition off.

Remove the Radiator Fan Control Relay #1.

Turn the ignition on.

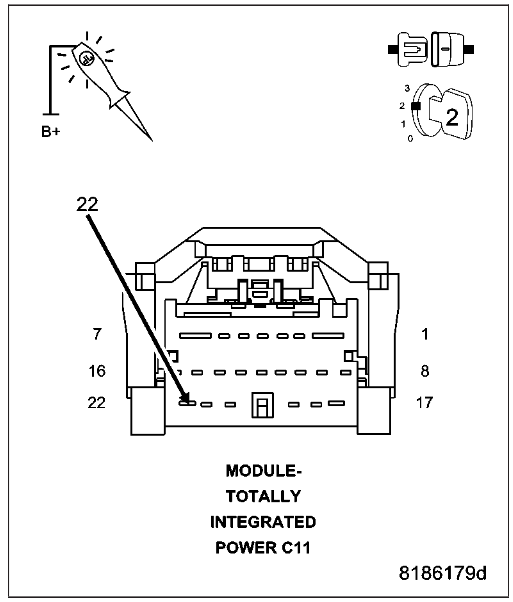
Using a 12-volt test light connected to ground, probe the Fused B+ circuit in the Radiator Fan Control Relay #1 connector.

Is the voltage above 11.0 volts?

Yes >> Go To 3

No >> Repair the open or short to ground in the (A935) Fused B+ circuit. Inspect the related fuse and repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



3. (N112) RADIATOR FAN CONTROL RELAY CONTROL CIRCUIT

Disconnect the TIPM C-11 harness connector.

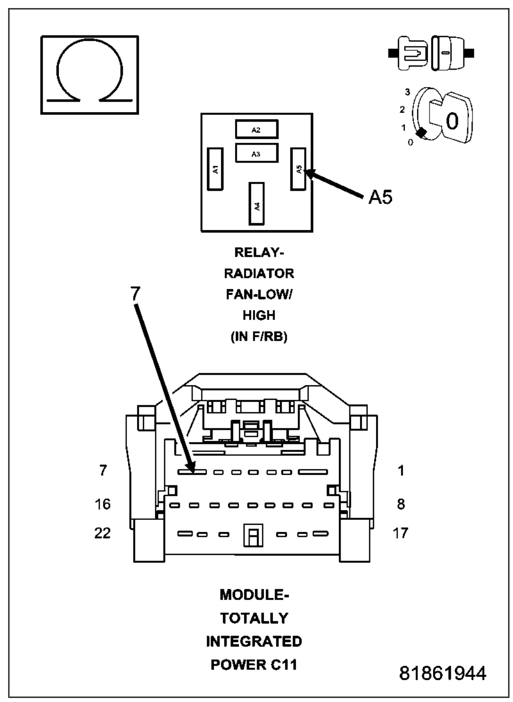
Turn the ignition on, engine not running.

With a scan tool, select Radiator Cooling Fan Relay #1 Control State, Toggle, to actuate the Radiator Fan Control Relay.

Using a 12–volt test light connected to battery voltage, probe the (N112) Radiator Control Relay Control circuit in the TIPM C-11 harness connector.

Does the test light illuminate and flash on and off?

Yes >> Replace the Radiator Fan Control Relay.



Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

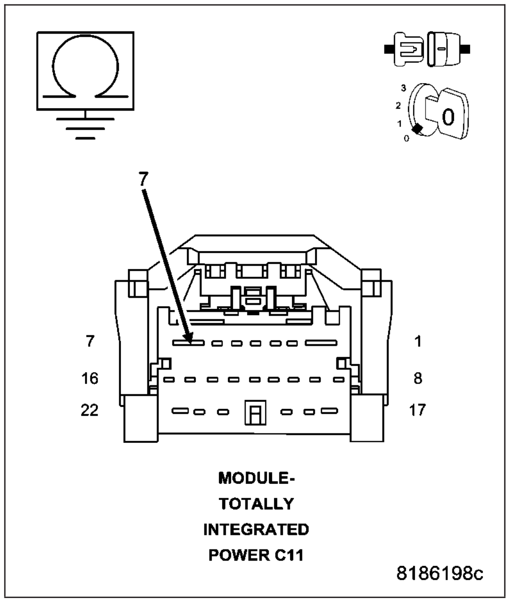
No >> Go To 4

4. (N201) LOW/HIGH RADIATOR FAN CONTROL RELAY CONTROL CIRCUIT OPEN

Turn the ignition off.

Measure the resistance of the (N201) Low/High Radiator Fan Control Relay Control circuit between the Rad Fan Control Relay #1 connector and the TIPM C11 harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 5

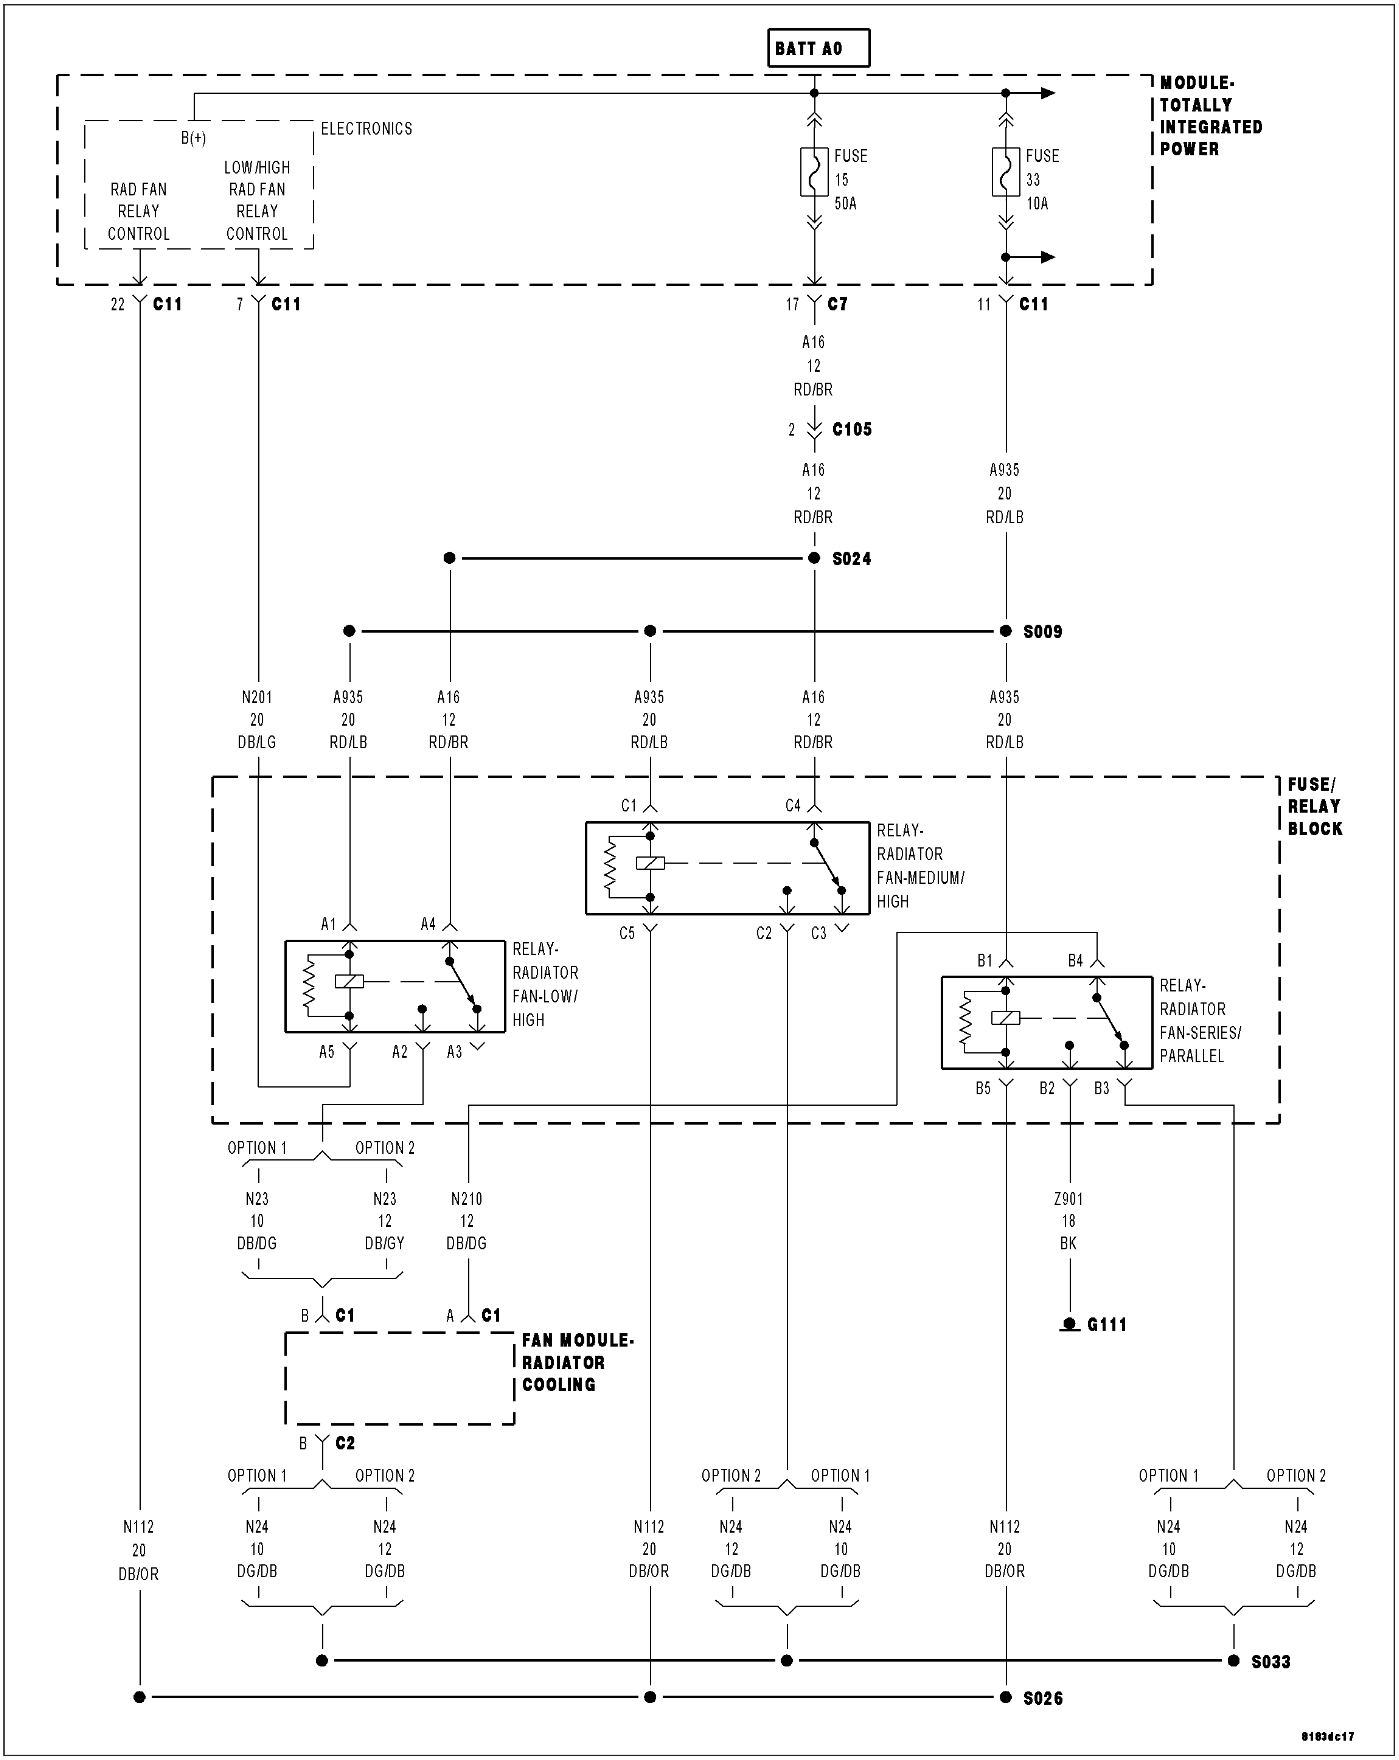
No >> Replace the PDM in accordance with the Service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

5. (N201) LOW/HIGH RADIATOR FAN CONTROL RELAY CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (N201) Low/High Radiator Fan Control Relay #1 Control circuit at the TIPM C11 harness connection.

Is the resistance below 1000 ohms?



Yes >> Replace the TIPM in accordance with the Service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace Front Control Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

P0481-COOLING FAN 2 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on. Battery voltage greater than 10 volts.
- **Set Condition:**
  The ECM receives a CAN Bus message from the TIPM indicating an open or shorted circuit on the Radiator Fan Medium/High Relay Control circuit.

Possible Causes
FUSED B+ CIRCUITS
(N112) RADIATOR FAN RELAY CONTROL CIRCUIT OPEN
(N112) RADIATOR FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND
RADIATOR FAN MEDIUM/HIGH RELAY
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

Diagnostic Test

1. RADIATOR FAN MEDIUM/HIGH RELAY OPERATION

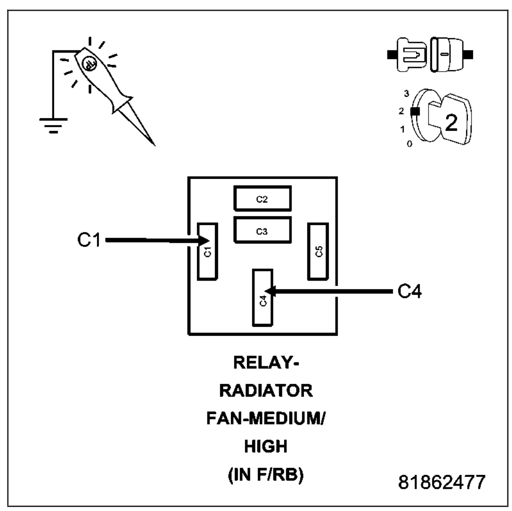
Ignition on, engine not running.

With a scan tool, select Radiator Cooling Fan Relay #2 Control State, to actuate the Radiator Fan Medium/High Relay.

Is the Cooling Fan Relay operating?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. FUSED B+ CIRCUITS

Turn the ignition off.

Remove the Radiator Medium/High Fan Relay.

Turn the ignition on.

Using a 12-volt test light connected to ground, probe the (A935) and (A16) Fused B+ circuits in the Relay connection.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Go To 3

3. RADIATOR FAN LOW/HIGH CONTROL RELAY SHORTED INTERNALLY

With the test light still at the Fused B+ circuits (Radiator Medium/High Fan Relay), remove the Radiator Fan Low/High Control Relay.

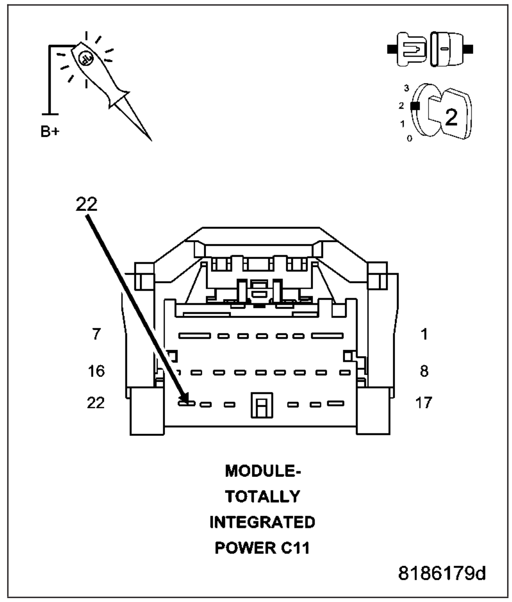
When the relay is removed, does the test light illuminate brightly?

Yes >> Replace the Radiator Fan Low/High Control Relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Repair the open or short to ground in the Fused B+ circuits. Inspect the related fuse and repair as necessary.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)



4. (N112) RADIATOR FAN RELAY CONTROL CIRCUIT

Disconnect the TIPM C-11 harness connector.

Turn the ignition on, engine not running.

With a scan tool, select Radiator Cooling Fan Relay #2 Control State and then Toggle, to actuate the Radiator Fan Medium/High Relay.

Using a 12–volt test light connected to battery voltage, probe the (N112) Radiator Fan High Relay Control circuit in the TIPM C-11 harness connector.

Does the test light illuminate and flash on and off?

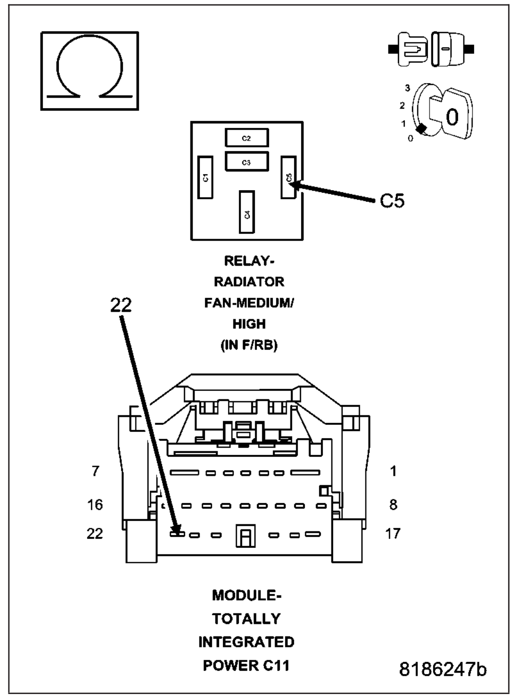
Yes >> Replace the Radiator Fan Medium/High Relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Go To 5

5. (N112) RADIATOR FAN RELAY CONTROL CIRCUIT OPEN

Turn the ignition off.



Measure the resistance of the (N112) Radiator Fan Relay Control circuit from the Relay connection to the TIPM C-11 harness connector.

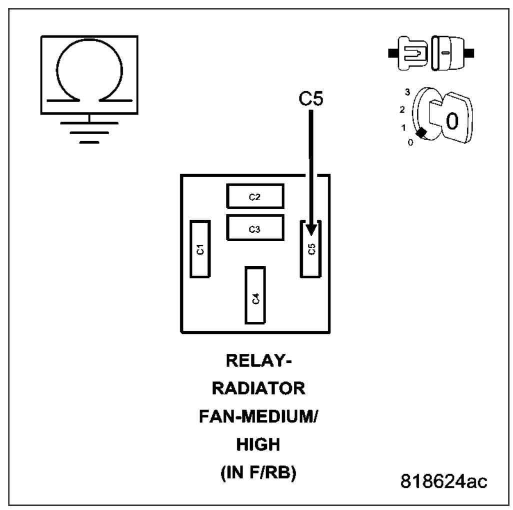
Is the resistance below 10.0 ohms?

Yes >> Go To 6

No >> Replace the PDM in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

6. (N112) RADIATOR FAN RELAY CONTROL CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (N112) Radiator Fan Relay Control circuit at the Relay connection.

Is the resistance below 100 ohms?

Yes >> Go To 7

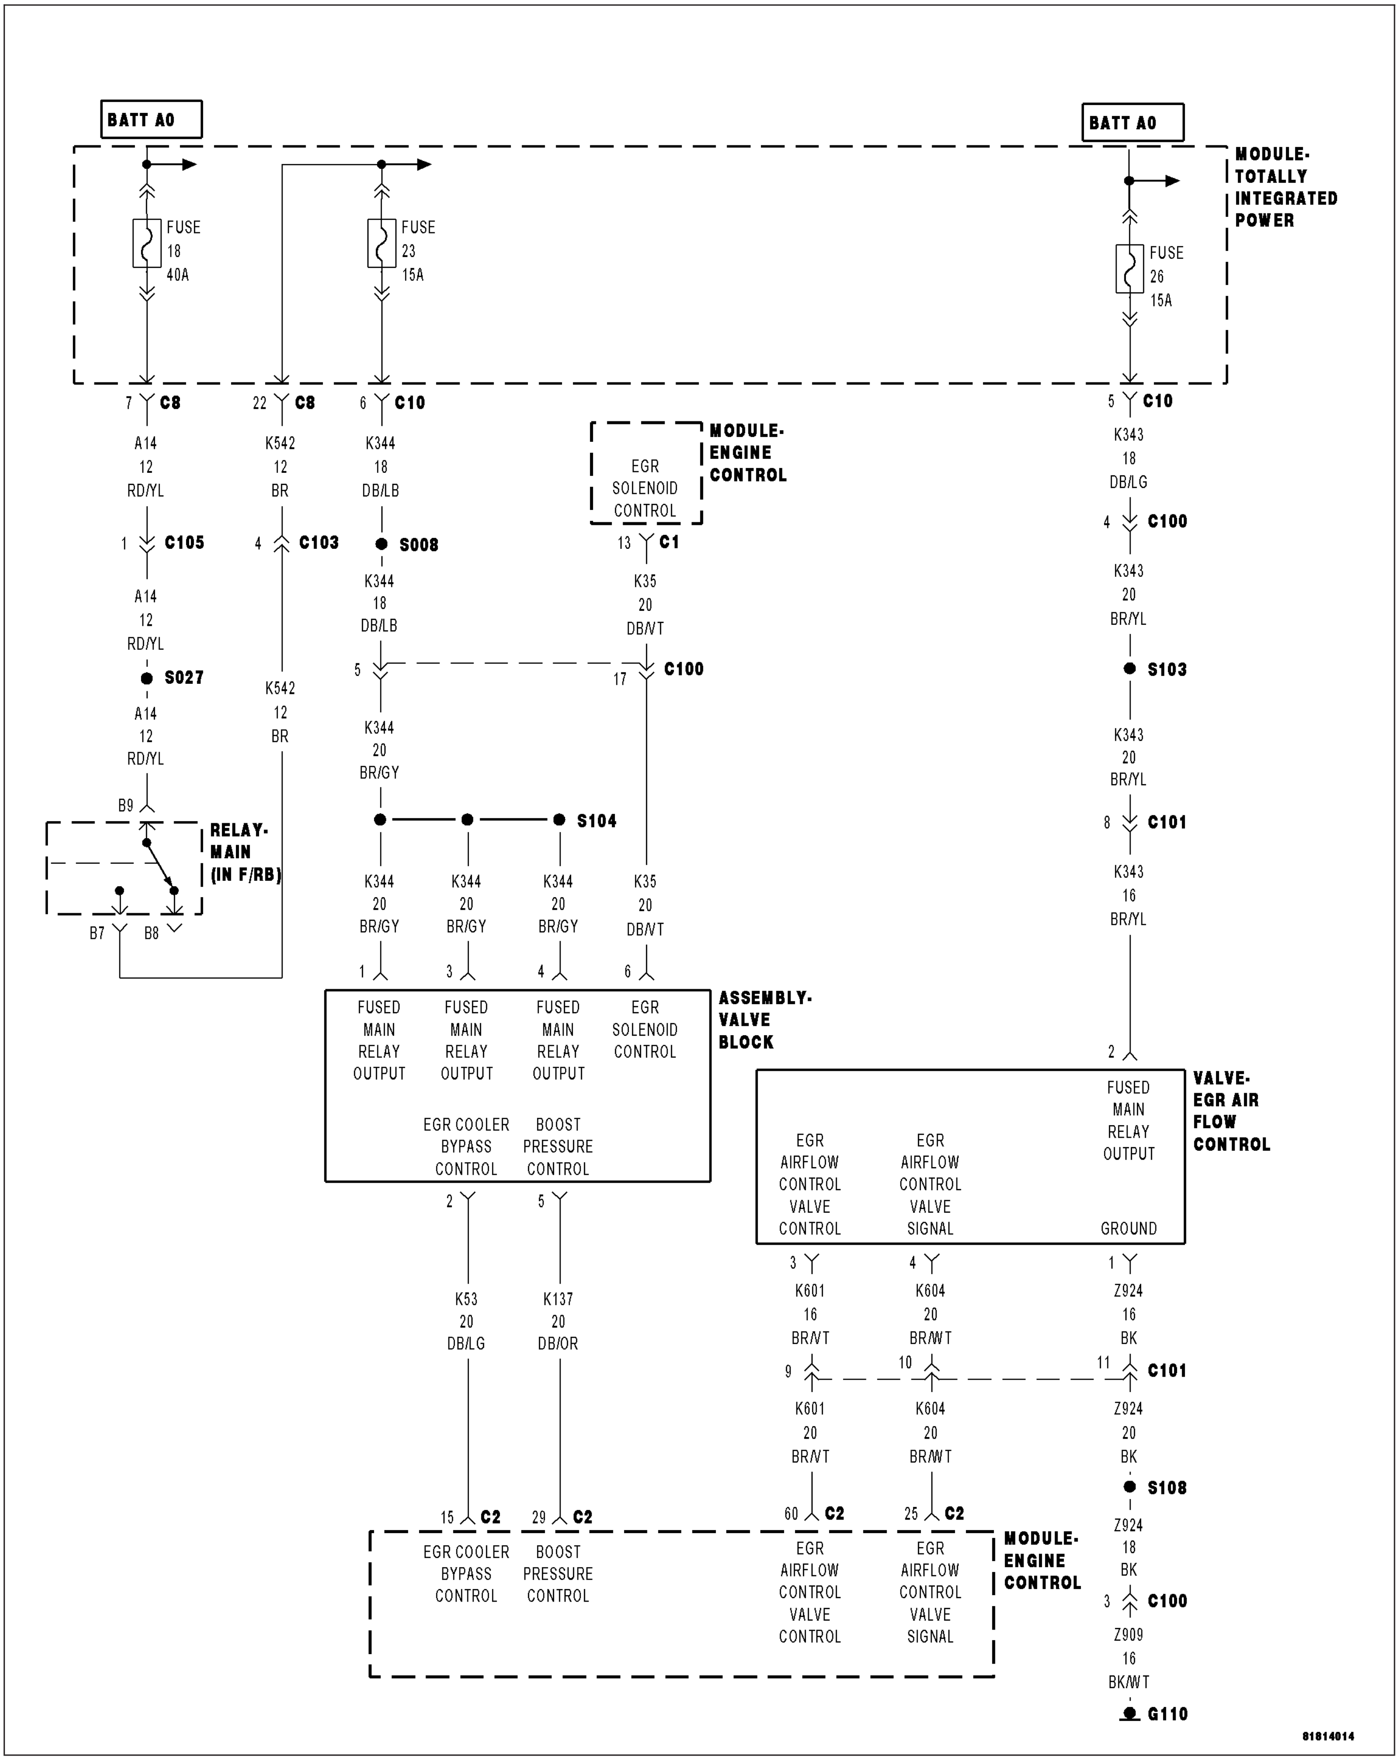
No >> Replace the Totally Integrated Power Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

7. RADIATOR FAN LOW/HIGH CONTROL RELAY SHORTED INTERNALLY

With the probe still at the (N112) Radiator Fan Control circuit, remove the Radiator Fan Low/High Control Relay.

Is the resistance still below 10 ohms?



Yes >> Repair the open or short to ground in the (N112) Radiator Fan High Control circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace the Radiator Fan Low/High Control Relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

P0487-EGR AIRFLOW THROTTLE CONTROL CIRCUIT A OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and the EGR Airflow Control Valve Motor command off.
- **Set Condition:**
  The Engine Control Module (ECM) detects an open (K601) EGR Airflow Control Valve Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND
(K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT SHORTED TO GROUND
EGR AIRFLOW CONTROL VALVE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Airflow Control Valve at 100%.

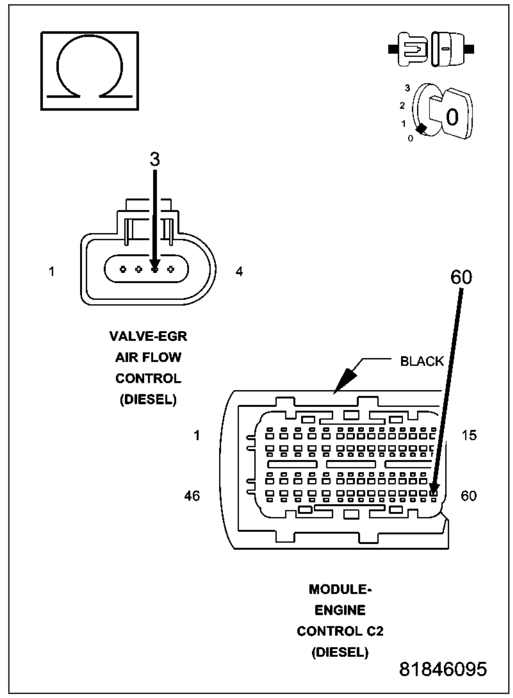
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

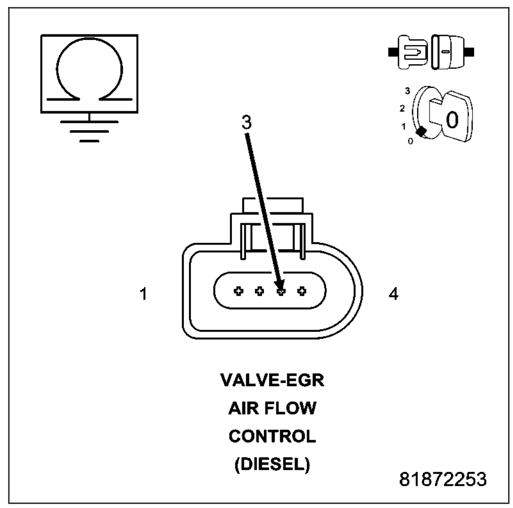
Turn the ignition off.

Disconnect the EGR Airflow Control Valve connector.

Disconnect the Engine Control Module (ECM) connector.

Measure the resistance of the (K601) EGR Airflow Control Valve Control circuit between the EGR Airflow Control Valve harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 3

No >> Repair the (K601) EGR Airflow Control Valve Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K601) EGR Airflow Control Valve Control circuit.

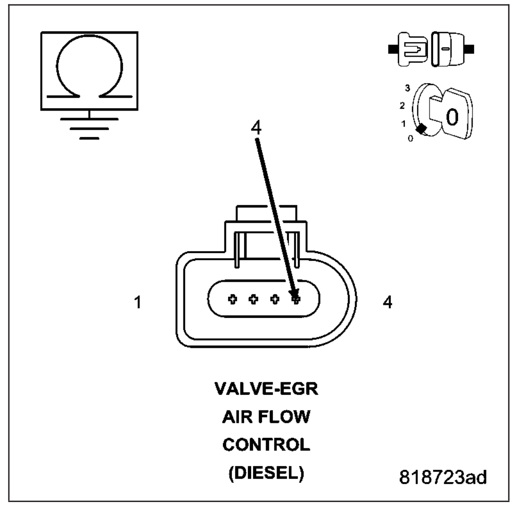
Is the resistance below above 1000 ohms?

Yes >> Go to 4

No >> Repair the (K601) EGR Airflow Control Valve Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (K604) EGR Airflow Control Valve Signal circuit.

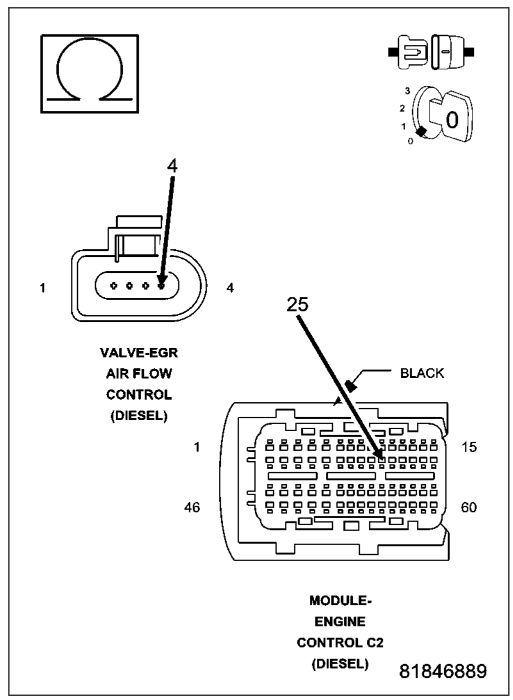
Is the resistance below above 1000 ohms?

Yes >> Go to 5

No >> Repair the (K604) EGR Airflow Control Valve Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (K604) EGR Airflow Control Valve Signal circuit between the EGR Airflow Control Valve harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 6

No >> Repair the (K604) EGR Airflow Control Valve Signal for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. EGR AIRFLOW CONTROL VALVE

Turn the ignition off.

Connect the Engine Control Module (ECM) connector.

Replace the EGR Airflow Control Valve in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Airflow Control Valve.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 7

No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

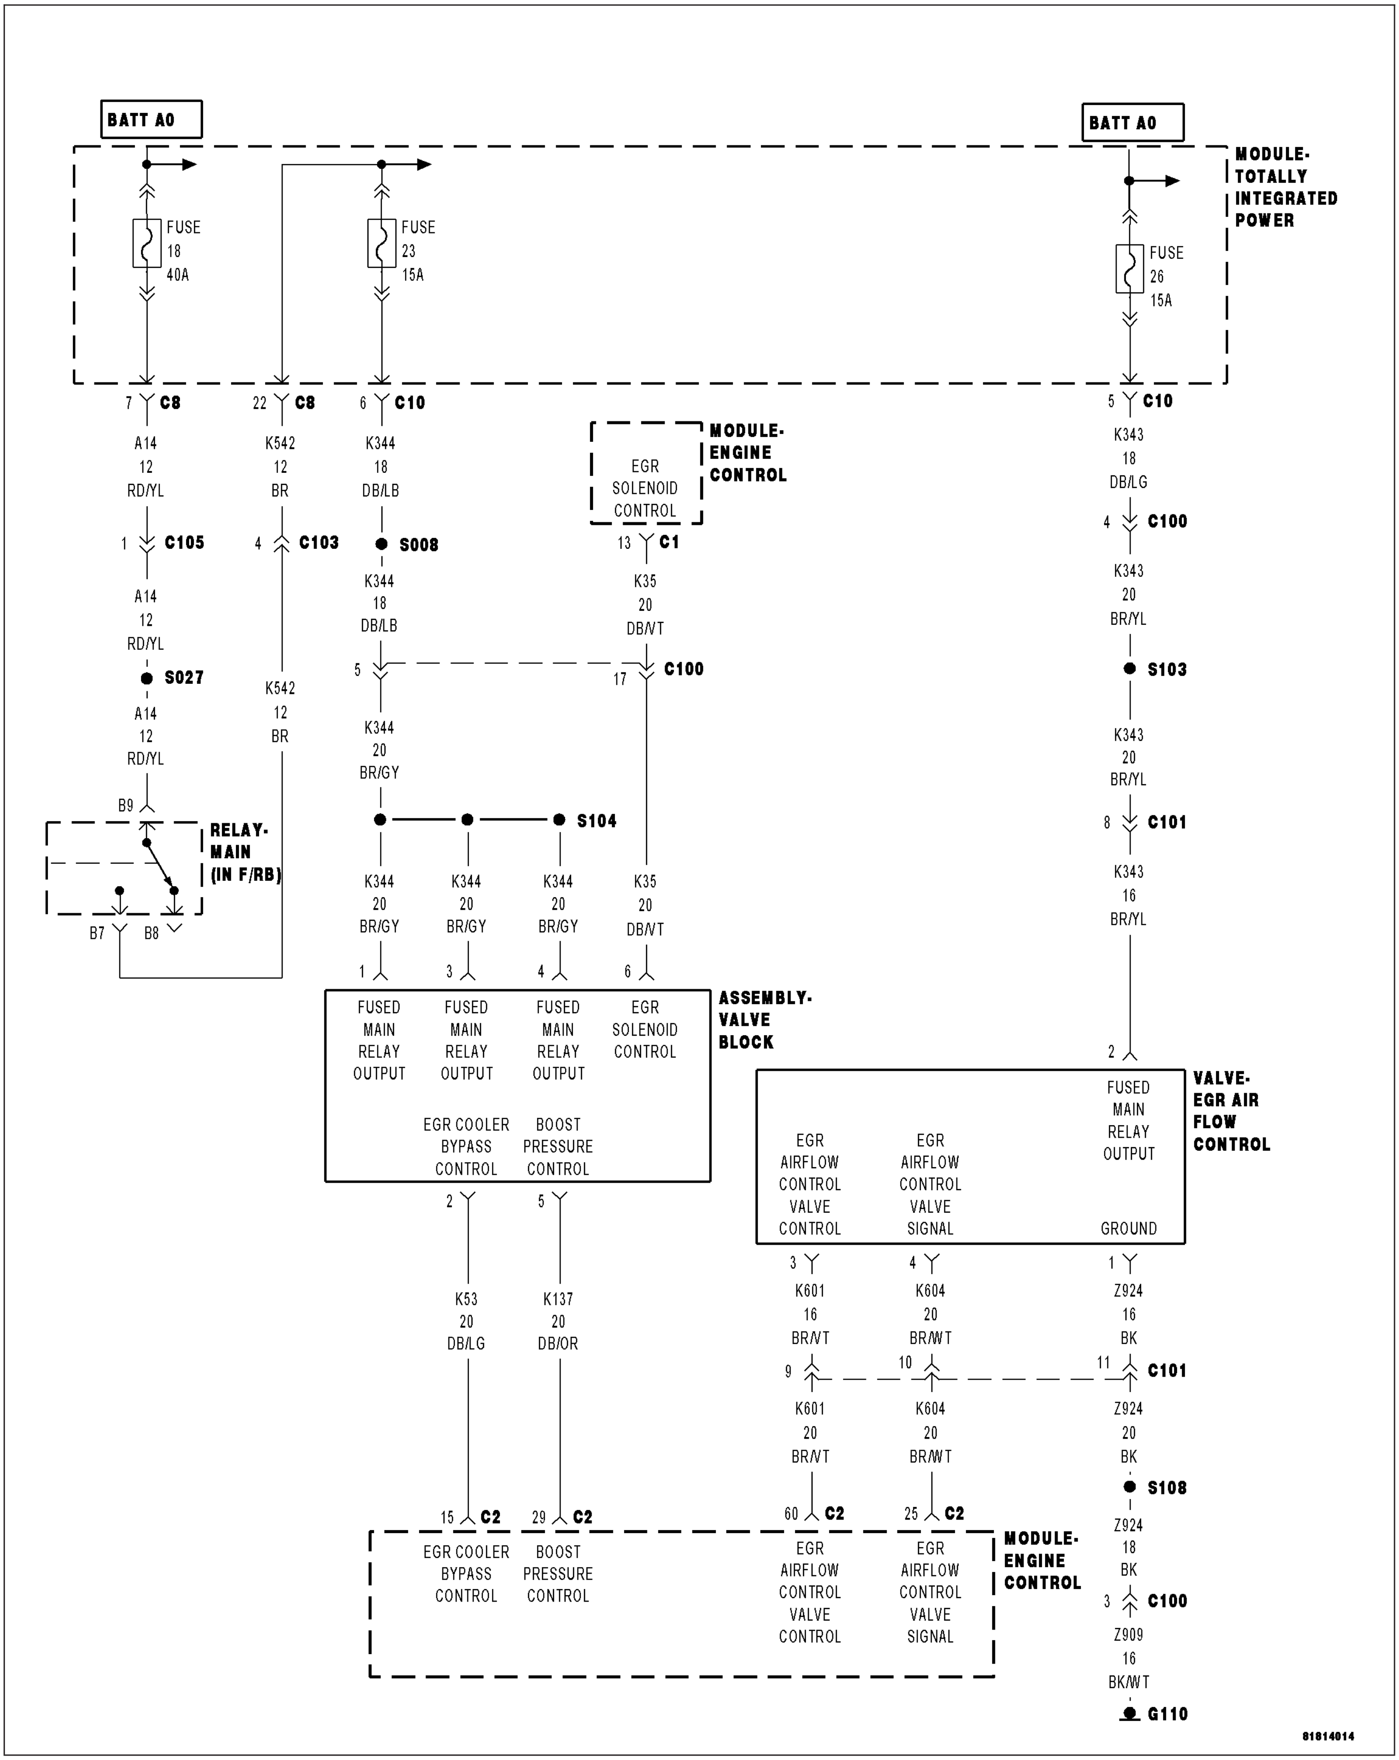
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Airflow Control Valve and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0488-EGR AIRFLOW THROTTLE CONTROL CIRCUIT PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and the EGR Airflow Control Valve Motor command on.
- **Set Condition:**
  The Engine Control Module (ECM) detects an implausible voltage on the (K601) EGR Airflow Control Valve Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO VOLTAGE
(k604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO (K604) EGR AIRFLOW CONTROL VALVE SIGNAL
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(k604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
EGR AIRFLOW CONTROL VALVE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Airflow Control Valve at 100%.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

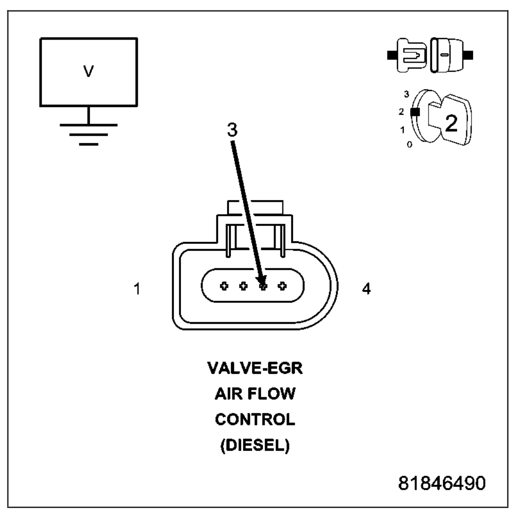
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the EGR Airflow Control Valve harness connector.



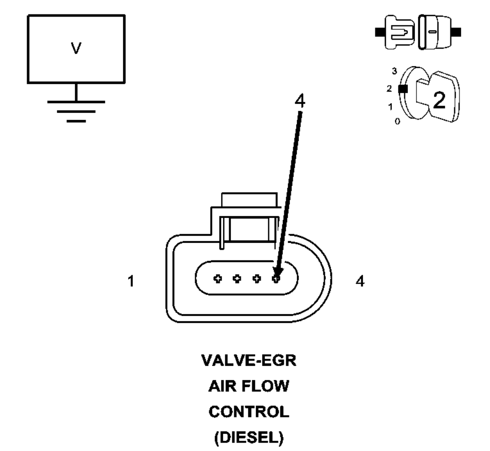
Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K601) EGR Airflow Control Valve Control circuit in the EGR Airflow Control Valve harness connector.



Is there any voltage present?

Yes >> Repair the (K601) EGR Airflow Control Valve Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

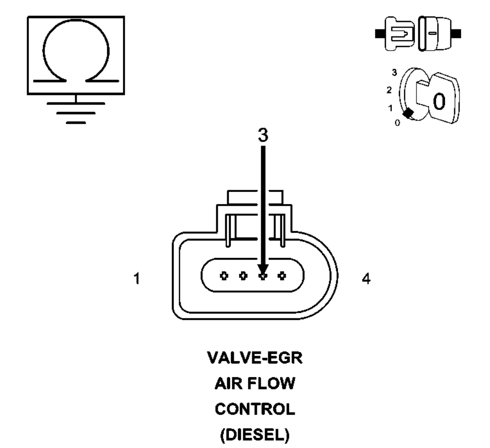
3. (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K604) EGR Airflow Control Valve Signal circuit.

81846600

Is there any voltage present?

Yes >> Repair the (K604) EGR Airflow Control Valve Signal circuit for a short to voltage.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

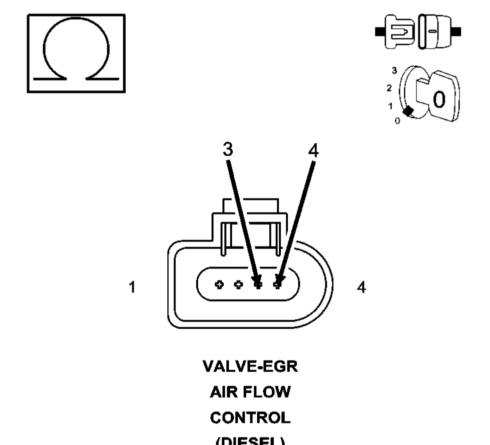
4. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (K601) EGR Airflow Control Valve Control circuit in the EGR Airflow Control Valve harness connector.

818451ab

Is the resistance above 1000 ohms?



Yes >> Go to 5

No >> Repair the (K601) EGR Airflow Control Valve Control circuit for a short to ground.

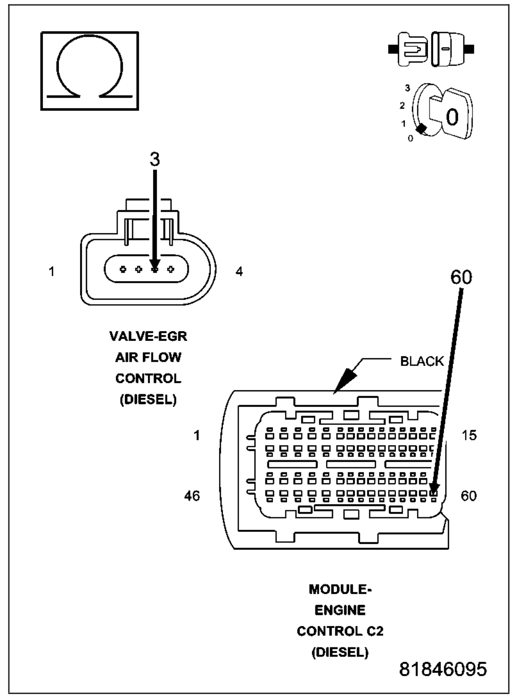
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT

Measure the resistance between the (K601) EGR Airflow Control Valve Control circuit and the (K604) EGR Airflow Control Valve Signal circuit in the EGR Airflow Control Valve harness connector.

8184605b

Is the resistance above 1000 ohms?



Yes >> Go to 6

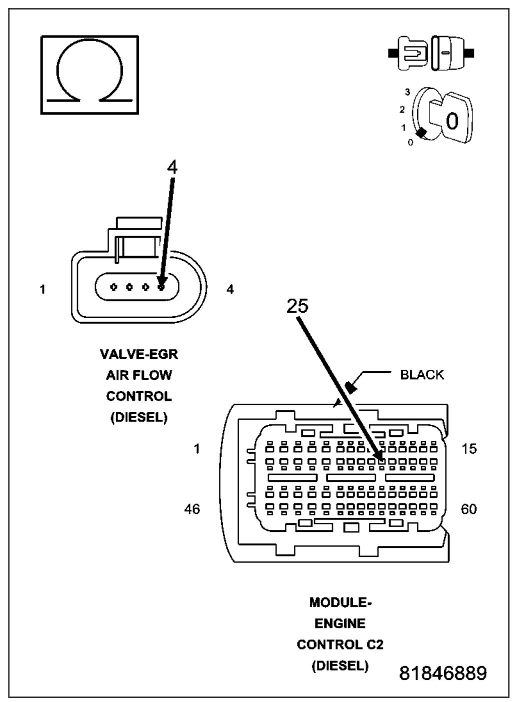
No >> Repair the (K601) EGR Airflow Control Valve Control circuit for a short to the (K604) EGR Airflow Control Valve Signal circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K601) EGR Airflow Control Valve Control circuit between the EGR Airflow Control Valve harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 7

No >> Repair the (K601) EGR Airflow Control Valve Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K604) EGR Airflow Control Valve Signal circuit between the EGR Airflow Control Valve harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 8

No >> Repair the (K604) EGR Airflow Control Valve Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. EGR AIRFLOW CONTROL VALVE

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the EGR Airflow Control Valve in accordance with the Service Information.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Airflow Control Valve.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 9

No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. ENGINE CONTROL MODULE (ECM)

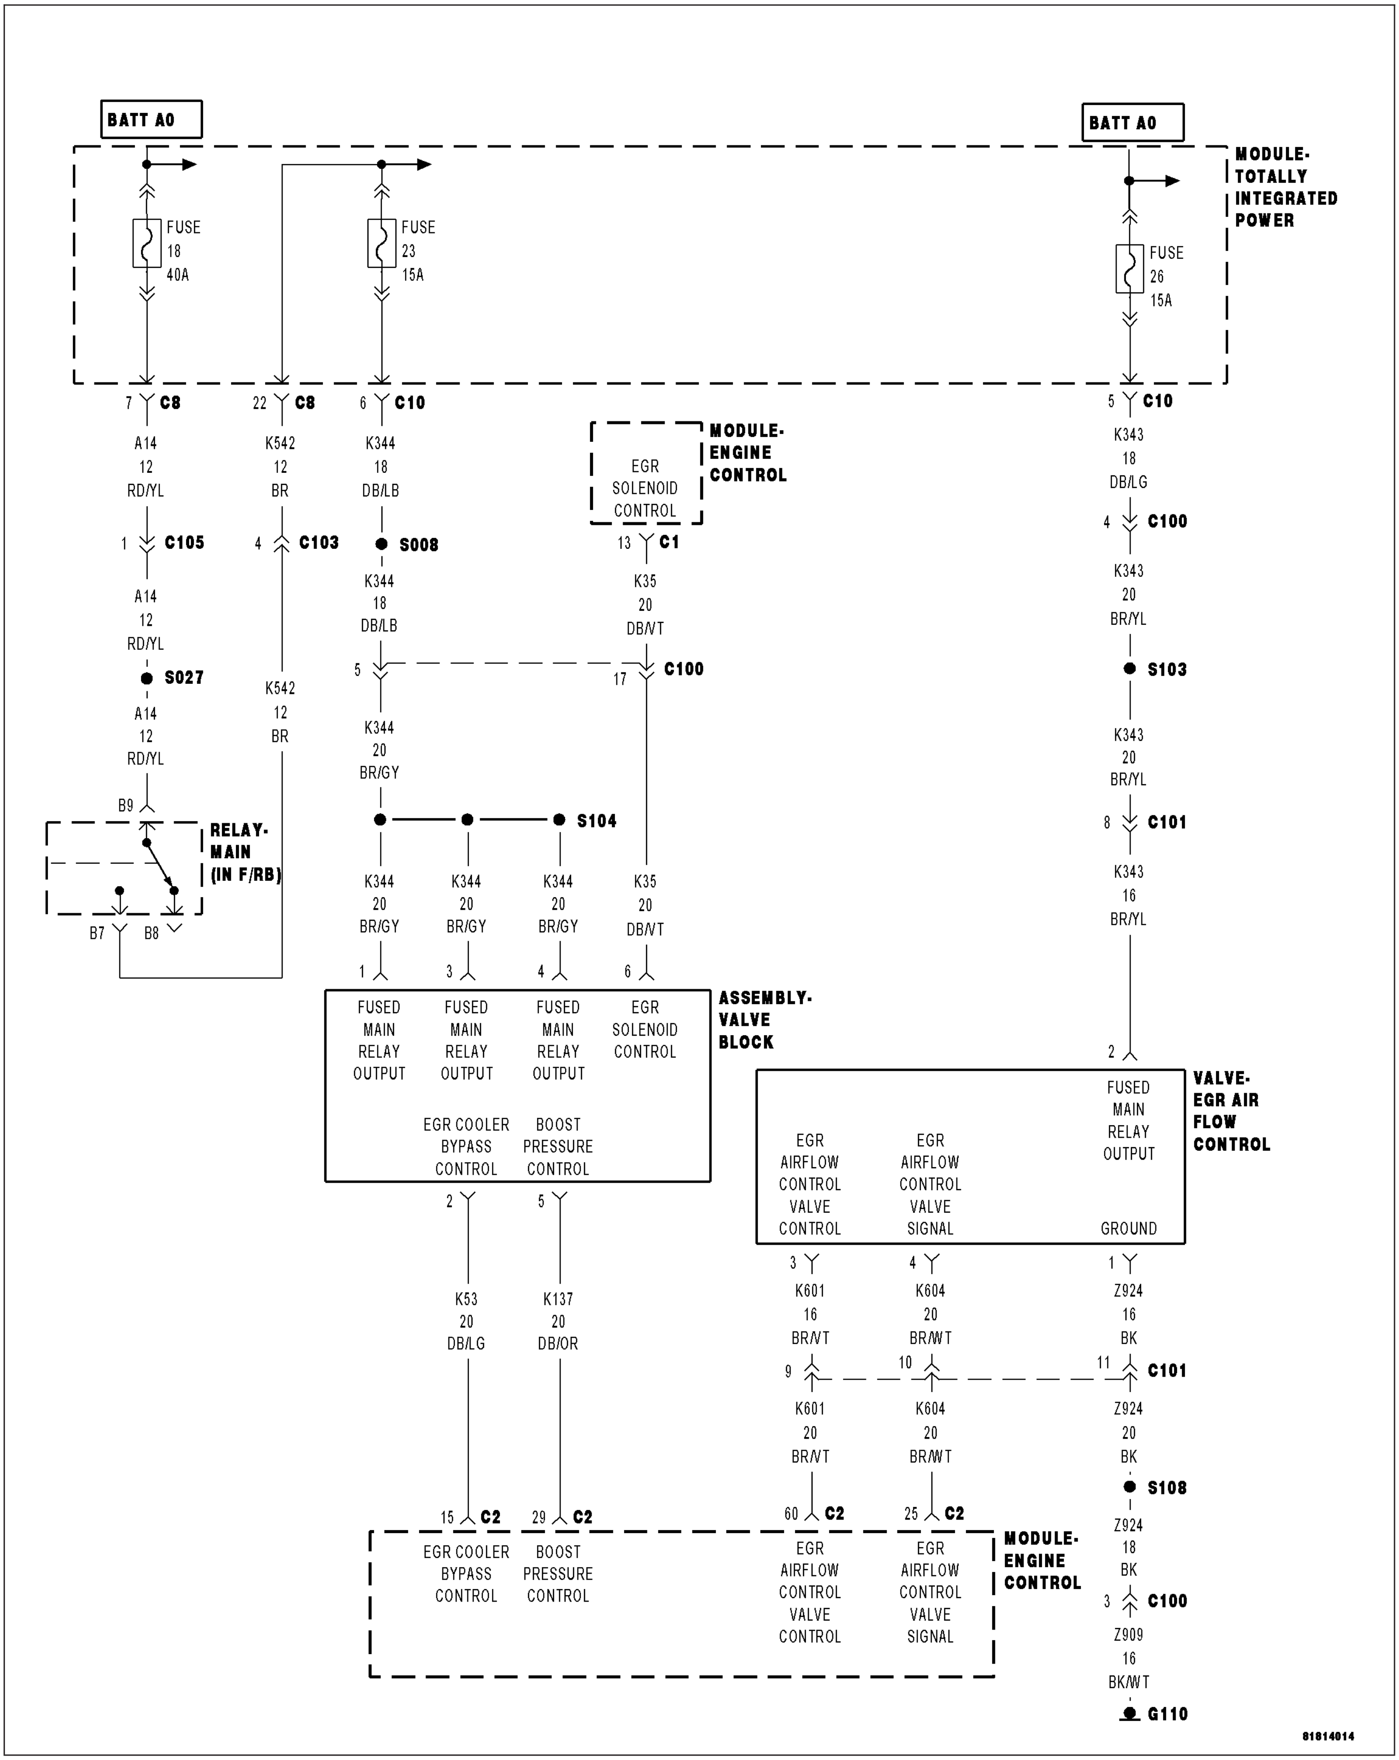
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Airflow Control Valve and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0489-EGR CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the EGR Solenoid command off.
- **Set Condition:**
  The ECM detects a short to ground on the (K35) EGR Solenoid Control circuit for 0.48 seconds.

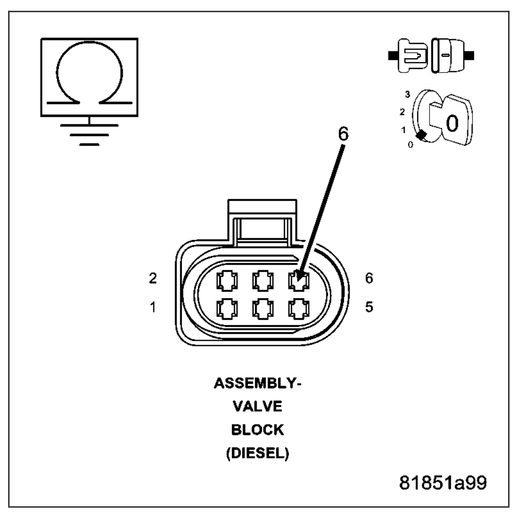
Possible Causes
INTERMITTENT DTC
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EGR VALVE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, Clear DTCs in the Engine Control Module (ECM).
With the scan tool, actuate the EGR Solenoid at 100%.
Monitor the scan tool for at least two minutes.
With the scan tool, select View DTCs.



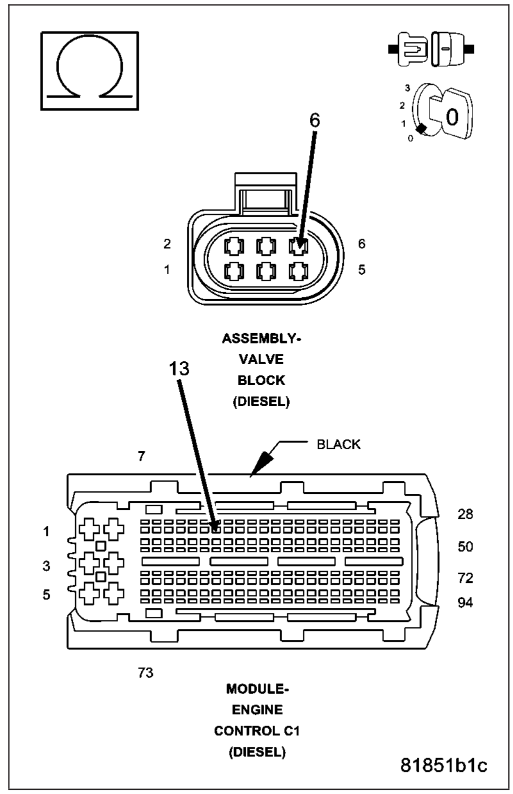
Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Valve Block Assembly harness connector.
Disconnect the Engine Control Module (ECM) harness connector.
Measure the resistance between ground and the (K35) EGR Solenoid Control circuit in the Valve Block Assembly harness connector.



Is the resistance below 1000 ohms?

Yes >> Repair the (K35) EGR Solenoid Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K35) EGR Solenoid Control circuit between the Valve Block Assembly harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (K35) EGR Solenoid Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. EGR VALVE

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Exhaust Gas Recirc Positioner to 100%.

Using a 12 volt test light connected to 12 volts, check the (K35) EGR Solenoid Control circuit in the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

With the scan tool, actuate the Exhaust Gas Recirc Positioner to 0%.

Using a 12 volt test light connected to 12 volts, check the (K35) EGR Solenoid Control circuit in the EGR Valve harness connector.

NOTE: The test light should not be illuminated.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright with the actuation at 100% and not illuminated with the actuation at 0%?

Yes >> Replace the EGR Valve in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

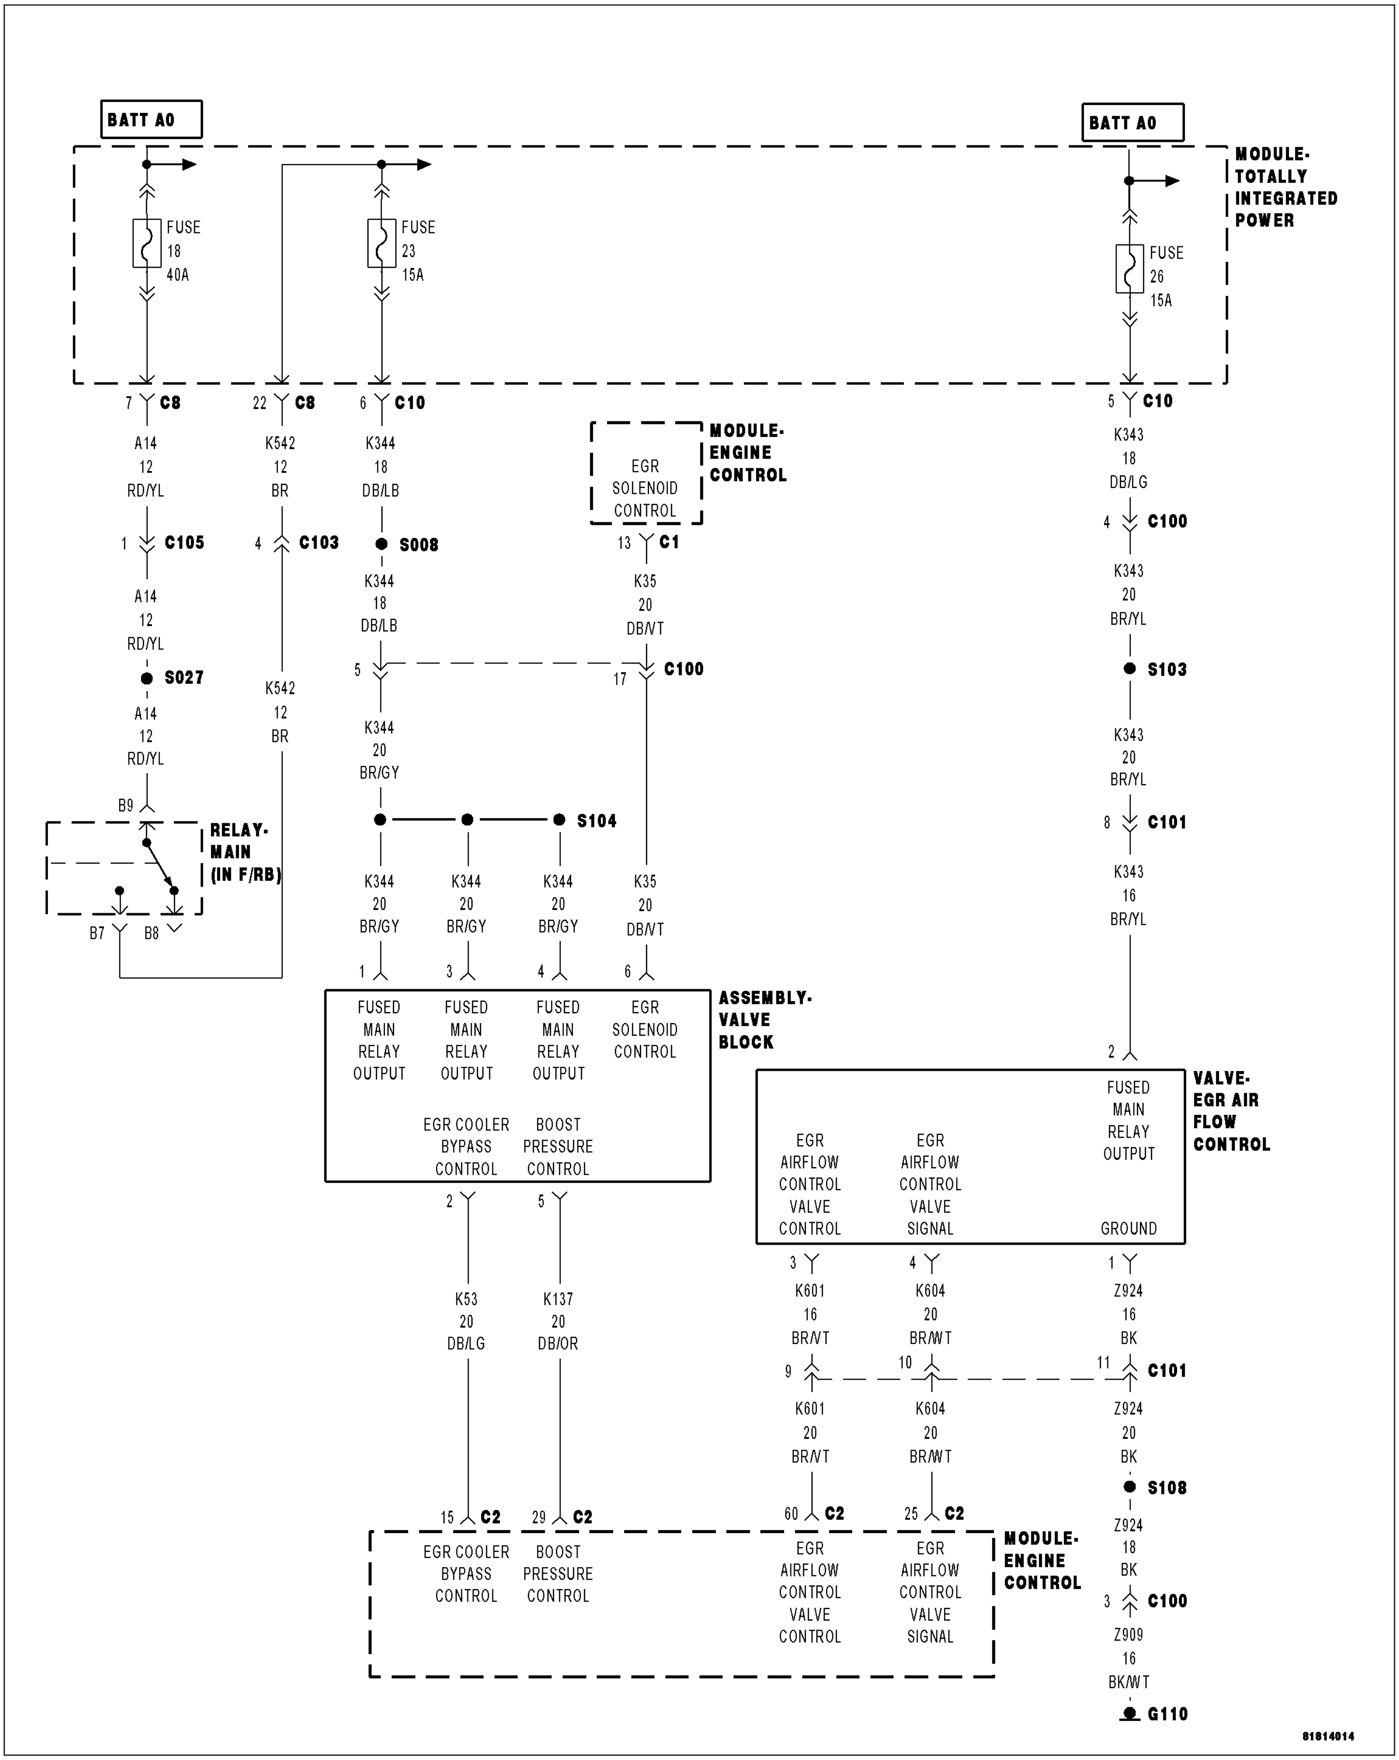
No >> Go to 5

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Valve and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0490-EGR CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the EGR Solenoid command on.
- **Set Condition:**
  The ECM detects excessive current on the (K35) EGR Solenoid Control circuit for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE
(K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT 2 CIRCUIT
(K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EGR VALVE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Solenoid at 100%.

Monitor the scan tool for at least two minutes.

Start the engine.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

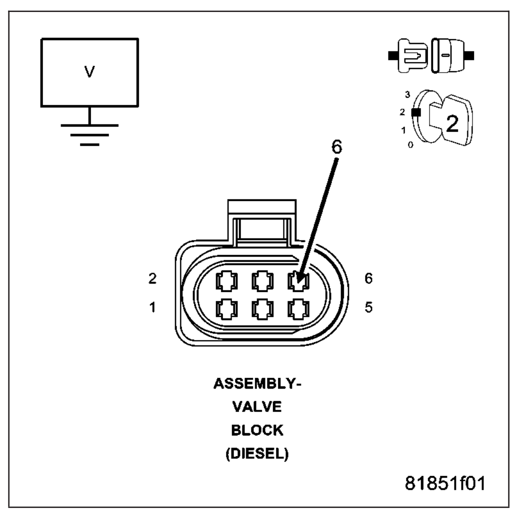
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Valve Block Assembly connector.



Disconnect the Engine Control Module connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

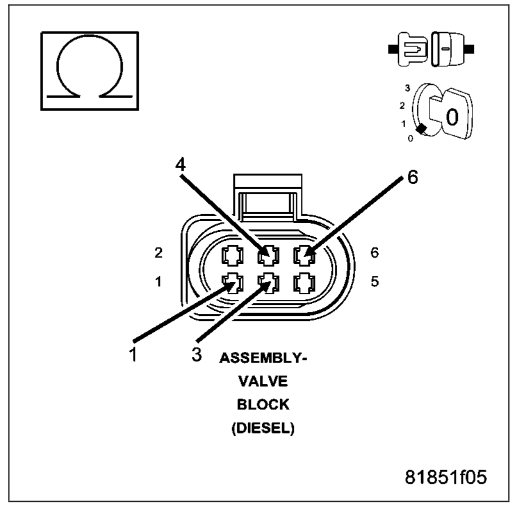
Turn the ignition on.

Measure the voltage of the (K35) EGR Solenoid Control circuit in the Valve Block Assembly harness connector.

Is there any voltage present?

Yes >> Repair the (K35) EGR Solenoid Control circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 3

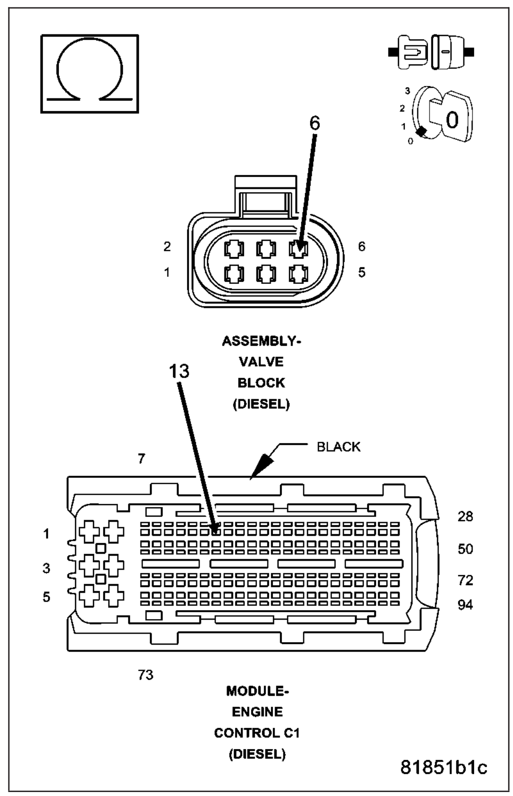
3. (K35) EGR SOLENOID CONTROL CIRCUIT SHORTED TO THE (K344) FUSED MAIN RELAY OUTPUT CIRCUIT

NOTE: Remove the jumper wire.

Turn the ignition off.

Measure the resistance between the (K35) EGR Solenoid Control circuit, terminal 6, and the (K344) Fused Main Relay Output circuits, terminals 1, 3, 4, in the Valve Block Assembly harness connector.

Is the resistance above 1000 ohms for each measurement?



Yes >> Go to 4

No >> Repair the (K35) EGR Solenoid Control circuit for a short to the (K344) Fused Main Relay Output circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K35) EGR SOLENOID CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K35) EGR Solenoid Control circuit between the Valve Block Assembly harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 5

No >> Repair the (K35) EGR Solenoid Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. EGR VALVE

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, actuate the Exhaust Gas Recirc Positioner to 100%.

Using a 12 volt test light connected to 12 volts, check the (K35) EGR Solenoid Control circuit in the Valve Block Assembly harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

NOTE: The circuit will remain actuated by the controller for 30 seconds. Be certain the actuation is active when checking the circuit.

Is the test light illuminated and bright?

Yes >> Replace the EGR Valve in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

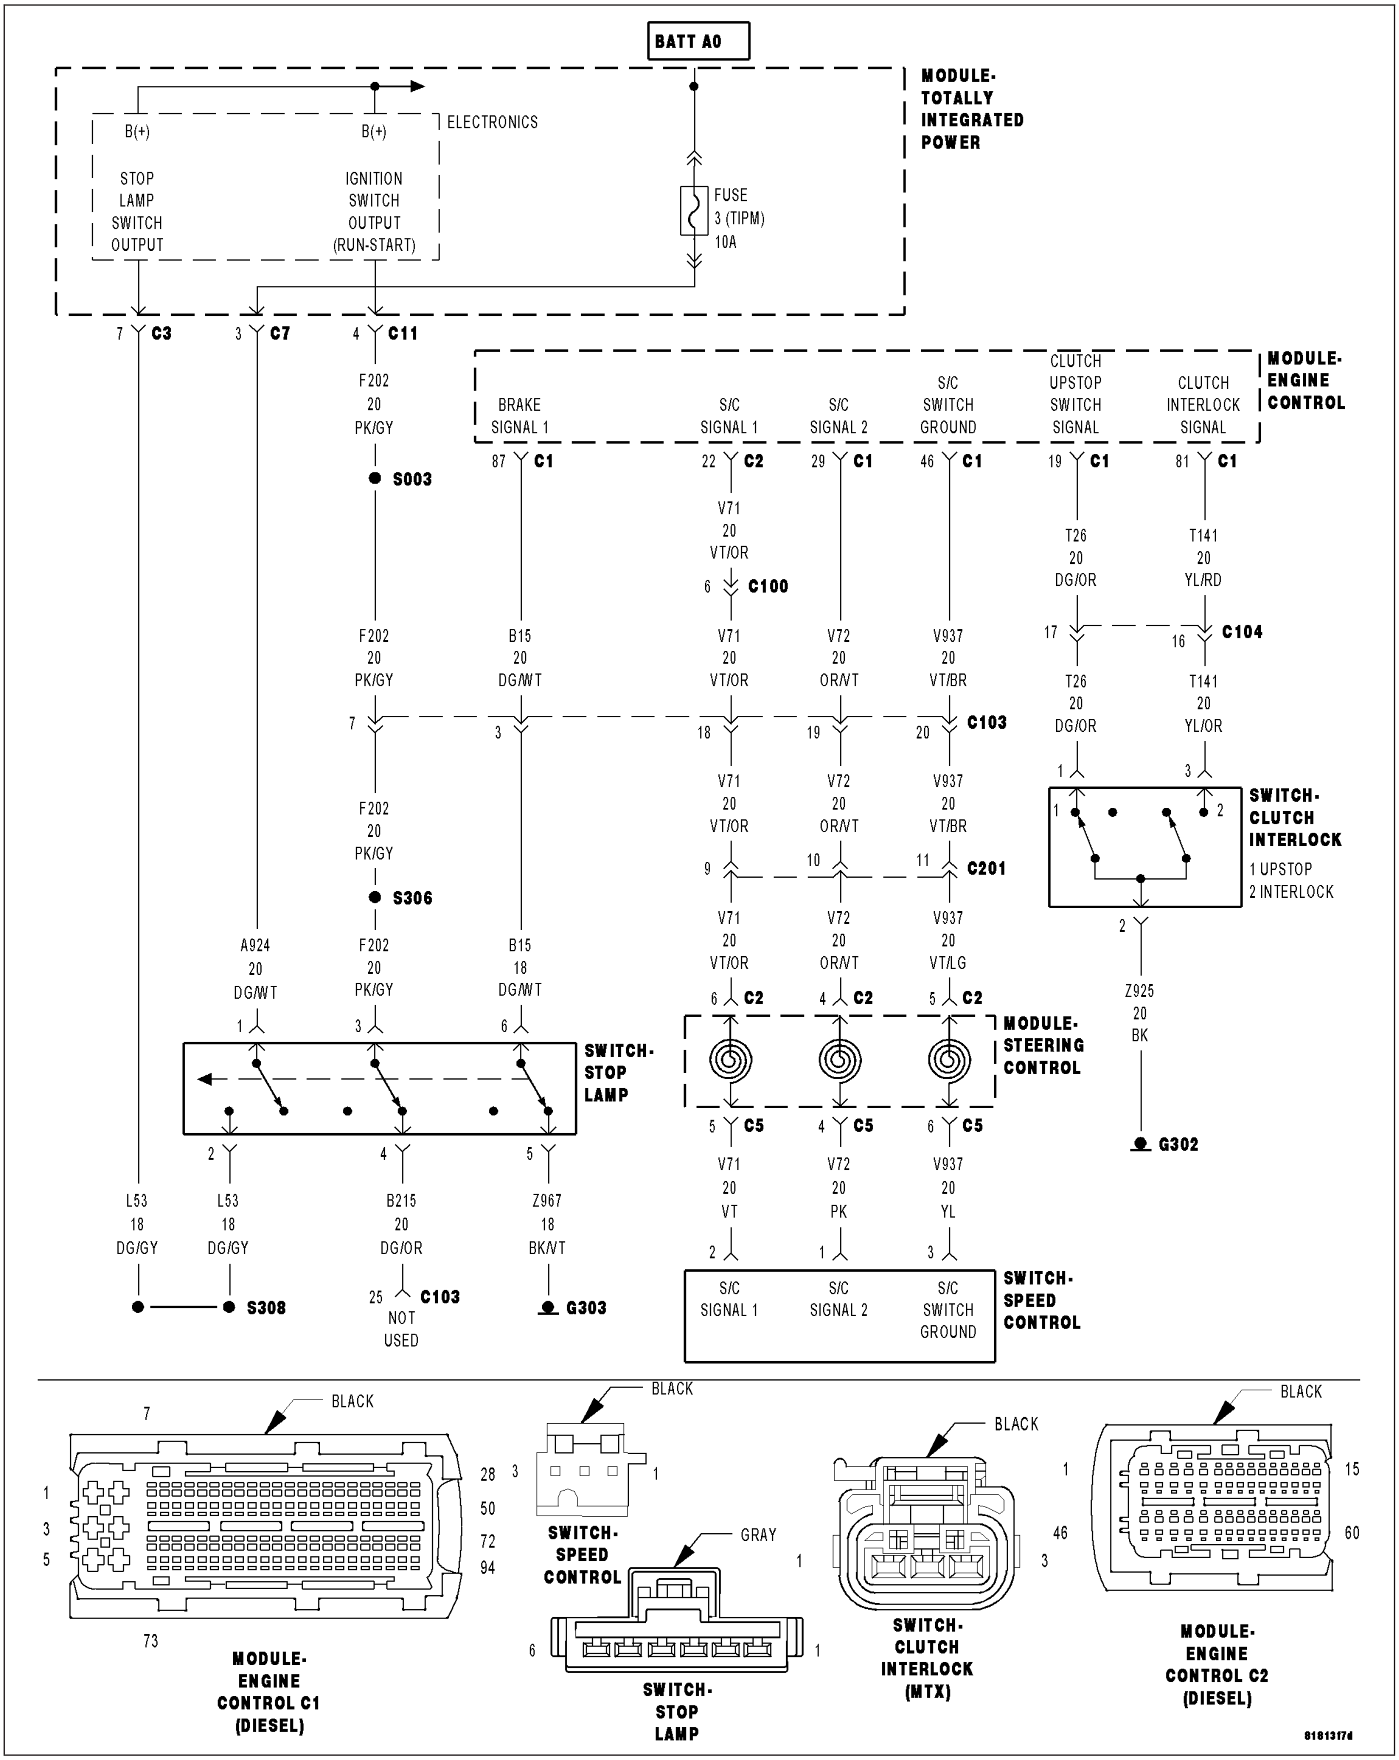
No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Solenoid and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0501–VEHICLE SPEED SENSOR #1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the system is active.
- **Set Condition:**
  There is an error in the vehicle speed message received over the CAN Bus from the Anti-lock Brake Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Test drive the vehicle

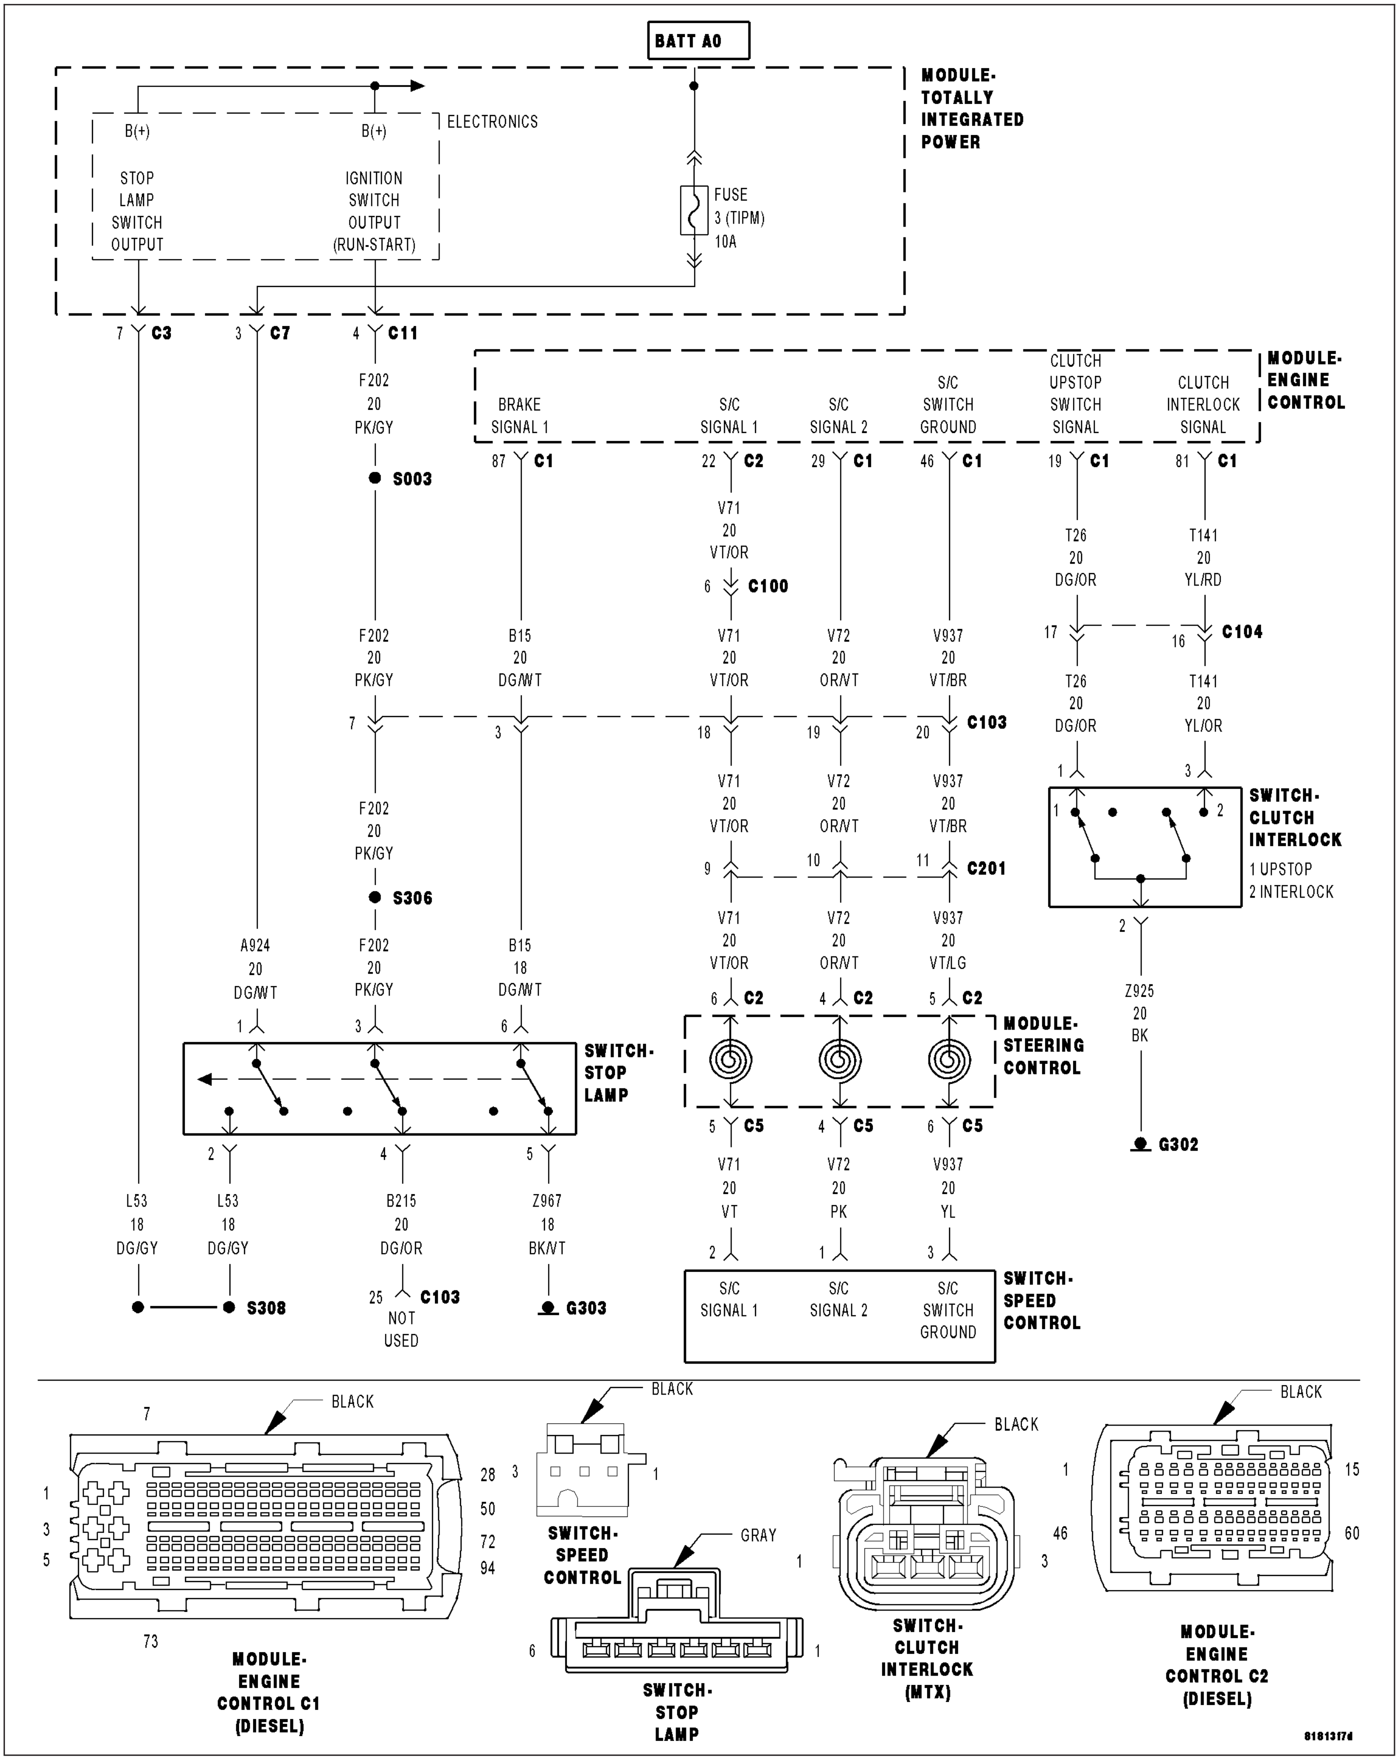
With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the ECM Verification Test Ver. 1.

2. DTCS PRESENT IN THE ANTI-LOCK BRAKE MODULE



With a scan tool check for DTCs in the Anti-lock Brake Module.

Are there any DTCs active in the Anti-lock Brake Module at this time?

Yes >> Repair Anti-Lock Brake Module DTC’s.

No >> Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0504-BRAKE SWITCH SIGNAL CIRCUITS PLAUSIBILITY WITH REDUNDANT CONTACT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Brake Switch Signal 1 and Brake Switch Signal 2 inputs to the ECM do not agree for 2 minutes.

Possible Causes
INTERMITTENT CONDITION
BRAKE SWITCH SIGNAL 2 - SWITCH 2 CKT OPEN
(A924) FUSED B+ CIRCUIT OPEN
(B215) BRAKE SWITCH SIGNAL 2 CIRCUIT SHORTED TO GROUND
BRAKE SWITCH SIGNAL 1 - SWITCH 1 CKT OPEN
(B215) BRAKE SWITCH SIGNAL 2 CIRCUIT OPEN
(Z967) STOP LAMP SWITCH GROUND CIRCUIT OPEN
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT OPEN
ENGINE CONTROL MODULE - BRAKE SWITCH SIGNAL 2
ENGINE CONTROL MODULE - INTERNAL
ENGINE CONTROL MODULE - BRAKE SWITCH SIGNAL 1

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK THE BRAKE SWITCH SIGNAL 1 STATUS

Turn the ignition on.

While observing the BRAKE SWITCH SIGNAL 1 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH SIGNAL1: PRESSED and RELEASED for the appropriate pedal position?

Yes >> Go To 2

No >> Go To 11

2. CHECK THE BRAKE SWITCH SIGNAL 2 STATUS

While observing the BRAKE SWITCH SIGNAL 2 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH SIGNAL 2: PRESSED and RELEASED for the appropriate pedal position

Yes >> Go To 3

No >> Go To 4

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

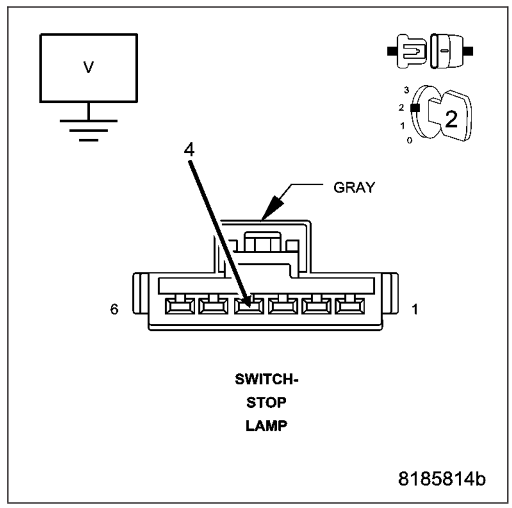
Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.



4. (B215) BRAKE SWITCH SIGNAL 2 CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Turn the ignition on.

Measure the voltage between the (B215) Brake Switch Signal 2 circuit and ground at the Stop Lamp Switch harness connector.

Is the voltage above 9.0 volts?

Yes >> Go To 5

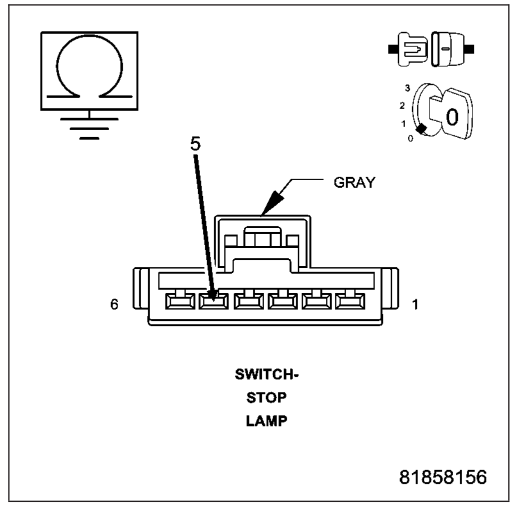
No >> Go To 8

5. STOP LAMP SWITCH - BRAKE SWITCH SIGNAL 2 CKT OPEN

While monitoring the BRAKE SWITCH 2 status with the scan tool, connect a jumper wire between ground and the (B215) Brake Switch Signal 2 circuit.

Does the scan tool display change from PRESSED to RELEASED?

Yes >> Adjust or replace the Stop Lamp Switch in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go To 6

6. (Z967) STOP LAMP SWITCH GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Measure the resistance between ground and the (Z967) Stop Lamp Switch Ground circuit at the Stop Lamp Switch harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 7

No >> Repair the (Z967) Stop Lamp Switch Ground circuit for an open.

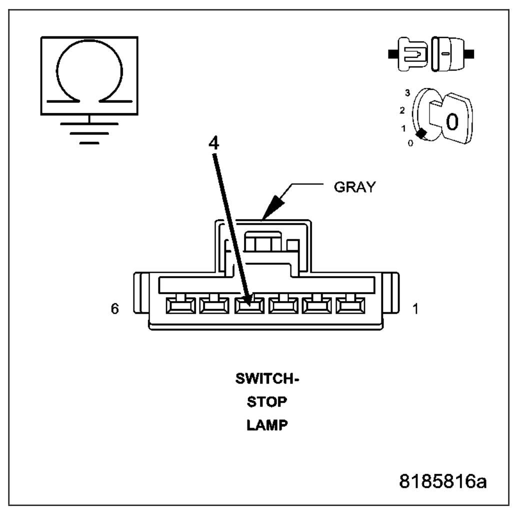
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE - INTERNAL

If there are no possible causes remaining, view repair.

Repair

Replace and program the Engine Control Module in accordance with the Service Information.



Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

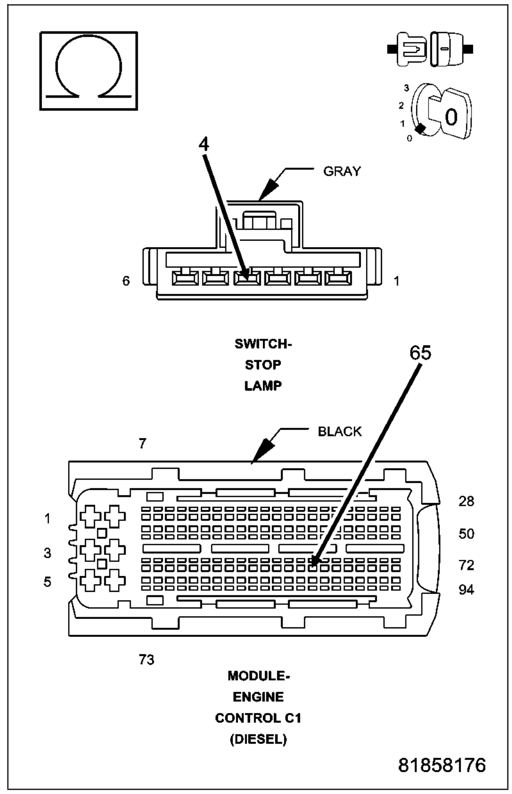
8. (B215) BRAKE SWITCH SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (B215) Brake Switch Signal 2 circuit at the Stop Lamp Switch harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 9

No >> Repair the (B215) Brake Switch Signal 2 circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. (B215) BRAKE SWITCH SIGNAL 2 CIRCUIT OPEN

Measure the resistance of the (B215) Brake Switch Signal 2 circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

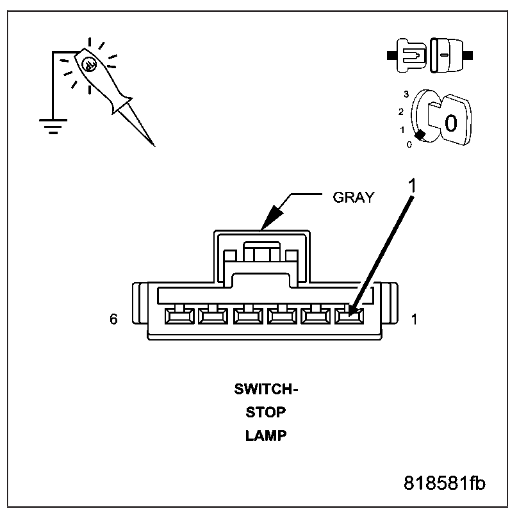
Yes >> Go To 10

No >> Repair the (B215) Brake Switch Signal 2 circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. ENGINE CONTROL MODULE - BRAKE SWITCH SIGNAL 2

If there are no possible causes remaining, view repair.

Repair



Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

11. (A924) FUSED B+ CIRCUIT OPEN

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Using a 12-volt test light connected to ground, check the (A924) Fused B+ circuit.

Does the test light illuminate brightly?

Yes >> Go To 12

No >> Repair the (A924) Fused B+ circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

12. STOP LAMP SWITCH - BRAKE SWITCH SIGNAL 1 OPEN

Turn the ignition on.

While monitoring the BRAKE SWITCH SIGNAL 1 status with the scan tool, connect a jumper wire between the Brake Switch Signal 1 circuit and the Fused B(+) circuit.

Does the scan tool display change from RELEASED to PRESSED?

Yes >> Adjust or replace the Stop Lamp Switch in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 13

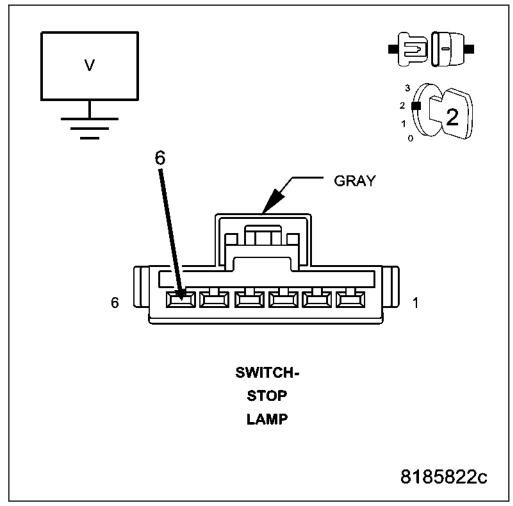
13. (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the ECM harness connectors.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.



Turn the ignition on.

Measure the voltage between the (B15) Brake Switch Signal 1 circuit and ground.

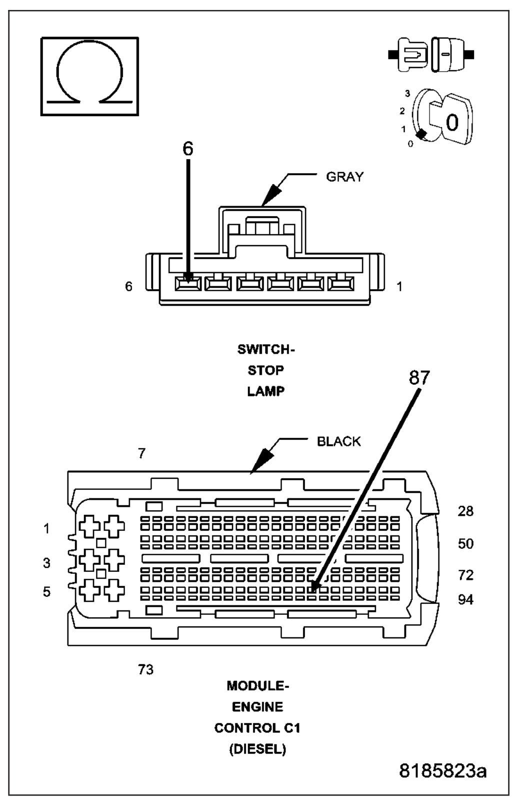
Is the voltage above 1.0 volt?

Yes >> Repair the (B15) Brake Switch Signal 1 circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 14

14. (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT OPEN

NOTE: Remove the jumper wire.



Turn the ignition off.

Measure the resistance of the (B15) Brake Switch Signal 1 circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (B15) Brake Switch Signal 1 circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0513-INVALID SKIM KEY

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM receives and invalid SKIM Key message from the SKREEM.

Possible Causes
INTERMITTENT DTC
UNPROGRAMMED IGNITION KEYS
SKREEM
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR SKREEM COMMUNICATION AND DTCS

Ignition on, engine not running.

With the scan tool, check for proper communication and active DTCs in the SKREEM.

Are any SKREEM communication problems or DTCs present?

Yes >> Refer to the symptom list for problems related to SKREEM Communication and DTCs before continuing.

No >> Go To 2

2. CHECK FOR ACTIVE DTC

With the scan tool, clear all ECM DTCs.

Turn the ignition on and off several times pausing 10 seconds between key cycles leaving the ignition on.

With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Refer to *CHECKING FOR INTERMITTENT DTC in the symptom list. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. REPROGRAM IGNITION KEYS AND RETEST

With the scan tool, clear all ignition keys out of SKREEM memory.

With the scan tool, reprogram all ignition keys to the SKREEM.

Turn the ignition on and off several times pausing 10 seconds between key cycles leaving the ignition on.

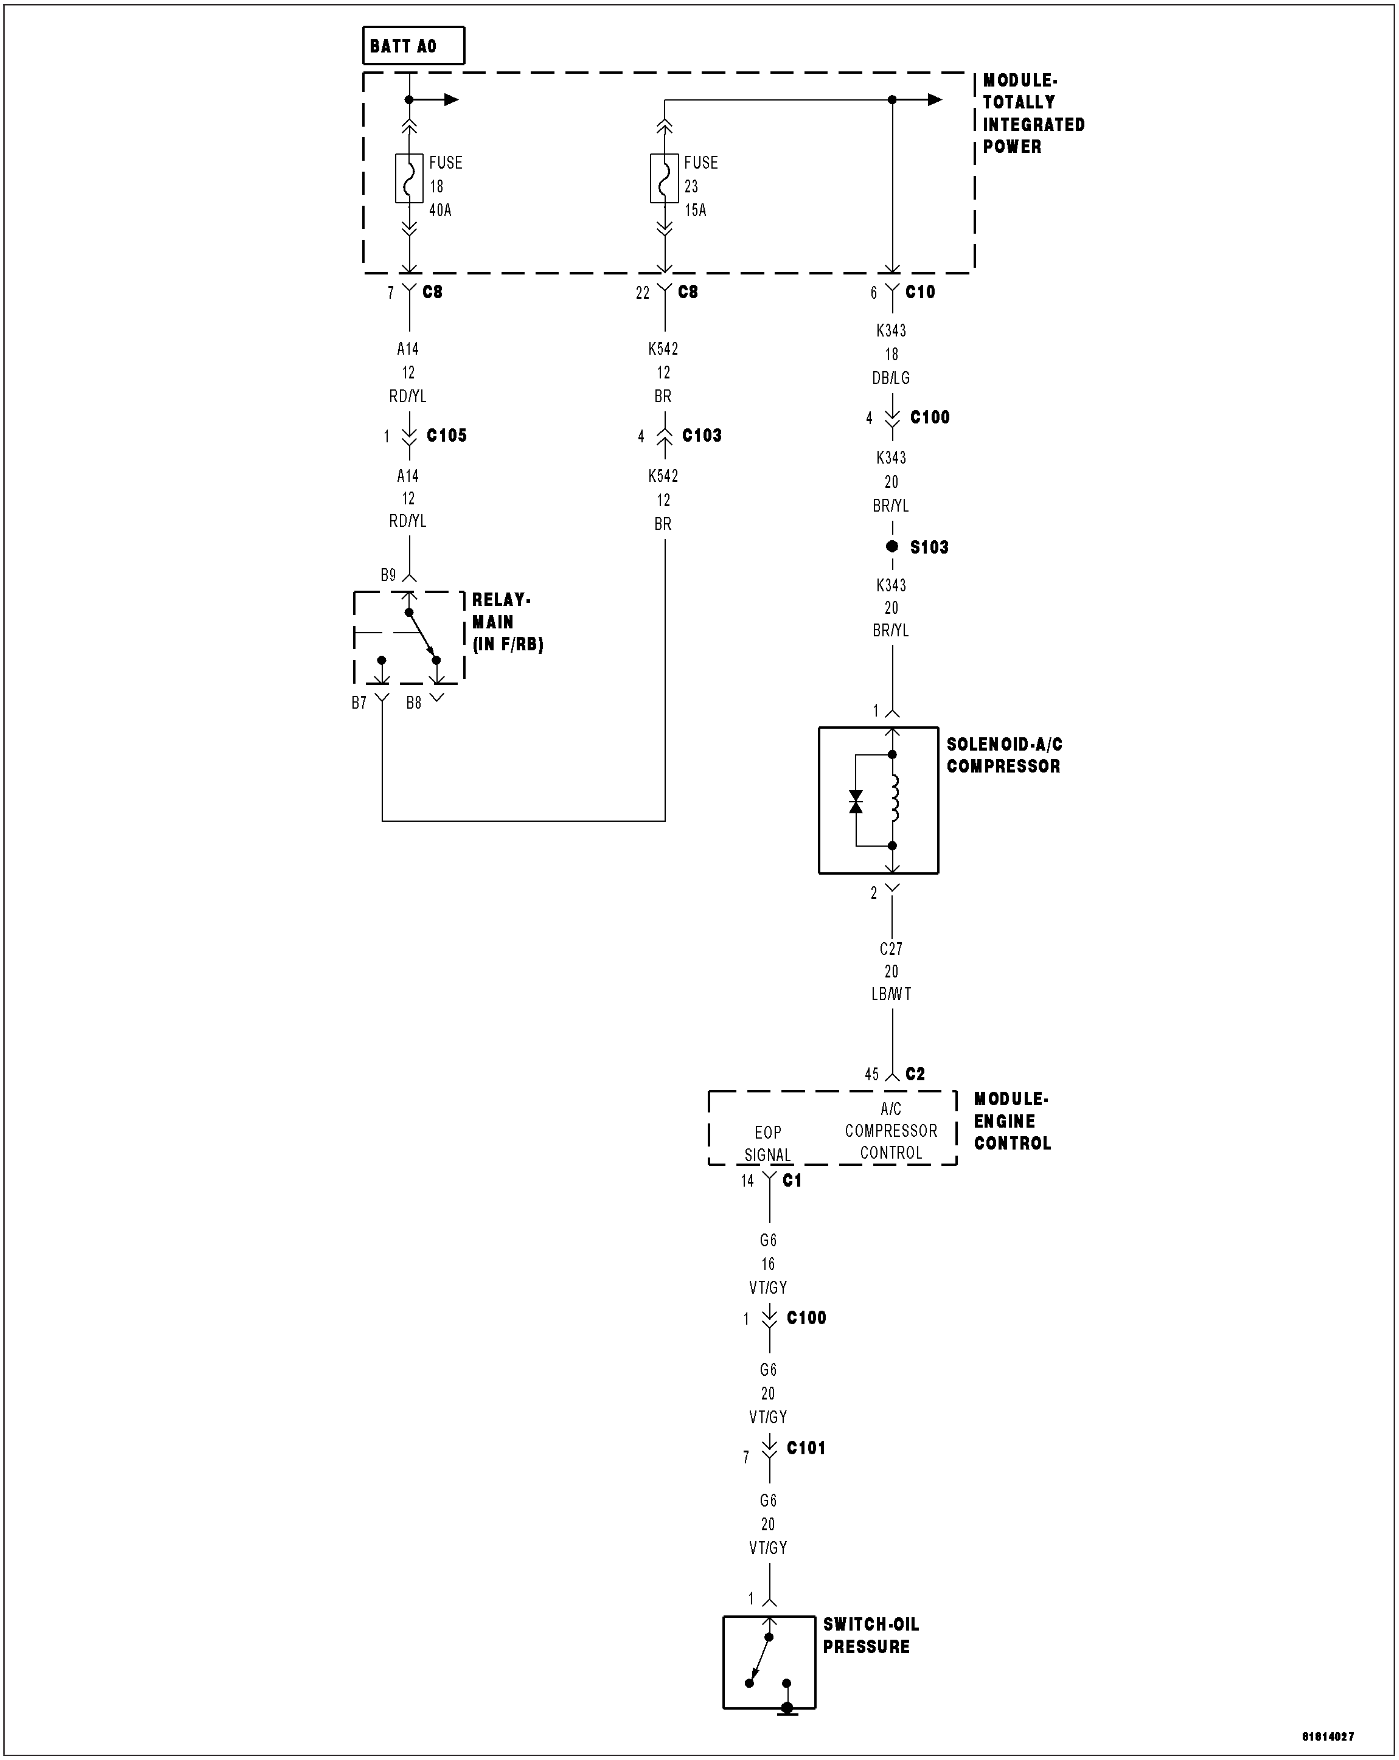
With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes >> 4

No >> Test complete.

4. REPLACE THE SKREEM AND RETEST



Replace and program the SKREEM in accordance with the Service Information.
Turn the ignition on.
With the scan tool, clear all ECM DTCs.
Turn the ignition on and off several times pausing 10 seconds between key cycles leaving the ignition on.
With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes >> Replace and program the Engine Control Module in accordance the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test complete.

P0521-ENGINE OIL PRESSURE SENSOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running
- **Set Condition:**
  The Engine Control Module (ECM) detects an implausible Engine Oil Pressure Switch signal.

Possible Causes
(G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT OPEN
(G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT SHORT TO GROUND
(G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT SHORT TO VOLTAGE
ENGINE OIL PRESSURE SWITCH
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

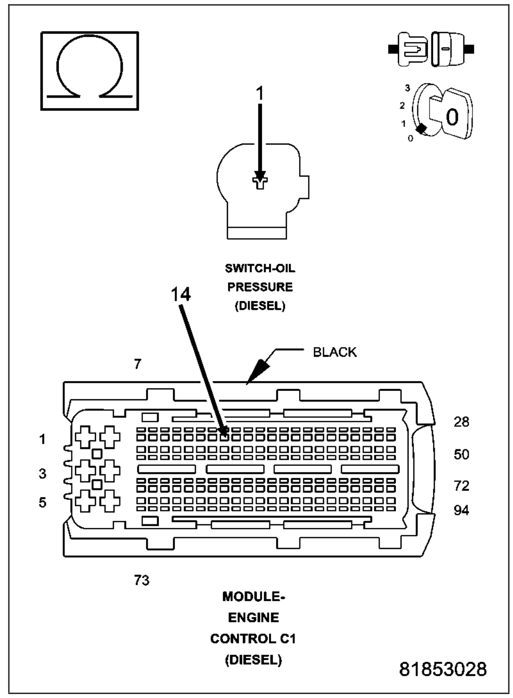
NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Incorrect engine oil level may cause this DTC to set. Check and verify that the engine oil level is filled to the proper specification.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off, wait 30 seconds, then start and idle the engine for at least 2 minutes.



With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

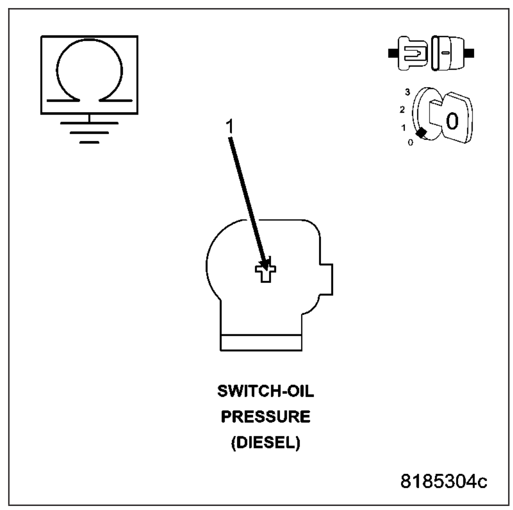
2. (G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Engine Oil Pressure Switch harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (G6) Engine Oil Pressure Switch Signal circuit.



Is the resistance below 10.0 ohms?

Yes >> Go To 3

No >> Repair the (G6) Engine Oil Pressure Switch Signal circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (G6) Engine Oil Pressure Switch Signal circuit.

Is the resistance above 1000 ohms?

Yes >> Go To 4

No >> Repair the (G6) Engine Oil Pressure Switch Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. (G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

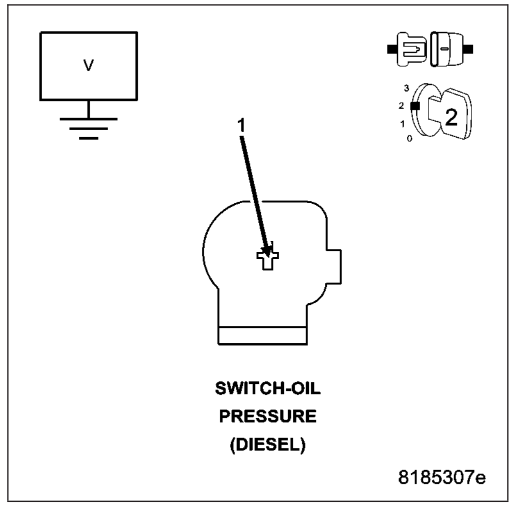
Turn the ignition on.

Measure the voltage of the (G6) Engine Oil Pressure Switch Signal circuit.

Is the voltage above 1.0 volt?

Yes >> Repair the (G6) Engine Oil Pressure Switch Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go To 5

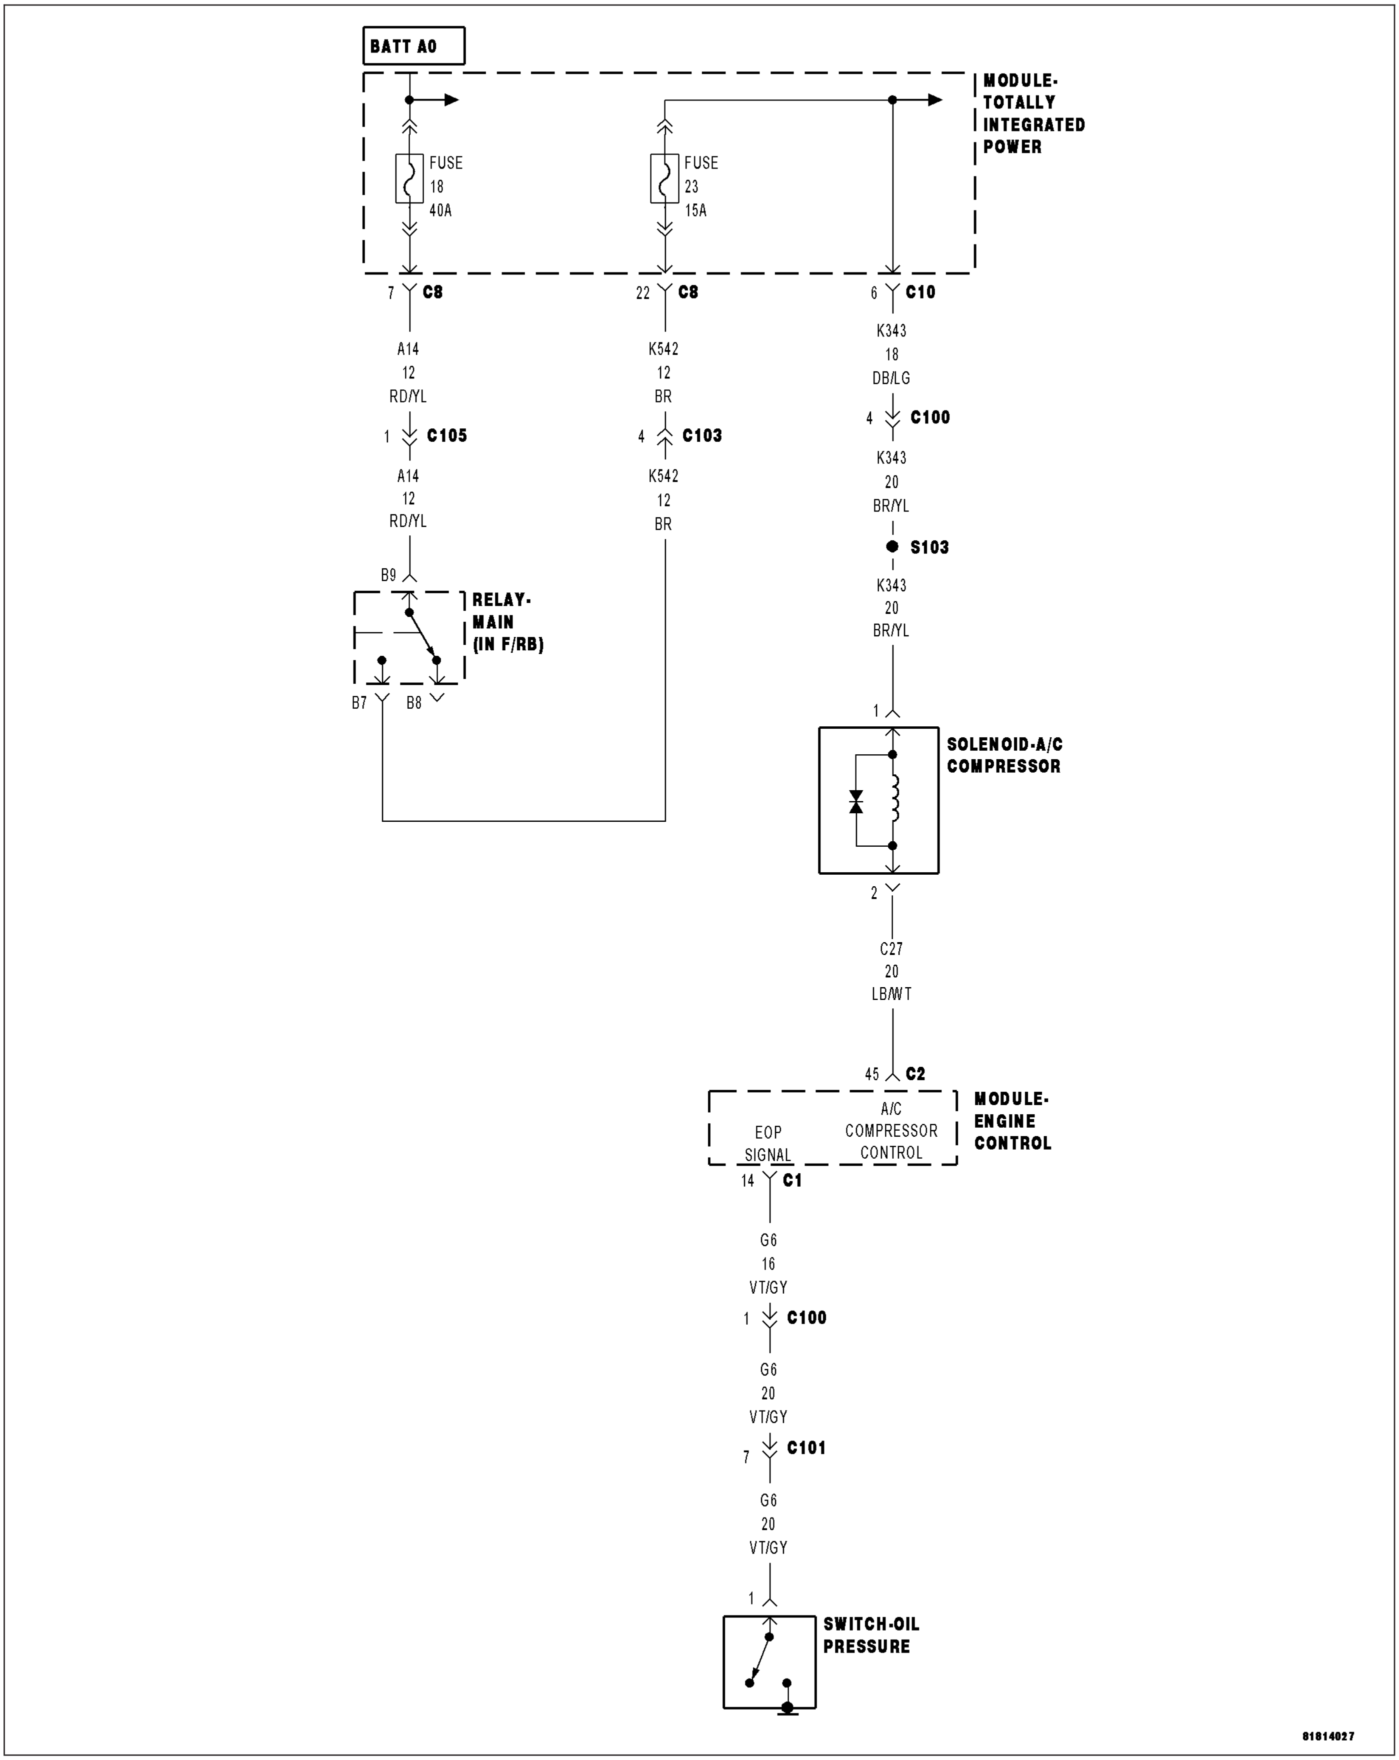
5. CHECKING THE (G6) ENGINE OIL PRESSURE SWITCH SIGNAL VOLTAGE

Reconnect the ECM harness connectors.

Turn the ignition on.

With a voltmeter, measure the voltage of the (G6) Engine Oil Pressure Switch Signal circuit at the Engine Oil Pressure Switch harness connector.

Is the voltage above 10.0 volts?



Yes >> Replace the Engine Oil Pressure Switch.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the ECM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0524- ENGINE OIL PRESSURE IS TOO LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The Engine Oil Pressure Switch indicates low oil level for 5 seconds.

Possible Causes
(G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT OPEN
(G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT SHORT TO GROUND
ENGINE OIL PRESSURE SWITCH
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Incorrect engine oil level may cause this DTC to set. Check and verify that the engine oil level is filled to the proper specification.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

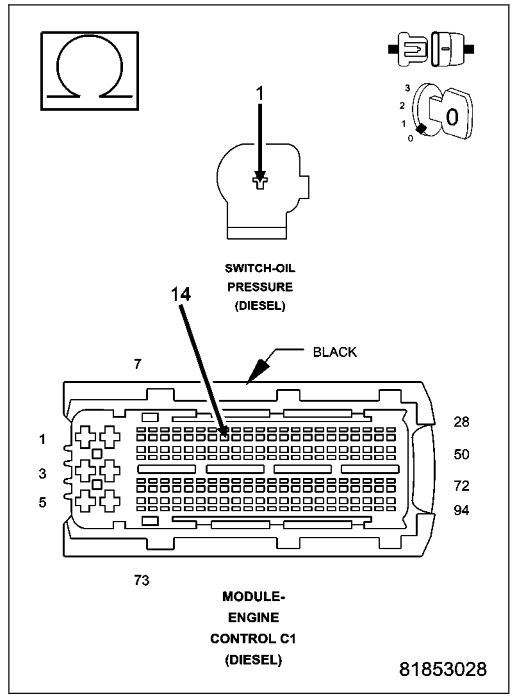
Turn the ignition off, wait 30 seconds, then start and idle the engine for at least 2 minutes.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT OPEN

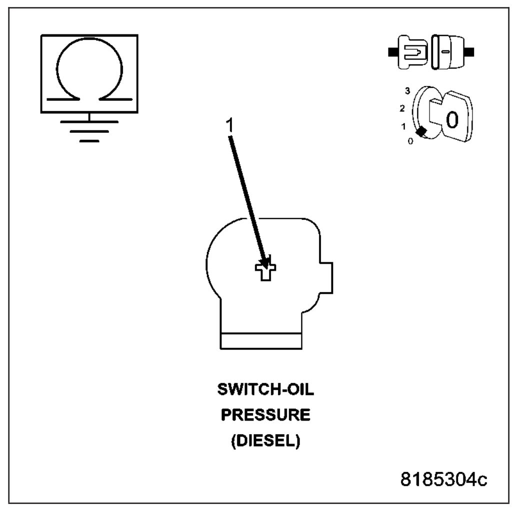
Turn the ignition off.

Disconnect the Engine Oil Pressure Switch harness connector.

Disconnect the ECM harness connectors.

Measure the resistance of the (G6) Engine Oil Pressure Switch Signal circuit.

Is the resistance below 10.0 ohms?



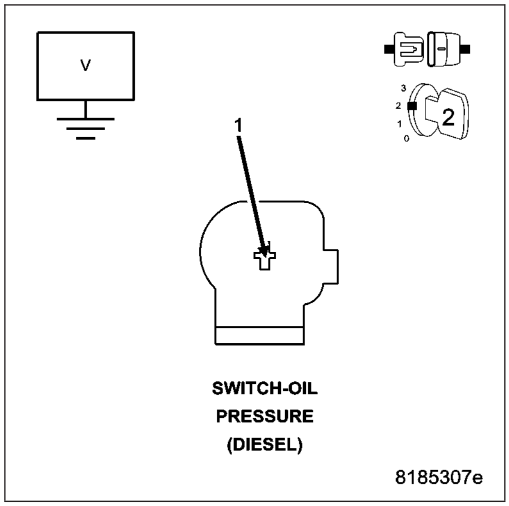
Yes >> Go To 3

No >> Repair the (G6) Engine Oil Pressure Switch Signal circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

3. (G6) ENGINE OIL PRESSURE SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (G6) Engine Oil Pressure Switch Signal circuit.



Is the resistance above 1000 ohms?

Yes >> Go To 4

No >> Repair the (G6) Engine Oil Pressure Switch Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

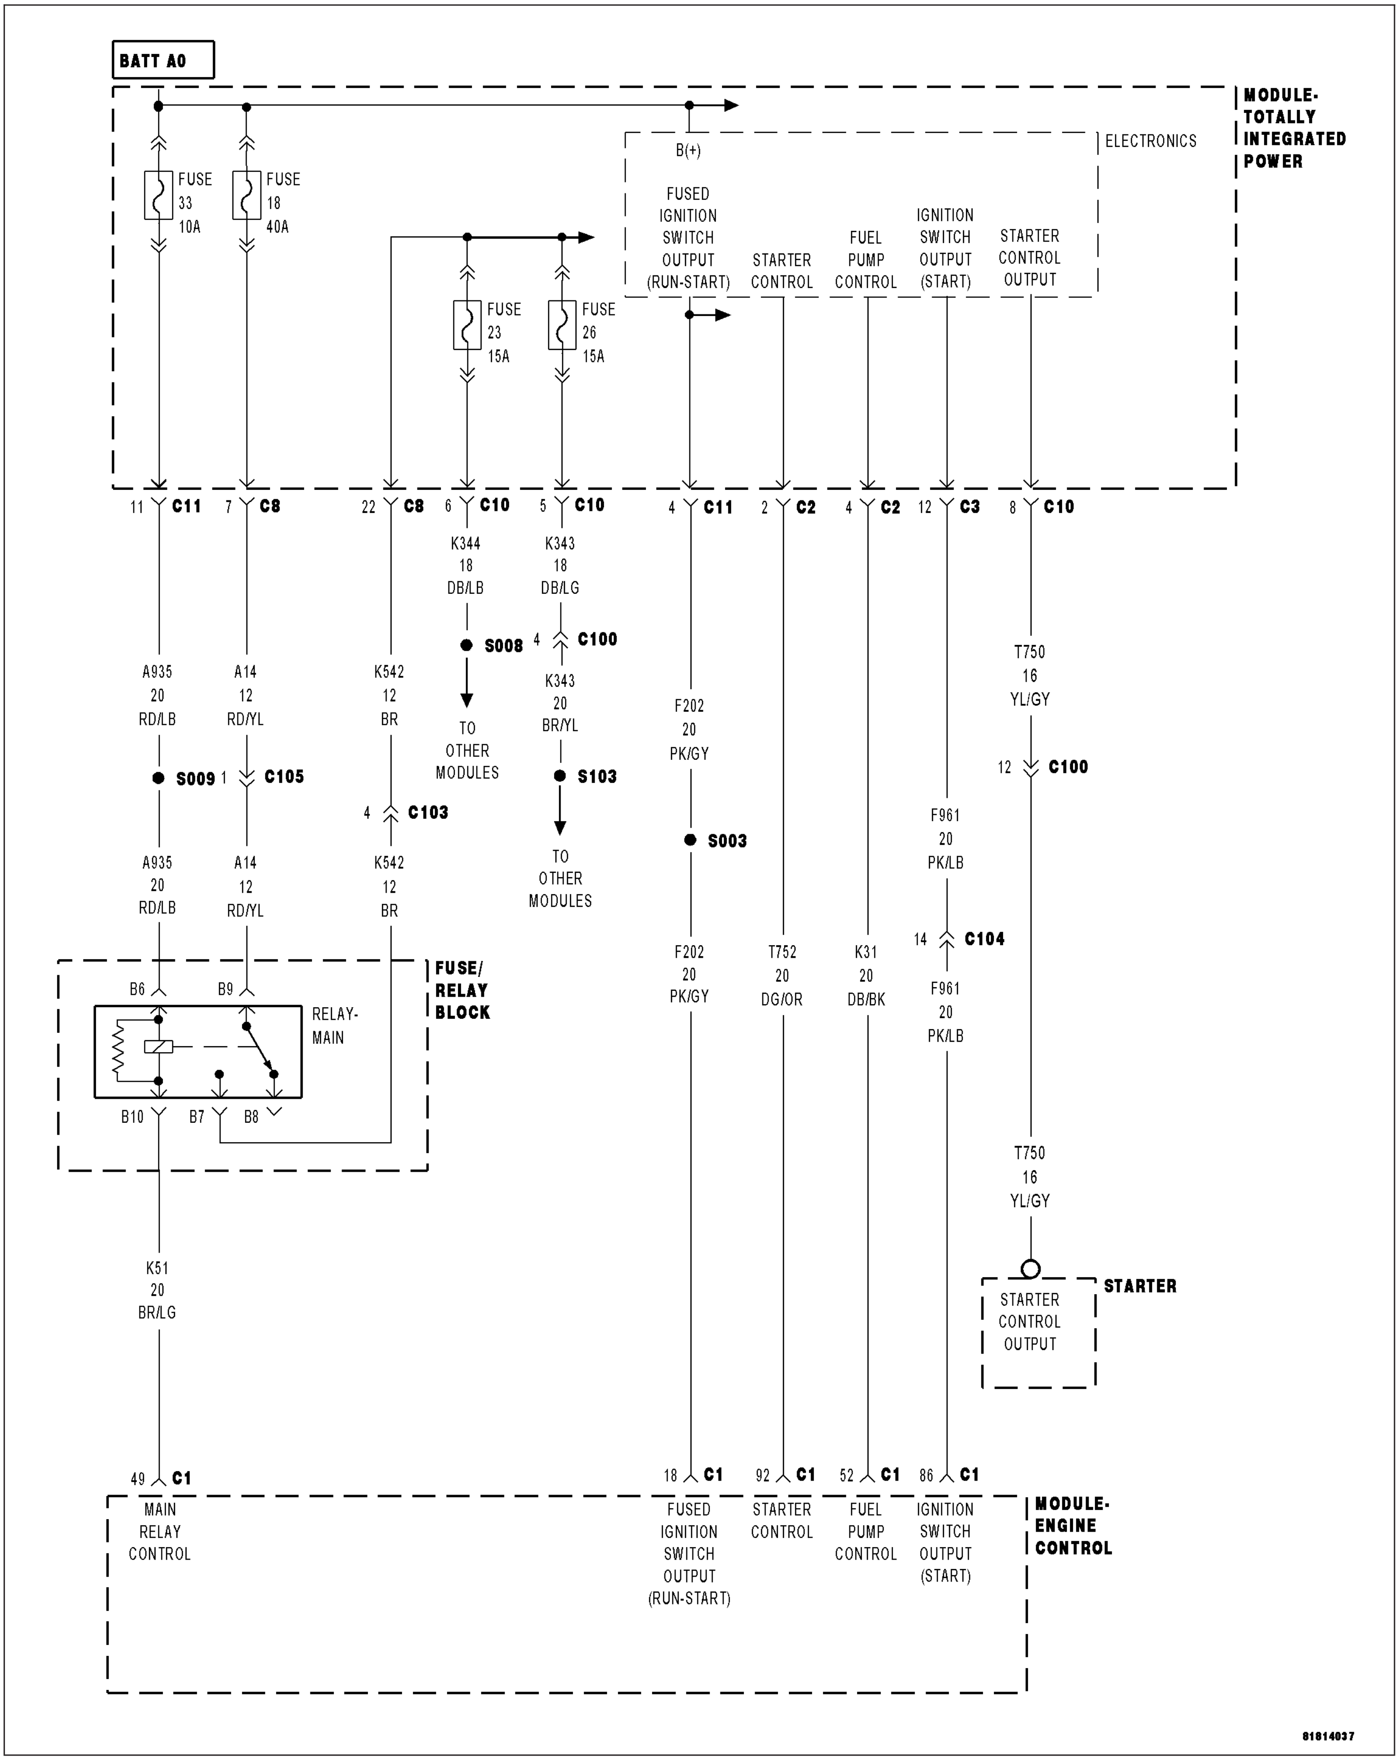
4. CHECKING THE (G6) ENGINE OIL PRESSURE SWITCH SIGNAL VOLTAGE

Reconnect the ECM harness connectors.

Turn the ignition on.

With a voltmeter, measure the voltage of the (G6) Engine Oil Pressure Switch Signal circuit at the Engine Oil Pressure Switch harness connector.

Is the voltage above 10.0 volts?



Yes >> Replace the Engine Oil Pressure Switch.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the ECM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P0562-ECM VOLTAGE TOO LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on or the engine running.
- **Set Condition:**
  The ECM detects battery voltage of 9.9 volts or less for 0.48 seconds.

Possible Causes
CHECKING ECM POWER AND GROUNDS
ECM
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

NOTE: This DTC may be caused by a charging system problem. Refer to the Service Information and verify proper charging system operation before continuing.

Test drive the vehicle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Go To 3

2. CHECK POWER AND GROUNDS

Refer to the symptom list and perform the Checking the ECM Power and Ground test.

Were any problem found with the ECM powers and grounds?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

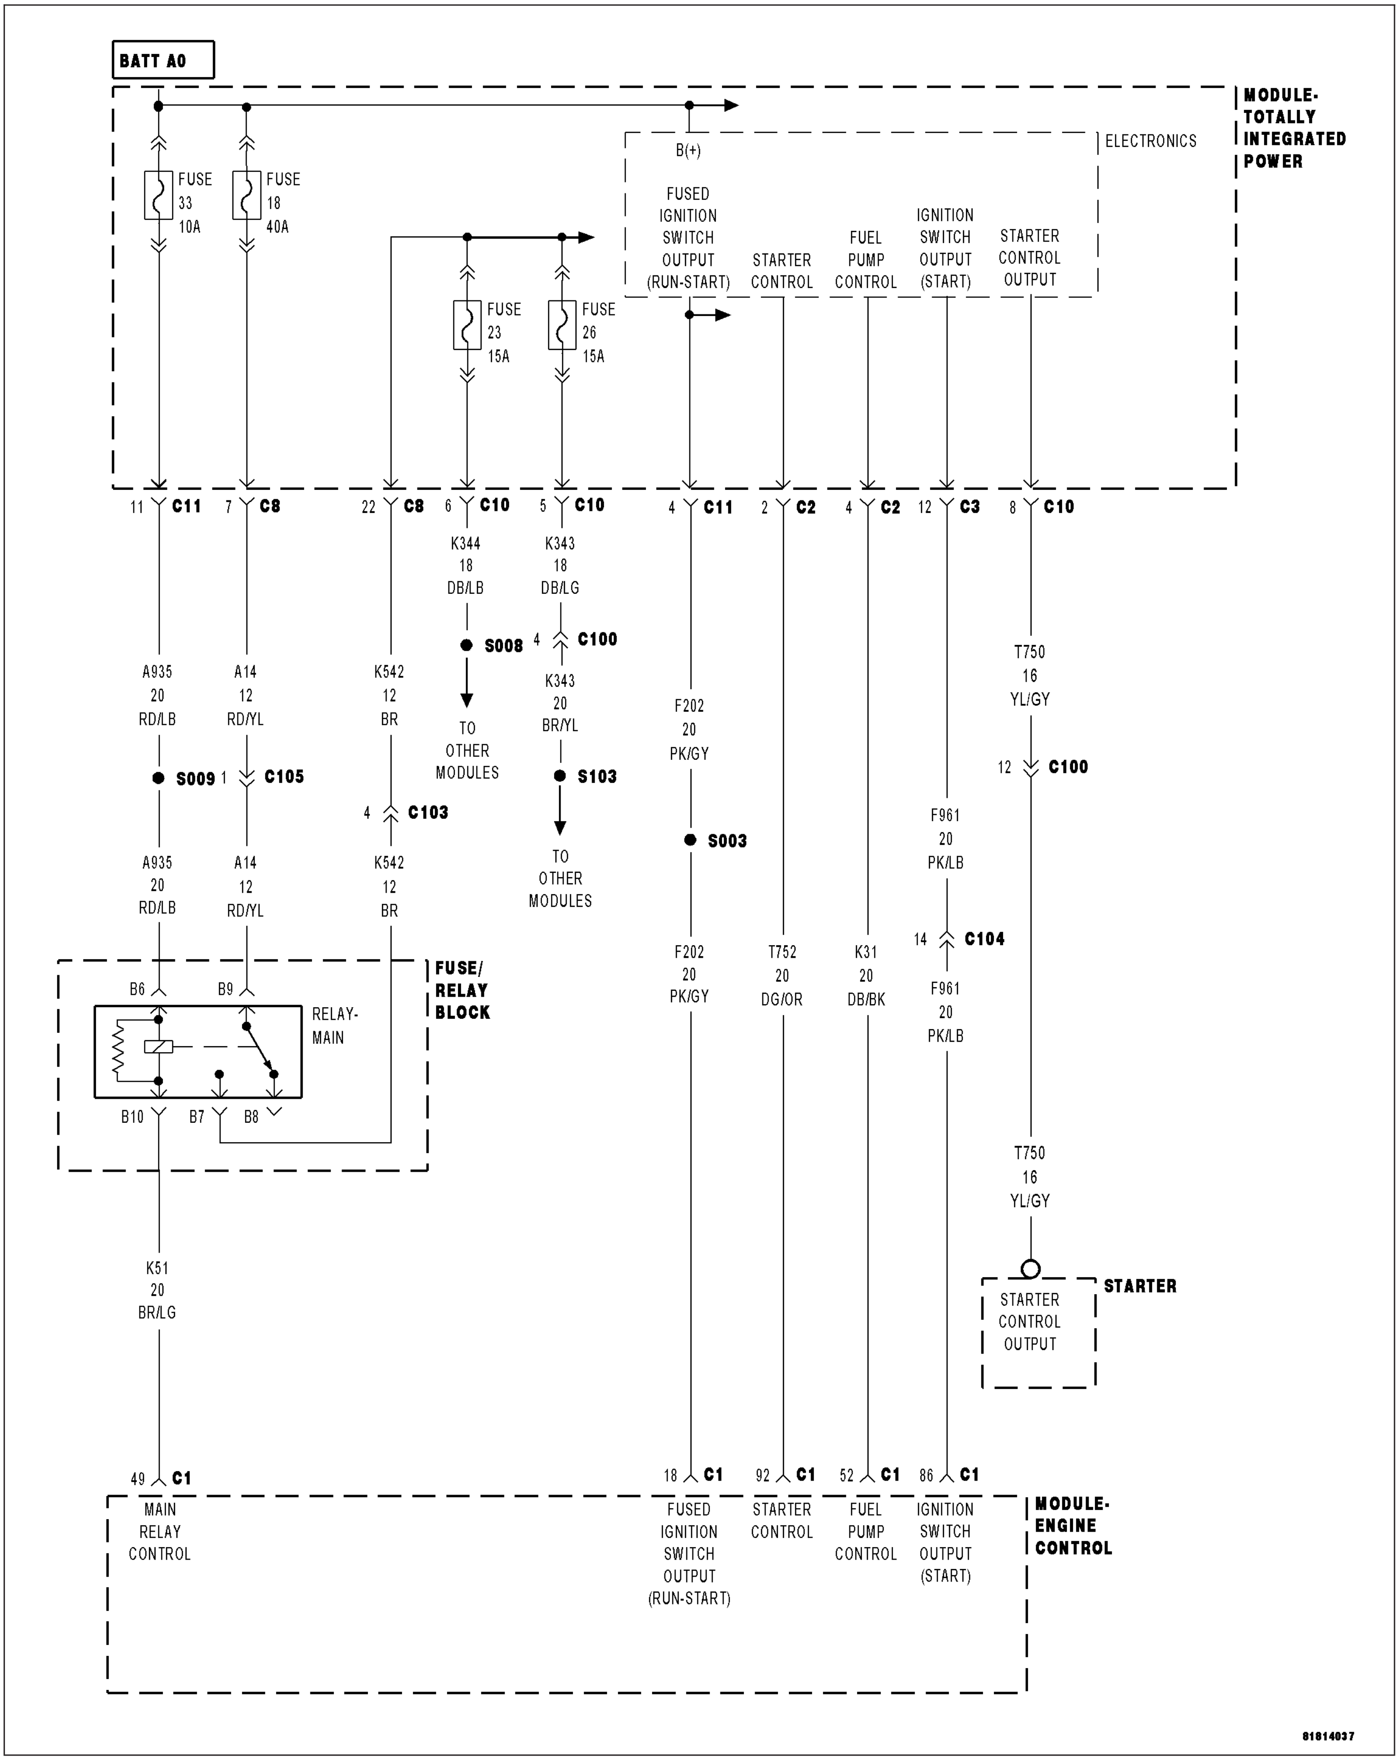
NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.



Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

P0563-ECM VOLTAGE TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on or the engine running.
- **Set Condition:**
  The ECM detects battery voltage of 17.0 volts or greater for 0.48 seconds

Possible Causes
CHECKING ECM POWER AND GROUNDS
ECM
INTERMITTENT CONDITION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

NOTE: This DTC may be caused by a charging system problem. Refer to the Service Information and verify proper charging system operation before continuing.

Test drive the vehicle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Go To 3

2. CHECK POWER AND GROUNDS

Refer to the symptom list and perform the Checking the ECM Power and Ground test.

Were any problem found with the ECM powers and grounds?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

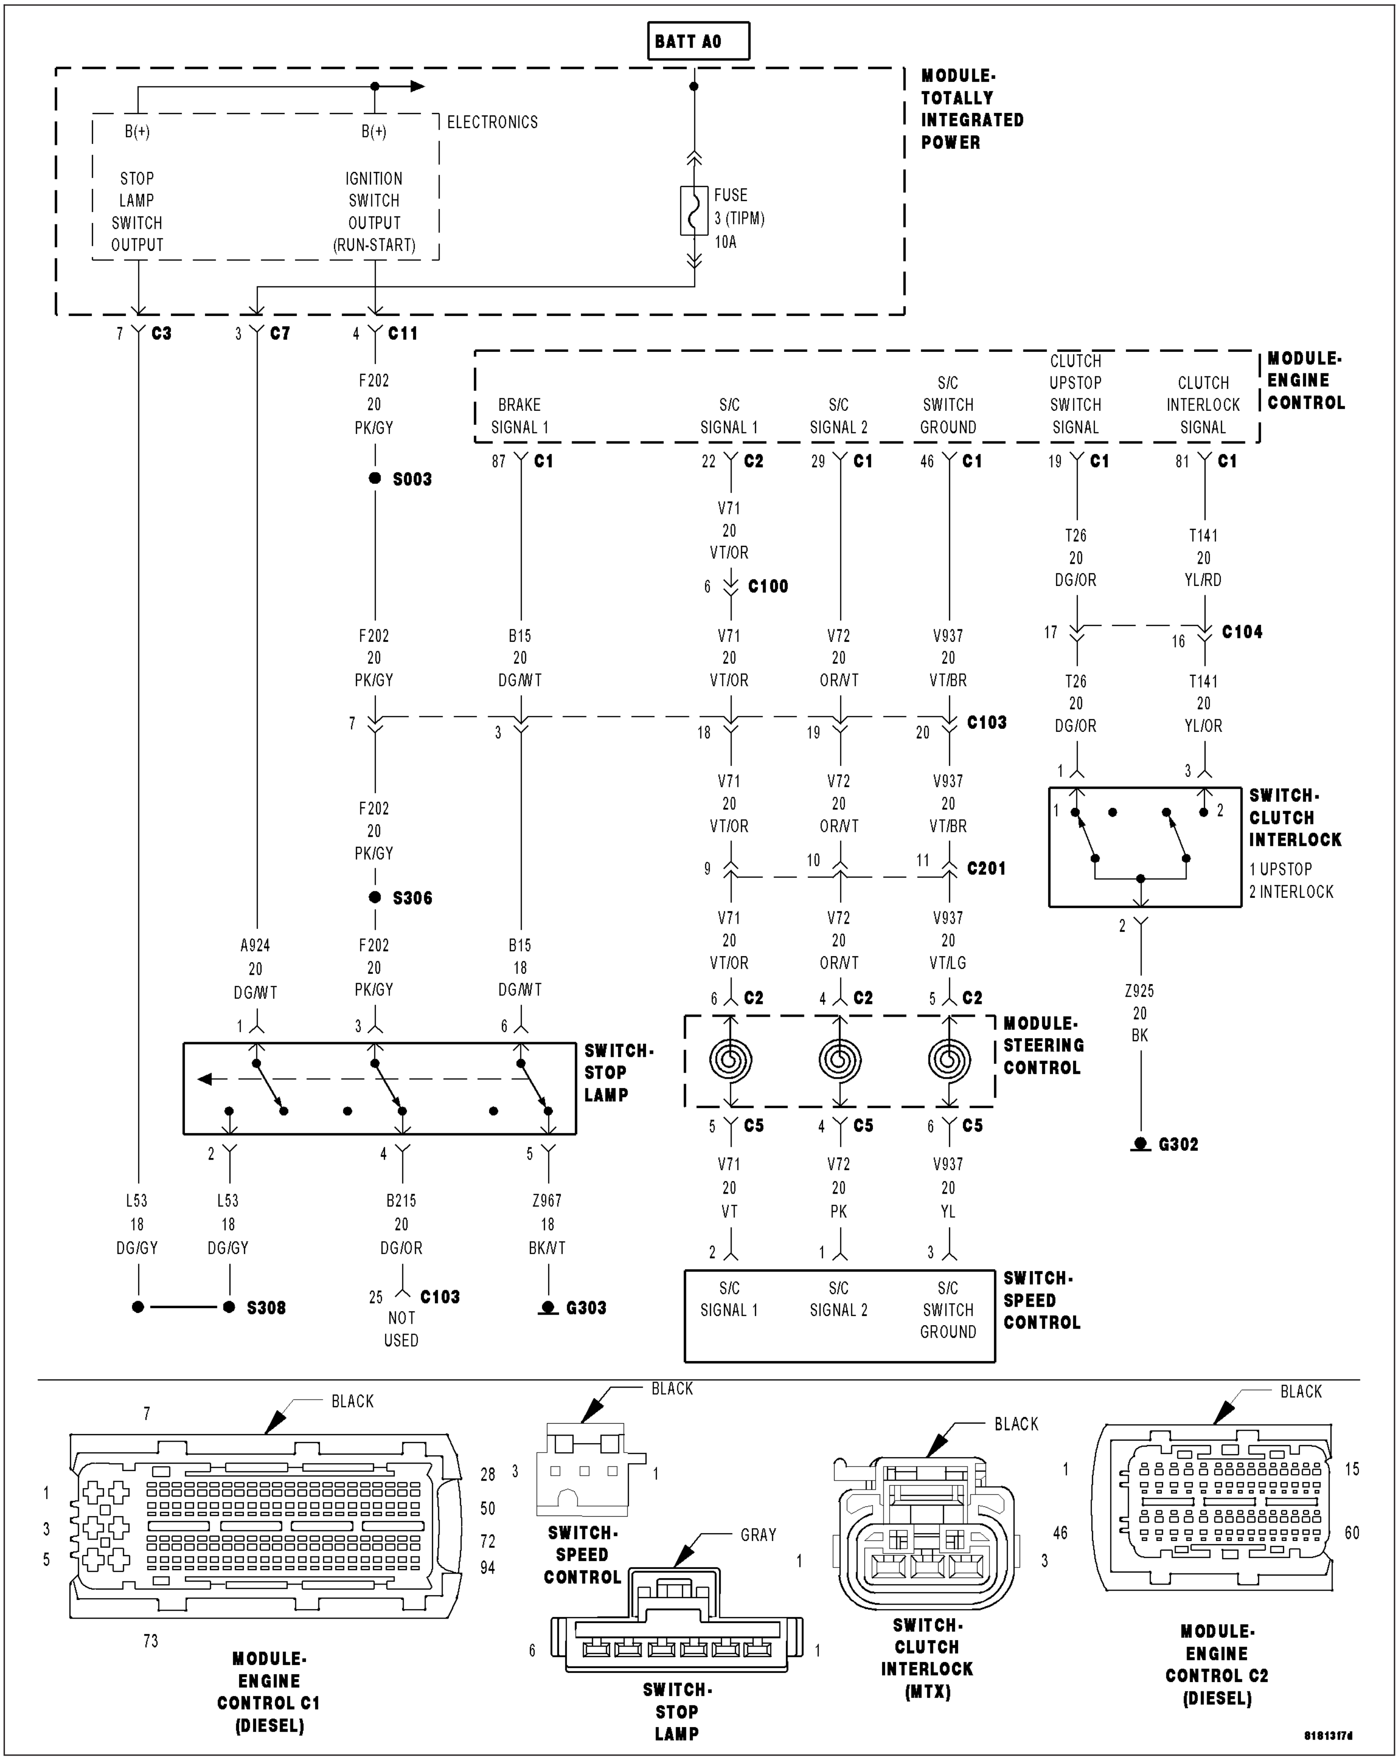
NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.



Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

P0573 BRAKE SWITCH 1 STUCK OFF

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Engine Control Module (ECM) detects that the vehicle has stopped and no brake switch signal was received.

Possible Causes
INTERMITTENT CONDITION
BRAKE SWITCH SIGNAL 2 - SWITCH 2 CKT OPEN
(A924) FUSED B+ CIRCUIT OPEN
(B215) BRAKE SWITCH SIGNAL 2 CIRCUIT SHORTED TO GROUND
BRAKE SWITCH SIGNAL 1 - SWITCH 1 CKT OPEN
(B215) BRAKE SWITCH SIGNAL 2 CIRCUIT OPEN
(Z967) STOP LAMP SWITCH GROUND CIRCUIT OPEN
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE
(B15) BRAKE SWITCH SIGNAL 1 CIRCUIT OPEN
ENGINE CONTROL MODULE - BRAKE SWITCH SIGNAL 2
ENGINE CONTROL MODULE - INTERNAL
ENGINE CONTROL MODULE - BRAKE SWITCH SIGNAL 1

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK THE BRAKE SWITCH SIGNAL 1 STATUS

Turn the ignition on.

While observing the BRAKE SWITCH SIGNAL 1 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH SIGNAL1: PRESSED and RELEASED for the appropriate pedal position?

Yes >> Go To 2

No >> Go To 11

2. CHECK THE BRAKE SWITCH SIGNAL 2 STATUS

While observing the BRAKE SWITCH SIGNAL 2 status on the scan tool display, press and release the brake pedal several times.

Does the scan tool display BRAKE SWITCH SIGNAL 2: PRESSED and RELEASED for the appropriate pedal position

Yes >> Go To 3

No >> Go To 4

3. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

Were any of the above conditions present?

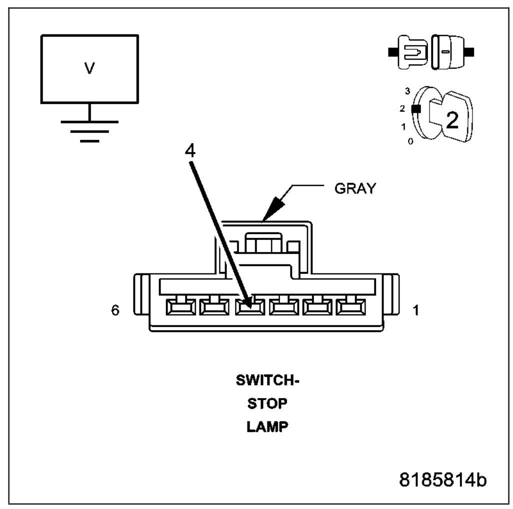
Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

4. (B215) BRAKE SWITCH SIGNAL 2 CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.



Turn the ignition on.

Measure the voltage between the (B215) Brake Switch Signal 2 circuit and ground at the Stop Lamp Switch harness connector.

Is the voltage above 9.0 volts?

Yes >> Go To 5

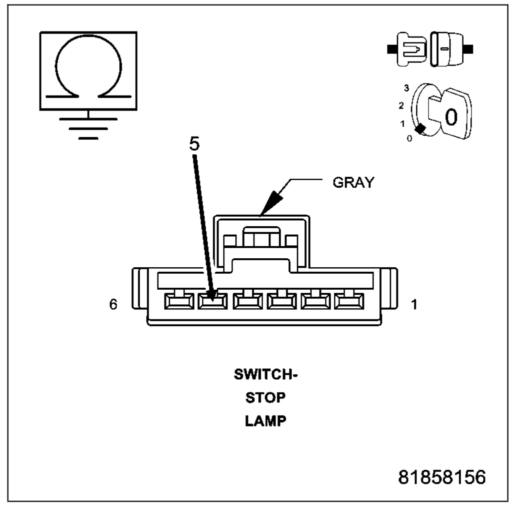
No >> Go To 8

5. STOP LAMP SWITCH - BRAKE SWITCH SIGNAL 2 CKT OPEN

While monitoring the BRAKE SWITCH 2 status with the scan tool, connect a jumper wire between ground and the (B215) Brake Switch Signal 2 circuit.

Does the scan tool display change from PRESSED to RELEASED?

Yes >> Adjust or replace the Stop Lamp Switch in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go To 6

6. (Z967) STOP LAMP SWITCH GROUND CIRCUIT OPEN

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Measure the resistance between ground and the (Z967) Stop Lamp Switch Ground circuit at the Stop Lamp Switch harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 7

No >> Repair the (Z967) Stop Lamp Switch Ground circuit for an open.

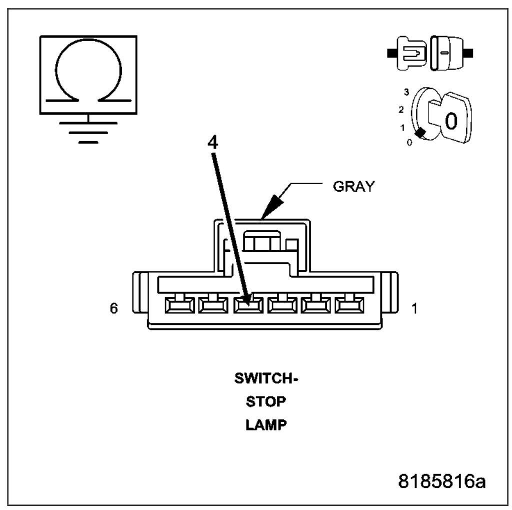
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE - INTERNAL

If there are no possible causes remaining, view repair.

Repair

Replace and program the Engine Control Module in accordance with the Service Information.



Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

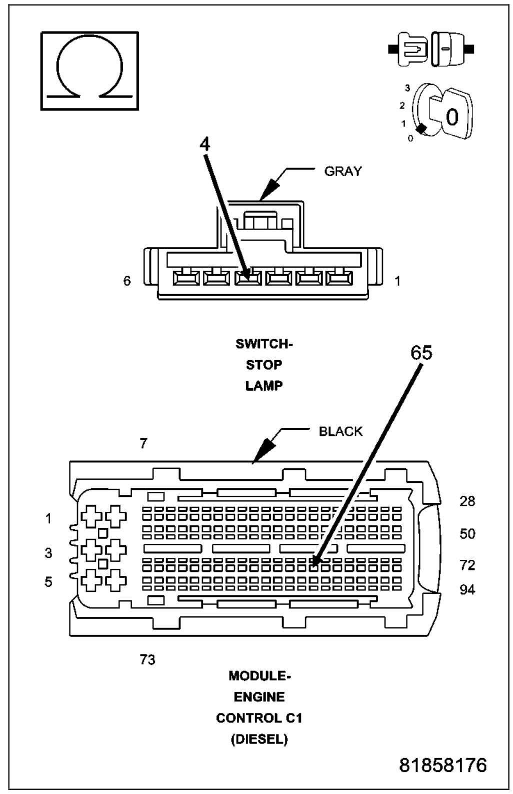
8. (B215) BRAKE SWITCH SIGNAL 2 CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (B215) Brake Switch Signal 2 circuit at the Stop Lamp Switch harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 9

No >> Repair the (B215) Brake Switch Signal 2 circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. (B215) BRAKE SWITCH SIGNAL 2 CIRCUIT OPEN

Measure the resistance of the (B215) Brake Switch Signal 2 circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

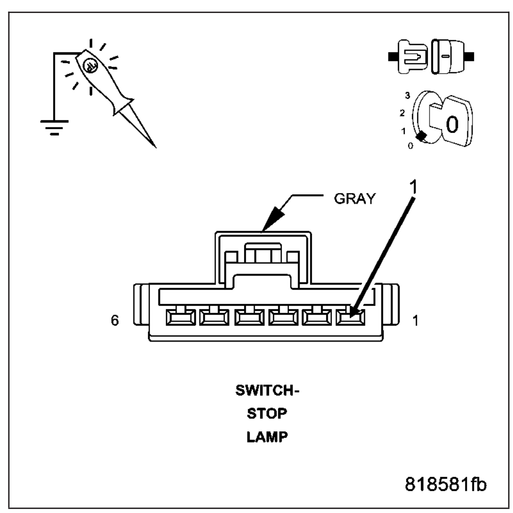
Yes >> Go To 10

No >> Repair the (B215) Brake Switch Signal 2 circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

10. ENGINE CONTROL MODULE - BRAKE SWITCH SIGNAL 2

If there are no possible causes remaining, view repair.

Repair



Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

11. (A924) FUSED B+ CIRCUIT OPEN

Turn the ignition off.

Disconnect the Stop Lamp Switch harness connector.

Using a 12-volt test light connected to ground, check the (A924) Fused B+ circuit.

Does the test light illuminate brightly?

Yes >> Go To 12

No >> Repair the (A924) Fused B+ circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

12. STOP LAMP SWITCH - BRAKE SWITCH SIGNAL 1 OPEN

Turn the ignition on.

While monitoring the BRAKE SWITCH SIGNAL 1 status with the scan tool, connect a jumper wire between the Brake Switch Signal 1 circuit and the Fused B(+) circuit.

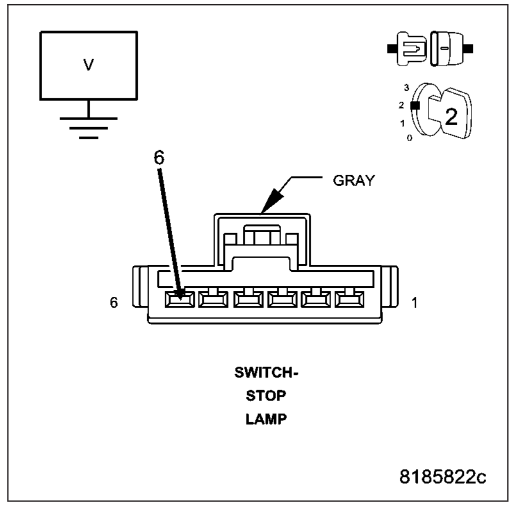
Does the scan tool display change from RELEASED to PRESSED?

Yes >> Adjust or replace the Stop Lamp Switch in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 13

13. (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.



Disconnect the ECM harness connectors.

Remove the Main Relay.

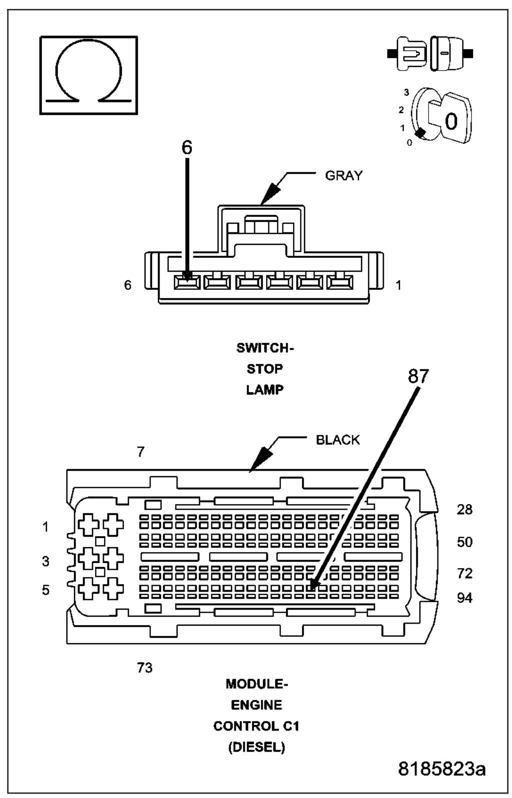
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage between the (B15) Brake Switch Signal 1 circuit and ground.

Is the voltage above 1.0 volt?

Yes >> Repair the (B15) Brake Switch Signal 1 circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go To 14

14. (B15) BRAKE SWITCH SIGNAL 1 CIRCUIT OPEN

NOTE: Remove the jumper wire.

Turn the ignition off.

Measure the resistance of the (B15) Brake Switch Signal 1 circuit between the Stop Lamp Switch harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

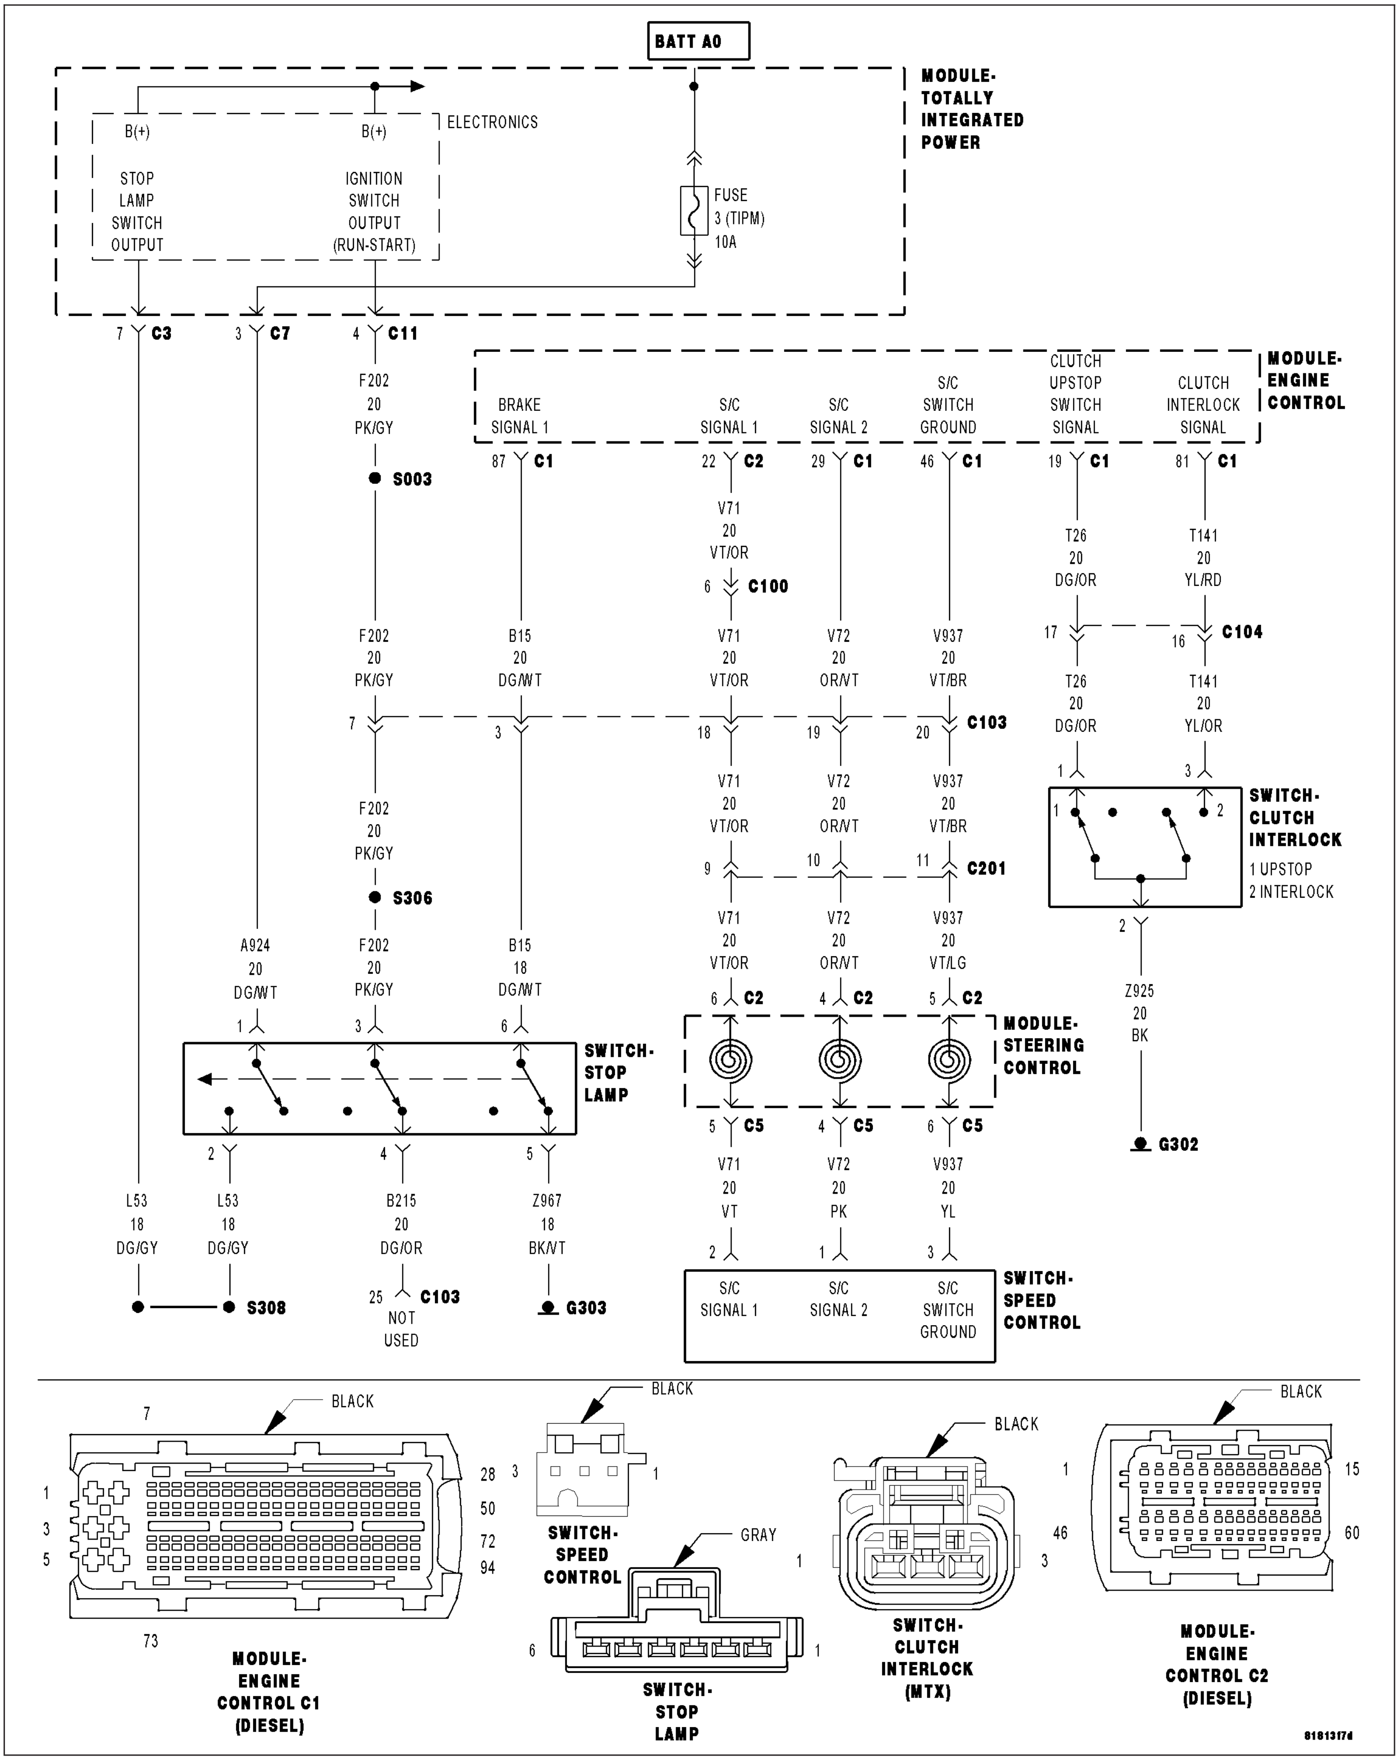
No >> Repair the (B15) Brake Switch Signal 1 circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0574–CRUISE CONTROL SYSTEM-VEHICLE SPEED TOO HIGH

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The vehicle speed is above 250 kph for 0.5 second.

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test



1. DTC EXPLANATION

NOTE: This DTC indicates that the vehicle speed has gone above the upper limit of speed control function.

View Repair.

Yes >> Test Complete.

P0578-SPEED CONTROL SWITCH 1 STUCK

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and no other S/C Switch DTCs present.
- **Set Condition:**
  The S/C Switch #1 signal indicates that a switch is pressed continuously for 60 seconds.

Possible Causes
INTERMITTENT DTC
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

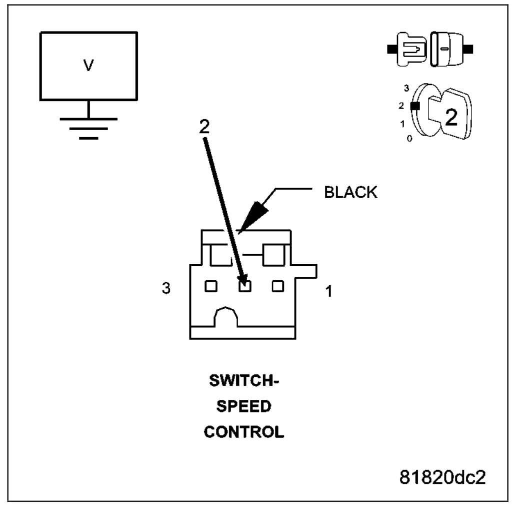
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V71) S/C SWITCH 1 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

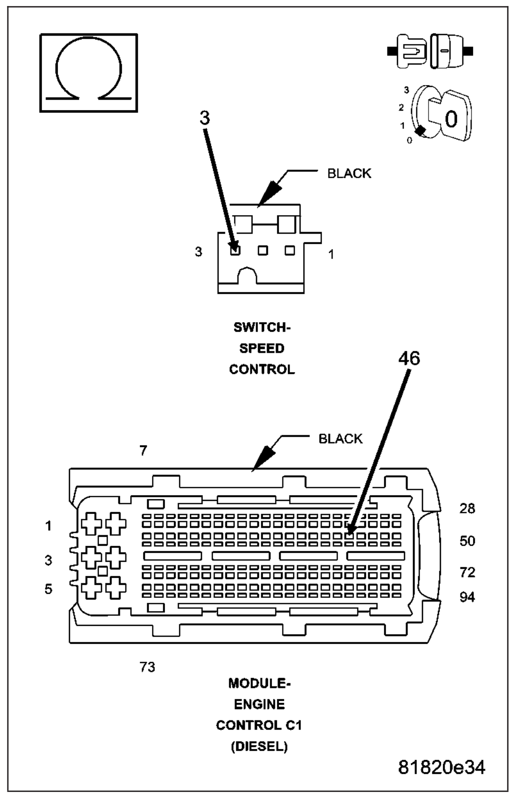
Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



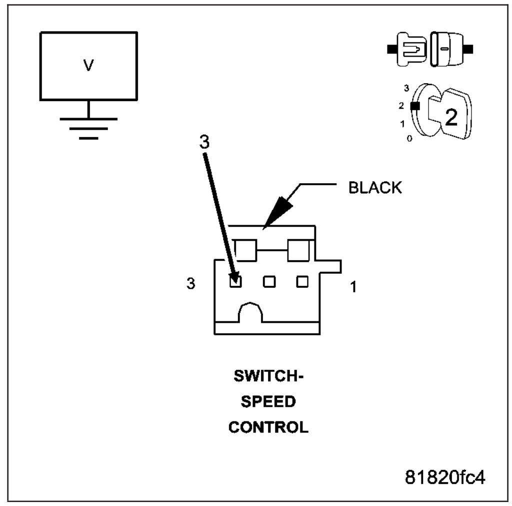
Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.



Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE

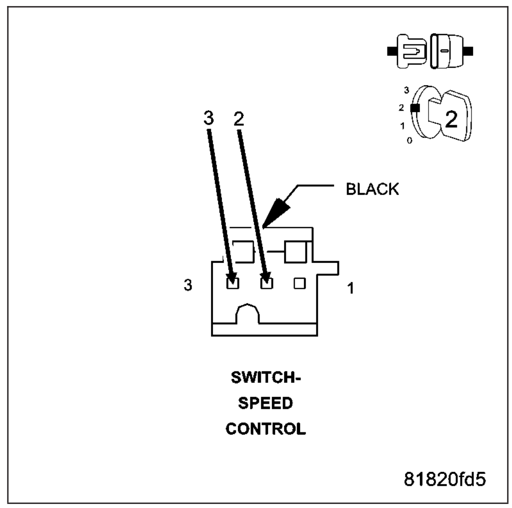
Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V937) S/C Switch Ground circuit.



Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. S/C SWITCH

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

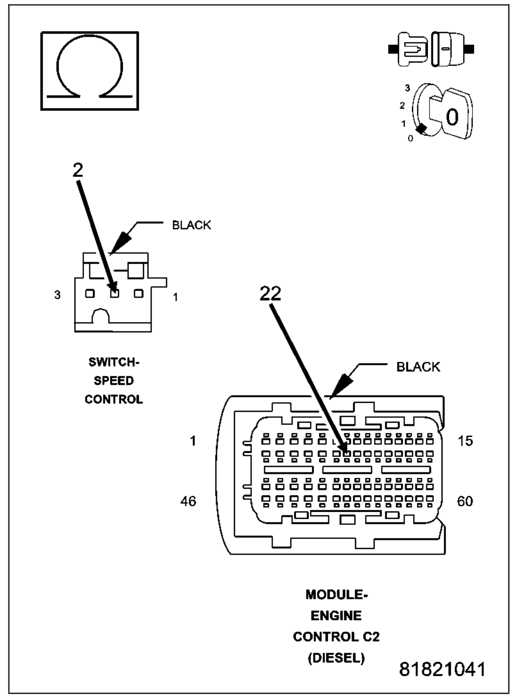
With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 9

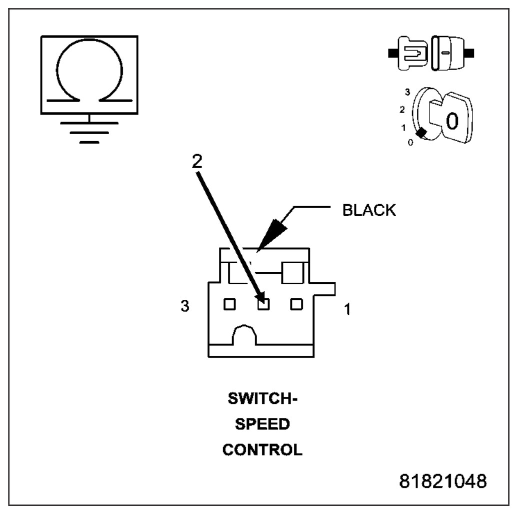
6. (V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) connector.

Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



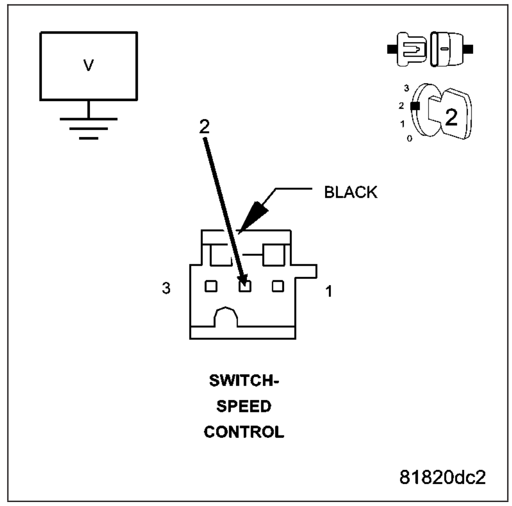
Yes >> Go To 7

No >> Repair the (V71) S/C Switch 1 Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (V71) S/C Switch 1 Signal circuit.



Is the resistance above 1000 ohms?

Yes >> Go to 9

No >> Repair the (V71) S/C Switch 1 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V71) S/C Switch 1 Signal circuit for a short to voltage.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

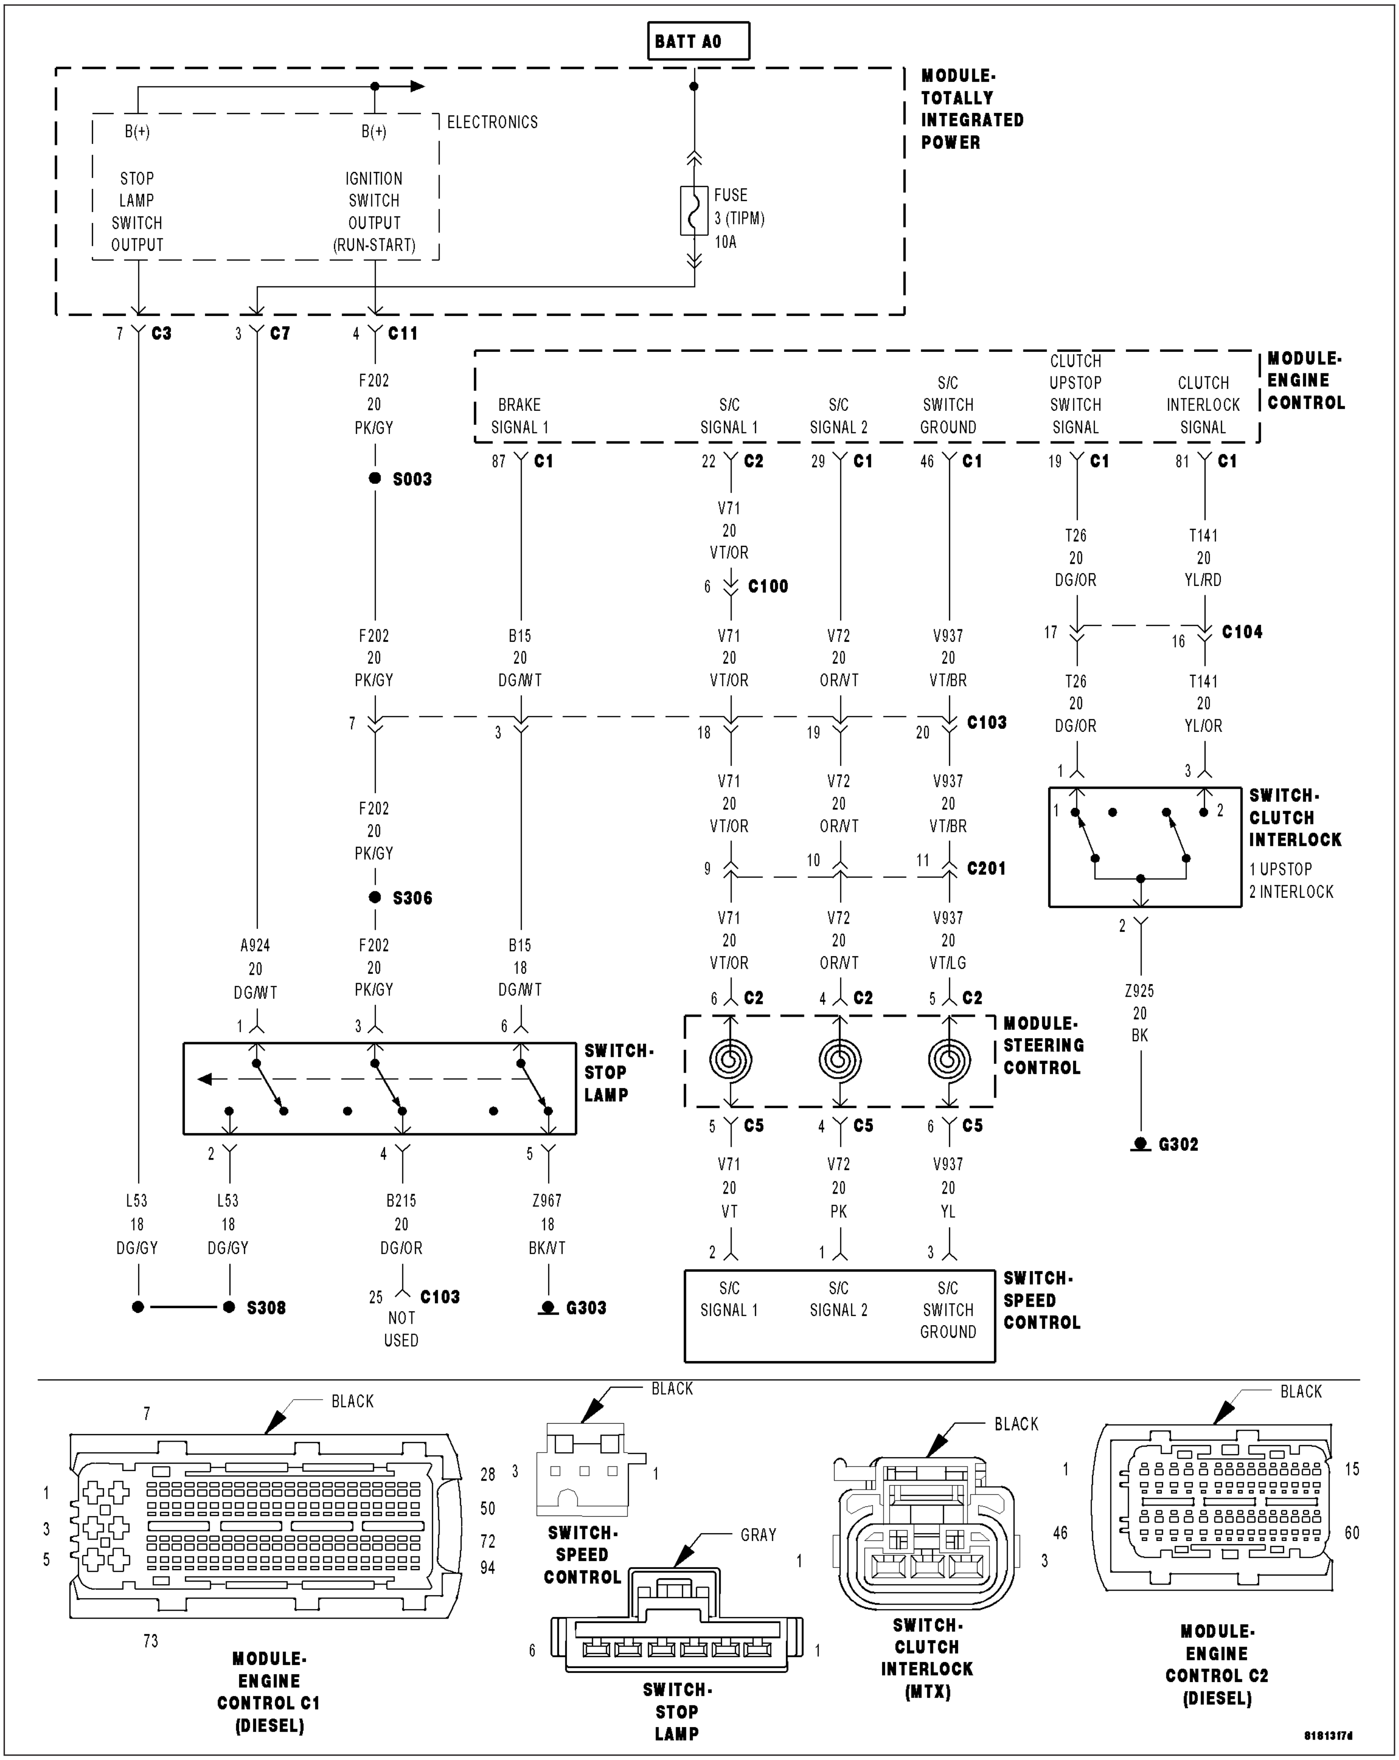
No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0579-SPEED CONTROL SWITCH 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The S/C Switch #1 Signal voltage is not within a valid switch signal window for 0.7 seconds.

Possible Causes
INTERMITTENT DTC
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

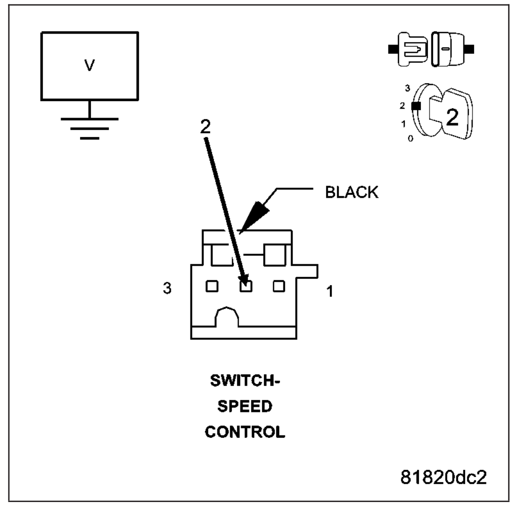
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V71) S/C SWITCH 1 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

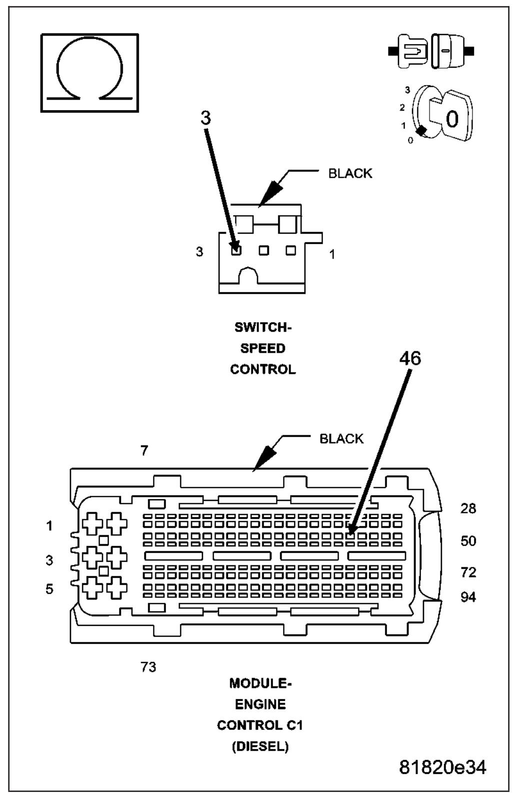
Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

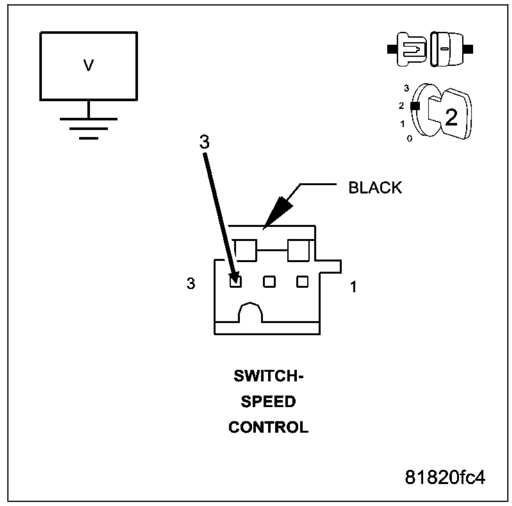
Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V937) S/C Switch Ground circuit.

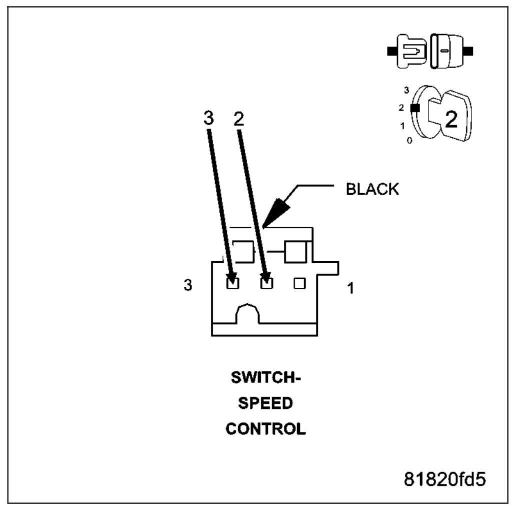
Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. S/C SWITCH



Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

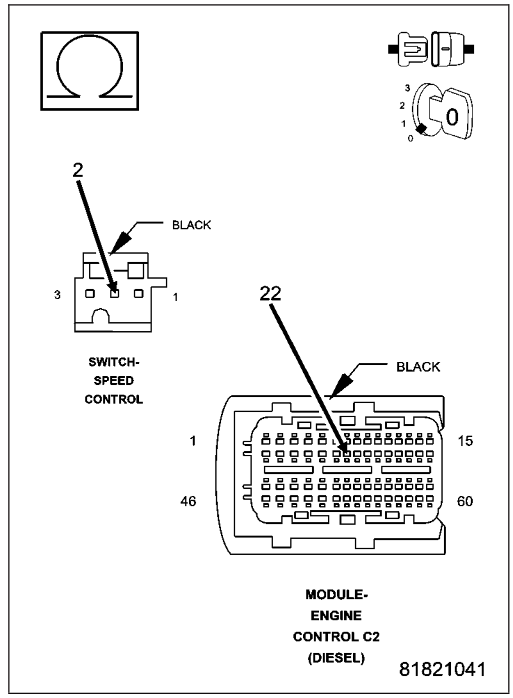
With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 9

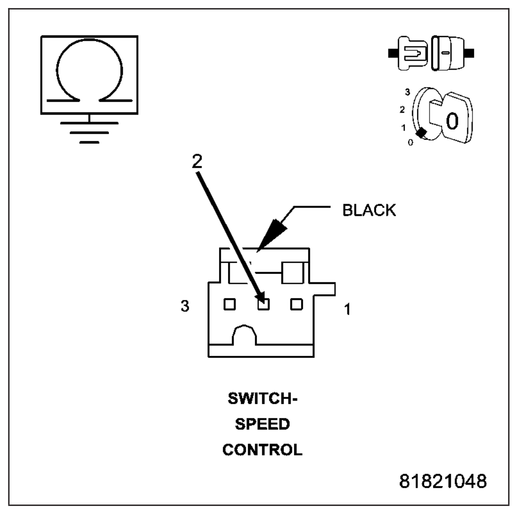
6. (V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 7

No >> Repair the (V71) S/C Switch 1 Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (V71) S/C Switch 1 Signal circuit.

Is the resistance above 1000 ohms?

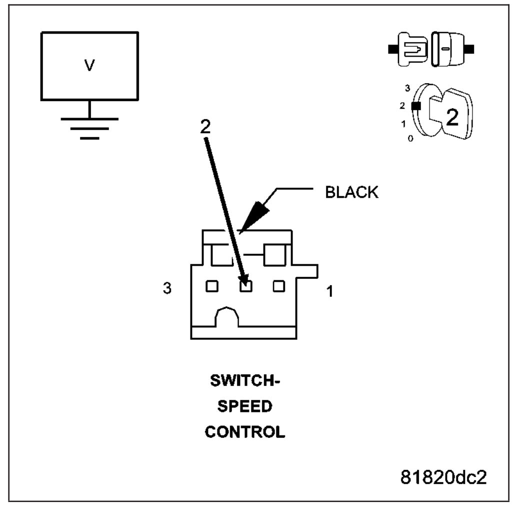
Yes >> Go to 9

No >> Repair the (V71) S/C Switch 1 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V71) S/C Switch 1 Signal circuit for a short to voltage.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

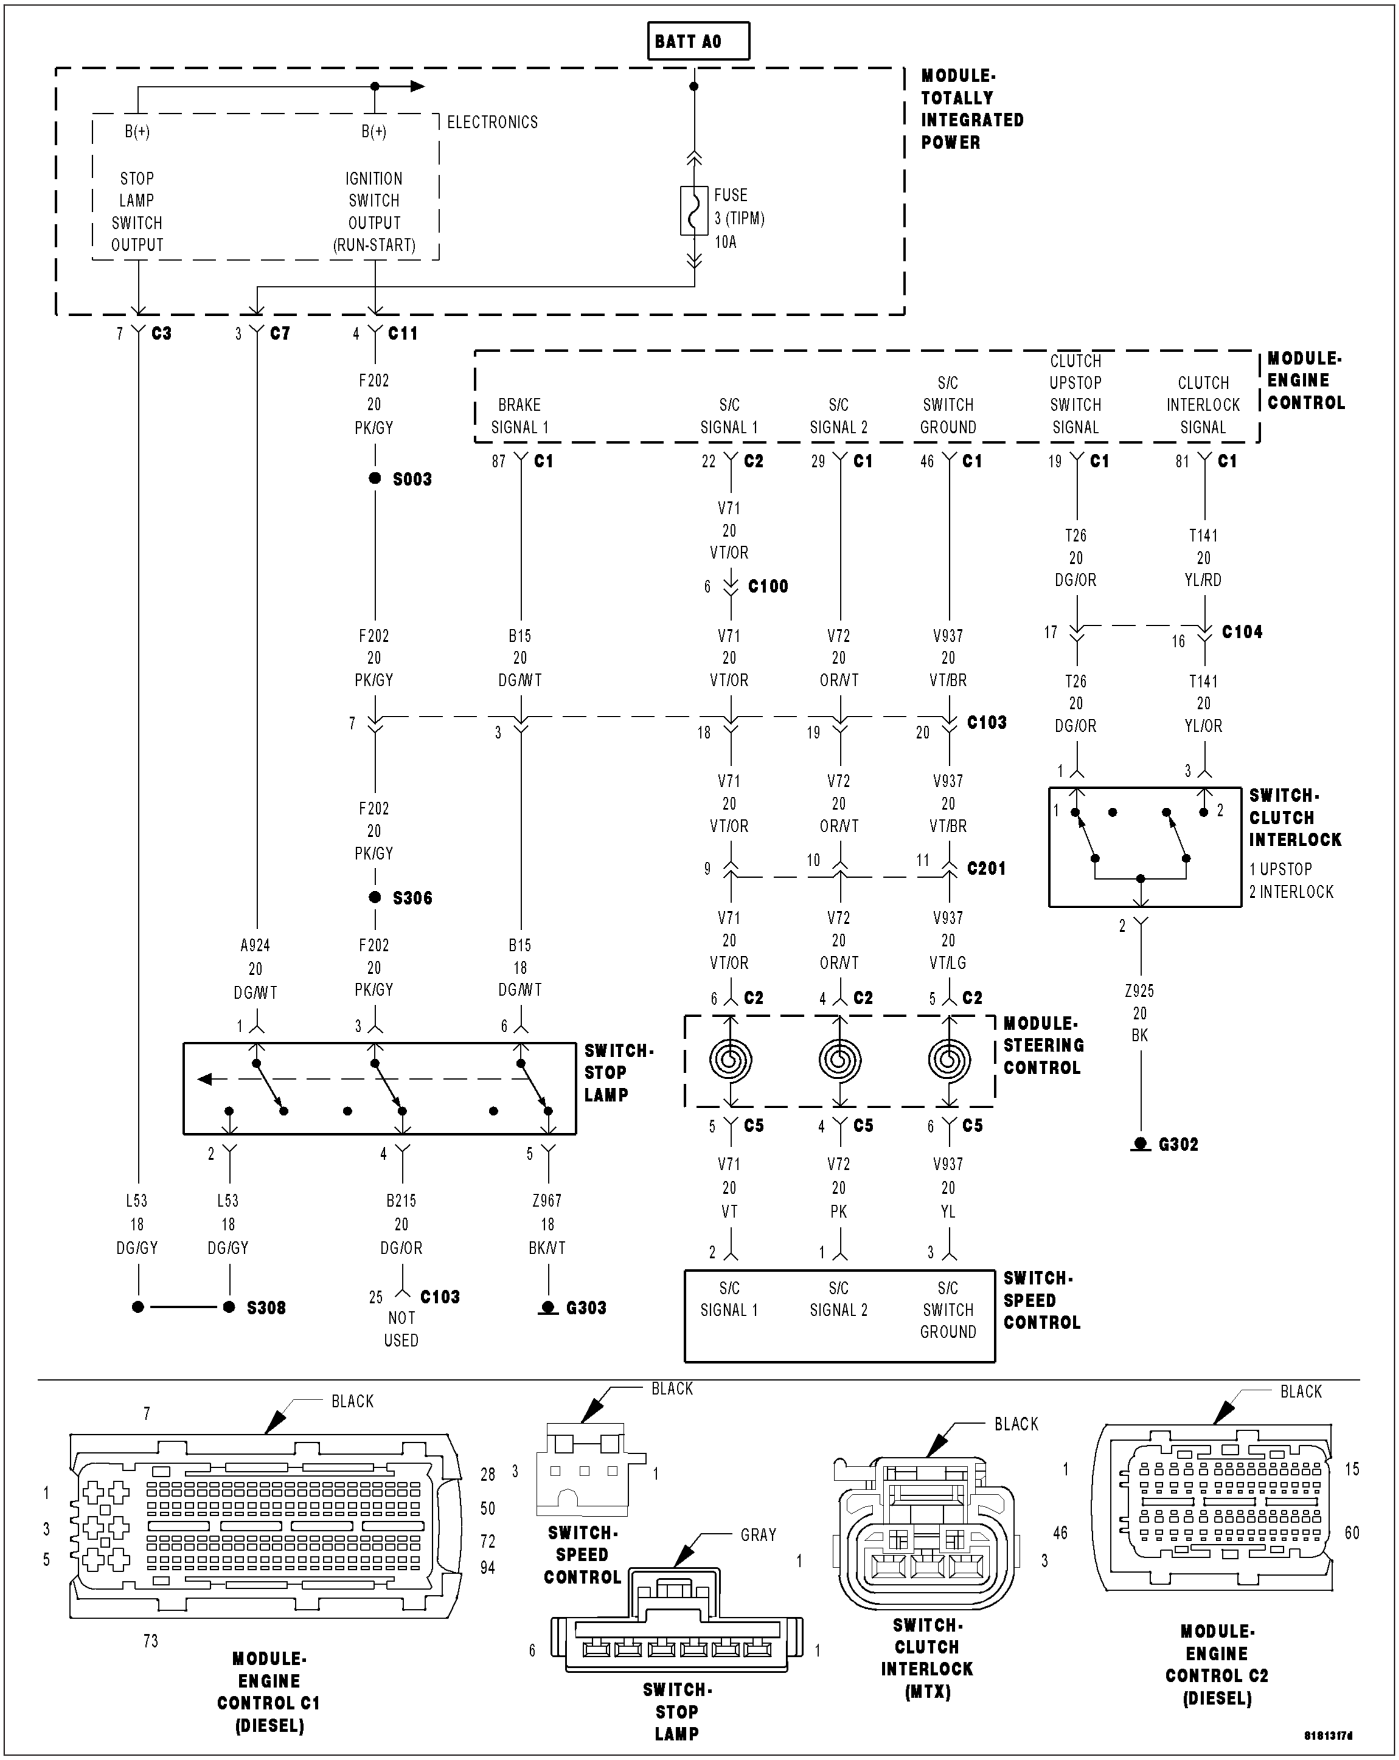
No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0580-SPEED CONTROL SWITCH 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The S/C Switch #1 Signal is below 0.39 volt for 0.06 seconds.

Possible Causes
INTERMITTENT DTC
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

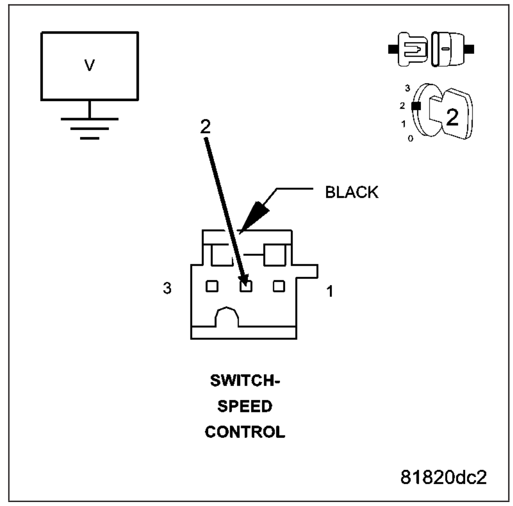
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V71) S/C SWITCH 1 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

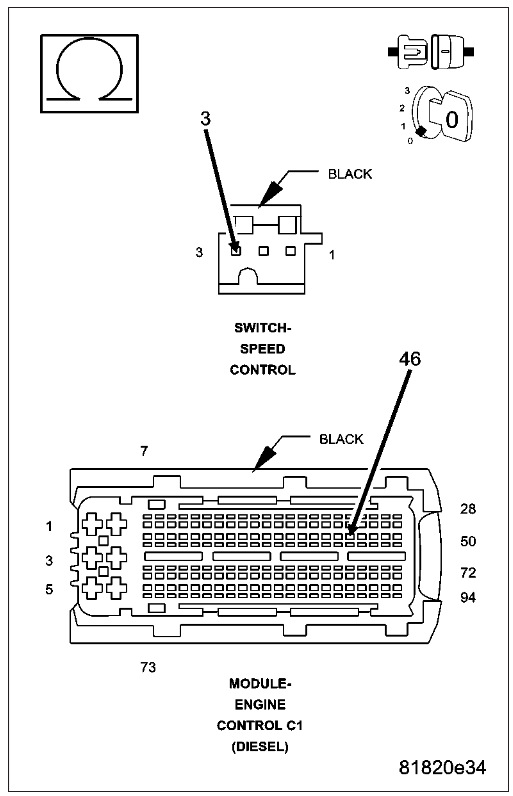
Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

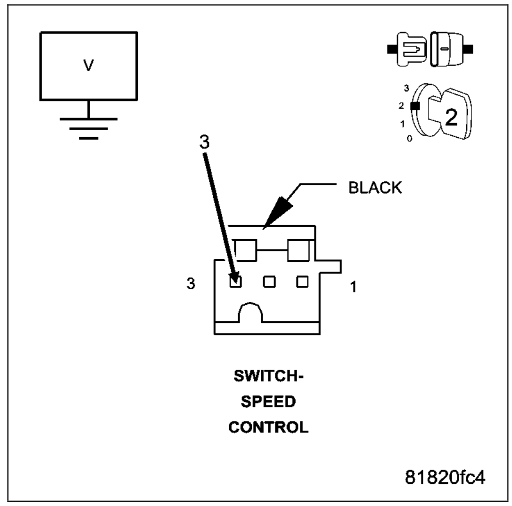
Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V937) S/C Switch Ground circuit.

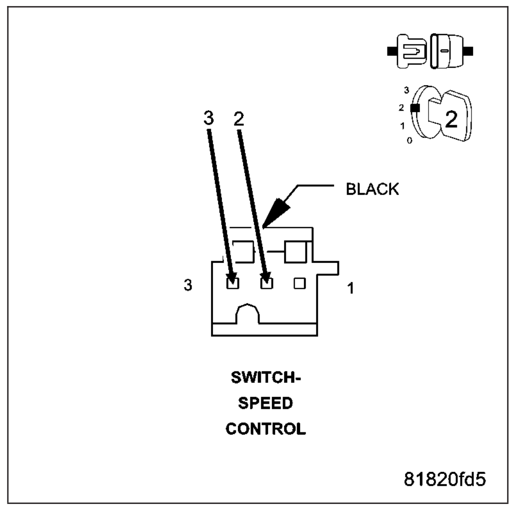
Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. S/C SWITCH



Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.

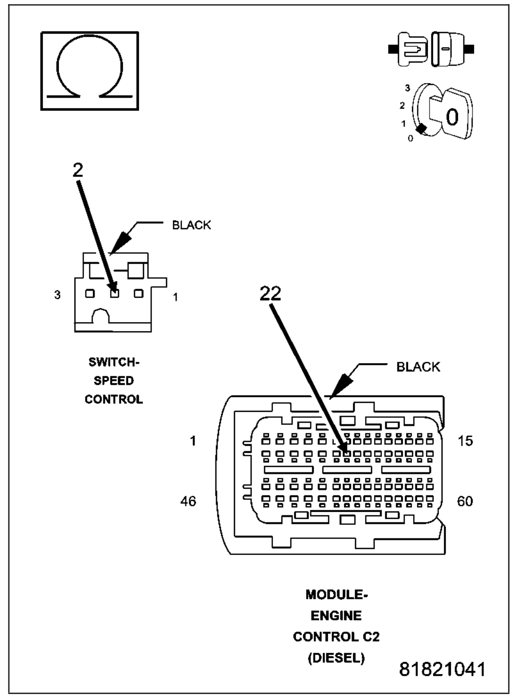
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

6. (V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.



Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

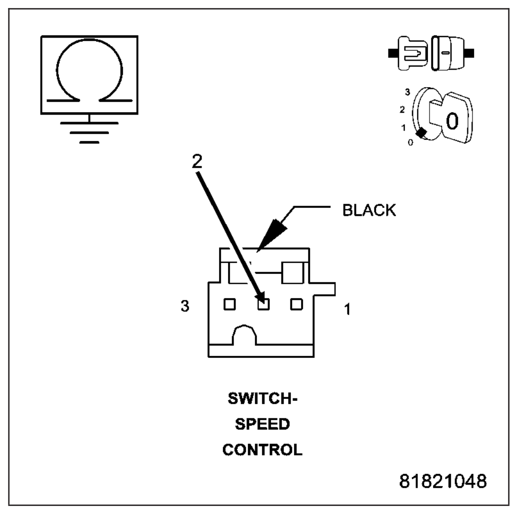
Is the resistance below 10.0 ohms?

Yes >> Go To 7

No >> Repair the (V71) S/C Switch 1 Signal circuit for an open circuit or high resistance.

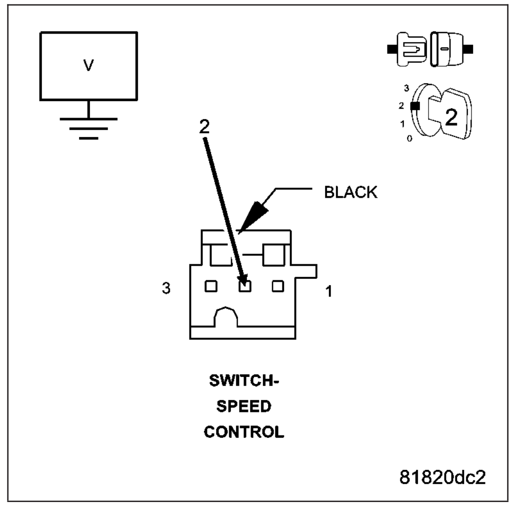
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (V71) S/C Switch 1 Signal circuit.

Is the resistance above 1000 ohms?



Yes >> Go to 9

No >> Repair the (V71) S/C Switch 1 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V71) S/C Switch 1 Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

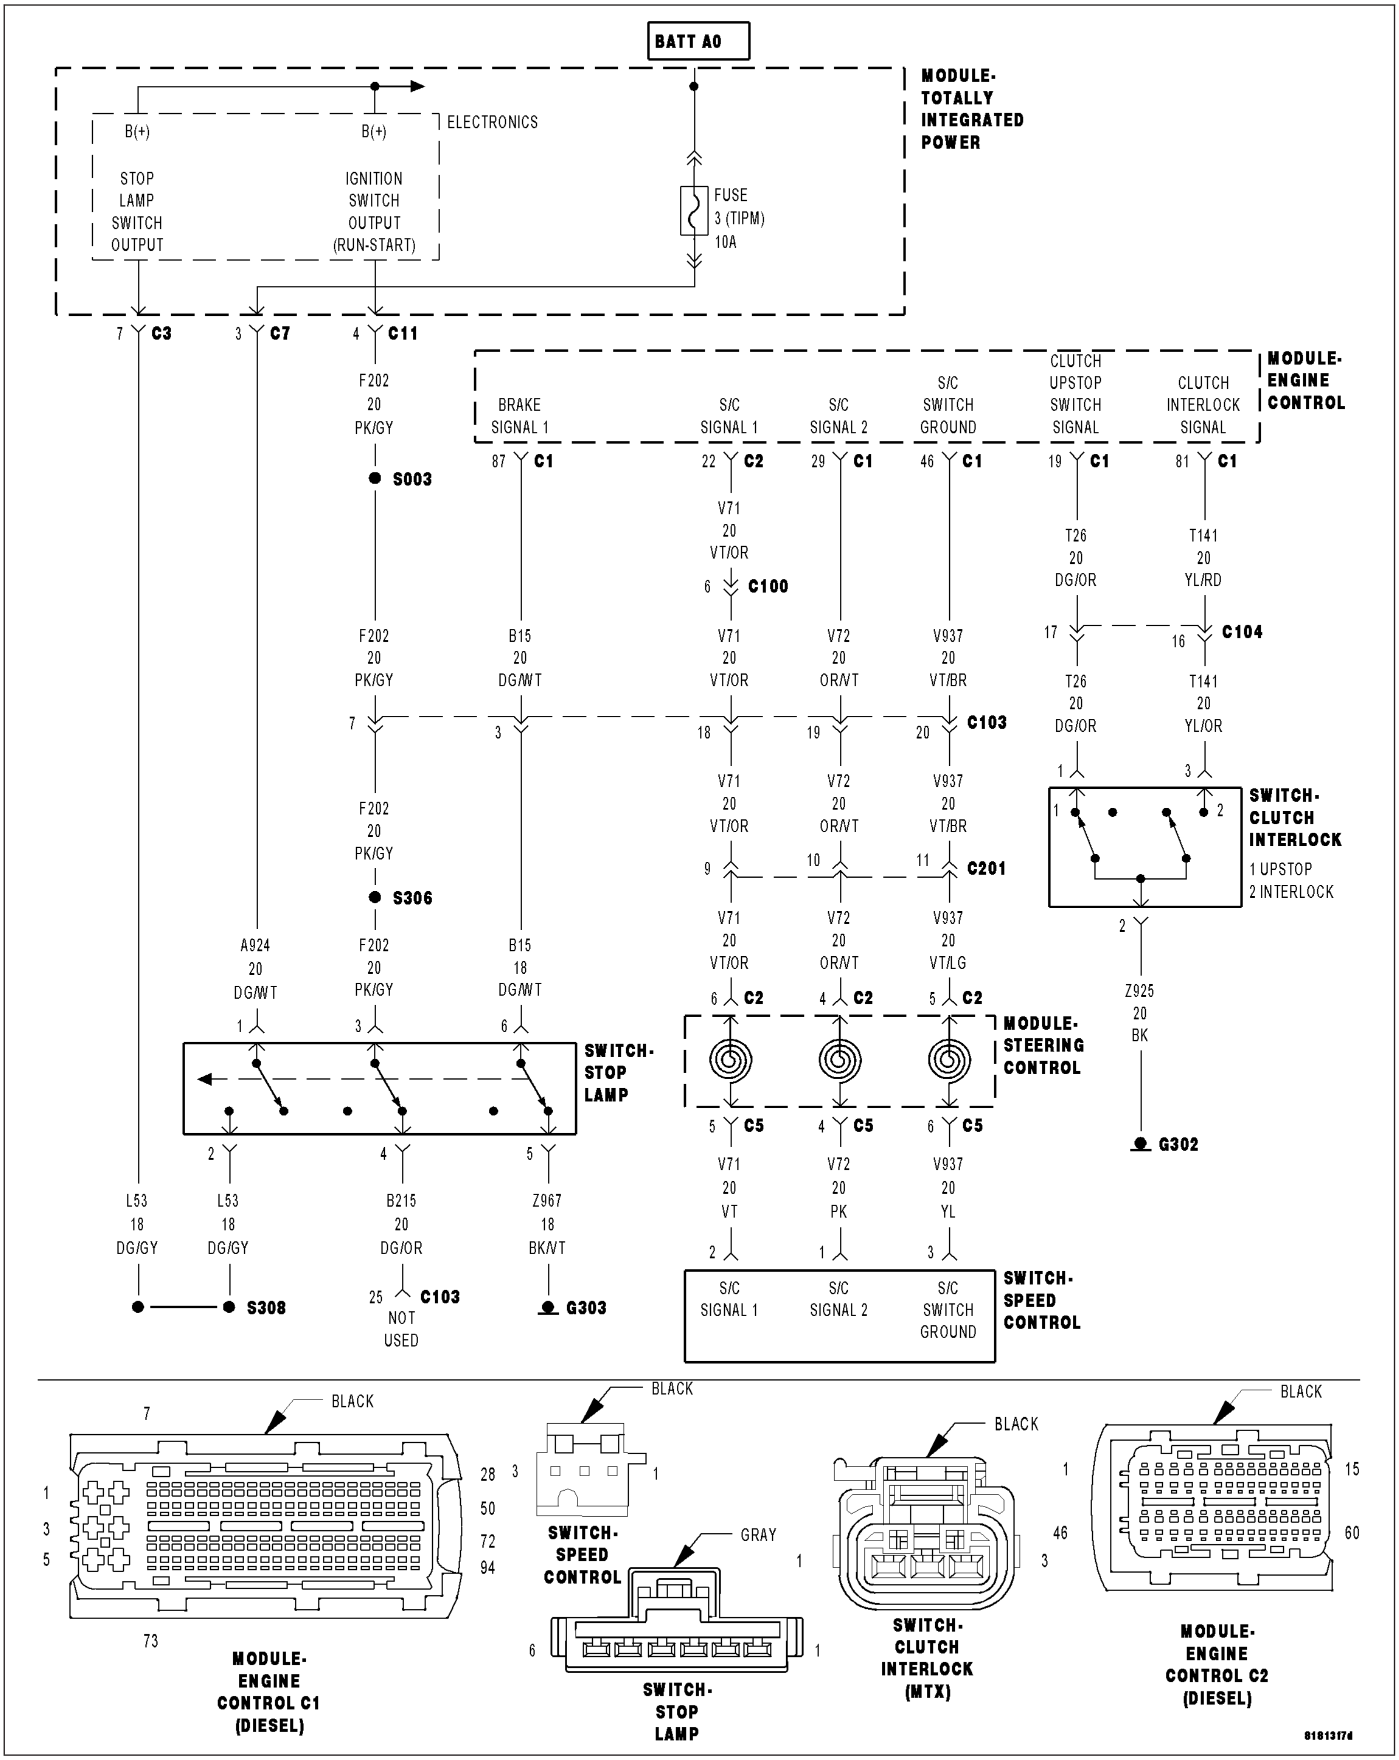
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0581-SPEED CONTROL SWITCH 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The S/C Switch #1 Signal is above 4.78 volts for 0.06 seconds.

Possible Causes
INTERMITTENT DTC
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

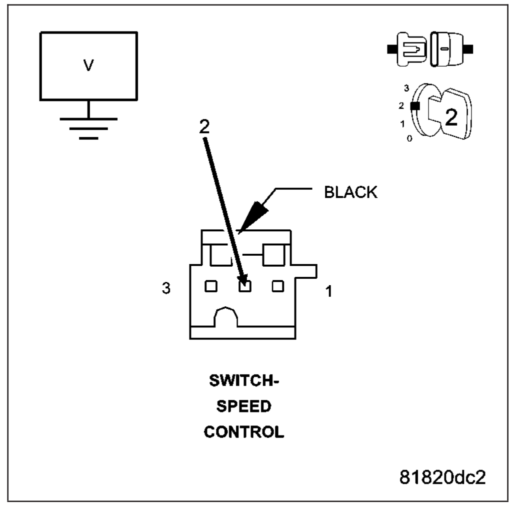
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V72) S/C SWITCH 1 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

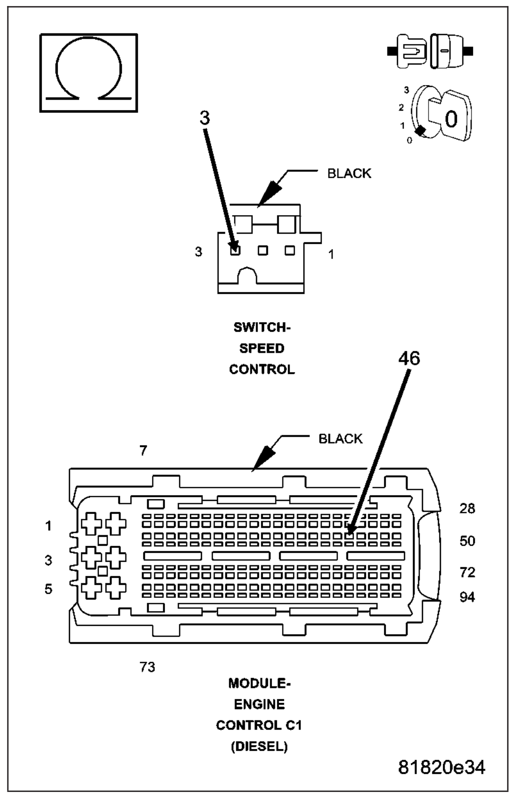
Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

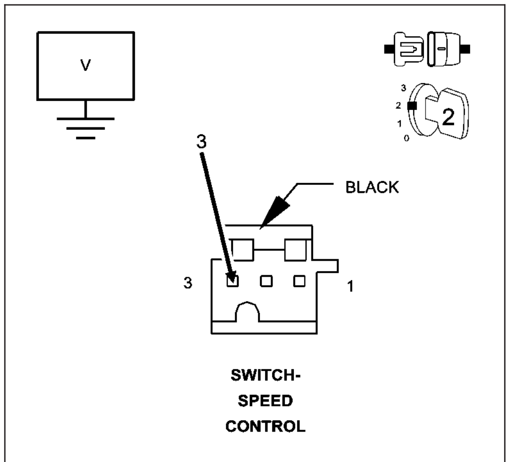
4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.



Measure the voltage of the (V937) S/C Switch Ground circuit.

Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

81820fc4

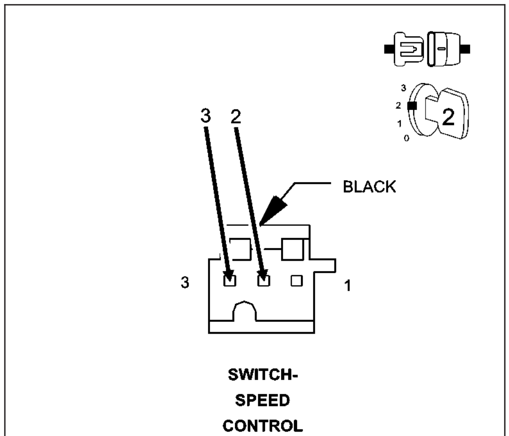
5. S/C SWITCH

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, monitor the S/C Switch Voltage.



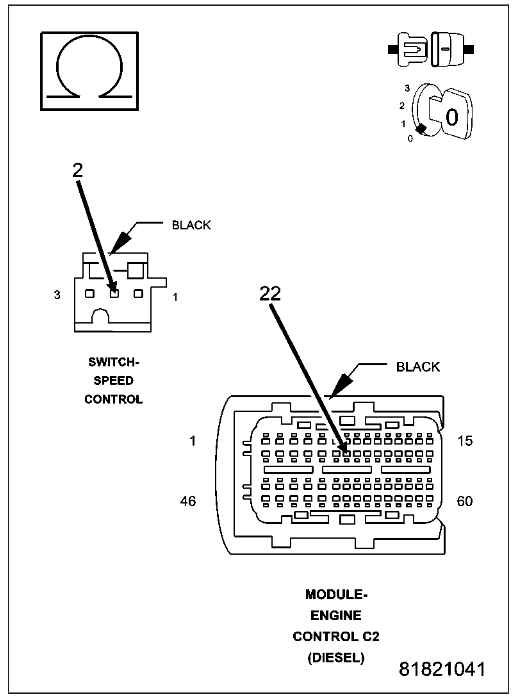
While monitoring the scan tool, connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire in place?

Yes >> Replace the Speed Control Switches in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9



81820fd5

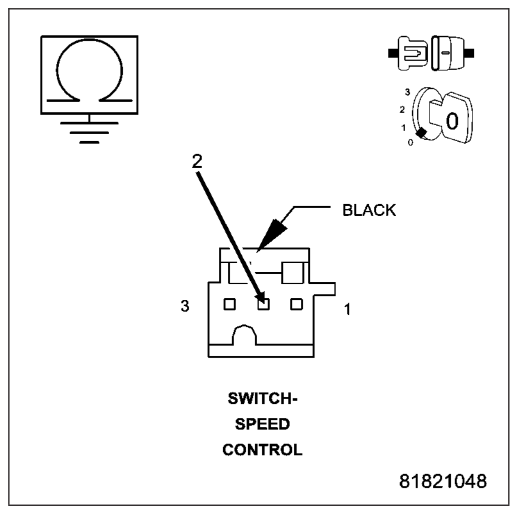
6. (V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



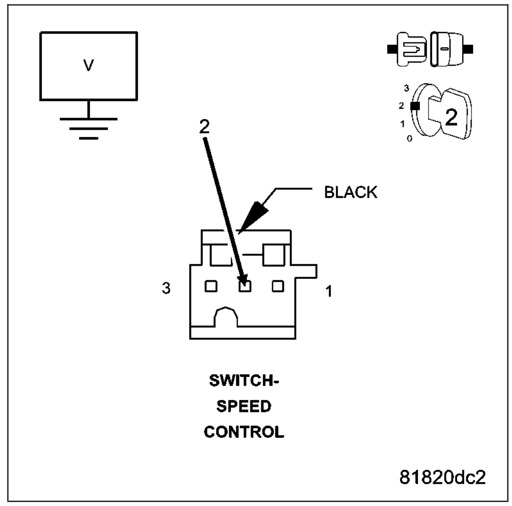
Yes >> Go To 7

No >> Repair the (V71) S/C Switch 1 Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (V71) S/C Switch 1 Signal circuit.



Is the resistance above 1000 ohms?

Yes >> Go to 9

No >> Repair the (V71) S/C Switch 1 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V71) S/C Switch 1 Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

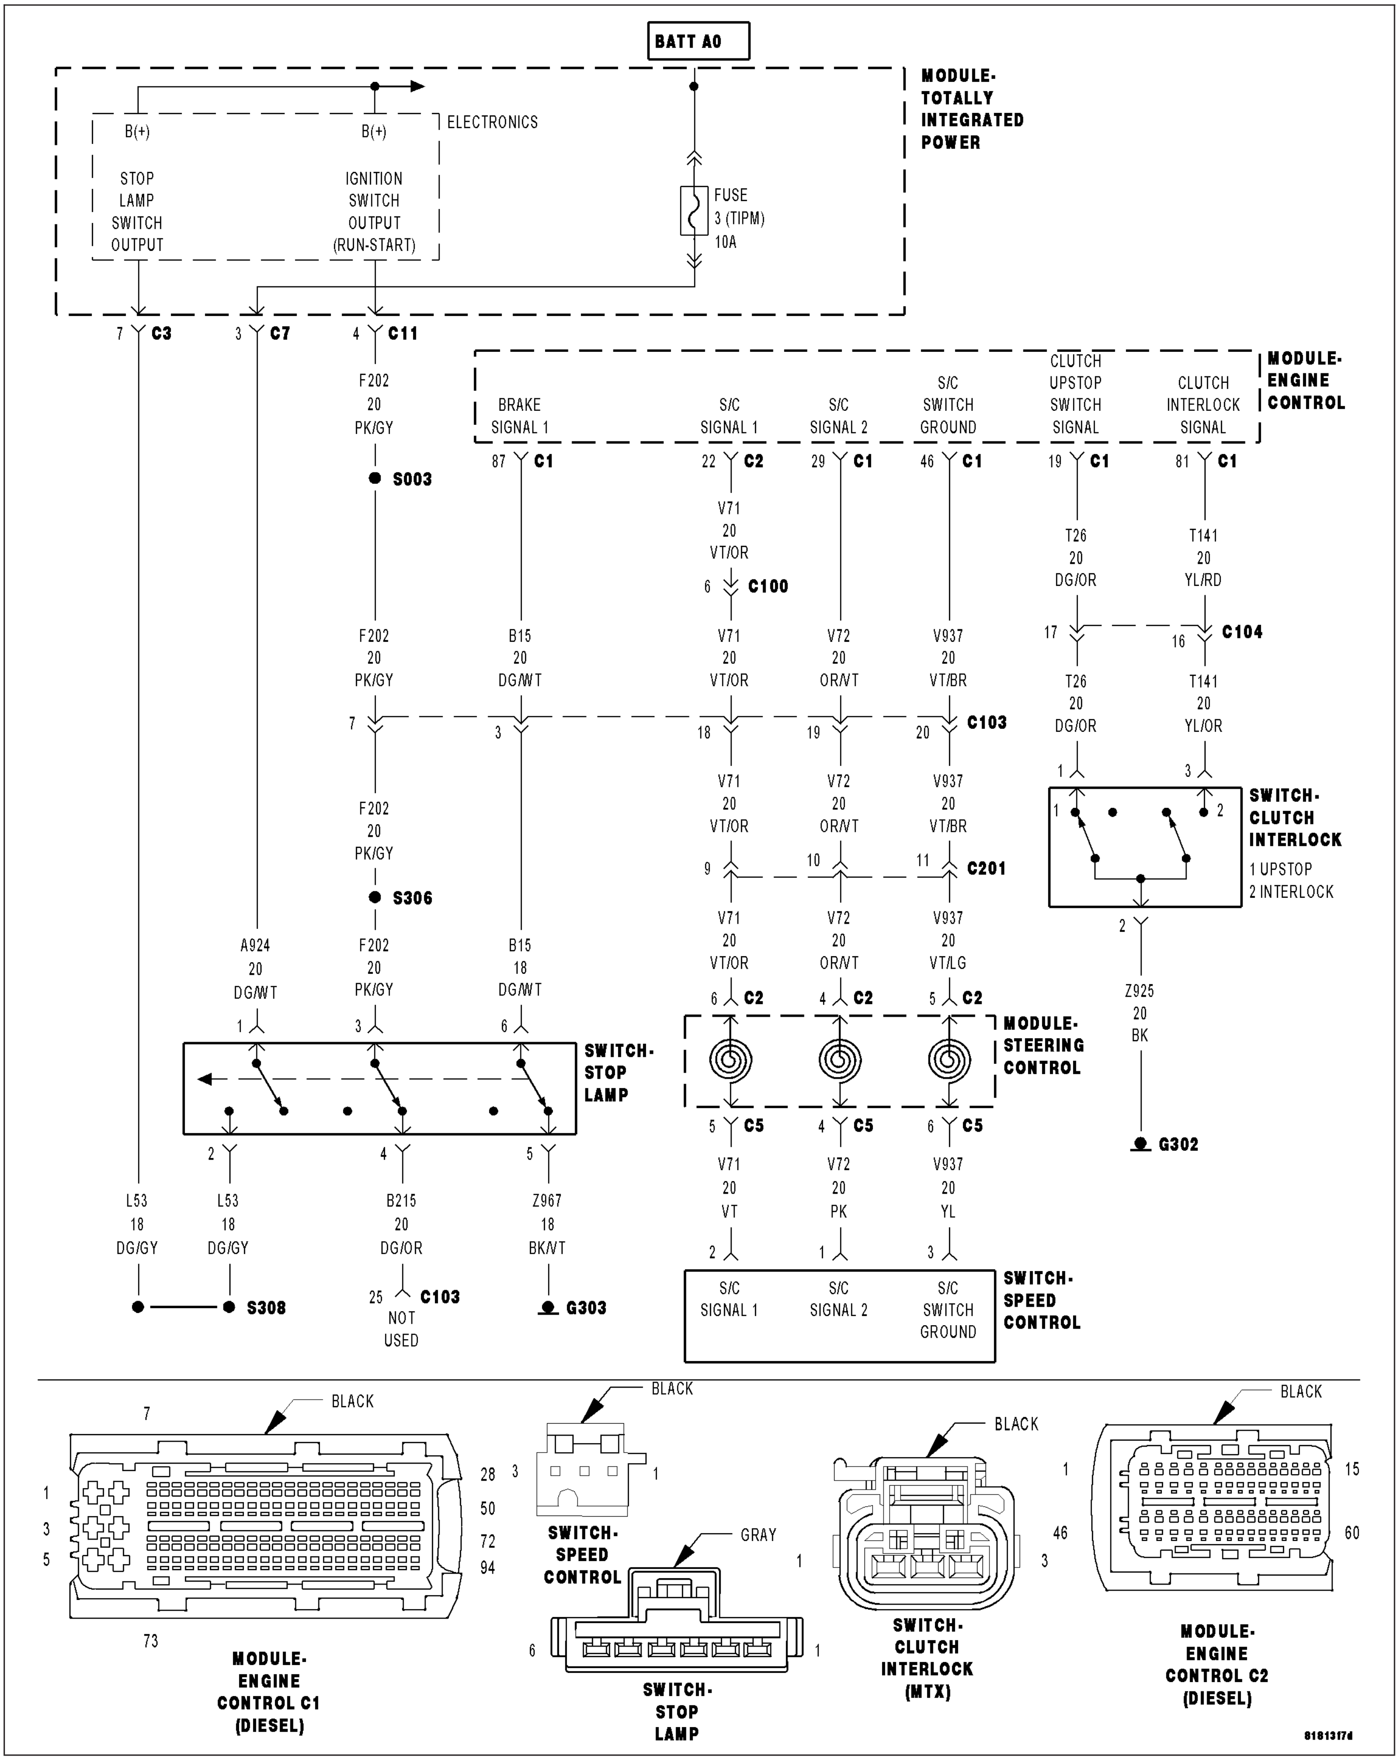
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0585-SPEED CONTROL SWITCH 1 2 CORRELATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and no other S/C Switch DTCs present.
- **Set Condition:**
  The (V71) S/C Switch 1 Signal and (V72) S/C Switch 2 Signal do not indicate the same S/C Switch position for 5.0 seconds.

Possible Causes
INTERMITTENT DTC
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V71) S/C SWITCH 1 SIGNAL CIRCUIT SHORTED TO GROUND
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

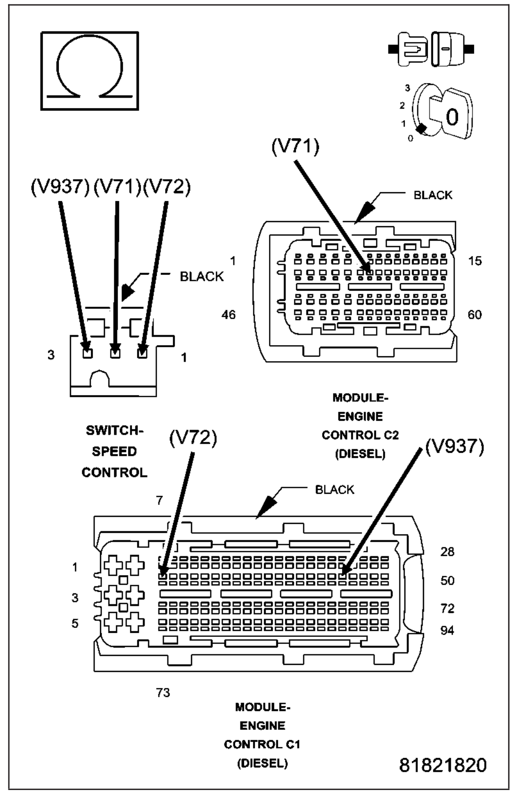
Do the S/C Switch voltages fall within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2

2. SPEED CONTROL SWITCH CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.



Disconnect the Speed Control Switch harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V71) S/C Switch 1 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for ALL measurements?

Yes >> Go To 3

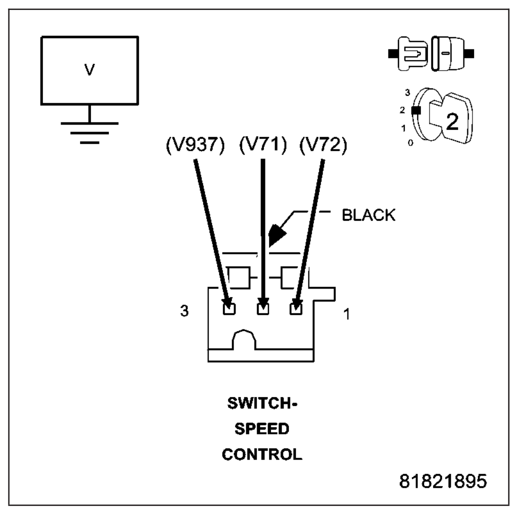
No >> Repair the Speed Control Switch circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. SPEED CONTROL SWITCH CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Remove the Main Relay.



Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V71) S/C Switch 1 Signal circuit.

Measure the voltage of the (V72) S/C Switch 2 Signal circuit.

Measure the voltage of the (V937) S/C Switch Ground circuit.

Is there any voltage present on any of the circuits?

Yes >> Repair the Speed Control Switch circuit for a short to voltage.

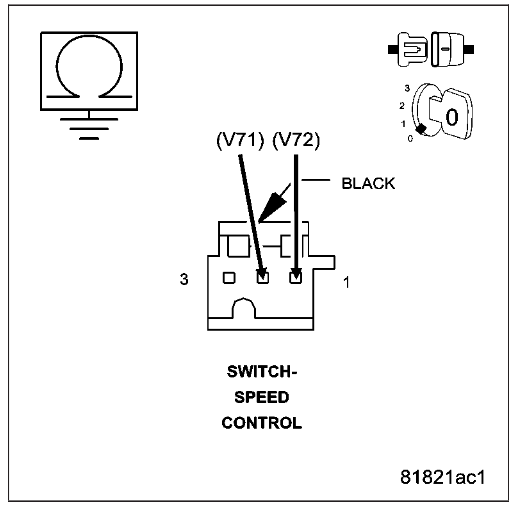
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. SPEED CONTROL SWITCH CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Measure the resistance between ground and the (V71) S/C Switch 1 Signal circuit.



Measure the resistance between ground and the (V72) S/C Switch 2 Signal circuit.

Is the resistance above 1000 ohms?

Yes >> Go to 5

No >> Repair the Speed Control Switch circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. SPEED CONTROL SWITCHES

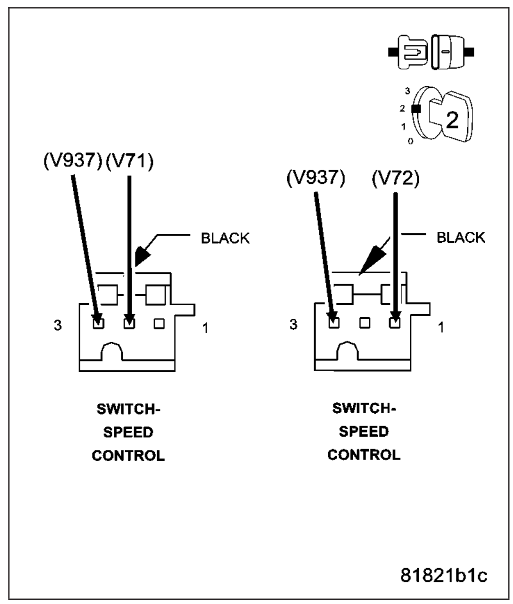
Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V71) S/C Switch 1 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.



While monitoring the scan tool, connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt for each circuit with the jumper wire in place?

Yes >> Replace the Speed Control Switches in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

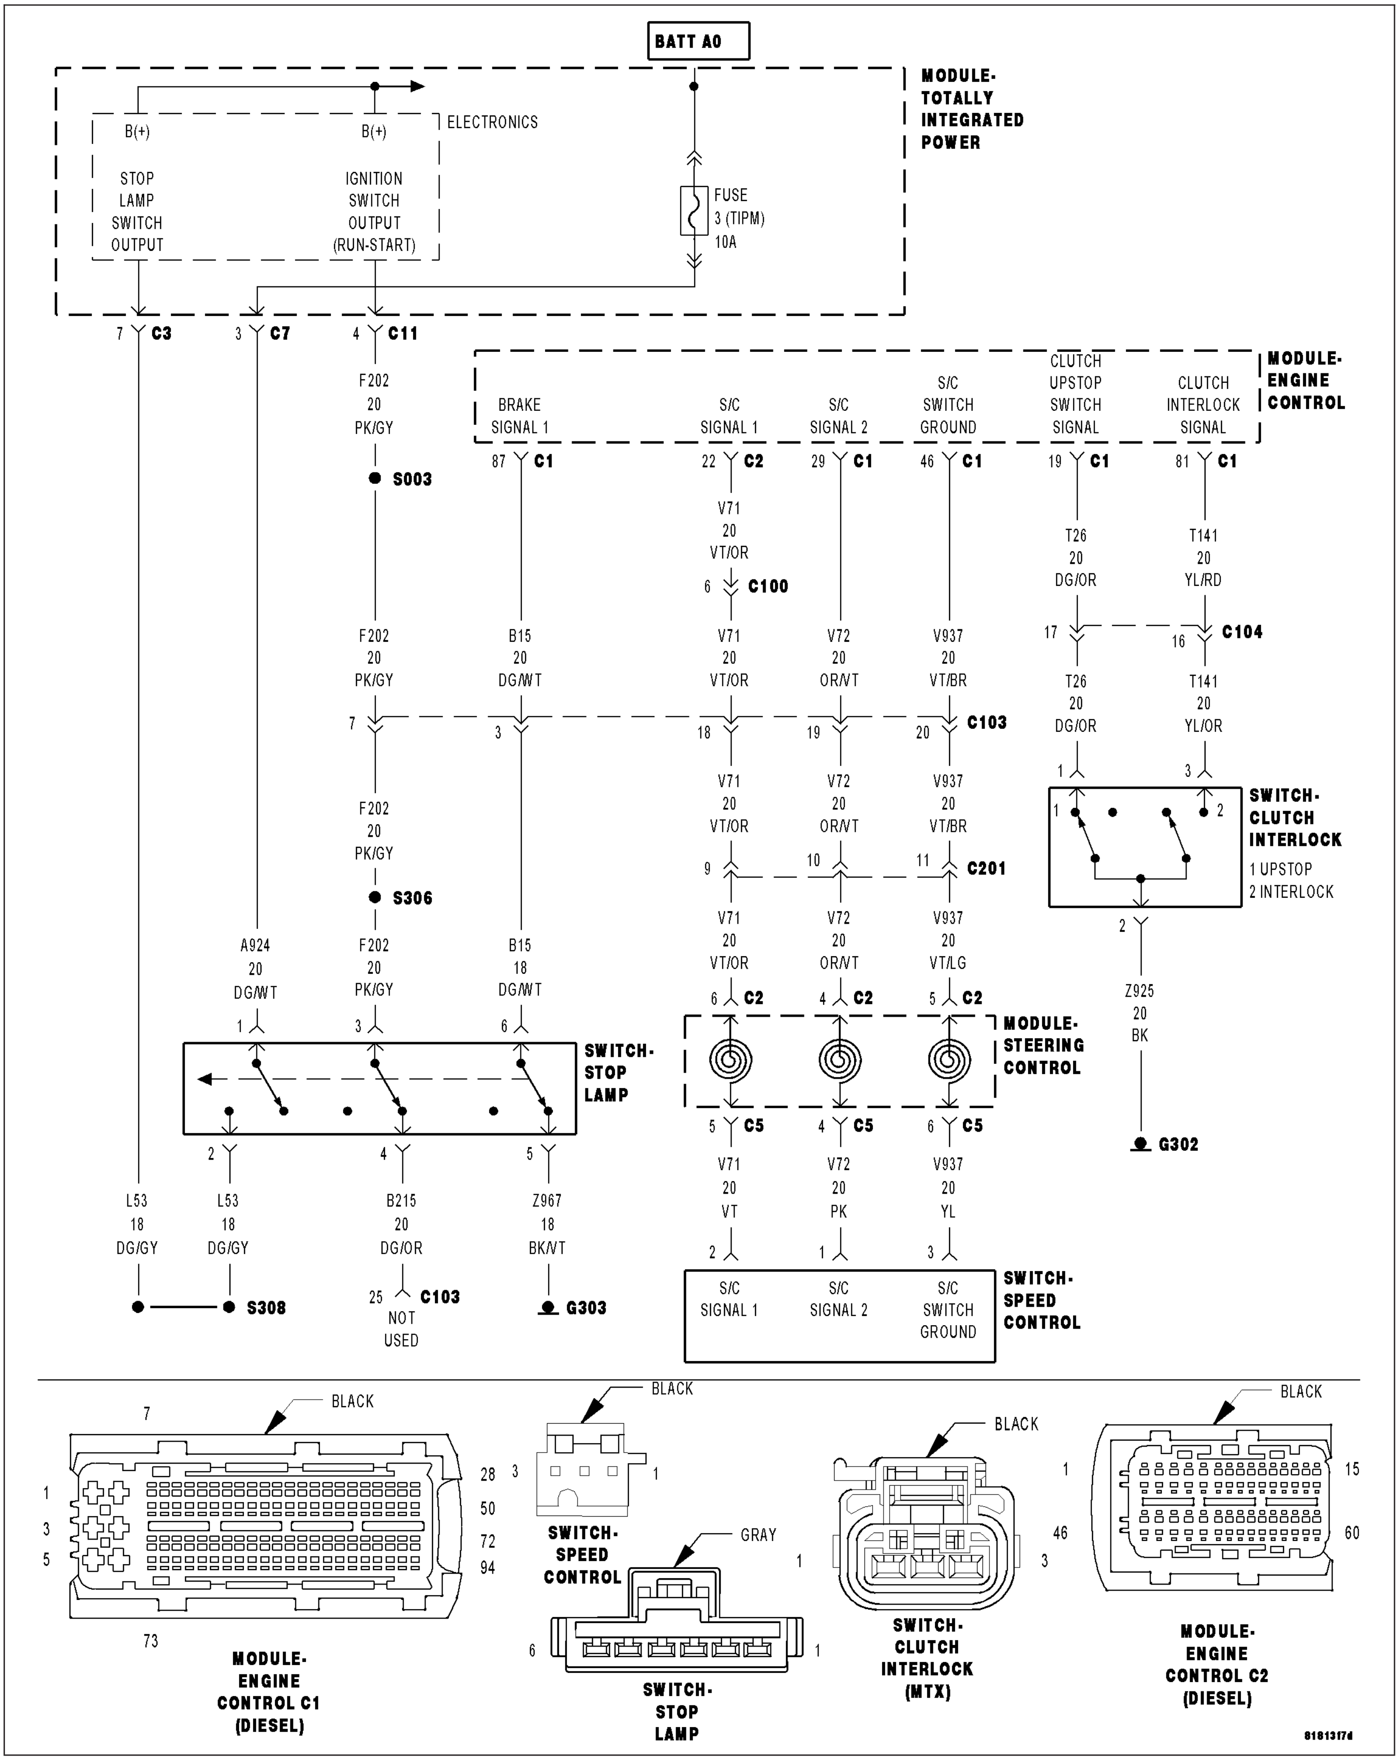
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0590-SPEED CONTROL SWITCH 2 STUCK

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and no other S/C Switch DTCs present.
- **Set Condition:**
  The S/C Switch #2 Signal indicates that a switch is pressed for more than 60 seconds.

Possible Causes
INTERMITTENT DTC
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

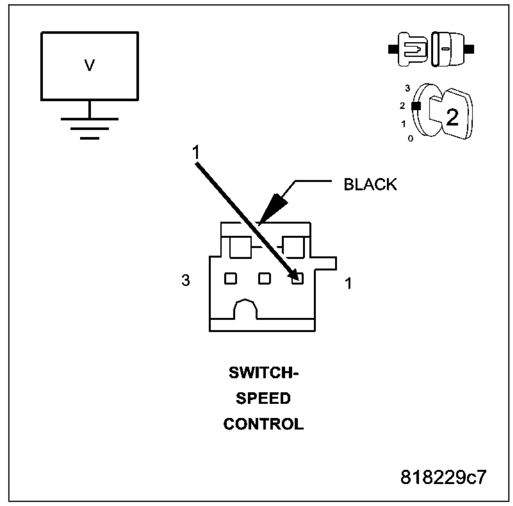
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V72) S/C SWITCH 2 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

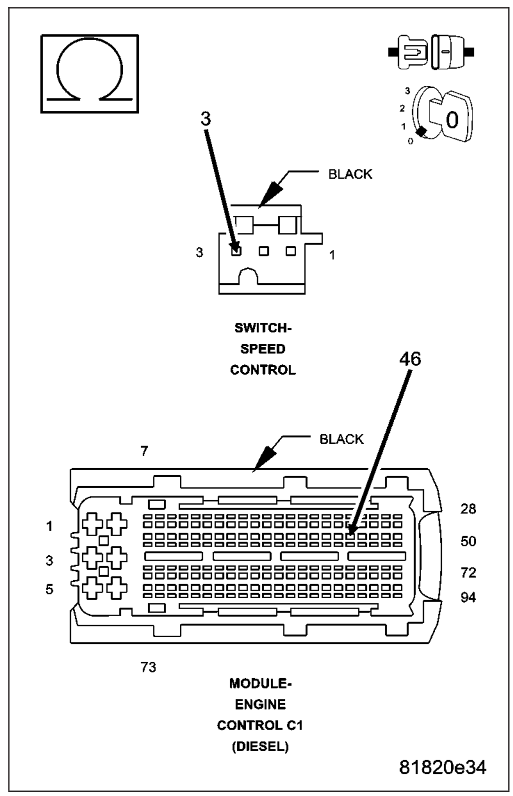
Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



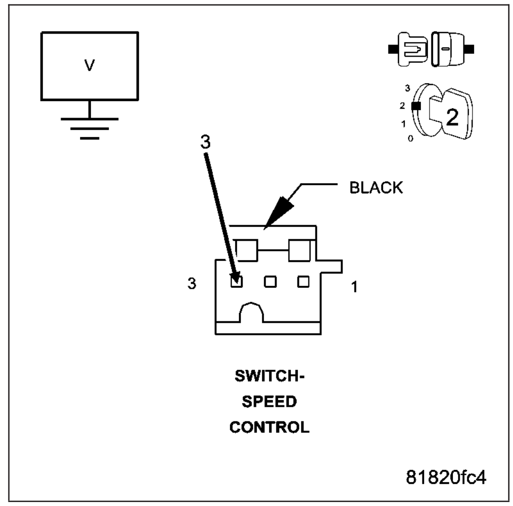
Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.



Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE

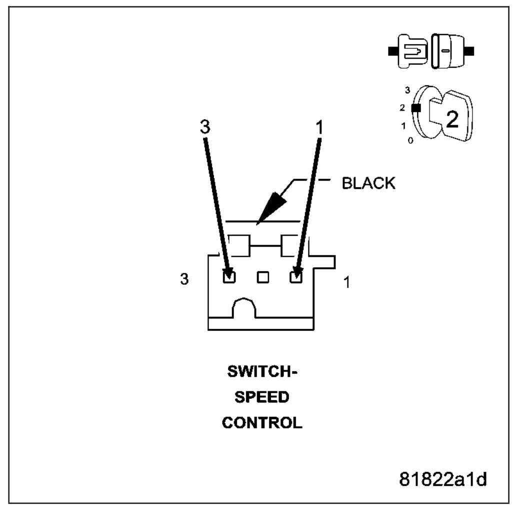
Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V937) S/C Switch Ground circuit.



Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. S/C SWITCH

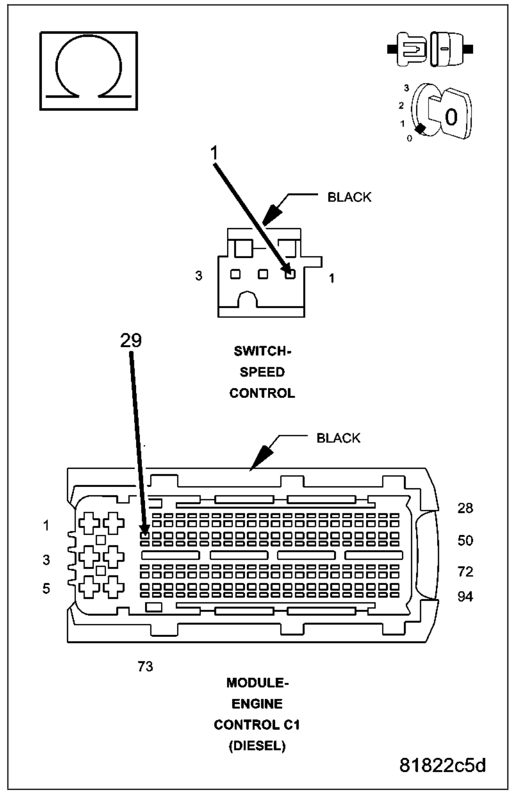
Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.



Does the scan tool display below 0.1 volt with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

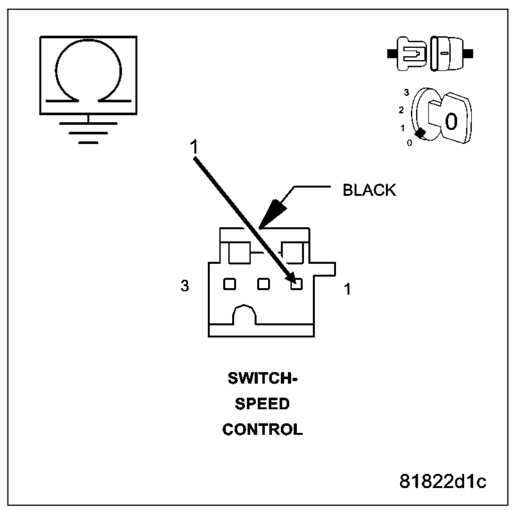
No >> Go to 9

6. (V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.



Is the resistance below 10.0 ohms?

Yes >> Go To 7

No >> Repair the (V71) S/C Switch 2 Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (V72) S/C Switch 2 Signal circuit.

Is the resistance above 1000 ohms?

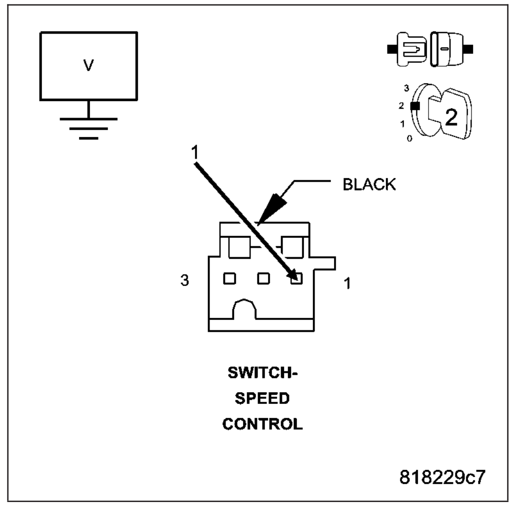
Yes >> Go to 9

No >> Repair the (V72) S/C Switch 2 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V72) S/C Switch 2 Signal circuit for a short to voltage.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

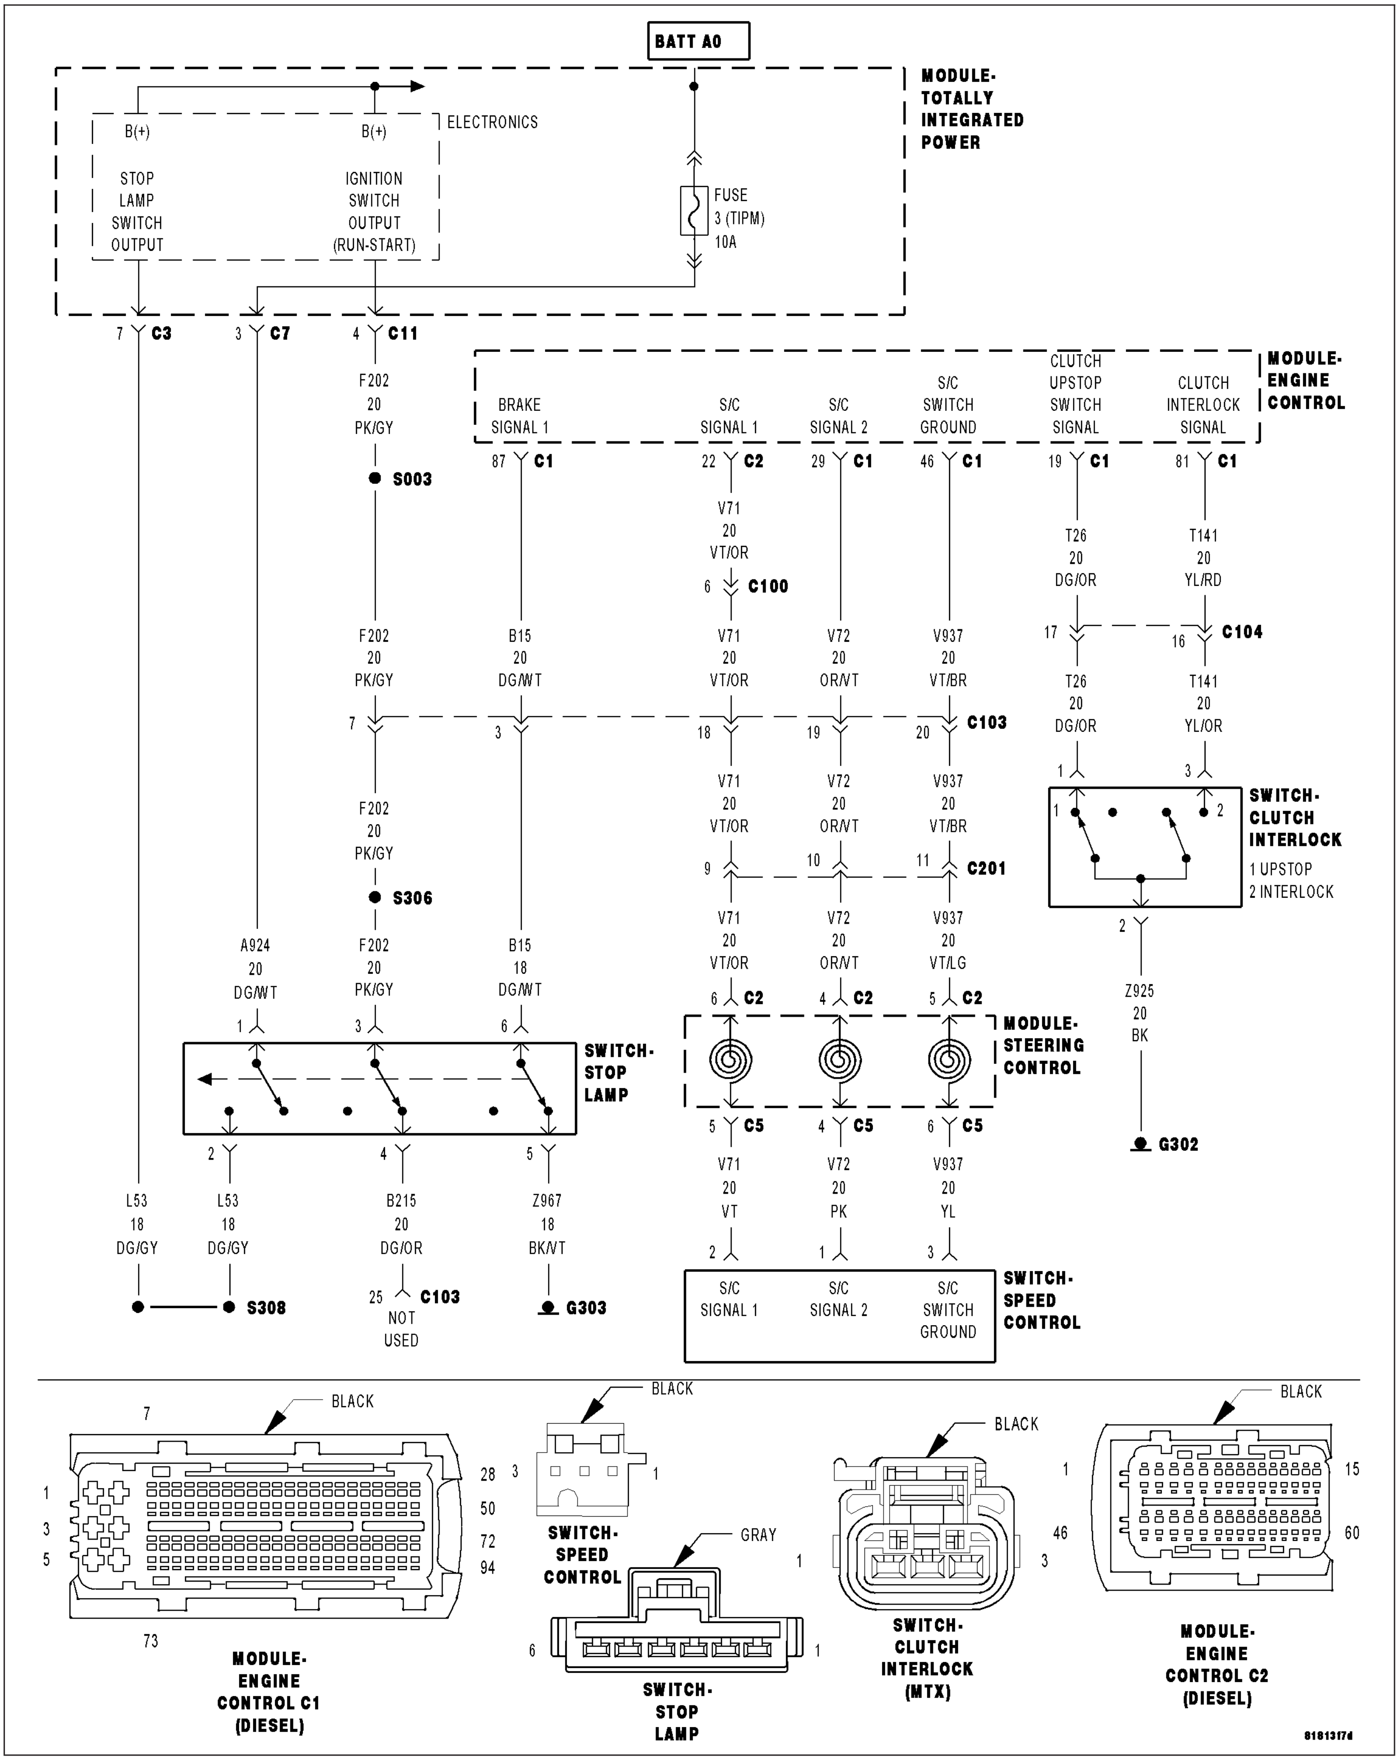
No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0591-SPEED CONTROL SWITCH 2 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The S/C Switch #2 Signal voltage is not within a valid switch signal window for 3.0 seconds.

Possible Causes
INTERMITTENT DTC
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

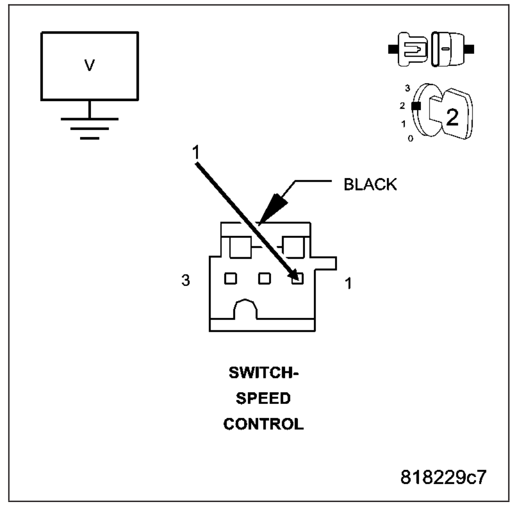
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V72) S/C SWITCH 2 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

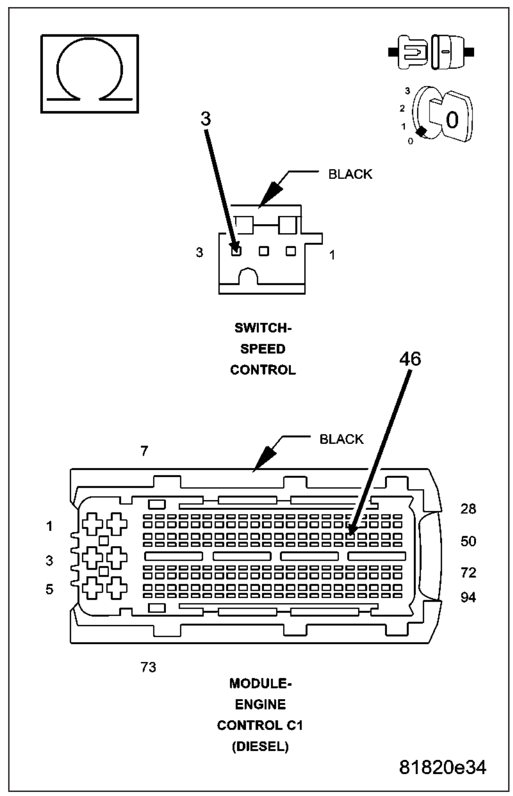
Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



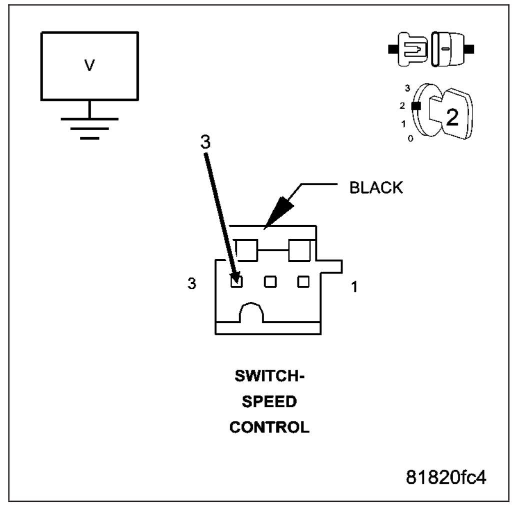
Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.



Is the resistance below 10.0 ohms for both circuits?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V937) S/C Switch Ground circuit.

Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. S/C SWITCH

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire in place?

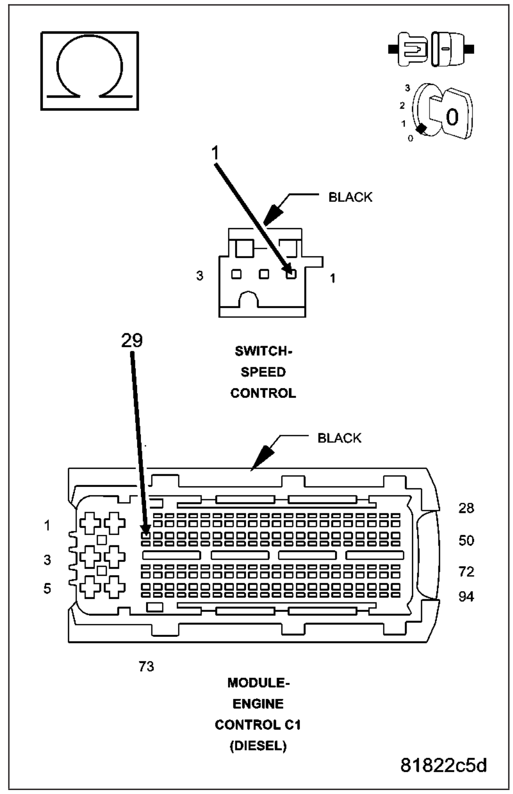
Yes >> Replace the Speed Control Switch in accordance with the Service Information.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

6. (V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.



Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

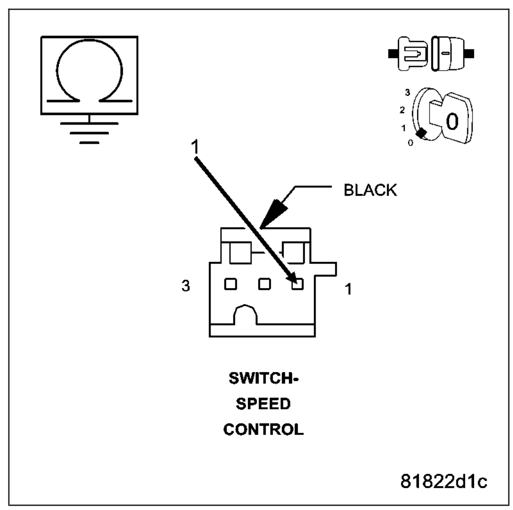
Is the resistance below 10.0 ohms?

Yes >> Go To 7

No >> Repair the (V72) S/C Switch 2 Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (V72) S/C Switch 2 Signal circuit.

Is the resistance above 1000 ohms?

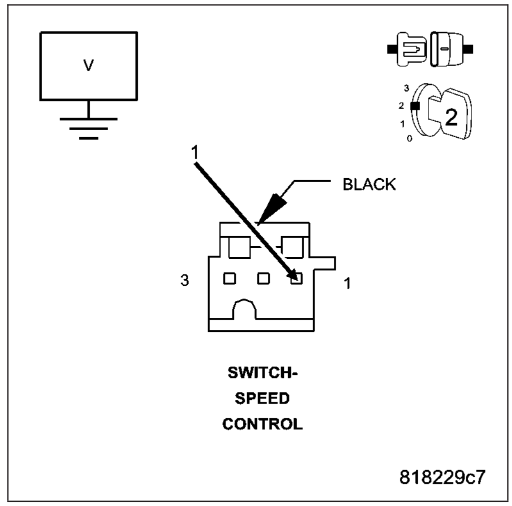
Yes >> Go to 9

No >> Repair the (V72) S/C Switch 2 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V72) S/C Switch 2 Signal circuit for a short to voltage.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

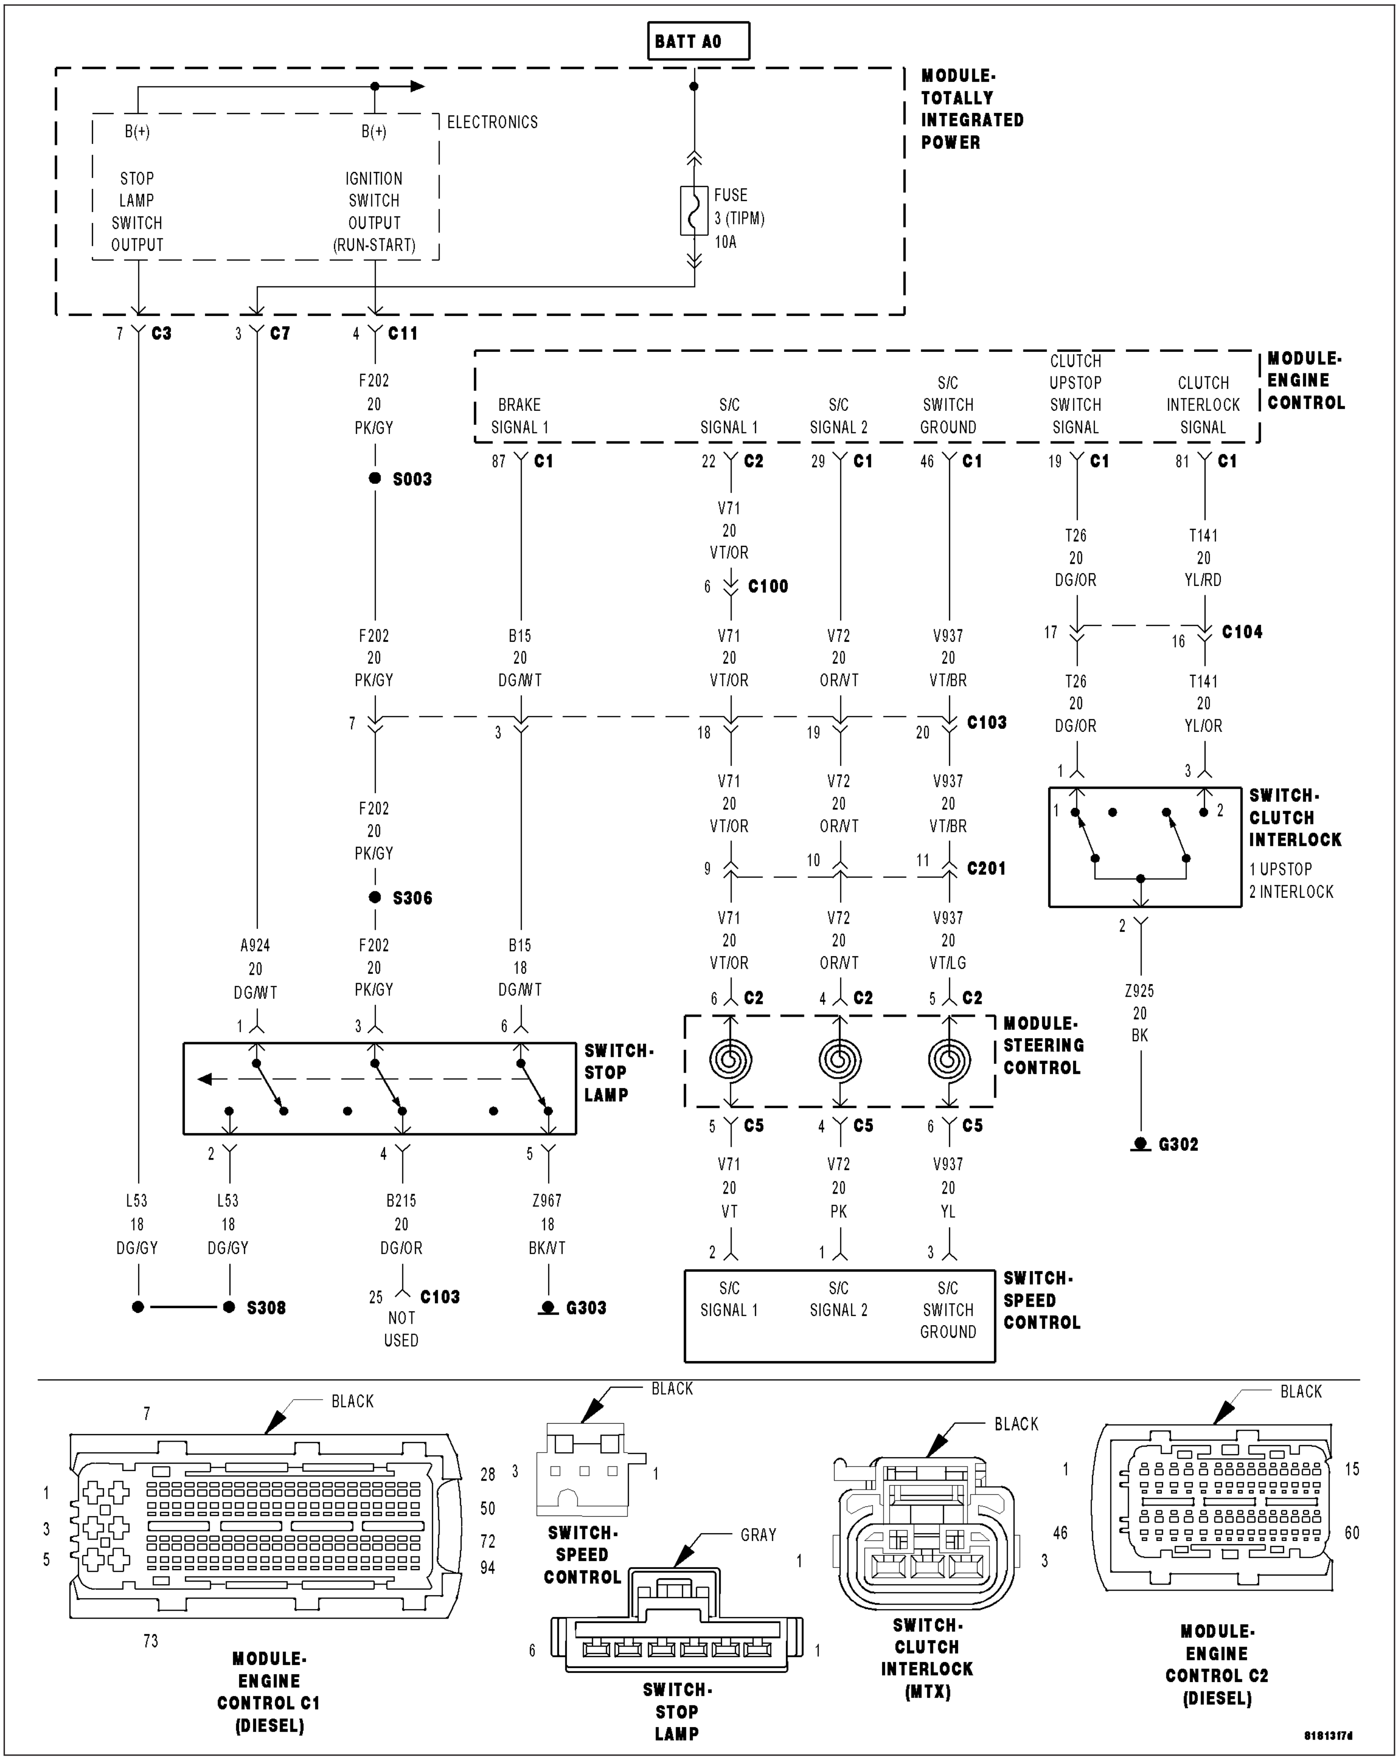
No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0592-SPEED CONTROL SWITCH 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The S/C Switch #2 Signal is below 0.39 volt for 0.06 seconds.

Possible Causes
INTERMITTENT DTC
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

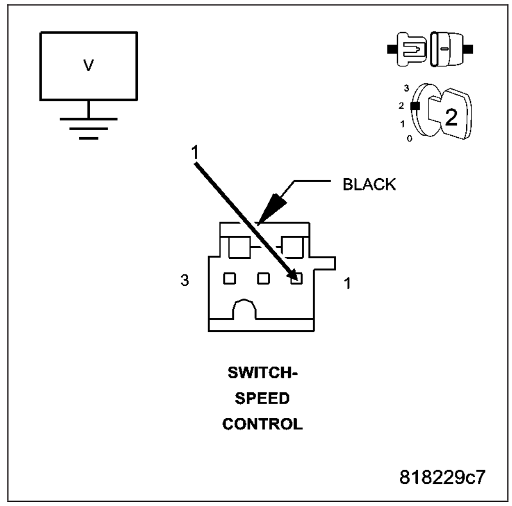
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V72) S/C SWITCH 2 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

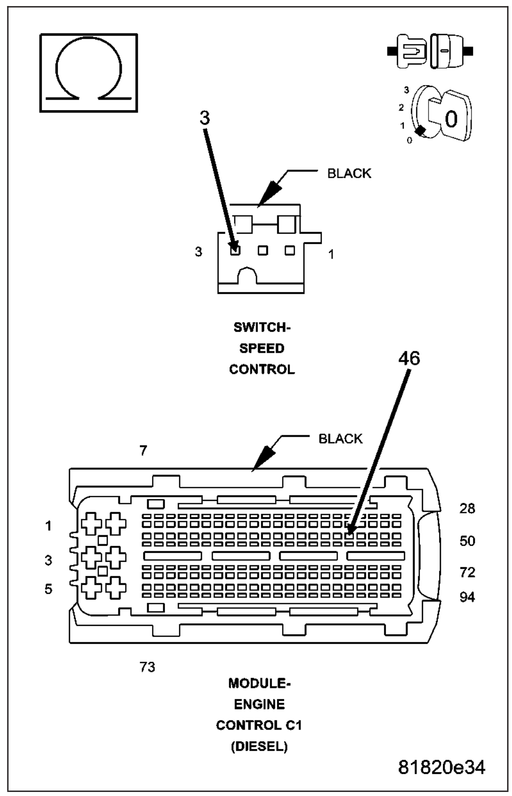
Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

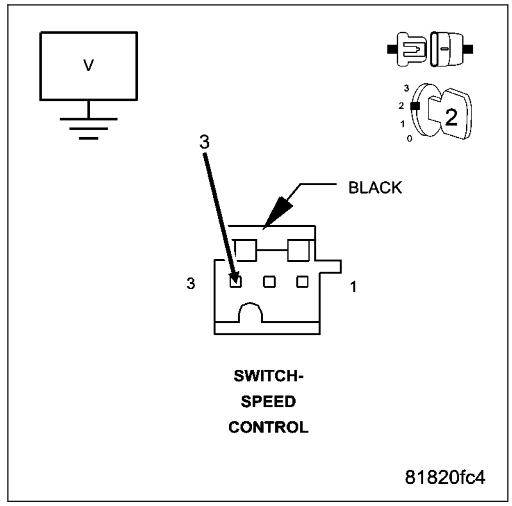
Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V937) S/C Switch Ground circuit.

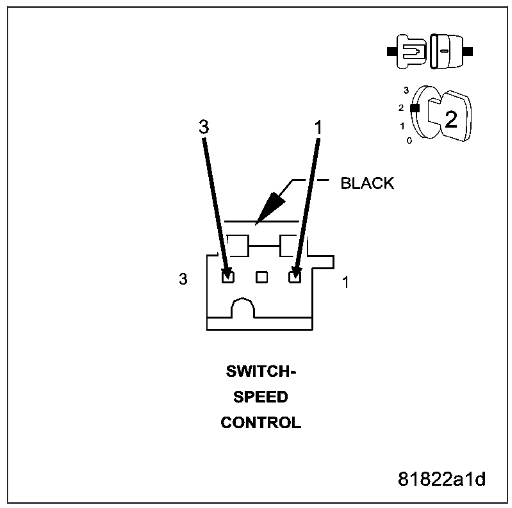
Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. S/C SWITCH



Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.

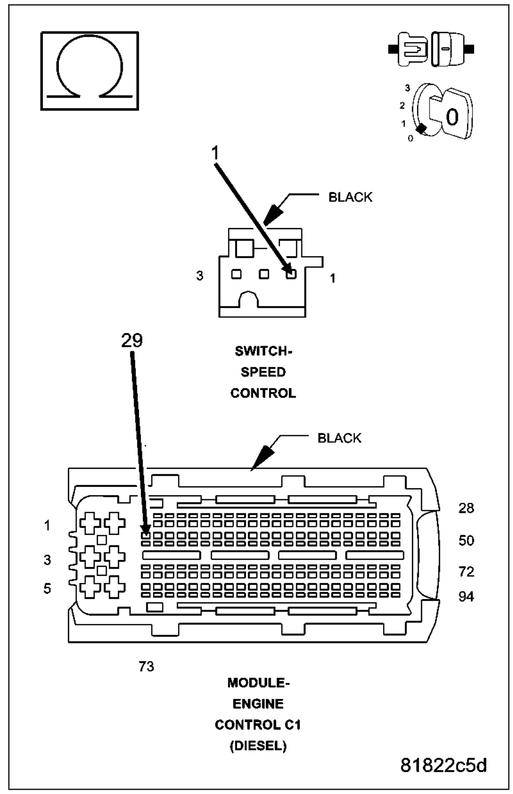
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

6. (V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.



Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

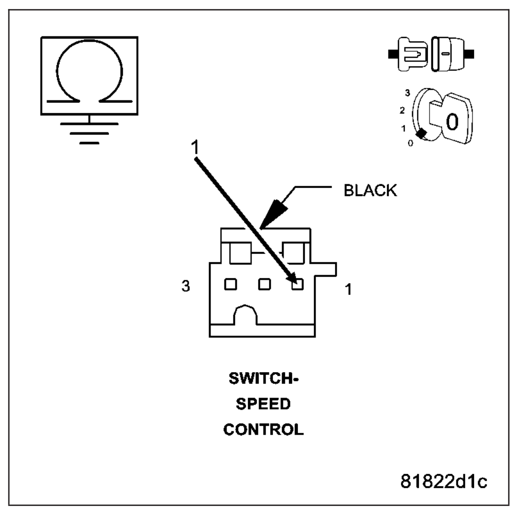
Is the resistance below 10.0 ohms?

Yes >> Go To 7

No >> Repair the (V72) S/C Switch 2 Signal circuit for an open circuit or high resistance.

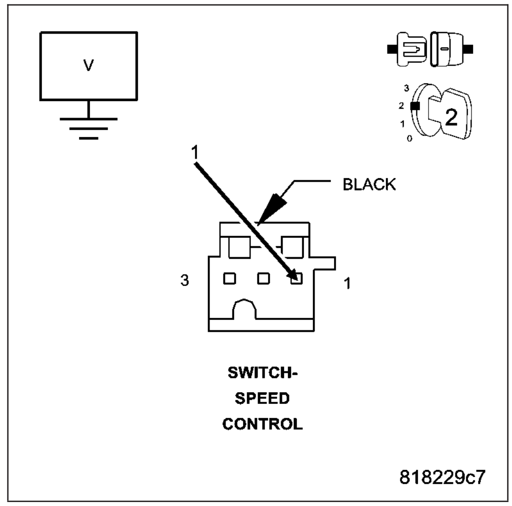
Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND



Measure the resistance between ground and the (V72) S/C Switch 2 Signal circuit.

Is the resistance above 1000 ohms?



Yes >> Go to 9

No >> Repair the (V72) S/C Switch 2 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V72) S/C Switch 2 Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

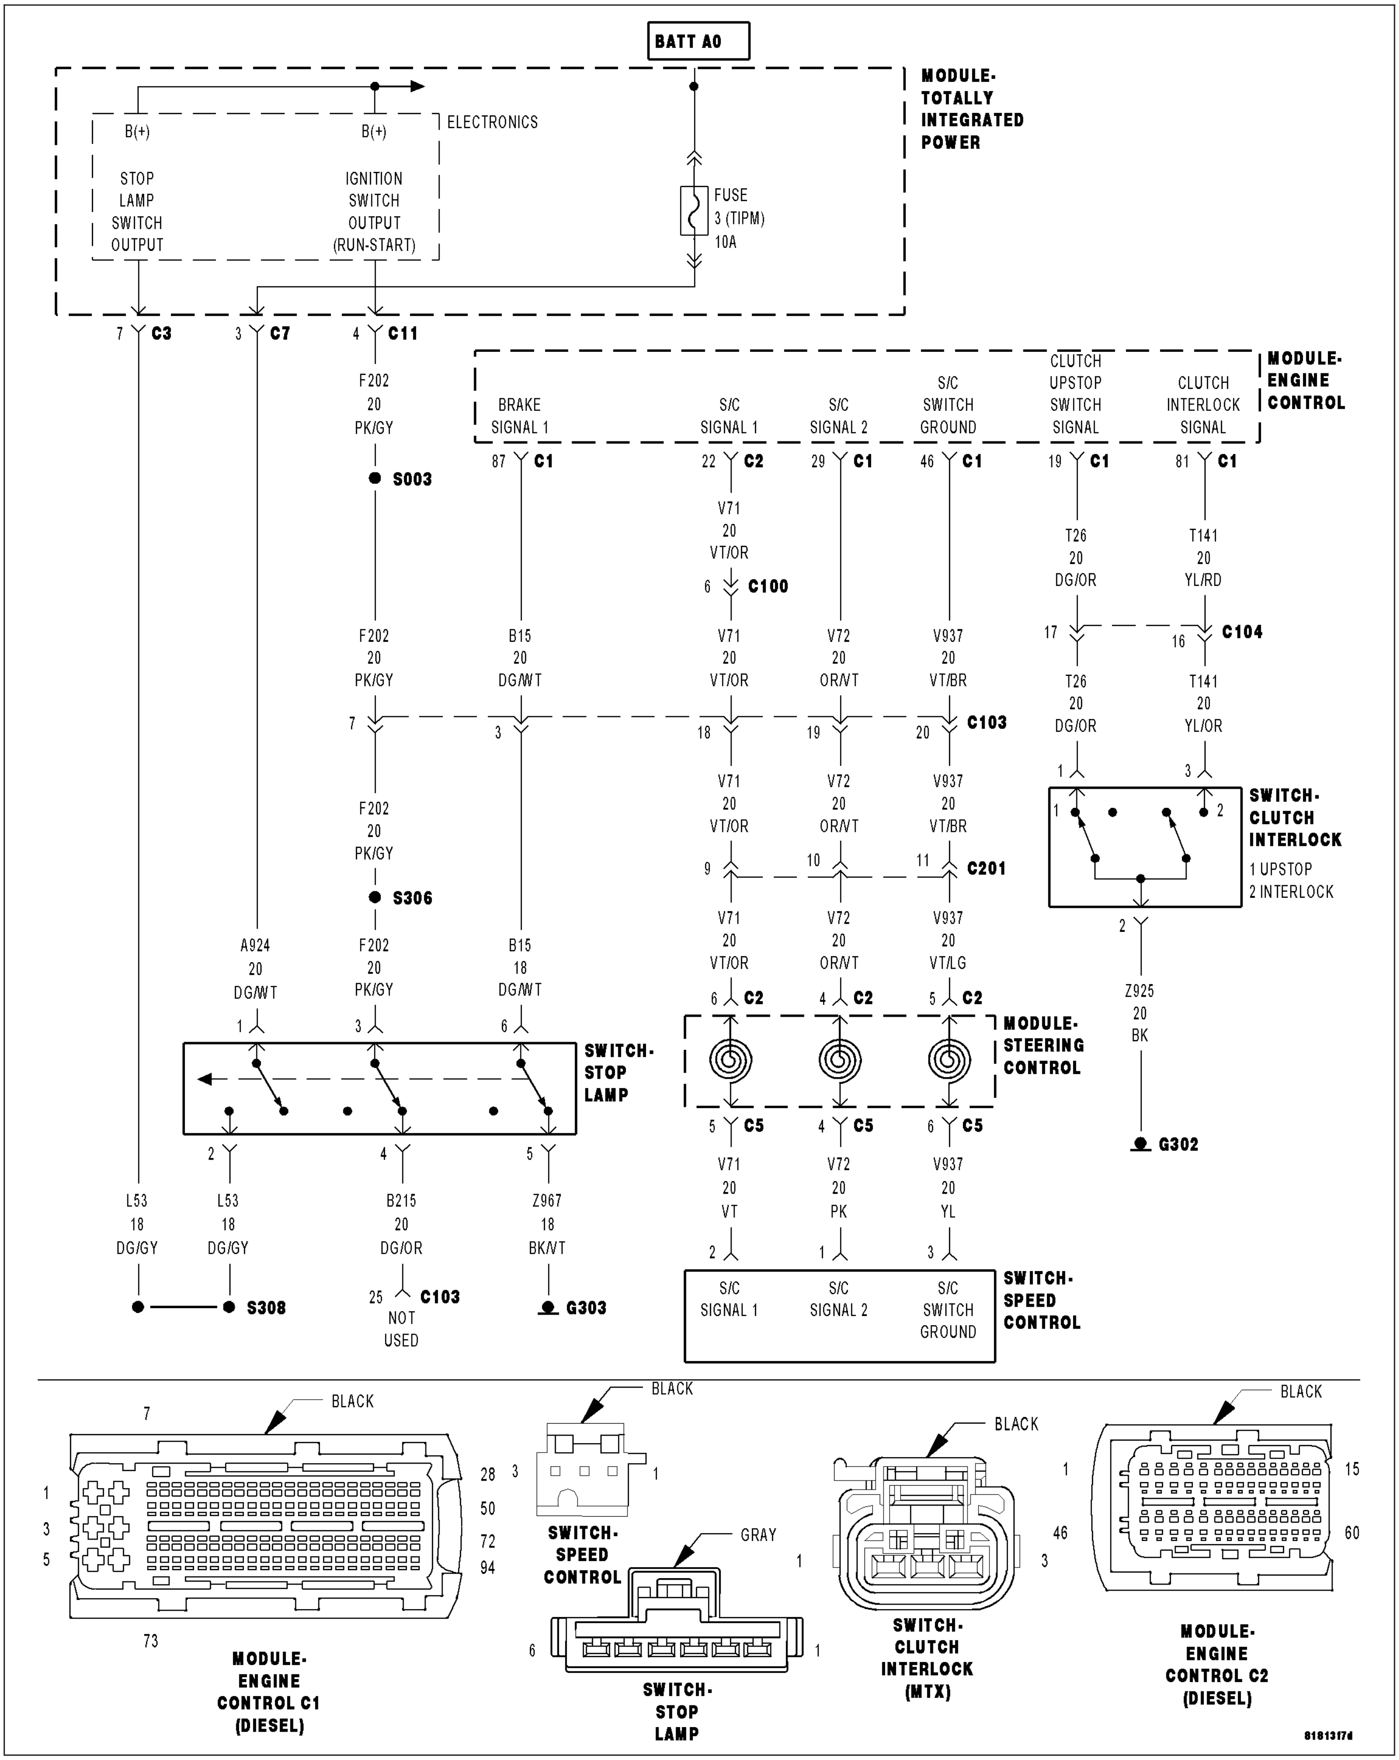
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver.1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0593-SPEED CONTROL SWITCH 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The S/C Switch #2 Signal is above 4.78 volts for 0.06 seconds.

Possible Causes
INTERMITTENT DTC
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(V937) S/C SWITCH GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND
SPEED CONTROL SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. S/C SWITCH VOLTAGES OUT OF RANGE

KEY	SIGNAL 1		SIGNAL 2	
	LO LIMIT	HI LIMIT	LO LIMIT	HI LIMIT
RELEASED	4.36	4.69	4.36	4.69
ON-OFF	0.50	1.10	3.53	3.90
SET	3.16	3.53	1.56	1.18
RESUME-ACCEL	3.84	4.19	1.70	2.43
CANCEL	1.59	1.97	2.43	3.22

Turn the ignition on.

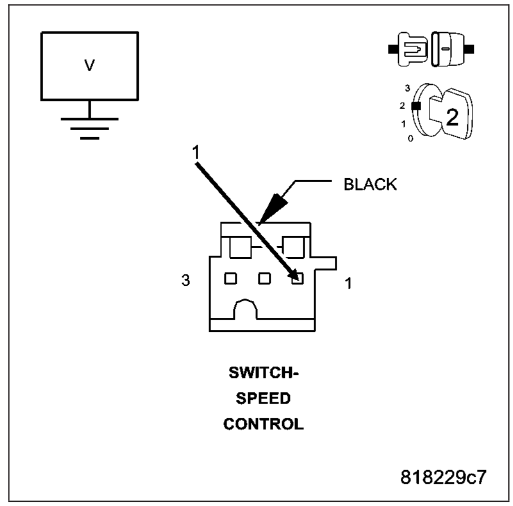
With the scan tool, monitor the S/C Switch signal voltages.

Press each button while noting the voltage readings for each circuit.

Are the S/C Switch voltages within the ranges specified in the table when each button is pressed?

Yes >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2



2. (V72) S/C SWITCH 2 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Speed Control Switch harness connector.

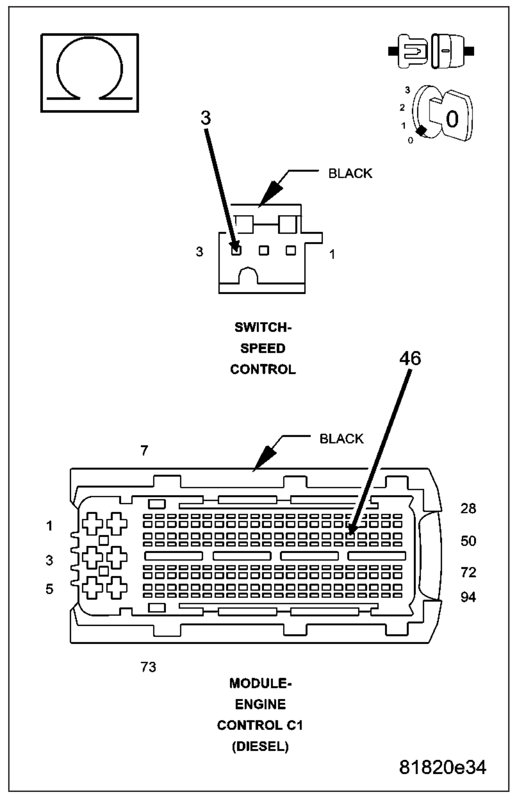
Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal Circuit at the Speed Control Switch.

Select the appropriate voltage reading.

4.5 to 5.5 volts
Go To 3

Below 4.5 volts
Go To 6



Above 5.5 volts
Go To 8

3. (V937) S/C SWITCH GROUND CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V937) S/C Switch Ground circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

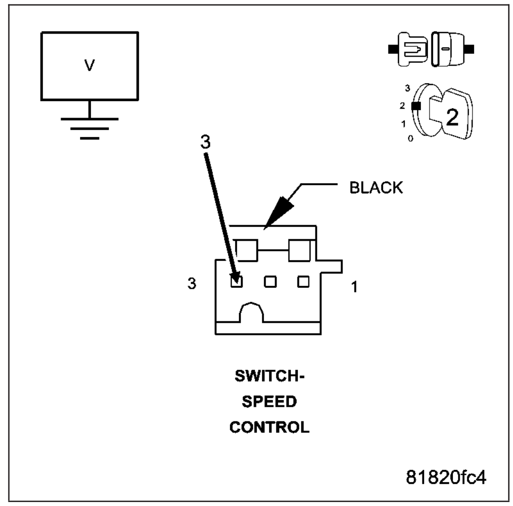
Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (V937) S/C Switch Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (V937) S/C SWITCH GROUND CIRCUIT SHORTED TO VOLTAGE



Turn the ignition off.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V937) S/C Switch Ground circuit.

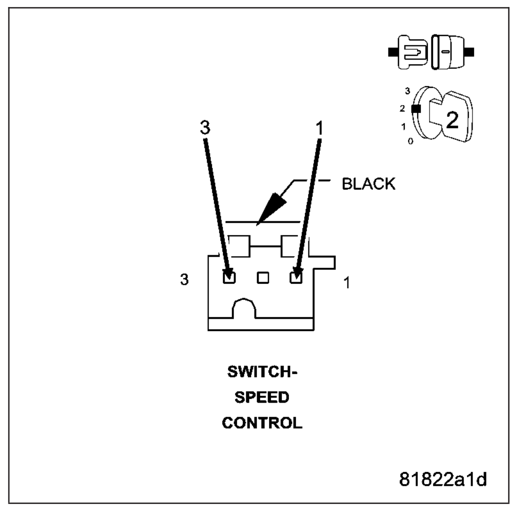
Is there any voltage present?

Yes >> Repair the (V937) S/C Switch Ground circuit for a short to voltage.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. S/C SWITCH



Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

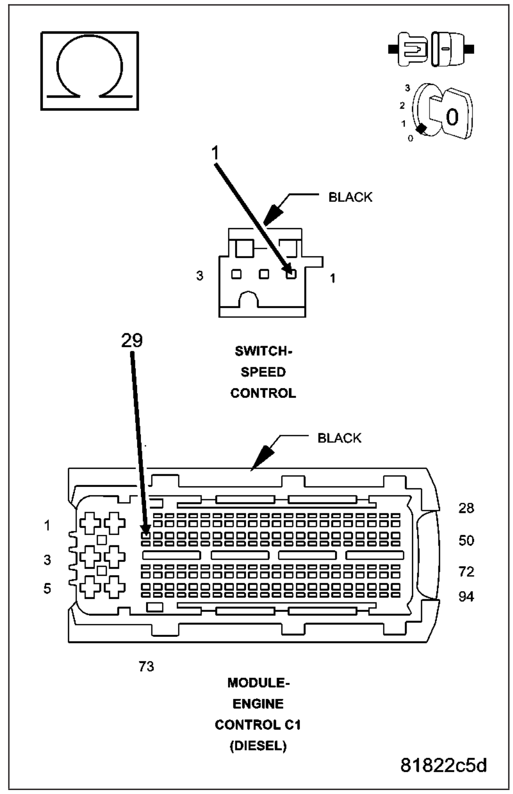
With the scan tool, monitor the S/C Switch Voltage.

While monitoring the scan tool, connect a jumper wire between the (V72) S/C Switch 2 Signal circuit and the (V937) S/C Switch Ground circuit in the S/C Switch harness connector.

Does the scan tool display below 0.1 volt with the jumper wire in place?

Yes >> Replace the Speed Control Switch in accordance with the Service Information.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



No >> Go to 9

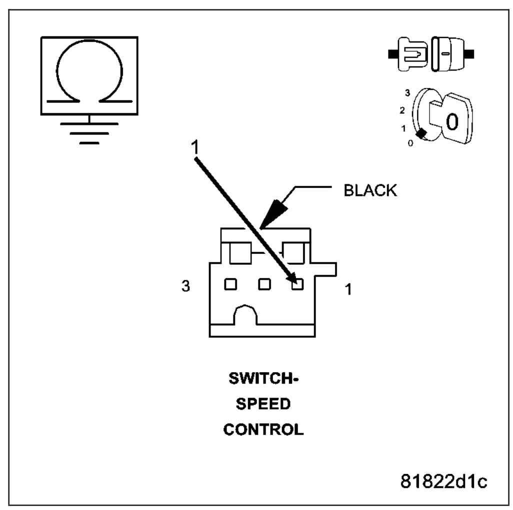
6. (V72) S/C SWITCH 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (V72) S/C Switch 2 Signal circuit between the Speed Control Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go To 7

No >> Repair the (V72) S/C Switch 2 Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (V72) S/C Switch 2 Signal circuit.

Is the resistance above 1000 ohms?

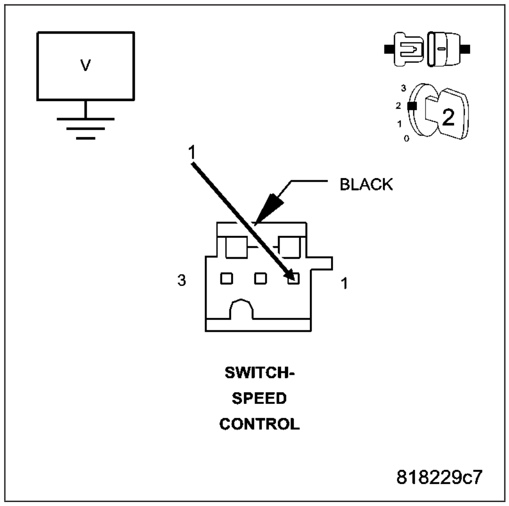
Yes >> Go to 9

No >> Repair the (V72) S/C Switch 2 Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. (V72) S/C SWITCH 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (V72) S/C Switch 2 Signal circuit.

Is there any voltage present?

Yes >> Repair the (V72) S/C Switch 2 Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 9

9. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Speed Control Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver. 4. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0606-INTERNAL ECM PROCESSOR

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Engine Control Module (ECM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the Engine Control Module (ECM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Check for proper ECM power supply from the ignition switch and the Main relay. Check the ECM for proper ground supply.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0606-INTERNAL ECM PROCESSOR

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Engine Control Module (ECM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the Engine Control Module (ECM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Check for proper ECM power supply from the ignition switch and the Main relay. Check the ECM for proper ground supply.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0607-ECU INTERNAL PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Engine Control Module (ECM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the Engine Control Module (ECM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Check for proper ECM power supply from the ignition switch and the Main relay. Check the ECM for proper ground supply.

Refer to any Technical Service Bulletins that may apply.

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0610-ECU VEHICLE OPTIONS MISMATCH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Engine Control Module (ECM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle leaving the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

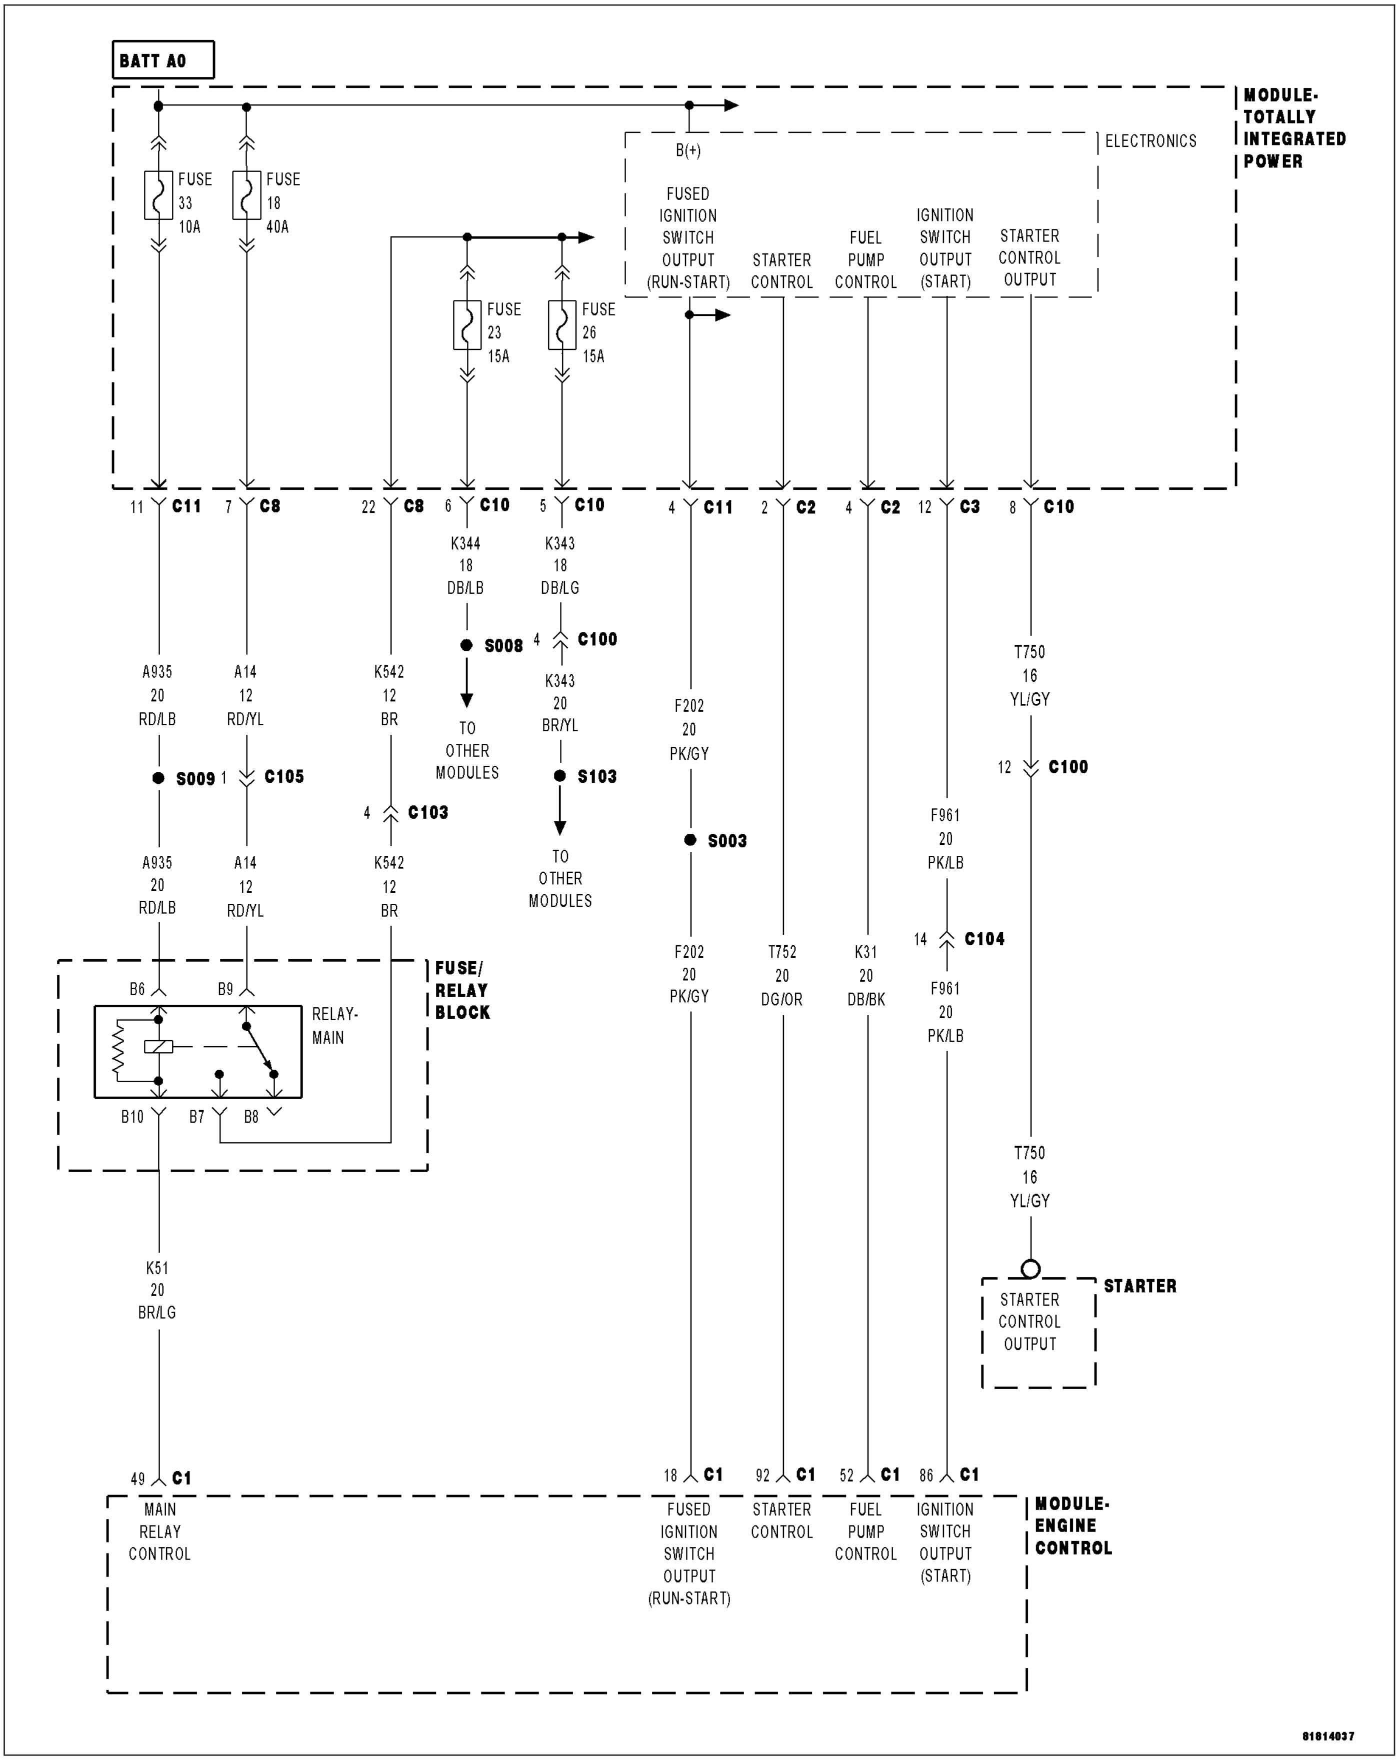
Using the wiring diagram/schematic as a guide, inspect the Engine Control Module (ECM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0615-STARTER CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Starter command off.
- **Set Condition:**
  The ECM does not detect voltage on the (T752) Engine Starter Control circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine several times.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

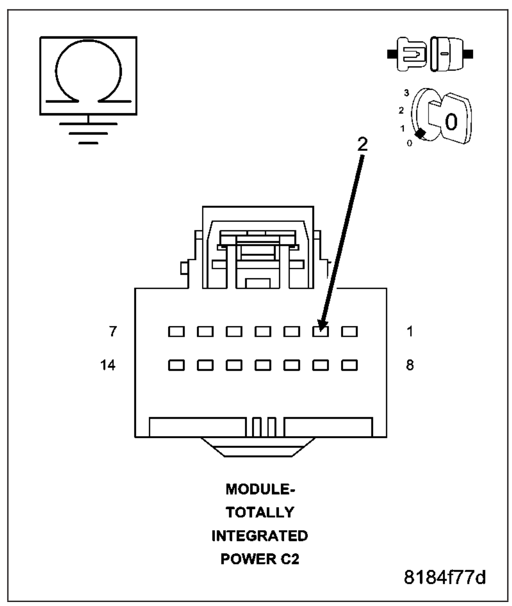
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the TIPM C2 harness connector.

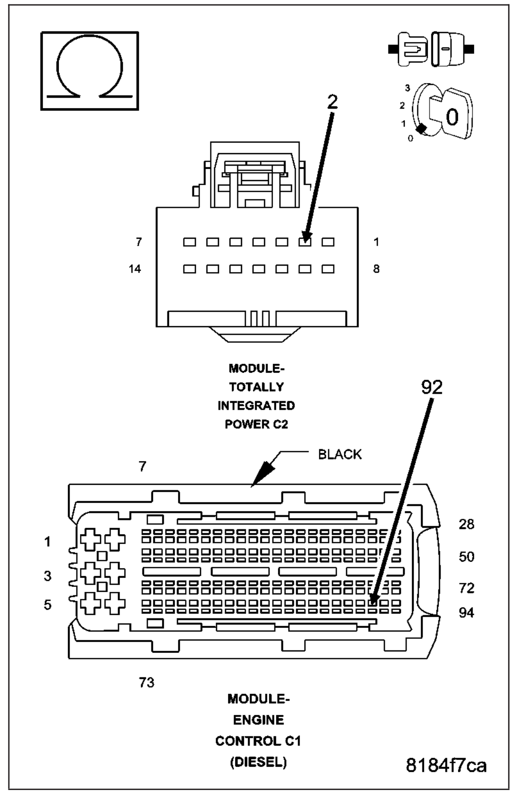
Disconnect the Engine Control Module (ECM) harness connectors.



Measure the resistance between ground and the (T752) Starter Control circuit in the TIPM C2 harness connector.

Is the resistance above 10k ohms?

Yes >> Go to 3



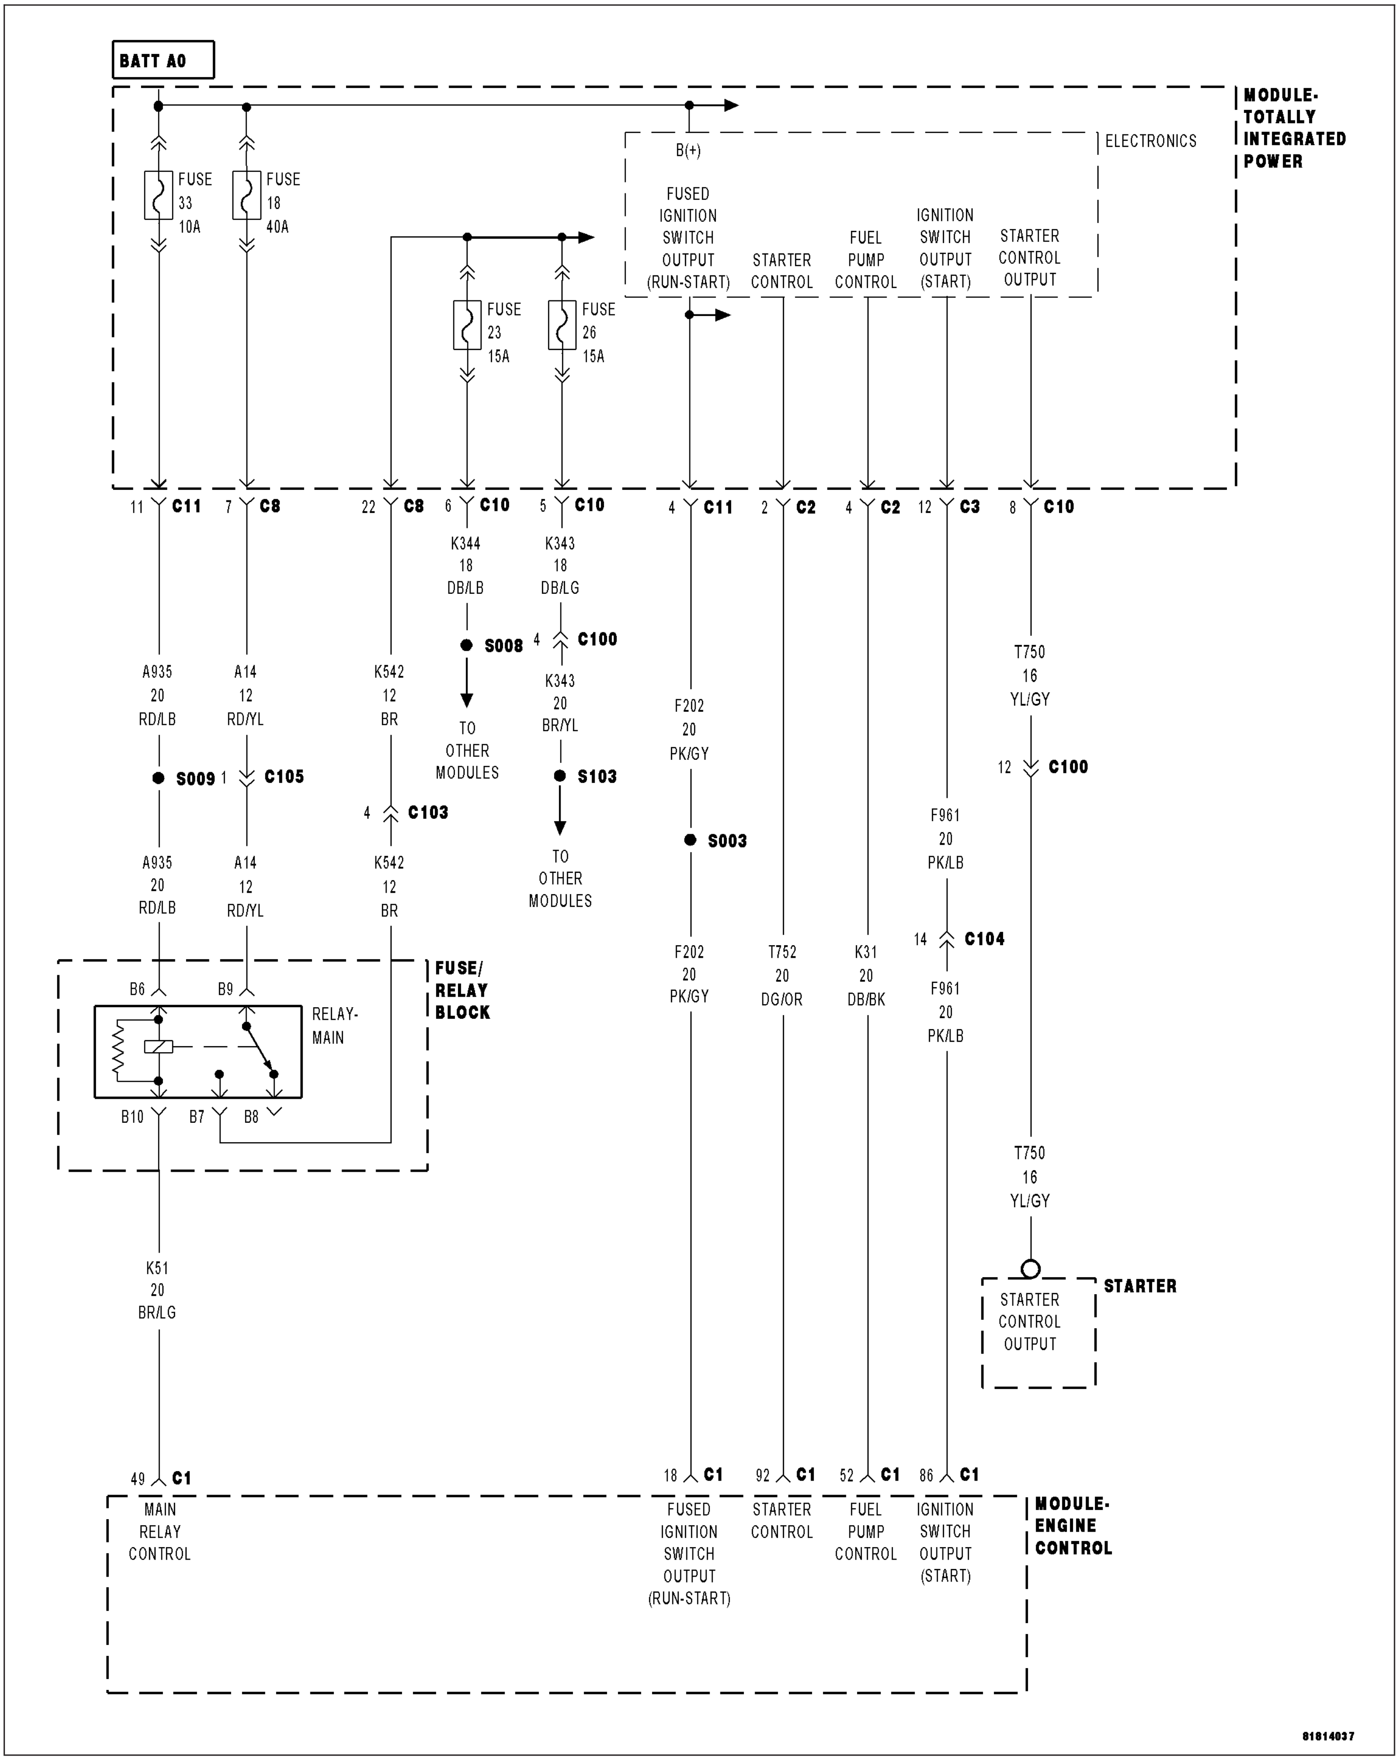
No >> Repair the (T752) Starter Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T752) Starter Control circuit between the TIPM C2 harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace and program the TIPM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (T752) Starter Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0616-STARTER CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Starter command off.
- **Set Condition:**
  The ECM detects a short to ground on the (T752) Engine Starter Control circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND
(T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine several times.

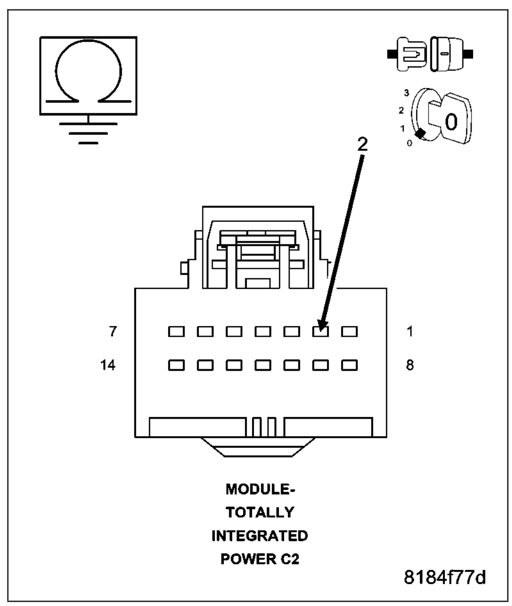
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (T752) STARTER CONTROL CIRCUIT SHORTED TO GROUND

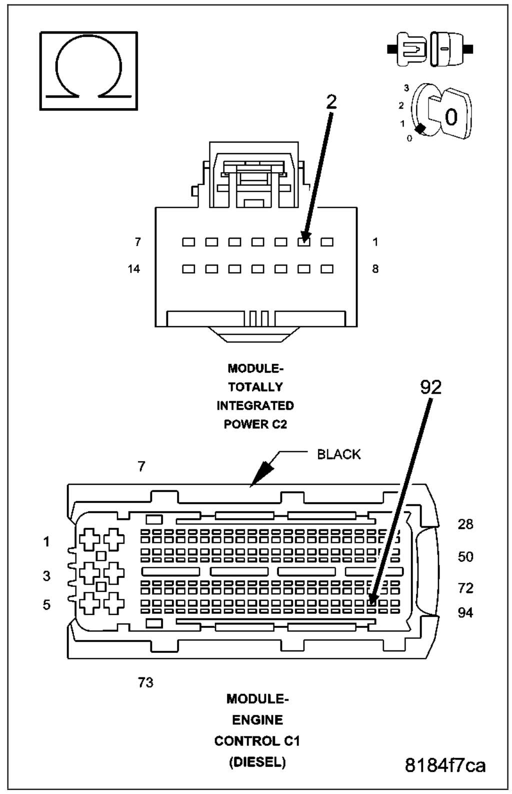
Turn the ignition off.

Disconnect the TIPM C2 harness connector.

Disconnect the Engine Control Module (ECM) harness connectors.

Measure the resistance between ground and the (T752) Starter Control circuit in the TIPM harness connector.

Is the resistance above 10k ohms?



Yes >> Go to 3

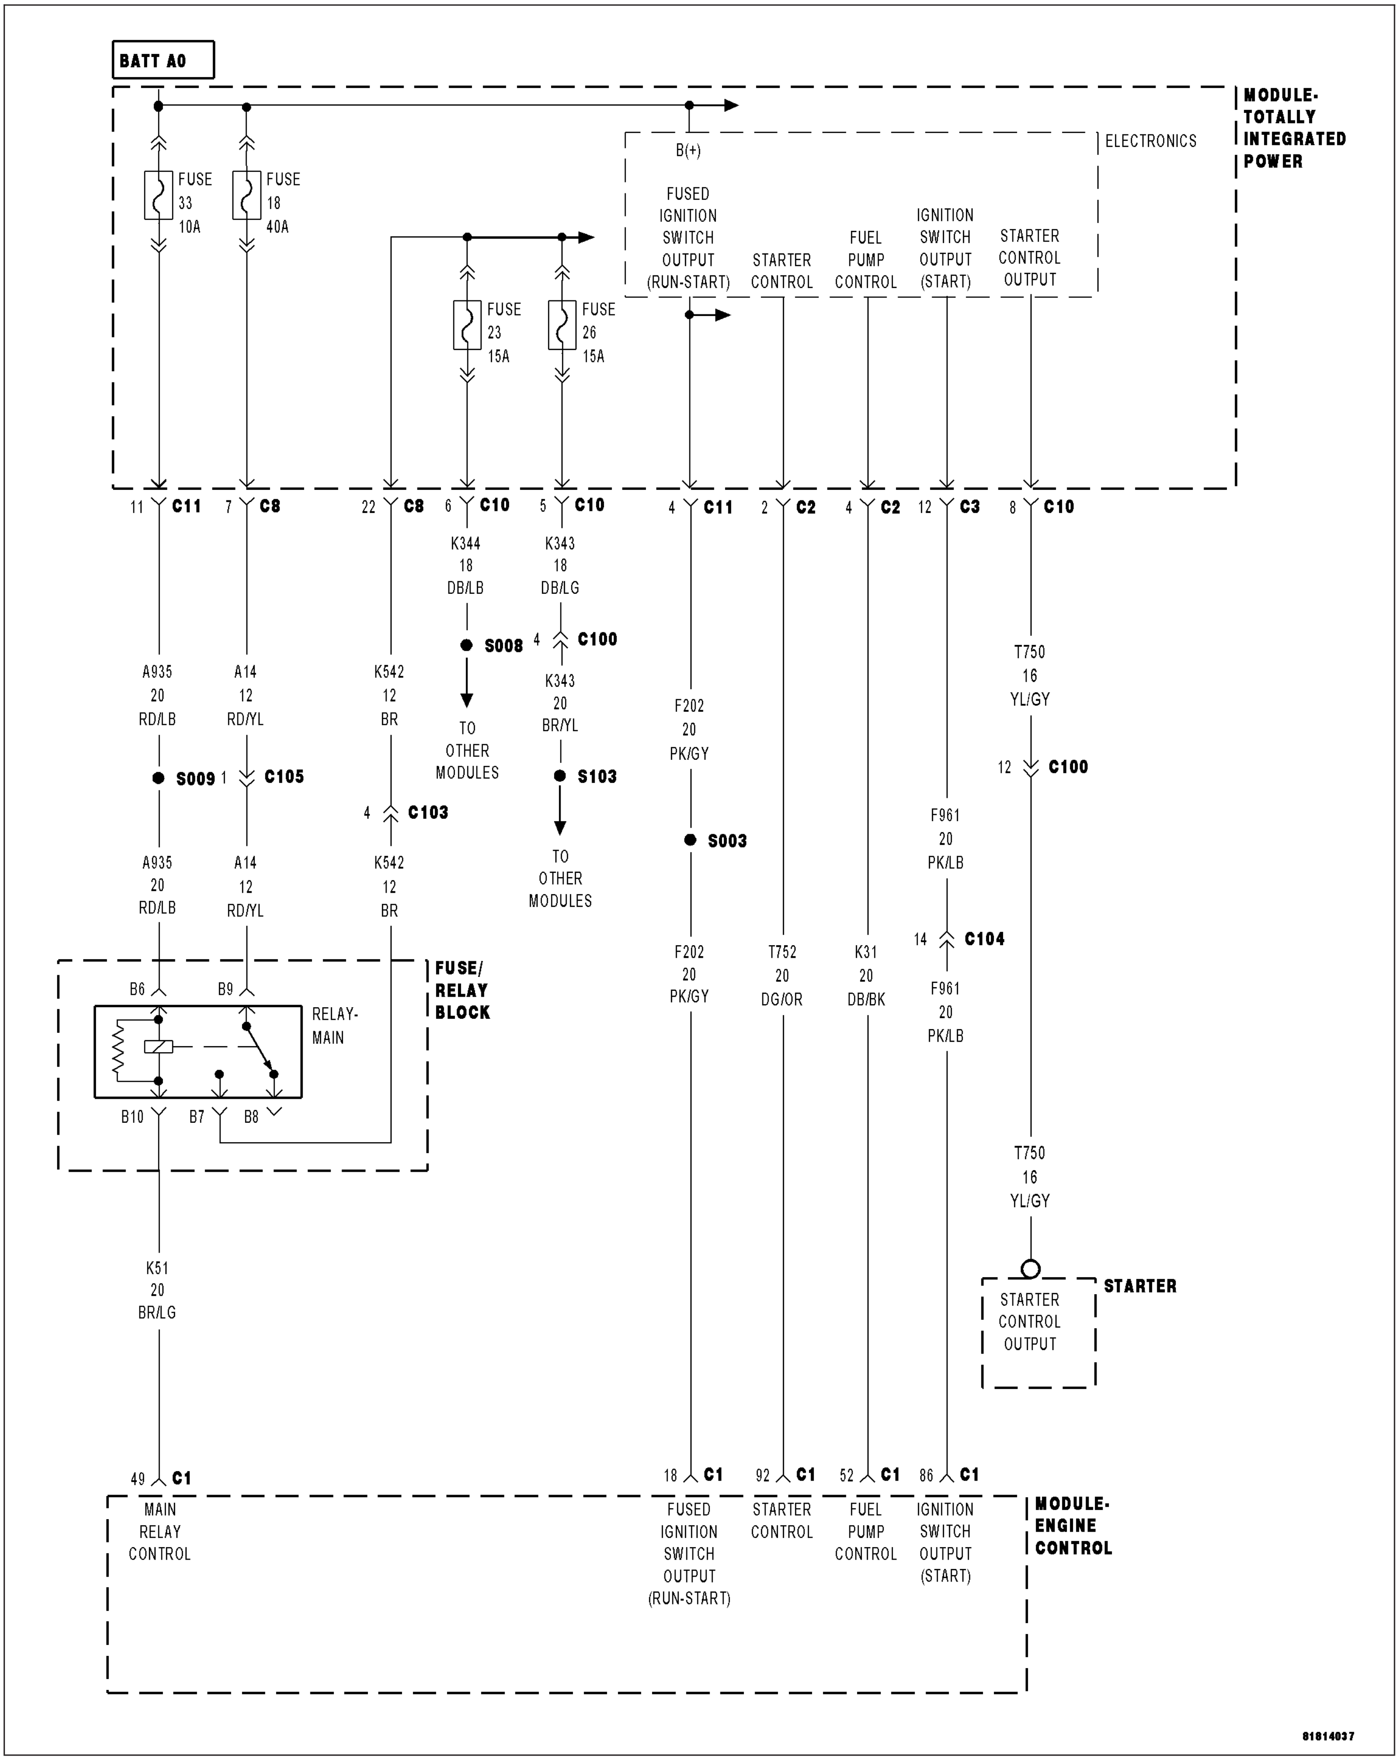
No >> Repair the (T752) Starter Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T752) Starter Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace and program the TIPM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (T752) Starter Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0617-STARTER CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Starter command on.
- **Set Condition:**
  The ECM detects a short circuit on the (T752) Engine Starter Control circuit for at 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(T752) STARTER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(T752) STARTER RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine several times.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

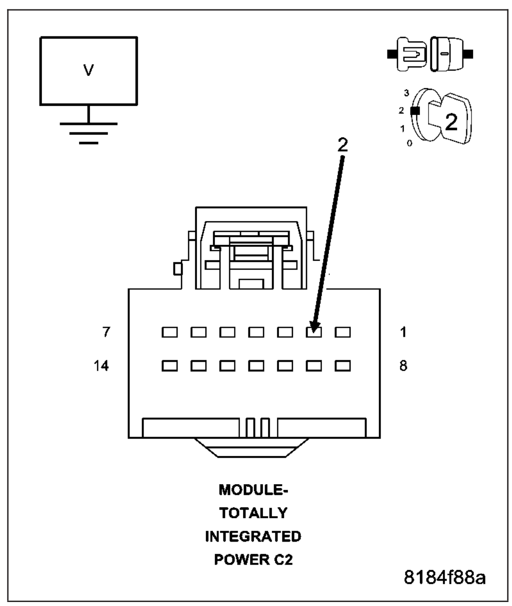
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (T752) STARTER CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C2 harness connector.



Disconnect the ECM harness connectors.

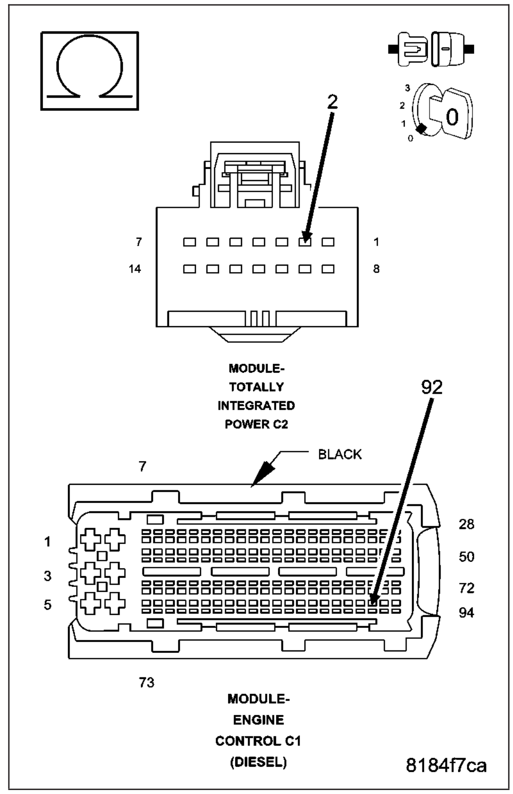
Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (T752) Starter Control circuit in the TIPM harness connector.

Is there any voltage present?



Yes >> Repair the (T752) Starter Control circuit for a short to voltage.

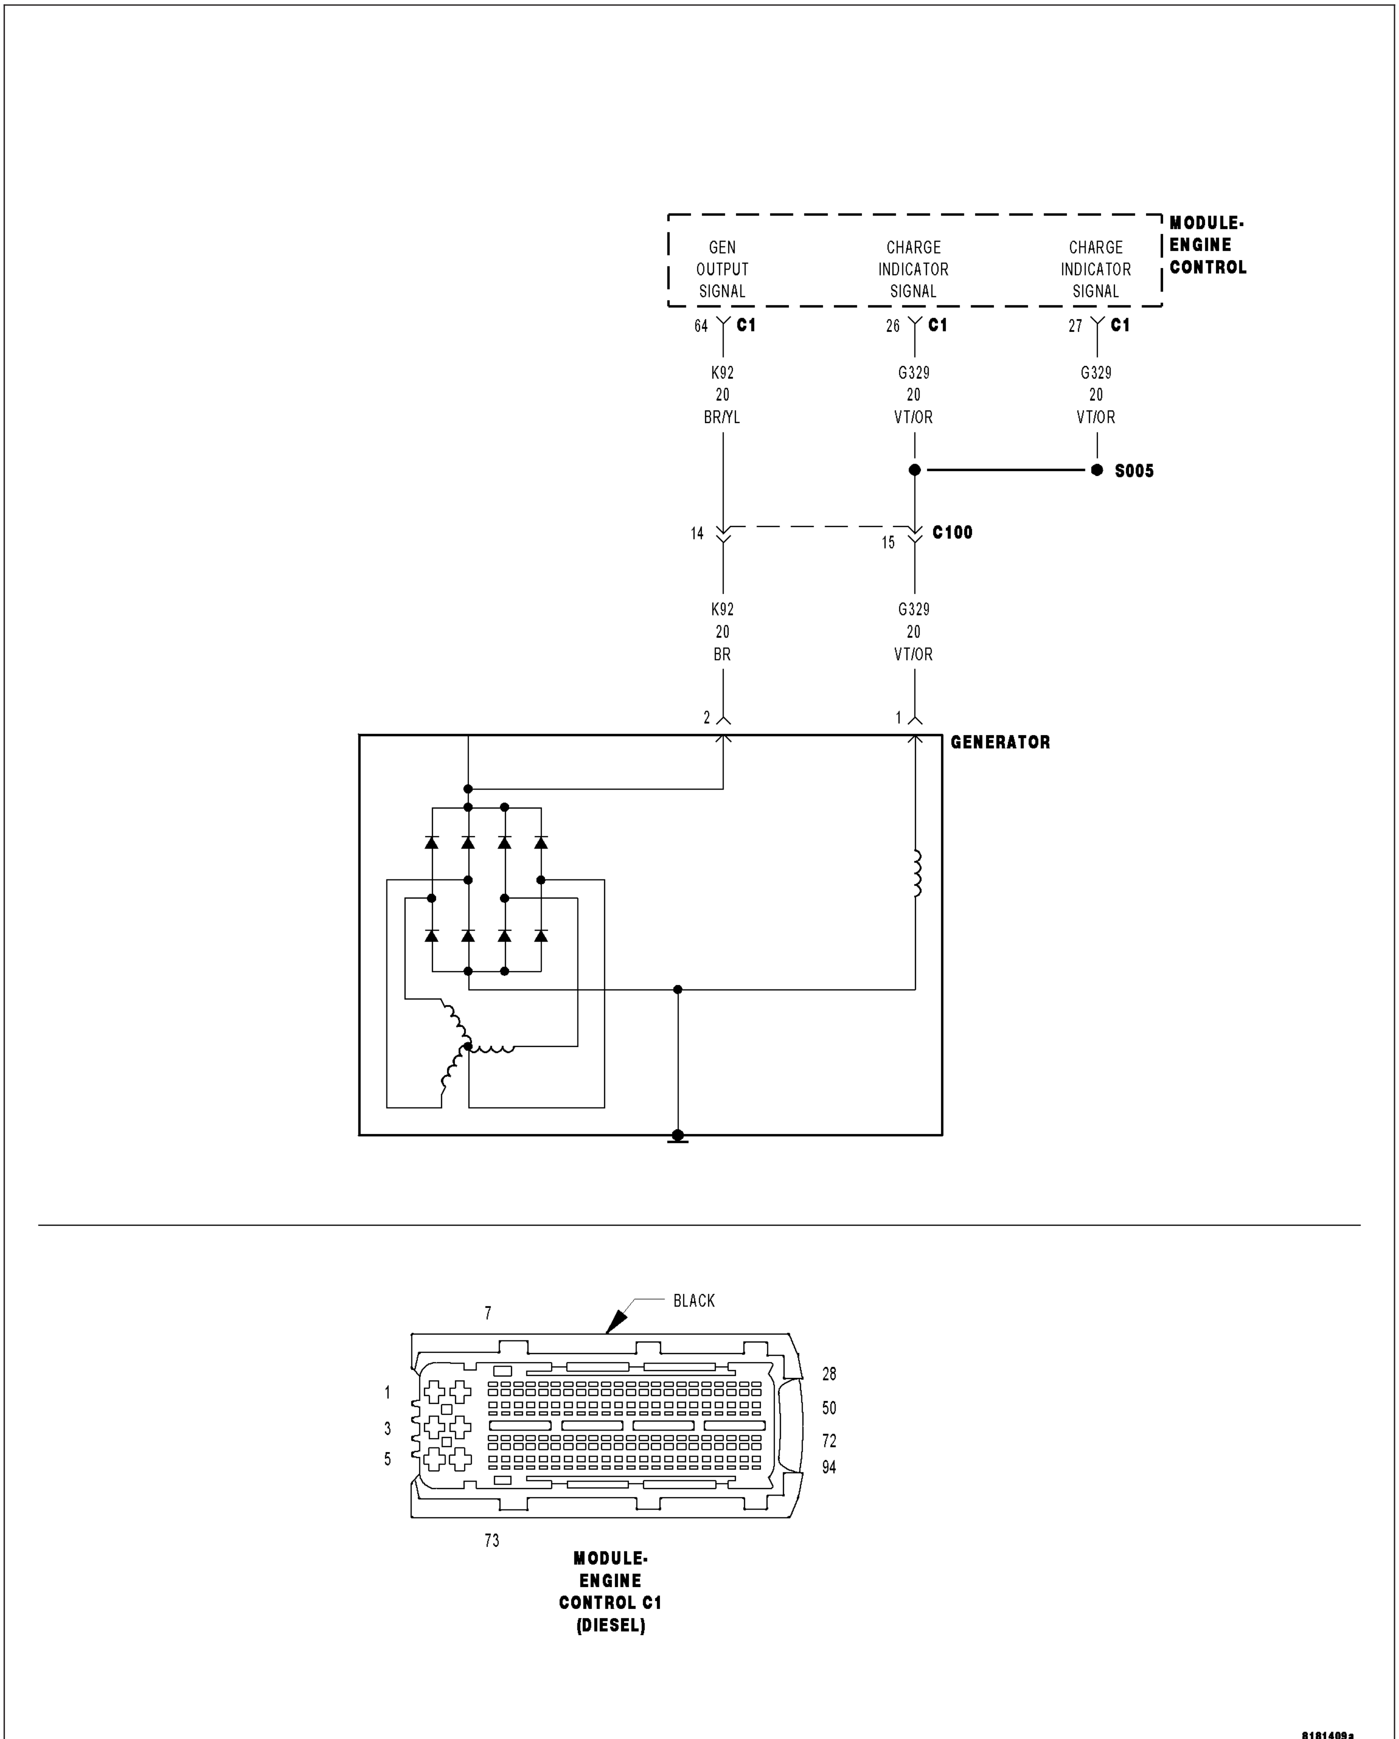
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (T752) STARTER CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (T752) Starter Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace and program the TIPM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (T752) Starter Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0621-GENERATOR LAMP/L-TERMINAL CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects an open or short to ground on the Charge Indicator Signal circuit.

Possible Causes
INTERMITTENT DTC
(G329) CHARGE INDICATOR SIGNAL CIRCUIT SHORTED TO GROUND
(G329) CHARGE INDICATOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

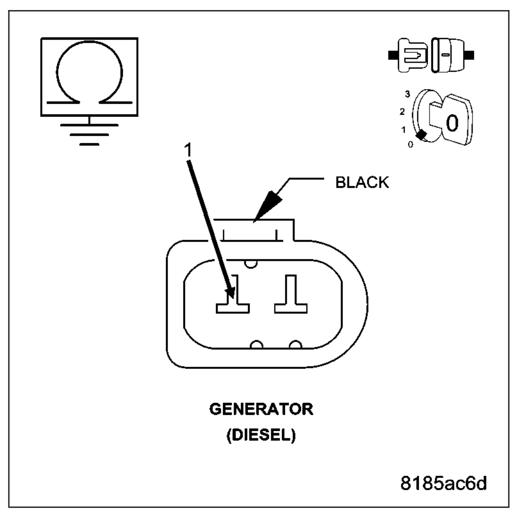
No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (G329) CHARGE INDICATOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Generator harness connector.

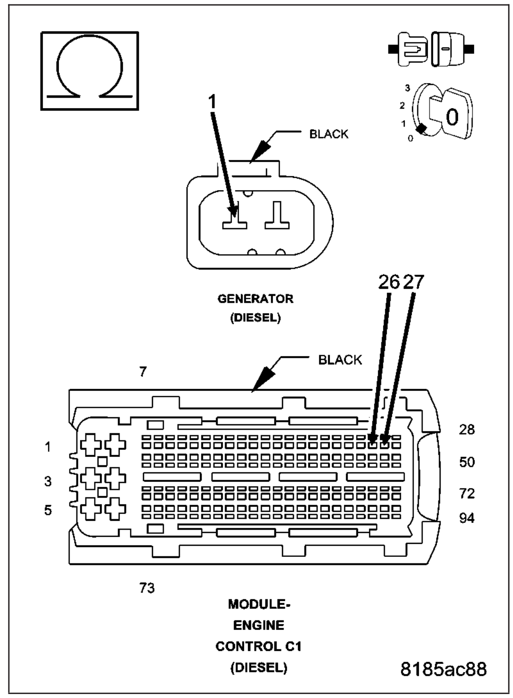
Disconnect the Engine Control Module (ECM) harness connector.



Measure the resistance between ground and the (G329) Charge Indicator Signal circuit in the Generator harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 3



No >> Repair the (G329) Charge Indicator Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (G329) CHARGE INDICATOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (G329) Charge Indicator Signal circuit between the Generator harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (G329) Charge Indicator Signal circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. GENERATOR

Turn the ignition off.

Replace the Generator.

With the scan tool, Clear DTCs.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 5

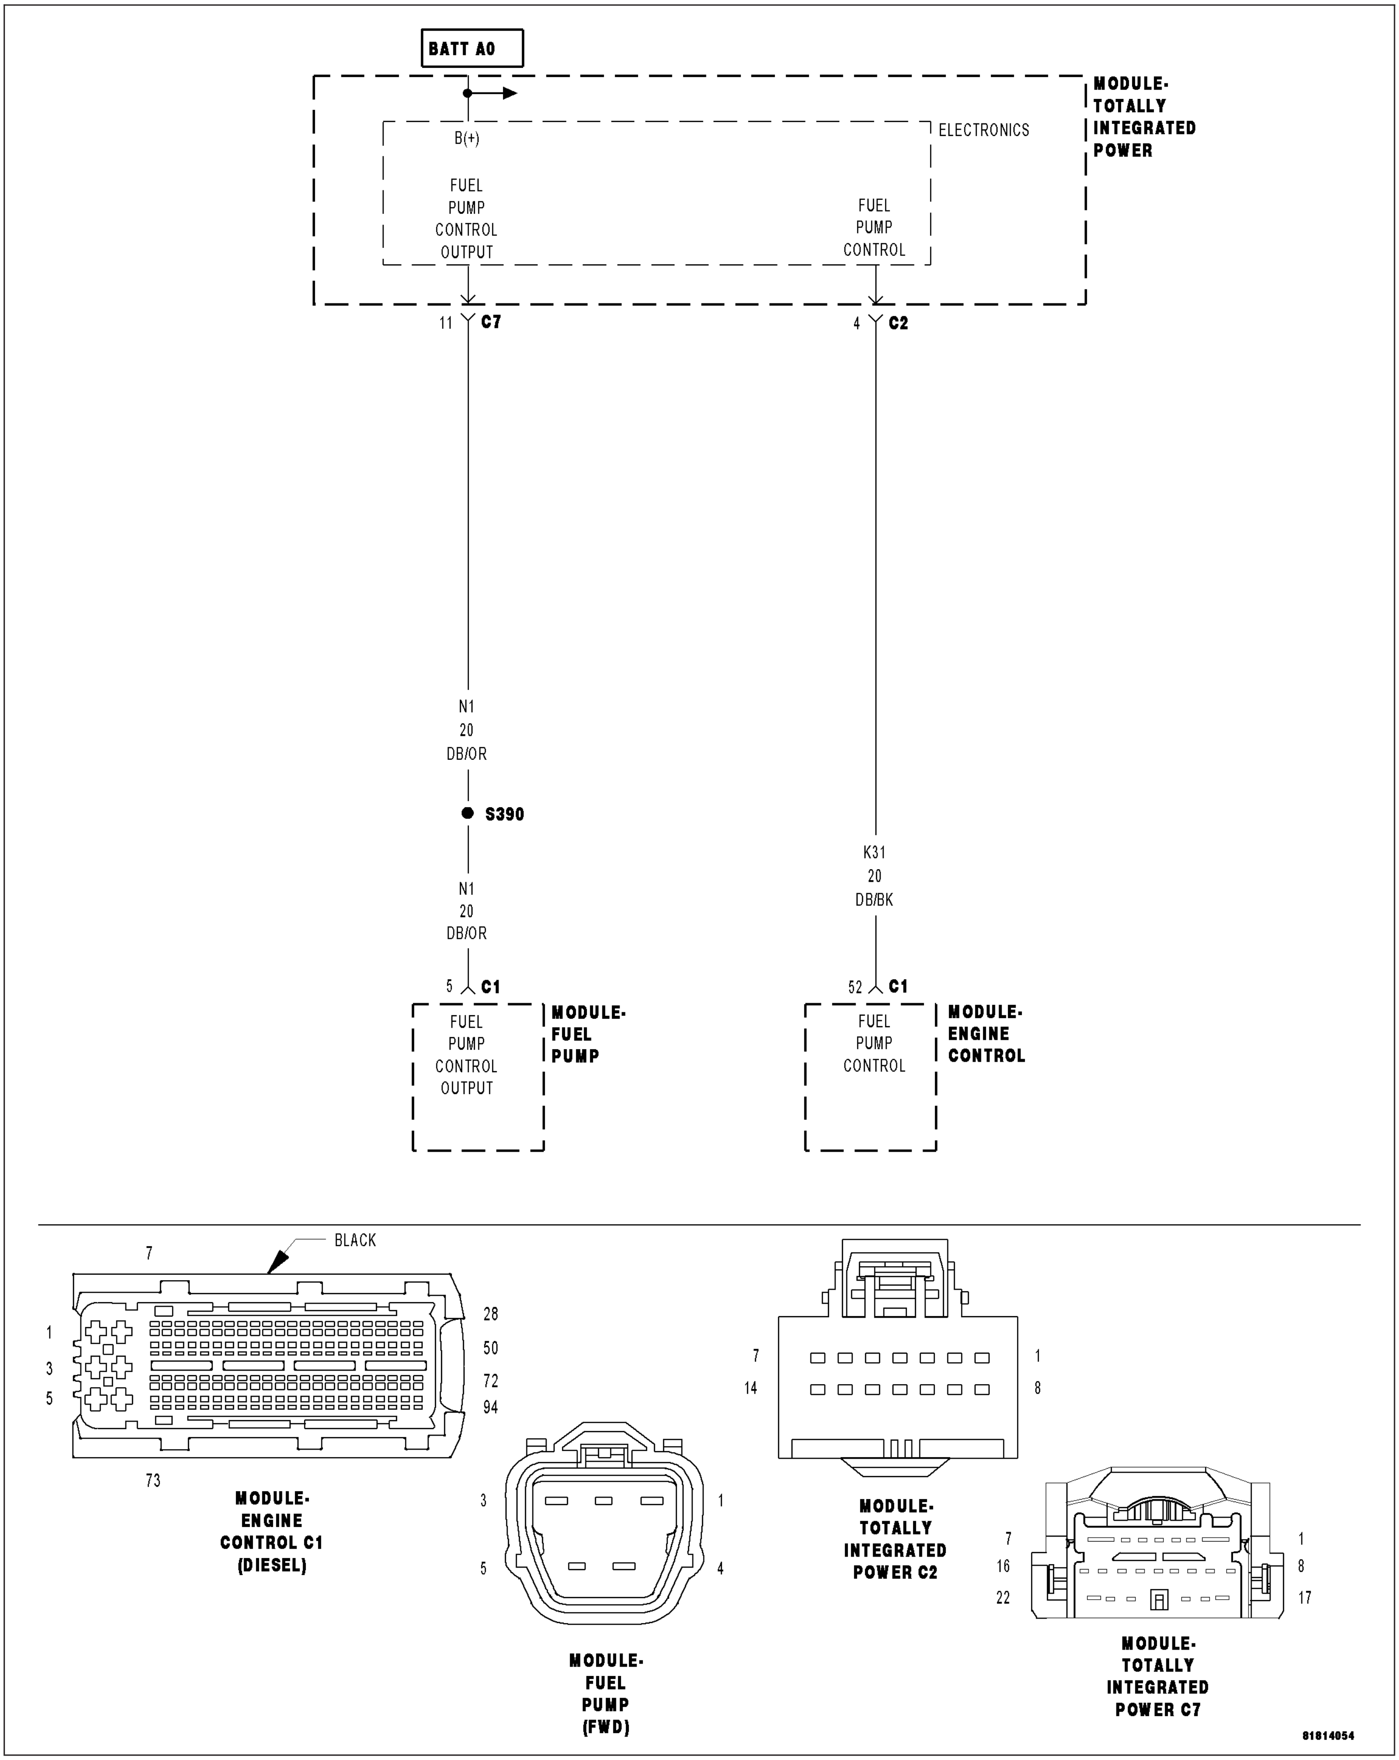
No >> Test complete
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0627-FUEL PUMP CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Fuel Pump command off.
- **Set Condition:**
  The ECM does not detect voltage on the (K31) Fuel Pump Control circuit for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Pump.

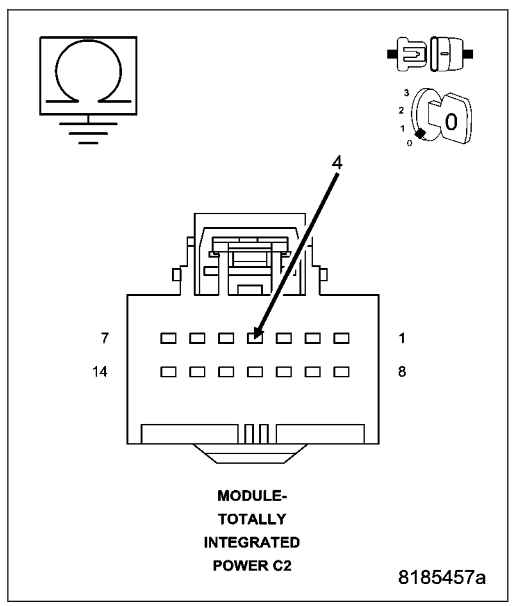
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND

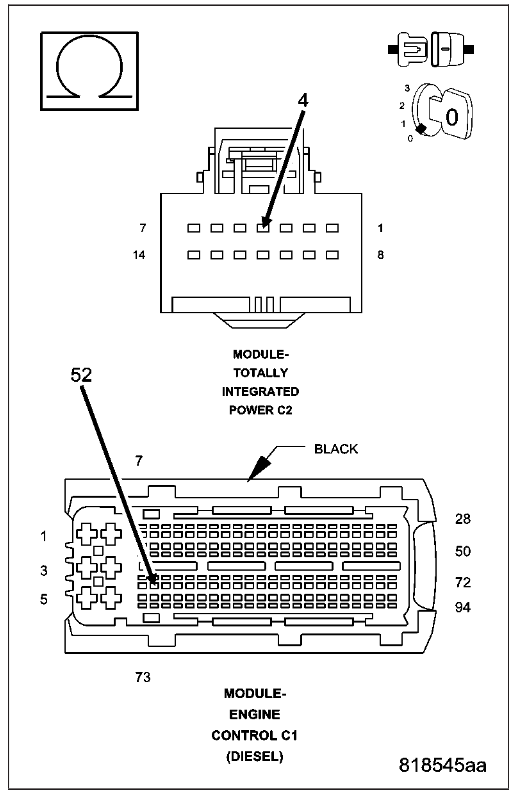
Turn the ignition off.

Disconnect the TIPM C2 harness connector.

Disconnect the Engine Control Module (ECM) harness connectors.

Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the TIPM harness connector.

Is the resistance above 10k ohms?



Yes >> Go to 3

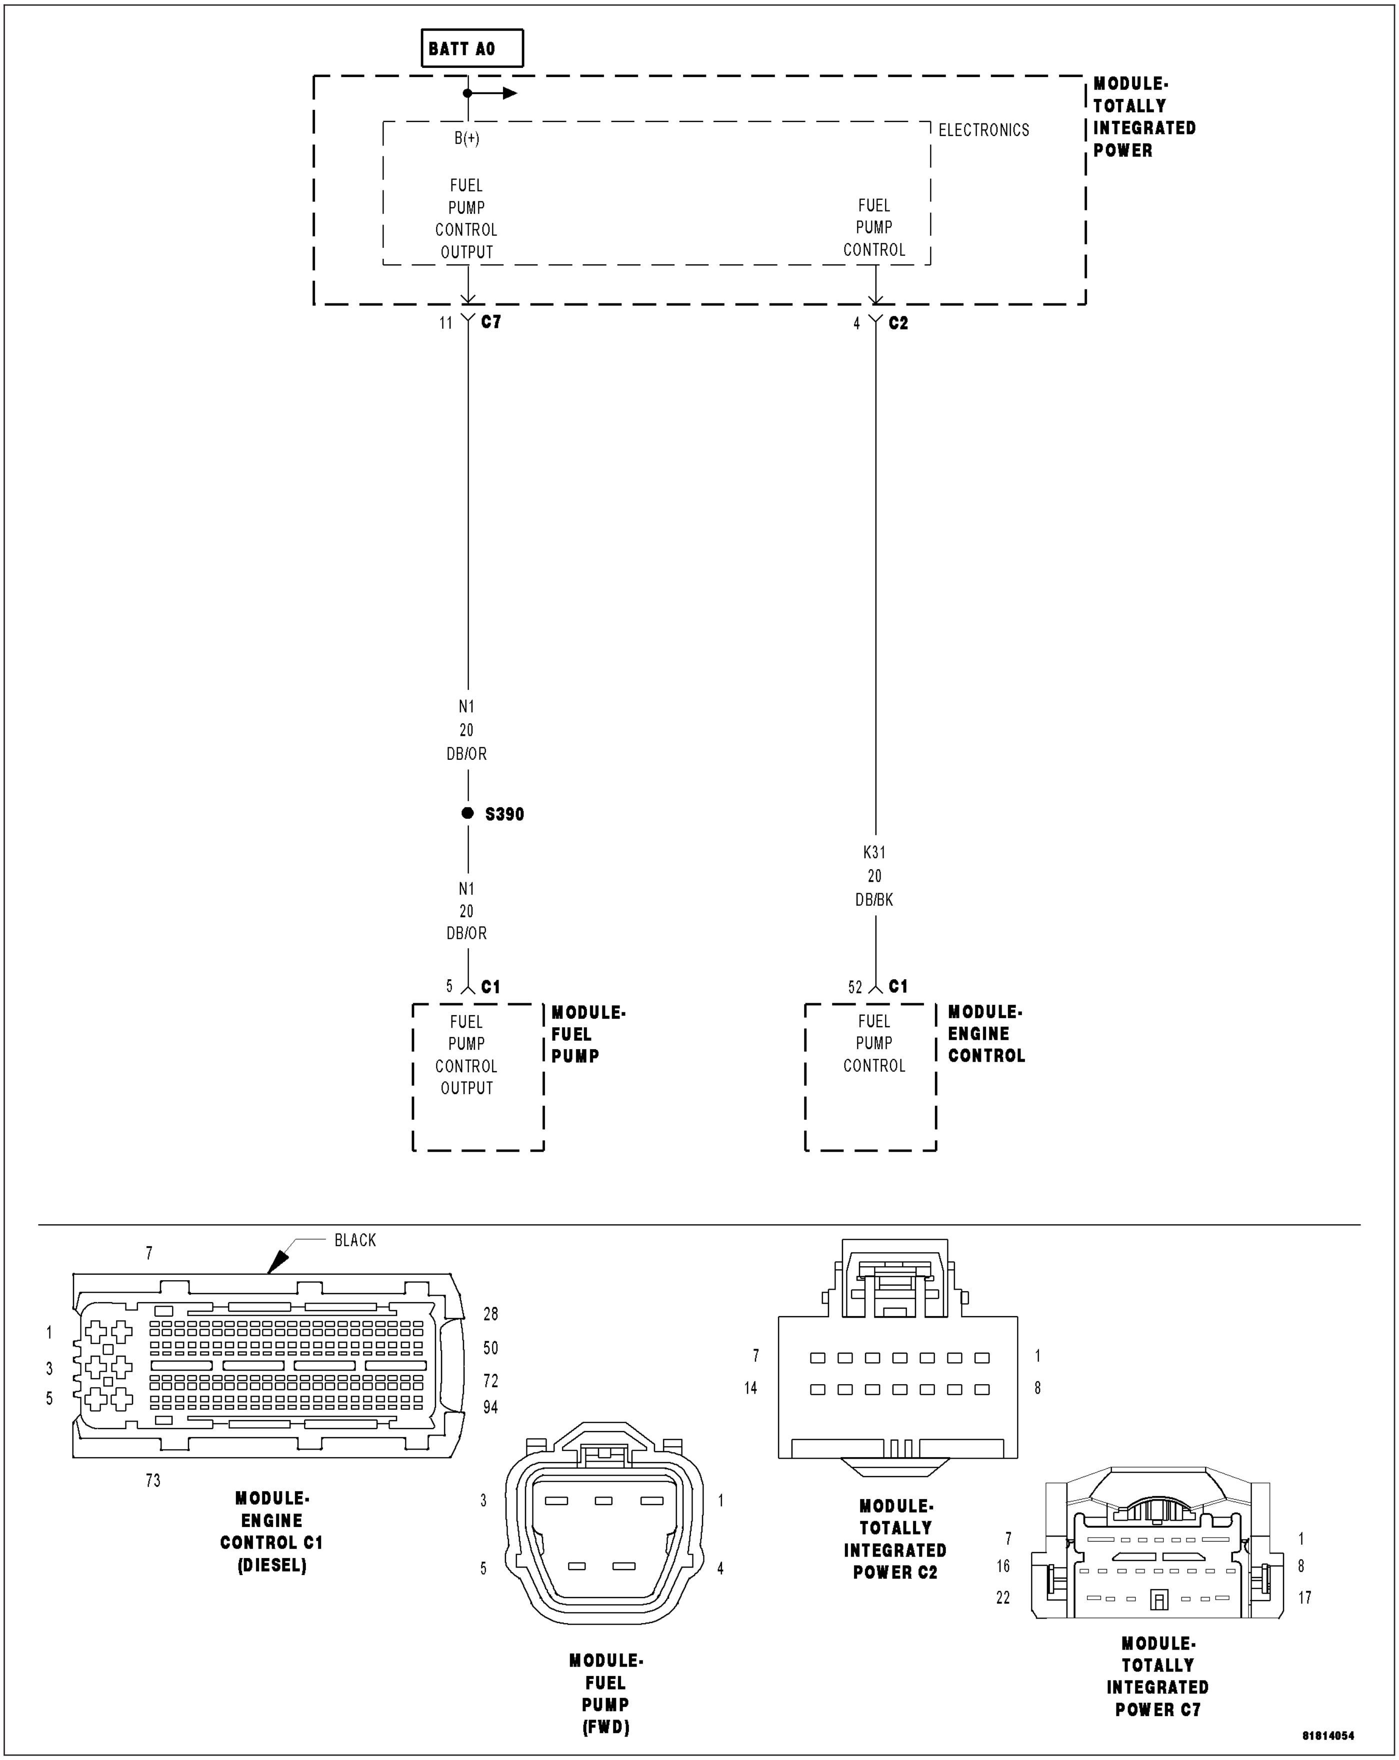
No >> Repair the (K31) Fuel Pump Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace and program the TIPM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0628-FUEL PUMP CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Fuel Pump command off.
- **Set Condition:**
  The ECM detects a short to ground on the (K31) Fuel Pump Control circuit for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND
(K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Fuel Pump.

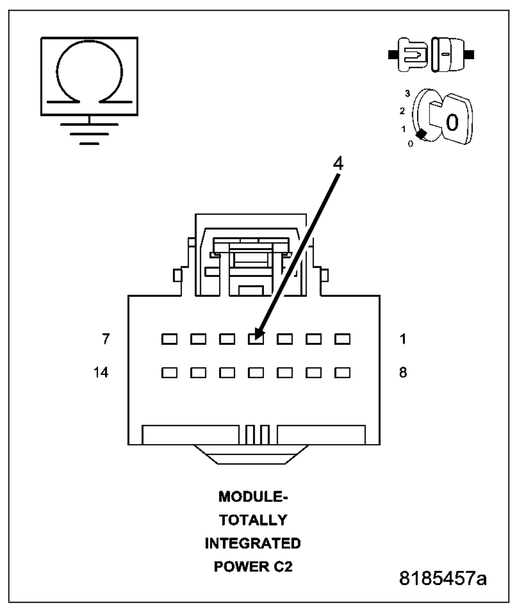
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO GROUND

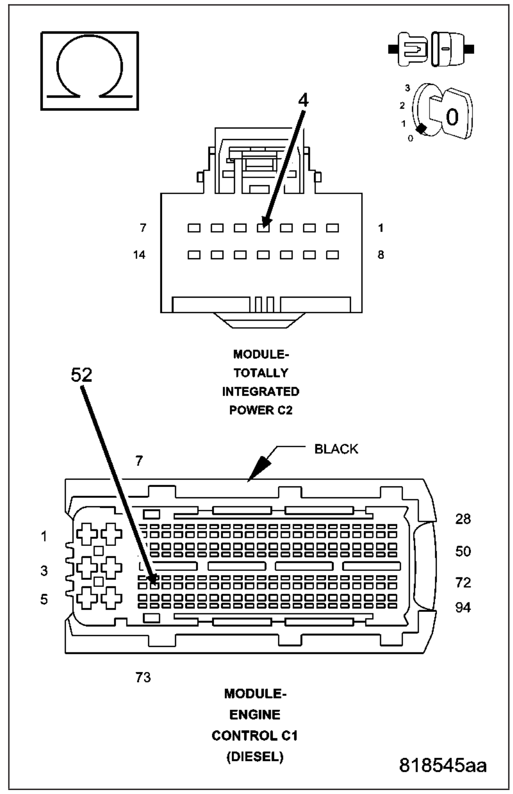
Turn the ignition off.

Disconnect the TIPM C2 harness connector.

Disconnect the Engine Control Module (ECM) harness connectors.

Measure the resistance between ground and the (K31) Fuel Pump Control circuit in the TIPM harness connector.

Is the resistance above 10k ohms?



Yes >> Go to 3

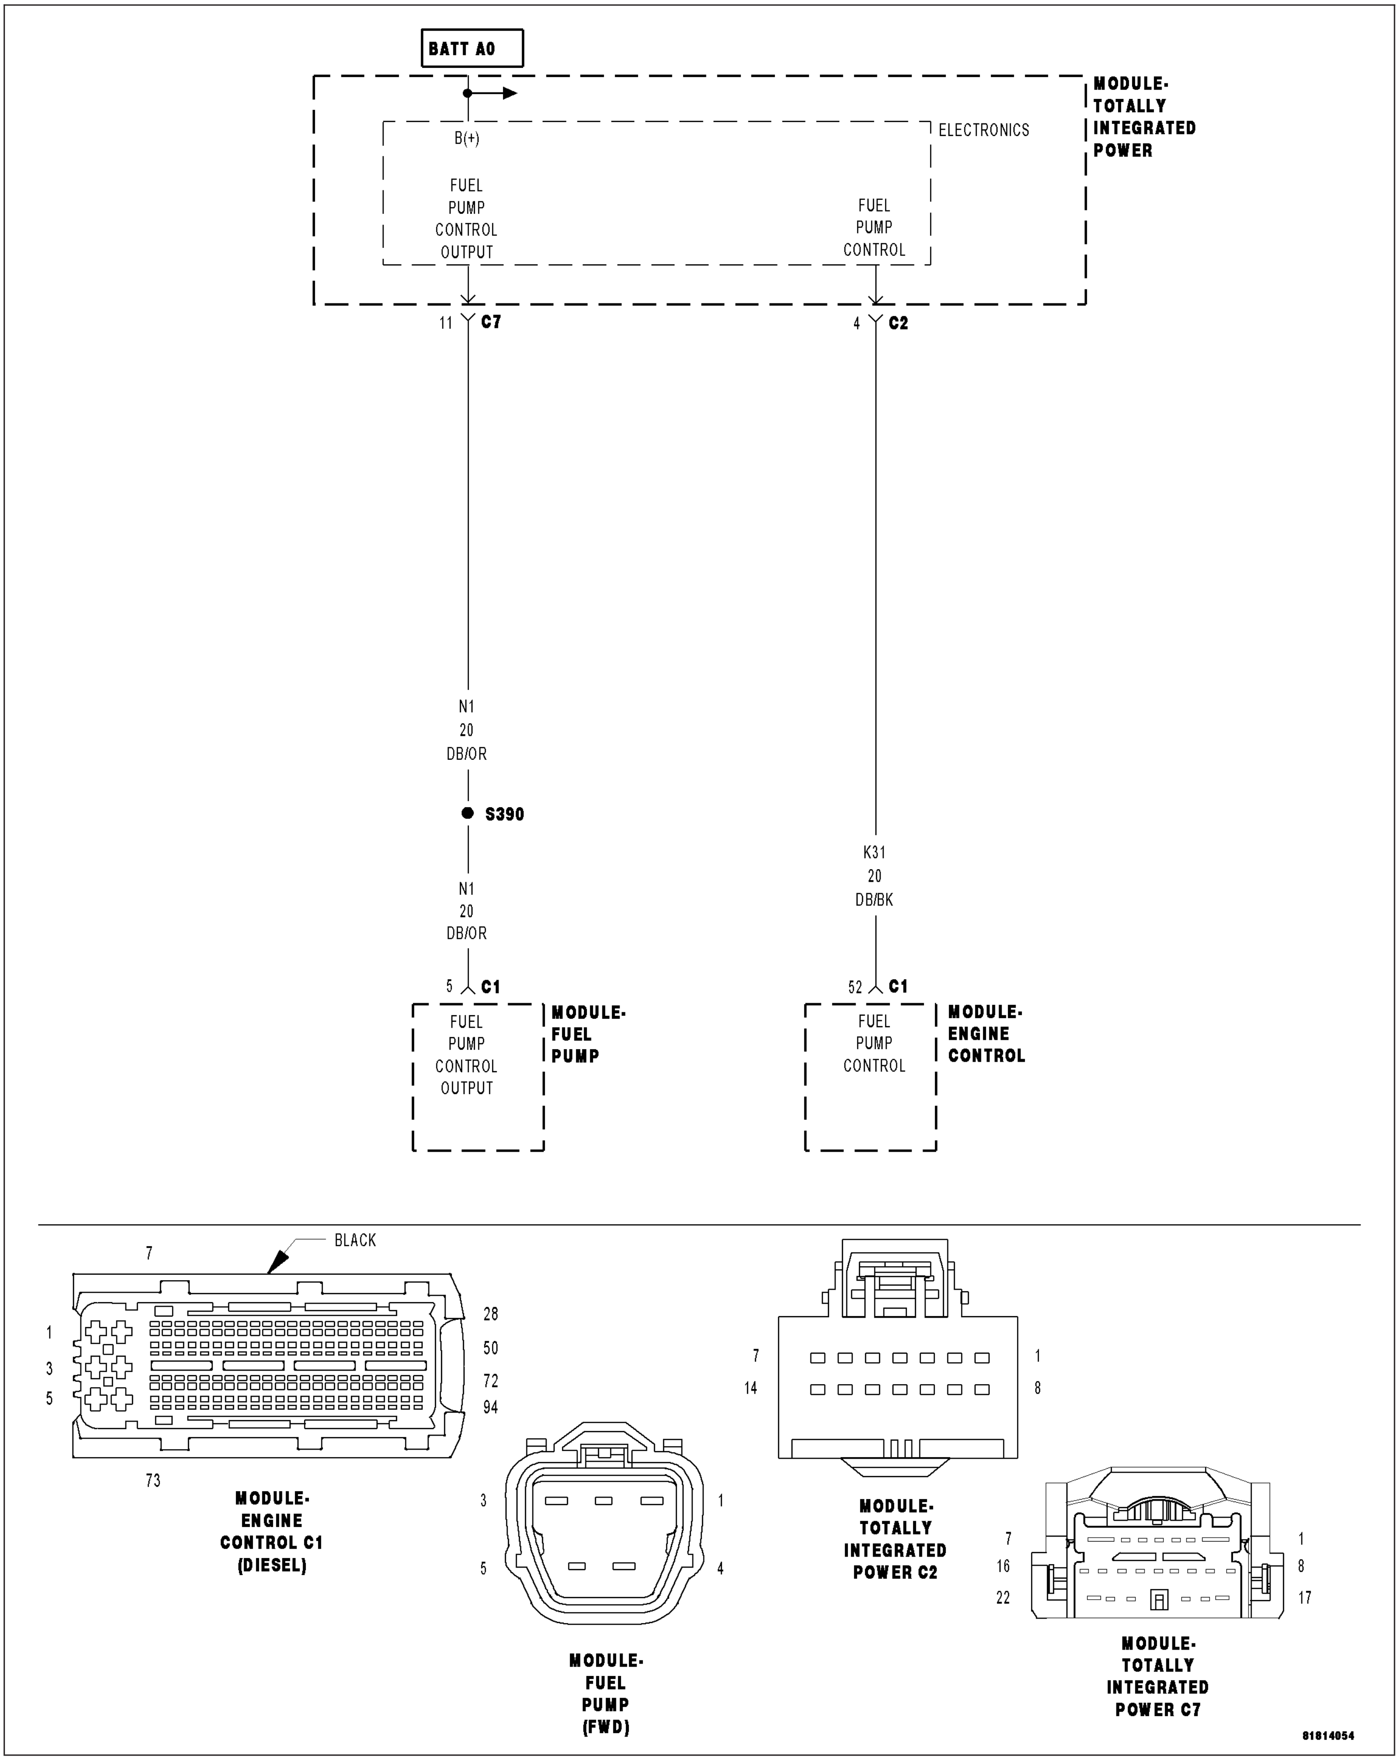
No >> Repair the (K31) Fuel Pump Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?



Yes >> Replace and program the TIPM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0629-FUEL PUMP CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Fuel Pump Relay command on.
- **Set Condition:**
  The ECM detects a short circuit on the (K31) Fuel Pump Relay Control circuit for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(K31) FUEL PUMP RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(K31) FUEL PUMP RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
TOTALLY INTEGRATED POWER MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

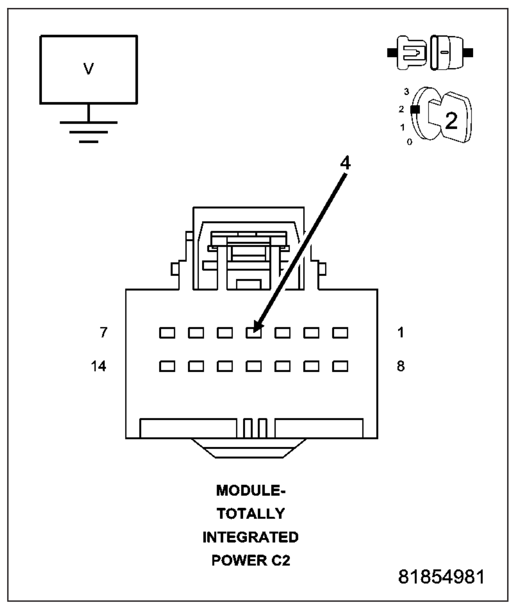
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K31) FUEL PUMP CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the TIPM C2 harness connector.



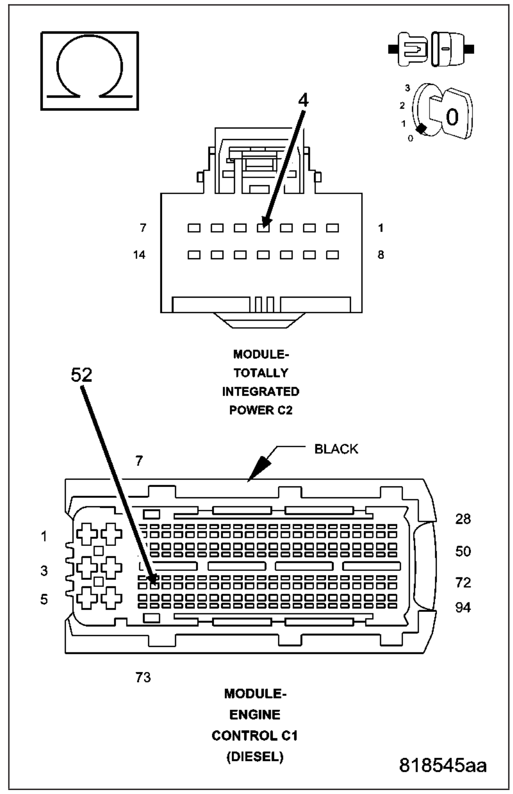
Disconnect the ECM harness connectors.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K31) Fuel Pump Control circuit in the TIPM harness connector.



Is there any voltage present?

Yes >> Repair the (K31) Fuel Pump Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K31) FUEL PUMP CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K31) Fuel Pump Control circuit between the TIPM harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Replace and program the TIPM in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K31) Fuel Pump Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P062F — INTERNAL CONTROL MODULE EEPROM ERROR

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Engine Control Module (ECM) detects an internal failure.

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the Engine Control Module (ECM) wiring and connectors.

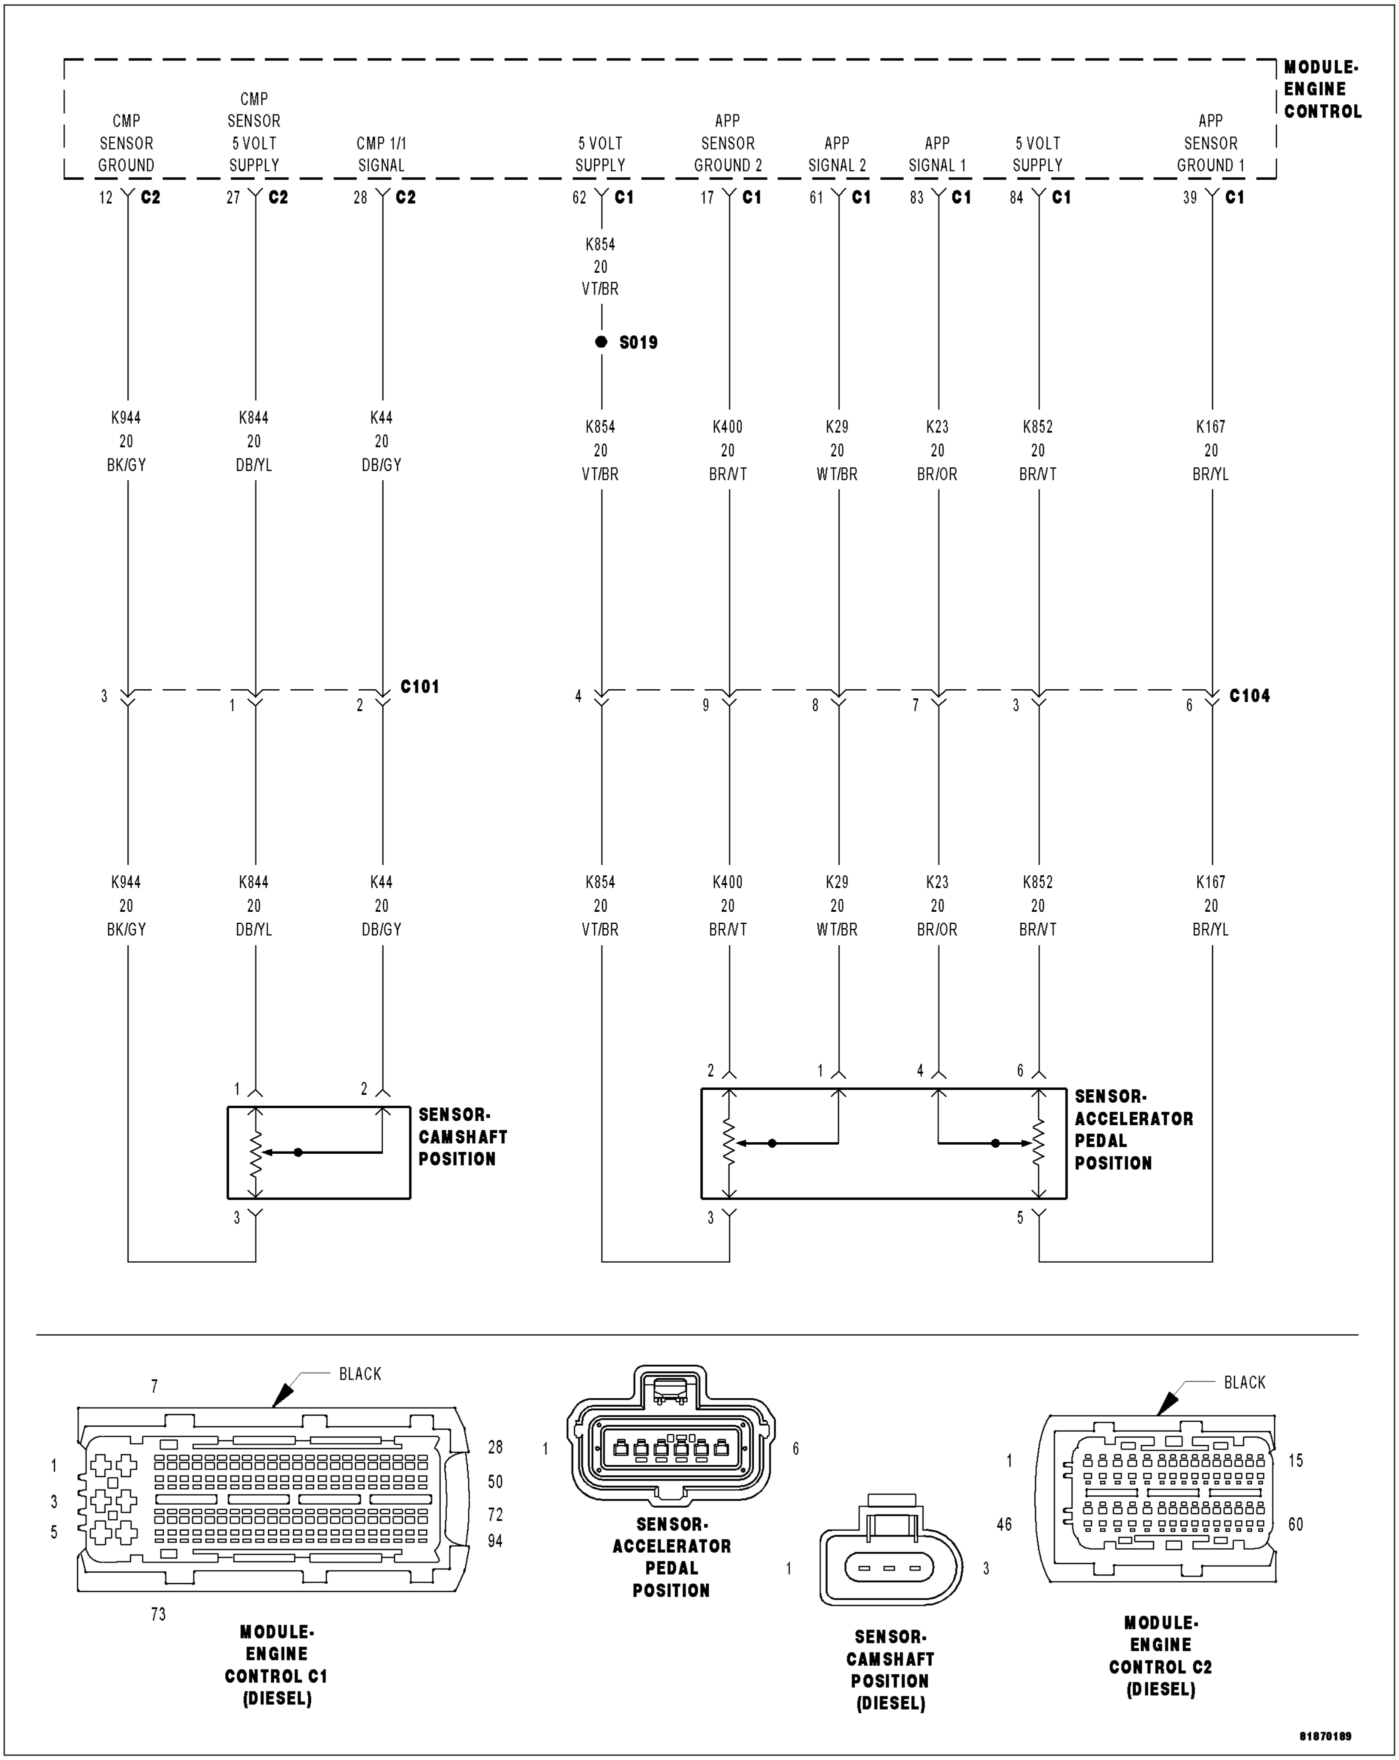
Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Check for proper ECM power supply from the ignition switch and the Main relay. Check the ECM for proper ground supply.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0642-SENSOR REFERENCE VOLTAGE 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects a low voltage on the Sensor Supply #1 circuit for 0.16 second

Possible Causes
INTERMITTENT DTC
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
CAMSHAFT POSITION SENSOR
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 1 provides 5 volts to the Camshaft Position Sensor and the Accelerator Pedal Position Sensor No. 1.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off for 10 seconds.

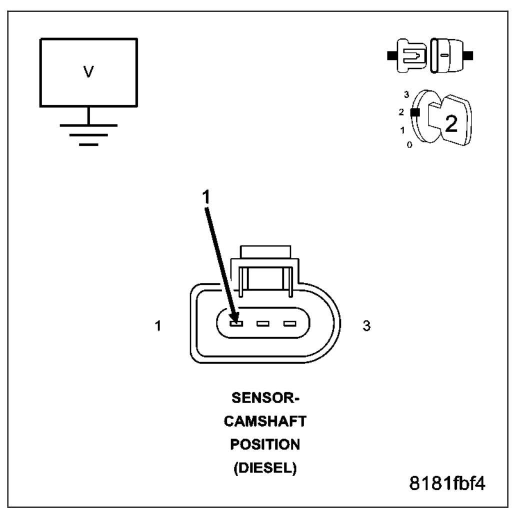
Turn the ignition on.

With the scan tool, View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. CAMSHAFT POSITION SENSOR

Turn the ignition off.

Disconnect the Camshaft Position Sensor harness connector.

Turn the ignition on.

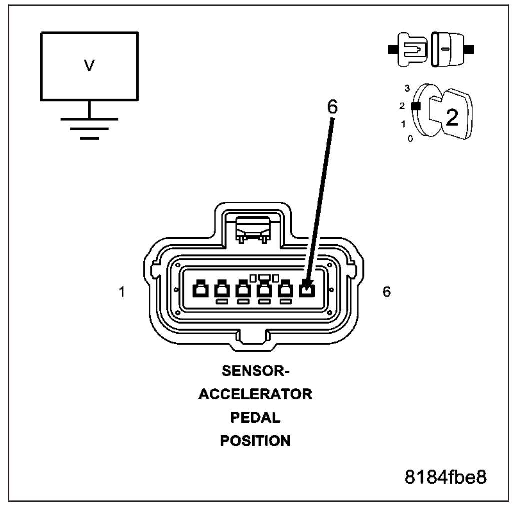
Measure the voltage of the (K844) Camshaft Position Sensor 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes >> Replace the Camshaft Position Sensor.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 3



3. ACCELERATOR PEDAL POSITION SENSOR NO. 1

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

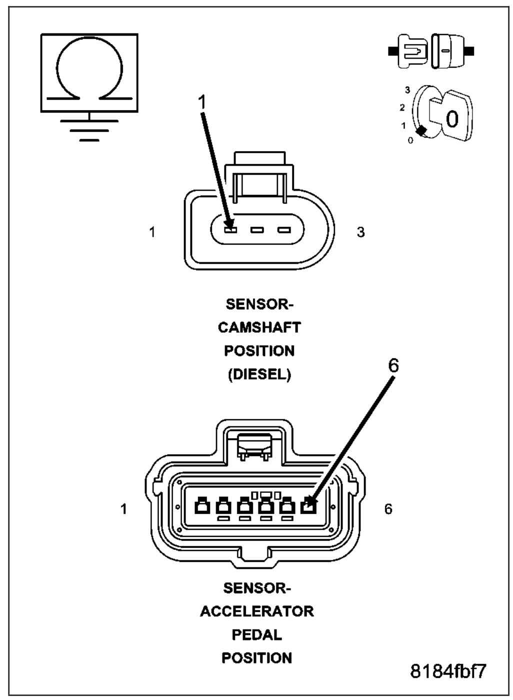
Measure the voltage of the (K852) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit.

Is the voltage above 4.6 volts?

Yes >> Replace the Accelerator Pedal Position Sensor.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4



4. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (K844) Camshaft Position Sensor 5 Volt Supply circuit.

Measure the resistance between ground and the (K852) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit.

Is the resistance above 1000 ohms for each circuit?

Yes >> Go To 5

No >> Repair the 5-Volt Supply circuit that measures below 1000 ohms for a short to ground.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ENGINE CONTROL MODULE (ECM)

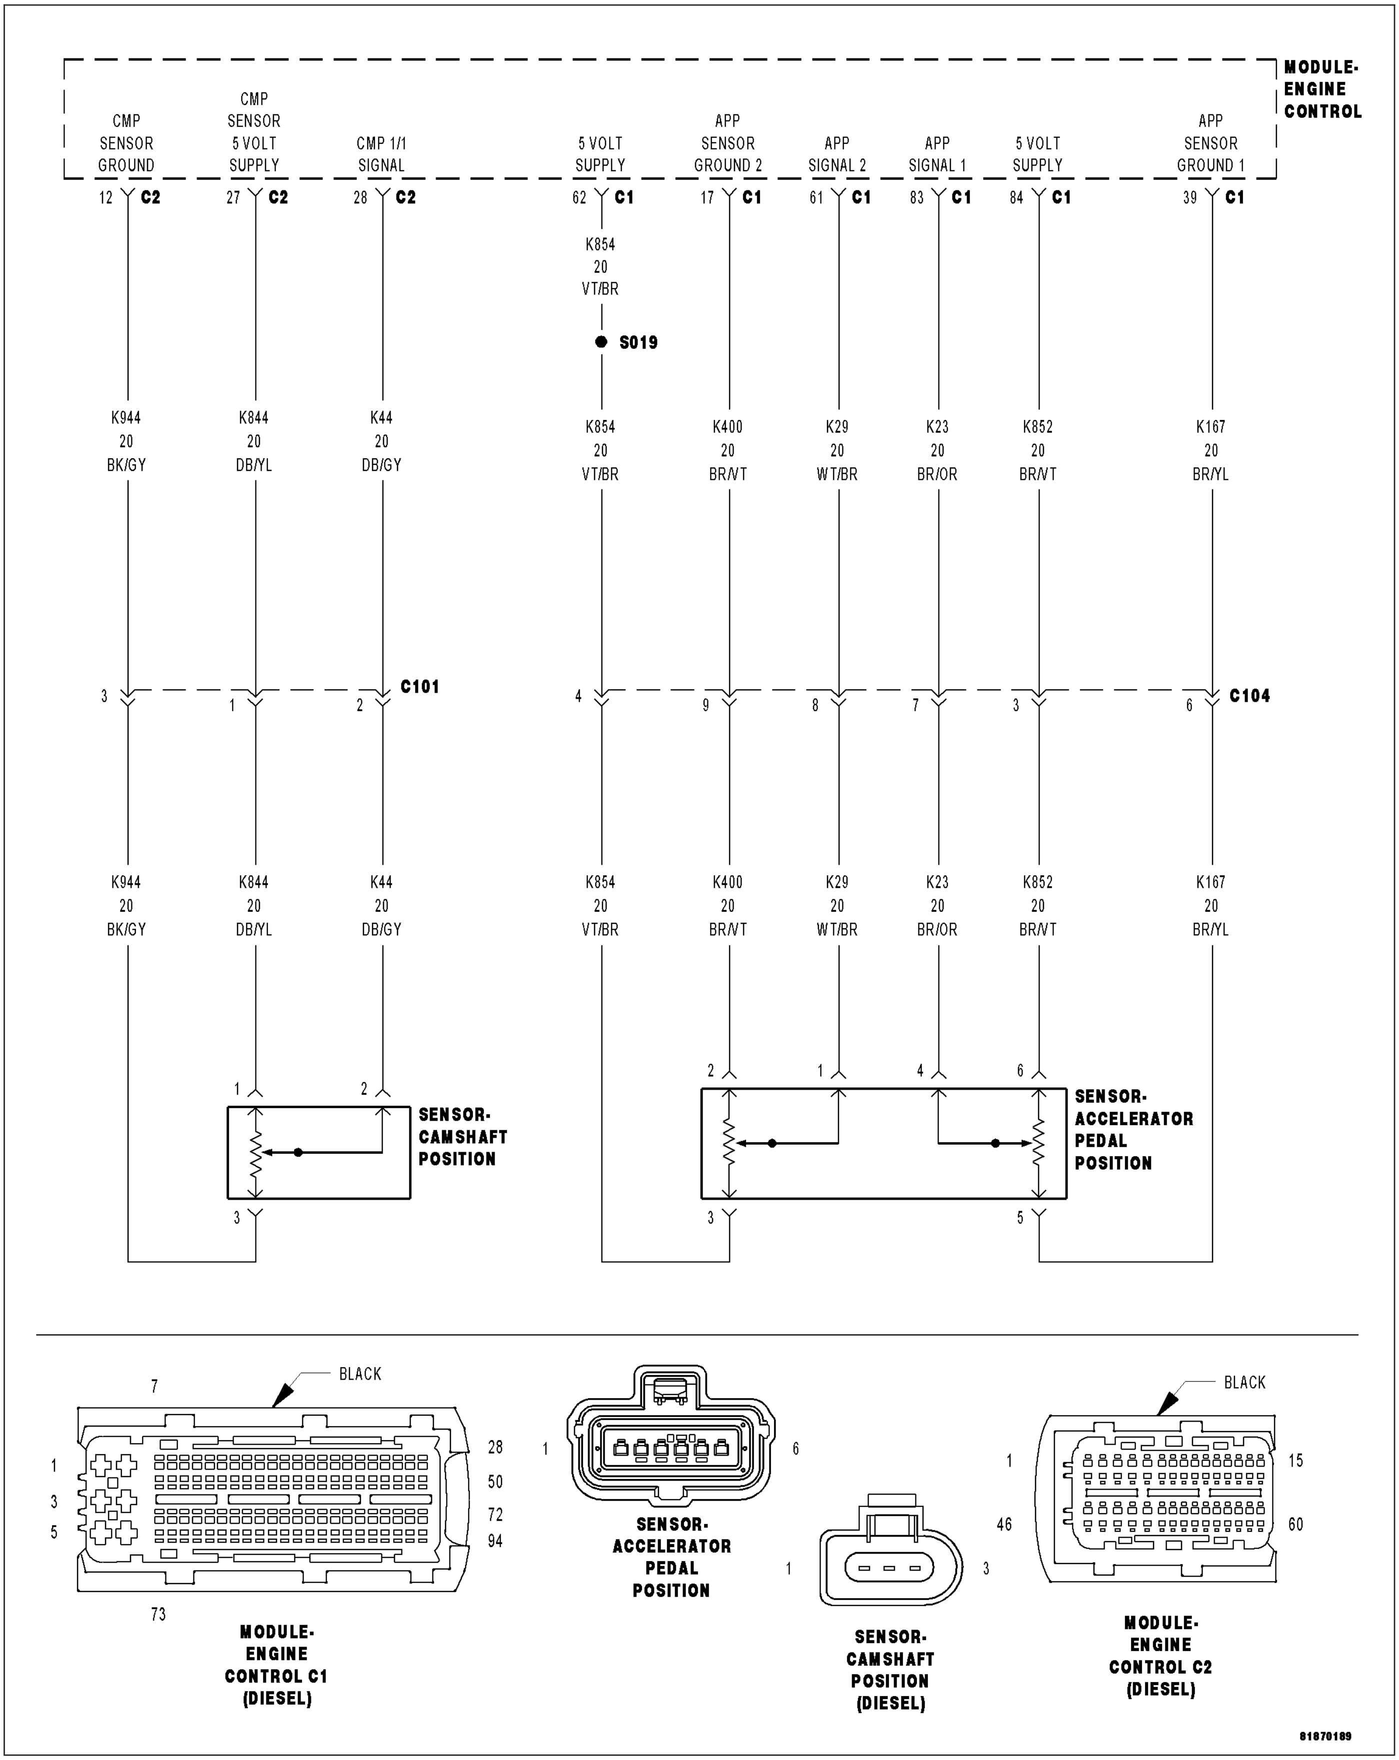
Turn the ignition off.

Inspect the (K844) Camshaft Position Sensor 5 Volt Supply circuit between the Camshaft Position Sensor and the ECM.

Inspect the (K852) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor and the ECM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0643-SENSOR REFERENCE VOLTAGE 1 TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects a short to voltage on the Sensor Supply #1 circuit for 0.16 second.

Possible Causes
INTERMITTENT DTC
(K852) ACCELERATOR PEDAL POSITION NO. 1 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K844) CAMSHAFT POSITION SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 3 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 2 provides 5 volts to the Accelerator Pedal Position Sensor No. 1 and the Camshaft Position Sensor.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off for 10 seconds.

Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

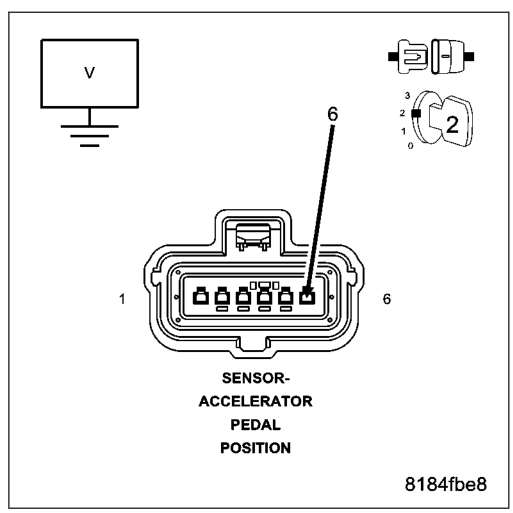
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K852) ACCELERATOR PEDAL POSITION SENSOR NO. 1 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.



Disconnect the ECM harness connectors.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

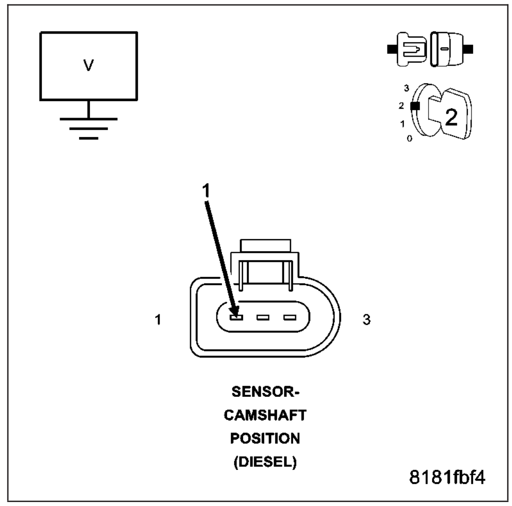
Measure the voltage on the (K852) Accelerator Pedal Position Sensor No. 1 5-Volt Supply circuit.

Is the voltage below 1.0 volt?

Yes >> Go To 3

No >> Repair the (K852) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit for a short to voltage.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



3. (K844) CAMSHAFT POSITION SENSOR 5-VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Camshaft Position Sensor harness connector.

Turn the ignition on.

Measure the voltage on the (K844) Camshaft Position Sensor 5 Volt Supply circuit.

Is the voltage below 1.0 volt?

Yes >> Go To 4

No >> Repair the (K844) Camshaft Position Sensor 5 Volt Supply circuit for a short to voltage.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Inspect the (K852) Accelerator Pedal Position Sensor No. 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor and the ECM.

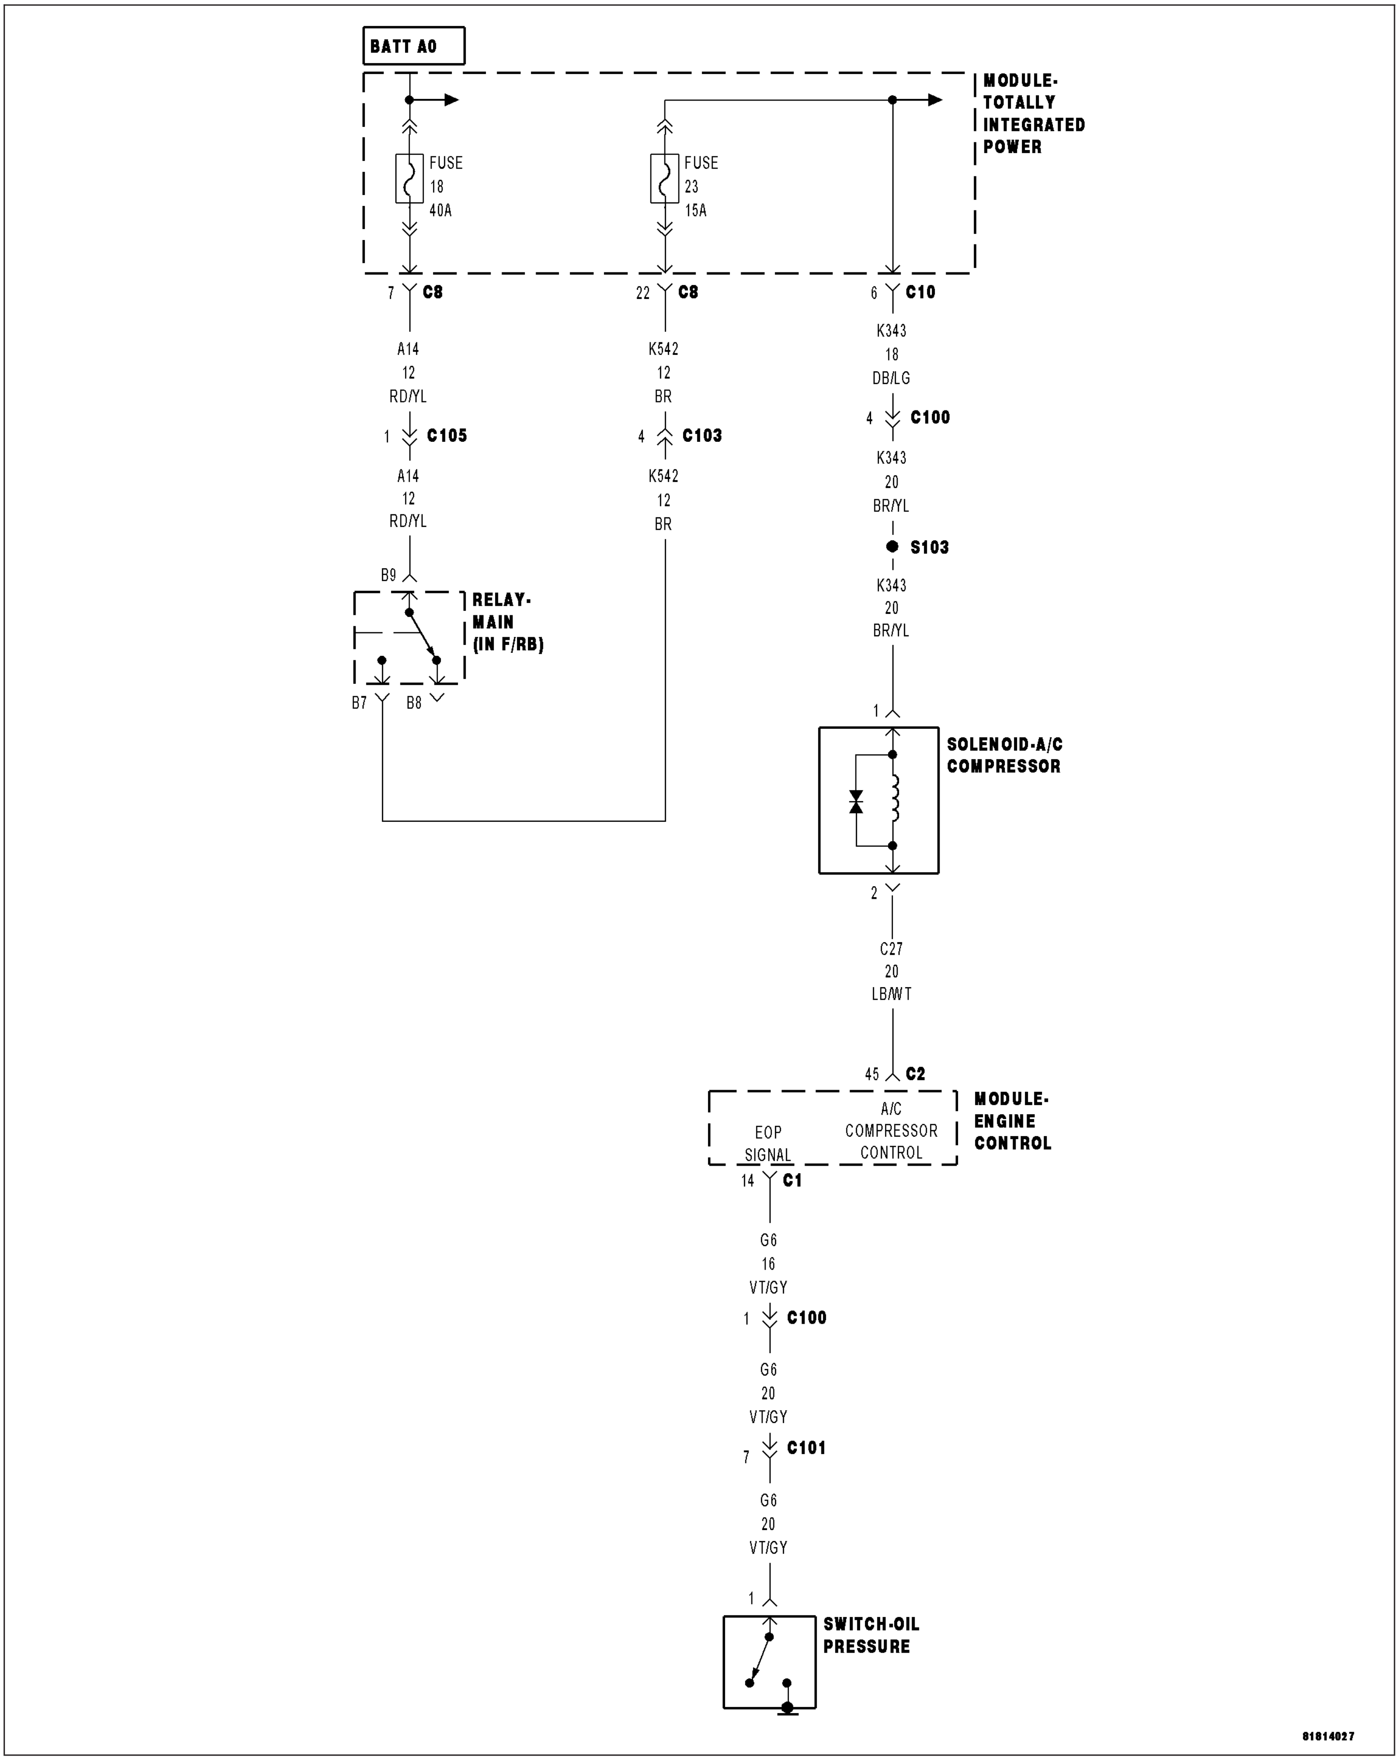
Inspect the (K844) Camshaft Position Sensor 5 Volt Supply circuit between the Camshaft Position Sensor and the ECM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?



Yes >> Repair as necessary.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0645-A/C CLUTCH CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the A/C compressor command off.
- **Set Condition:**
  The ECM does not detect voltage on the (C27) A/C Compressor Control circuit for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND
(C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
A/C COMPRESSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the A/C Compressor.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the A/C Compressor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

Is the resistance above 10.0 ohms?

Yes >> Go to 3

No >> Repair the (C27) A/C Compressor Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C27) A/C Compressor Control circuit between the A/C Compressor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (C27) A/C Compressor Control circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K343) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K343) Fused Main Relay Output circuit in the A/C Compressor harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 5

No >> Repair the (K343) Fused Main Relay Output circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. A/C COMPRESSOR

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, actuate the A/C Compressor.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 6

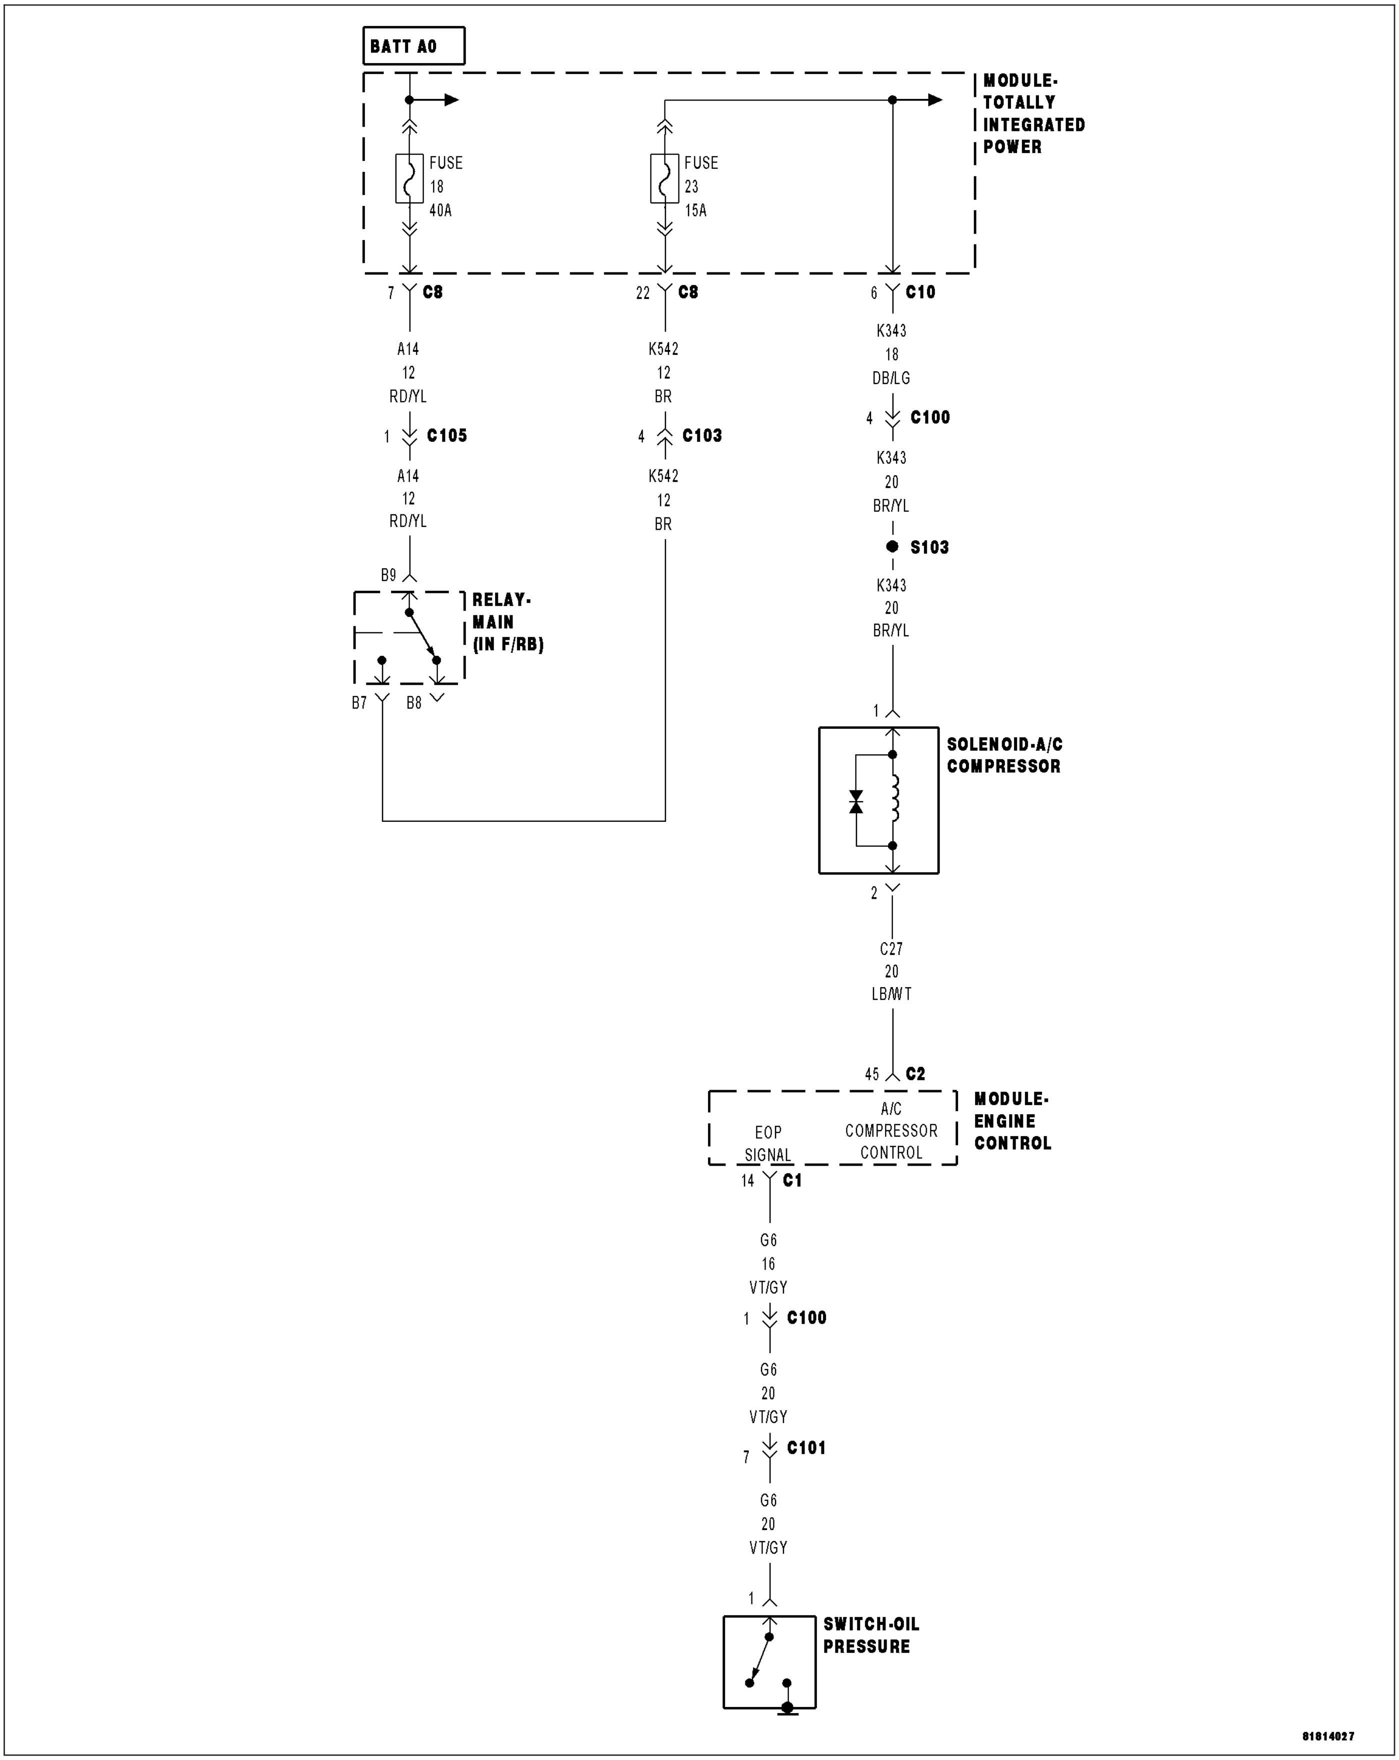
No >> Replace the A/C Compressor in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Clutch Relay and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0646-A/C CLUTCH CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the A/C Compressor command off.
- **Set Condition:**
  The ECM detects a short to ground on the (C27) A/C Compressor Control circuit for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND
(C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
A/C COMPRESSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the A/C Compressor.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the A/C Compressor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

Is the resistance below 1000.0 ohms?

Yes >> Repair the (C27) A/C Compressor Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C27) A/C Compressor Control circuit between the A/C Compressor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (C27) A/C Compressor Control circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. A/C COMPRESSOR

Connect the Engine Control Module (ECM) harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, actuate the A/C Compressor.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 5

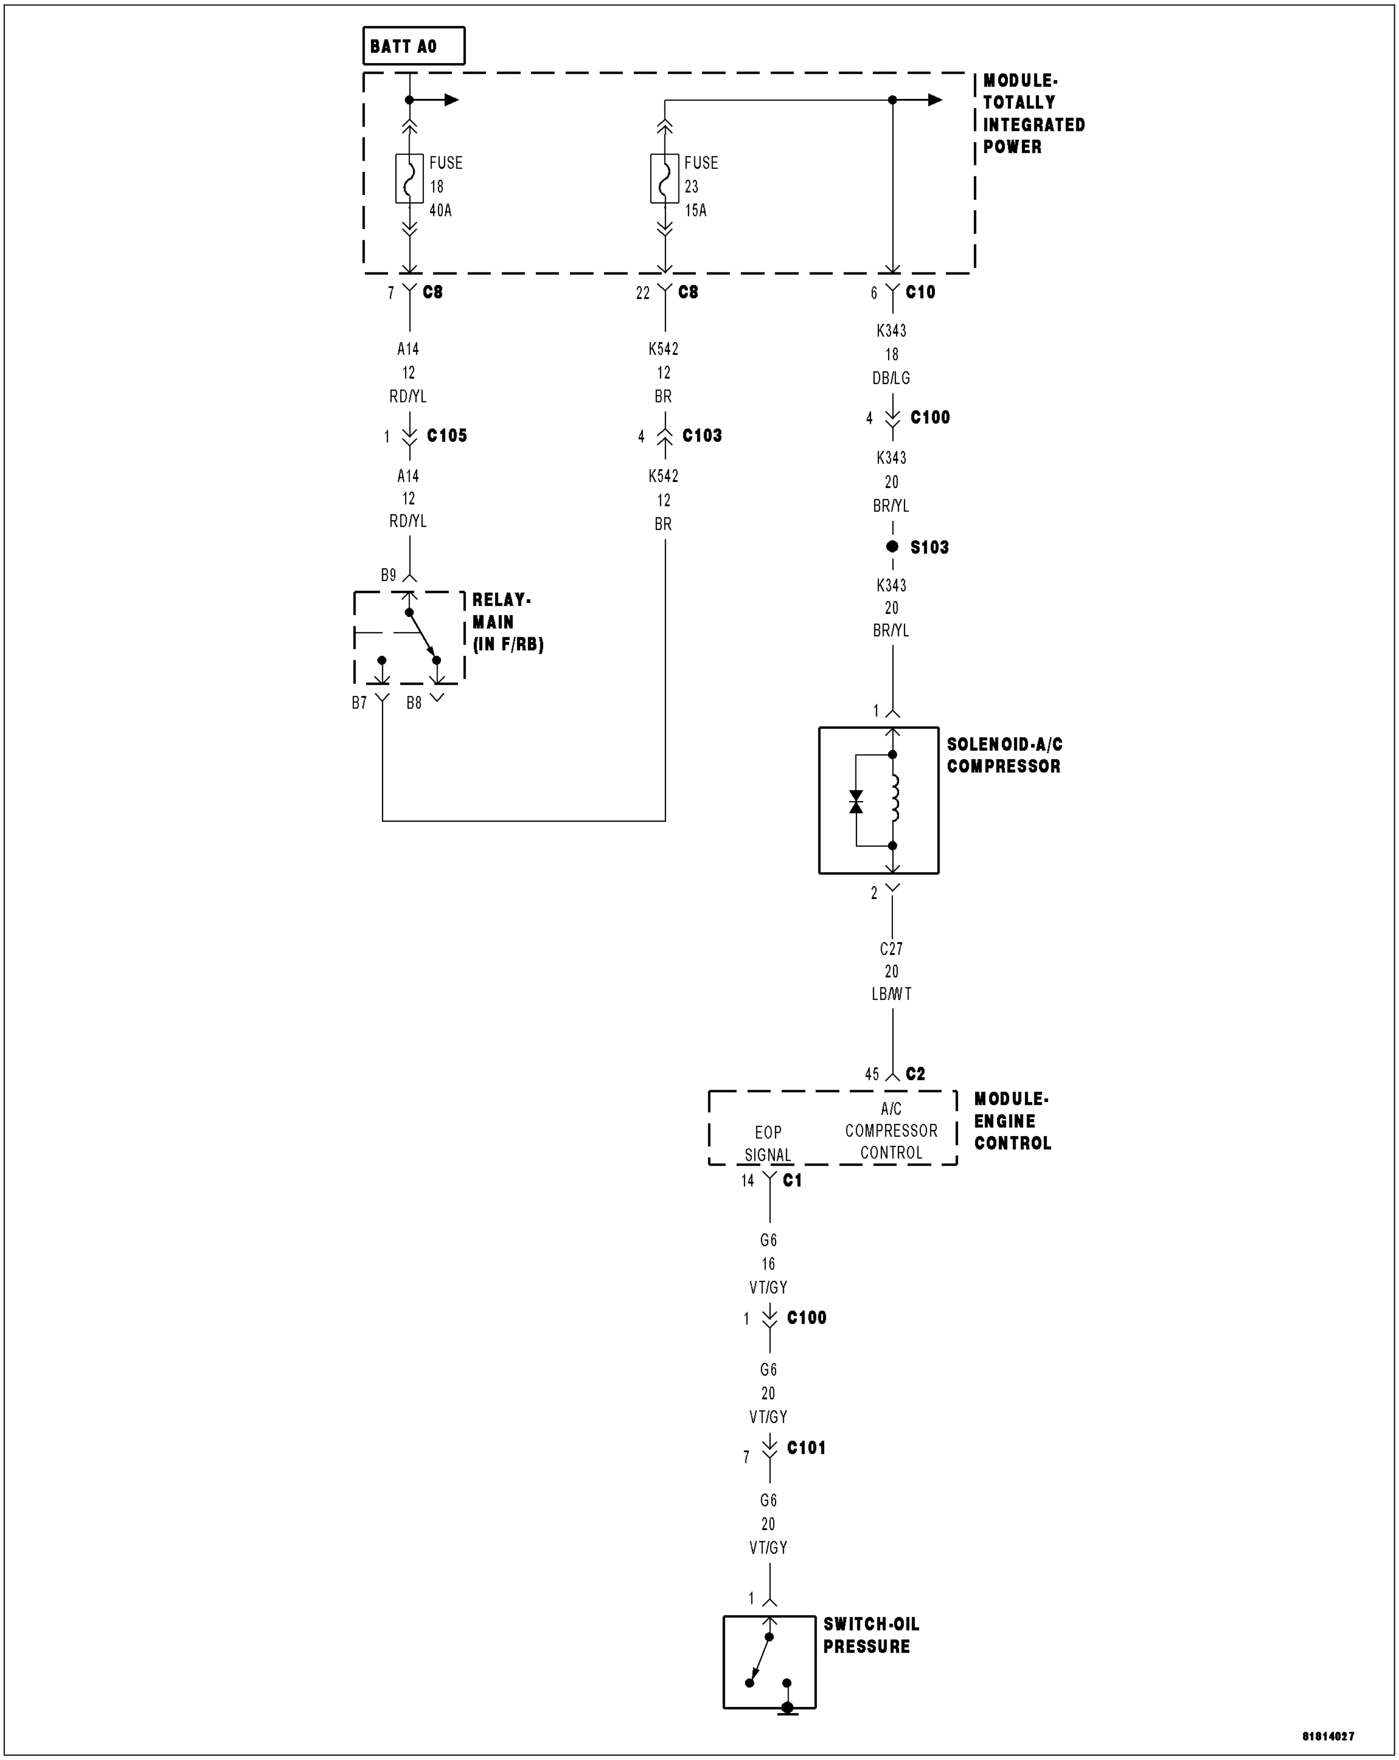
No >> Replace the A/C Compressor in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Compressor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0647-A/C CLUTCH CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the A/C Compressor command on.
- **Set Condition:**
  The ECM detects a short circuit on the (C27) A/C Compressor Control circuit for 0.48 seconds.

Possible Causes
INTERMITTENT DTC
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO VOLTAGE
(C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO THE (K343) FUSED MAIN RELAY OUTPUT CIRCUIT
(C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
A/C COMPRESSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the A/C Compressor.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Compressor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (C27) A/C Compressor Control circuit in the A/C Compressor harness connector.

Is there any voltage present?

Yes >> Repair the (C27) A/C Compressor Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (C27) A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO THE (K343) FUSED MAIN RELAY OUTPUT CIRCUIT

Turn the ignition off.

Measure the resistance between the (C27) A/C Compressor Control circuit and the (K343) Fused Main Relay Output circuit in the A/C Compressor harness connector.

Is the resistance above 10.0 ohms?

Yes >> Go to 4

No >> Repair the (C27) A/C Compressor Control circuit for a short to the (K343) Fused Main Relay Output circuit.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (C27) A/C COMPRESSOR CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (C27) A/C Compressor Control circuit between the A/C Compressor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 5

No >> Repair the (C27) A/C Compressor Control circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. A/C COMPRESSOR

Connect the Engine Control Module (ECM) harness connector.

Install a known good relay in place of the vehicle's A/C Compressor.

Turn the ignition on.

With the scan tool, Clear DTCs.

With the scan tool, actuate the A/C Compressor.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 6

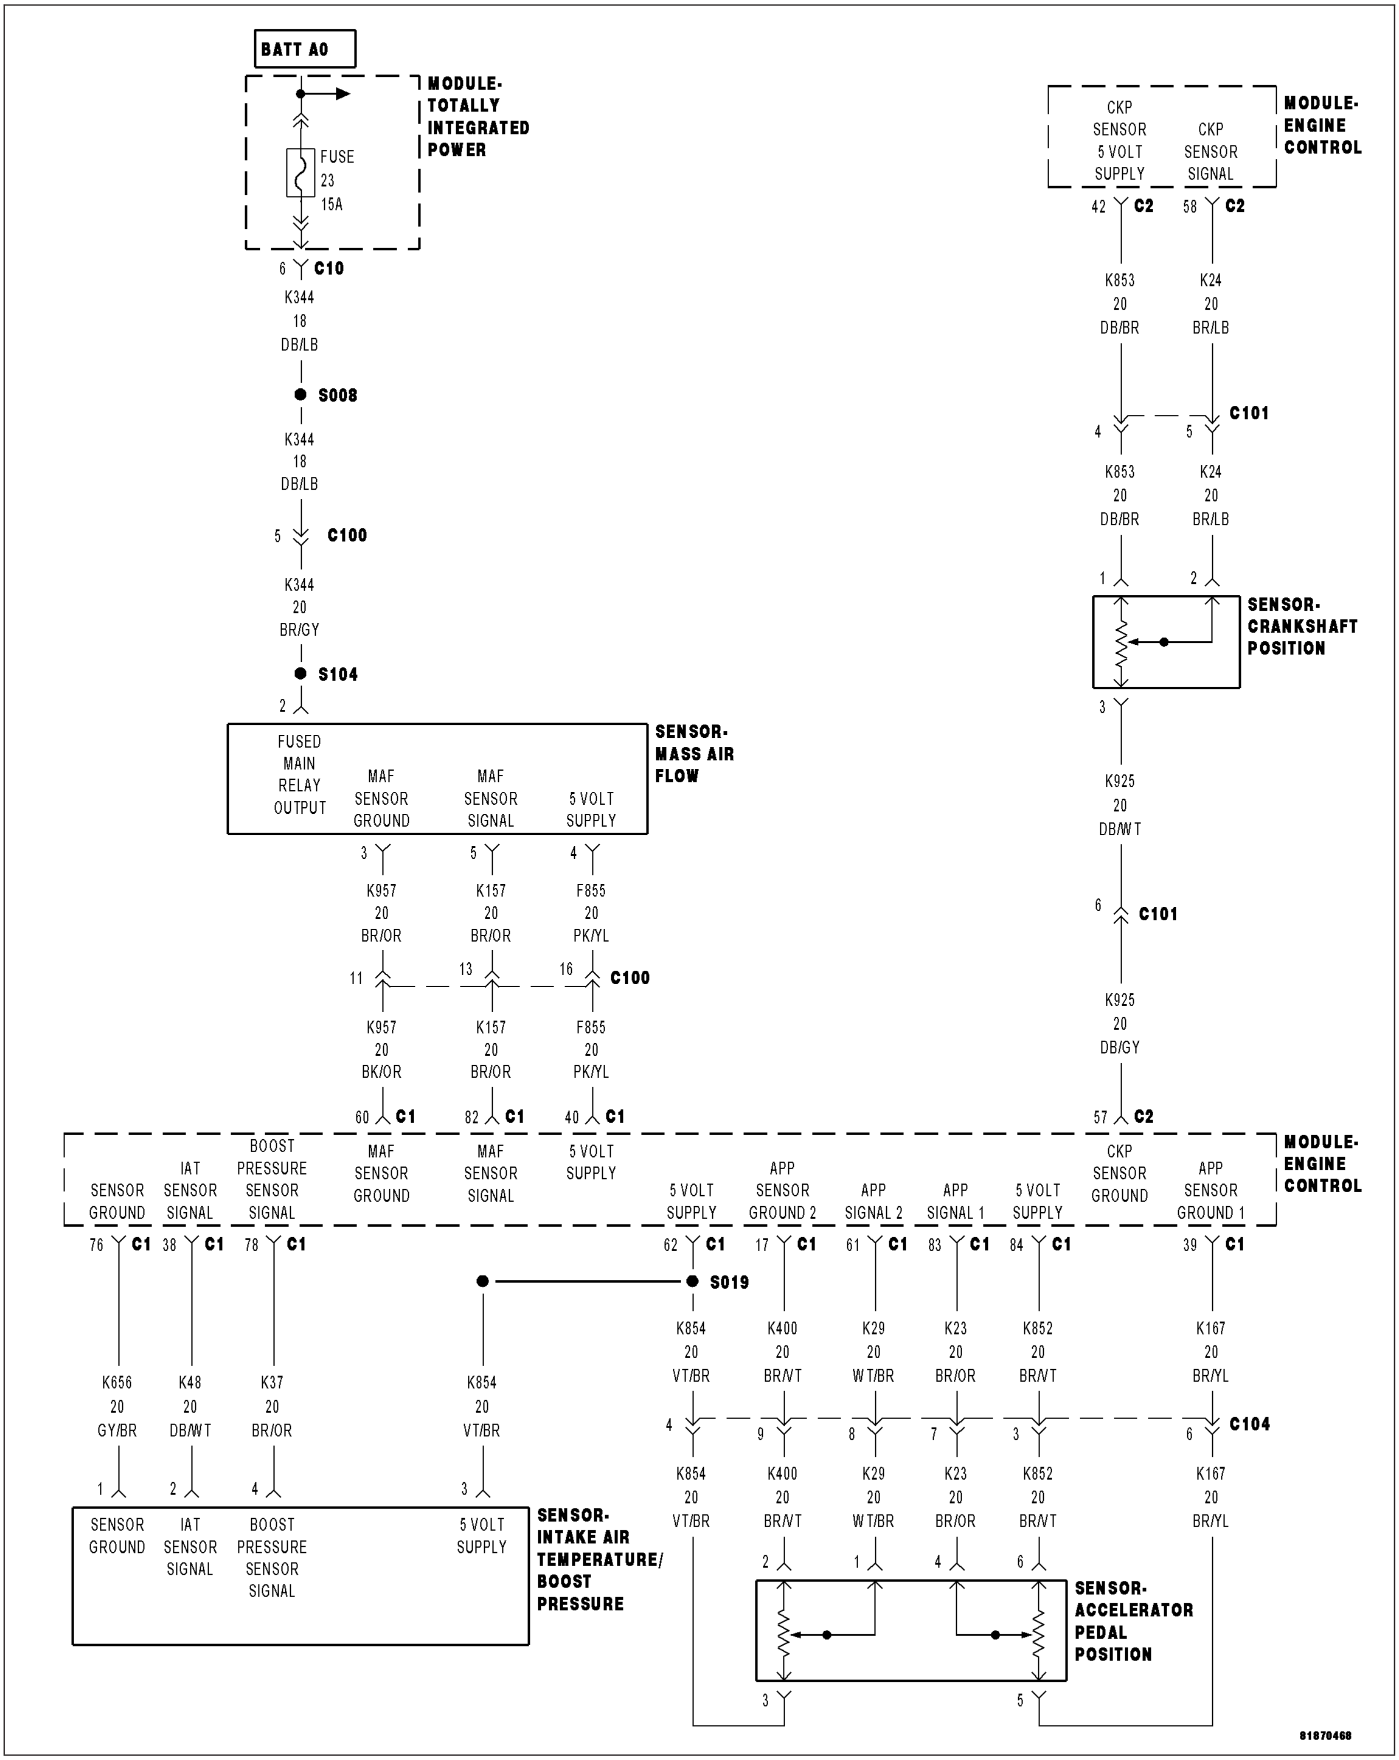
No >> Replace the A/C Compressor in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the A/C Compressor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0652-SENSOR REFERENCE VOLTAGE 2 TOO LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects low voltage on the Sensor Supply #2 circuit for 0.16 second

Possible Causes
INTERMITTENT DTC
CRANKSHAFT POSITION SENSOR
INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR
ACCELERATOR PEDAL POSITION SENSOR
MASS AIRFLOW SENSOR
5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 2 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 2 provides 5 volts to the Crankshaft Position Sensor, the Boost Pressure Sensor, Accelerator Pedal Position Sensor No. 2, and the Mass Airflow Sensor.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off for 10 seconds.

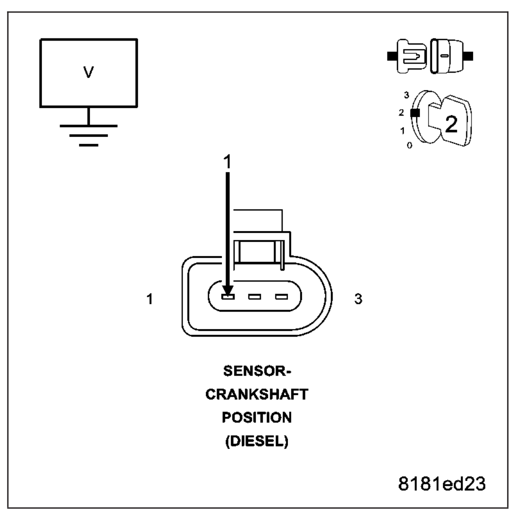
Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. CRANKSHAFT POSITION SENSOR

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.

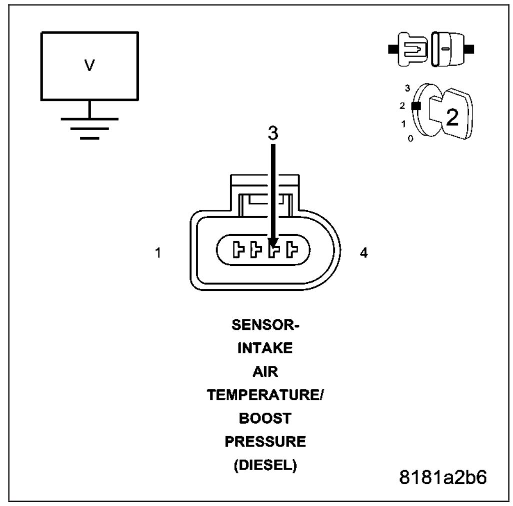
Turn the ignition on.

Measure the voltage of the (K853) Crankshaft Position Sensor 5 Volt Supply circuit at the Crankshaft Position Sensor harness connector.

Is the voltage above 4.6 volts?

Yes >> Replace the Crankshaft Position Sensor.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 3



3. INTAKE AIR TEMPERATURE/BOOST PRESSURE SENSOR

Turn the ignition off.

Disconnect the Intake Air Temperature/Boost Pressure Sensor harness connector.

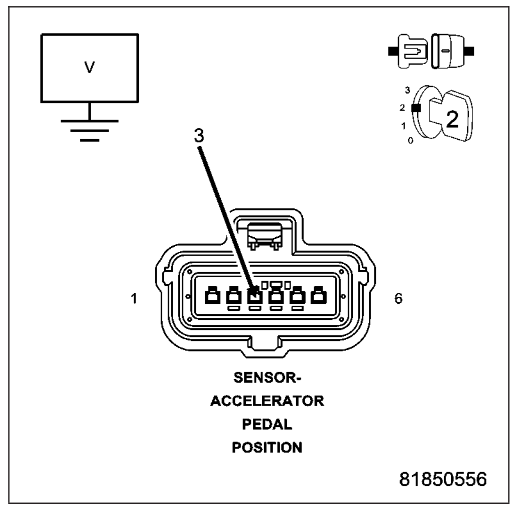
Turn the ignition on.

Measure the voltage of the (K854) Boost Pressure Sensor 5 Volt Supply circuit at the Intake Air Temperature/Boost Pressure Sensor harness connector.

Is the voltage above 4.6 volts?

Yes >> Replace the Intake Air Temperature/Boost Pressure Sensor.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4



4. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Disconnect the Accelerator Pedal Position harness connector.

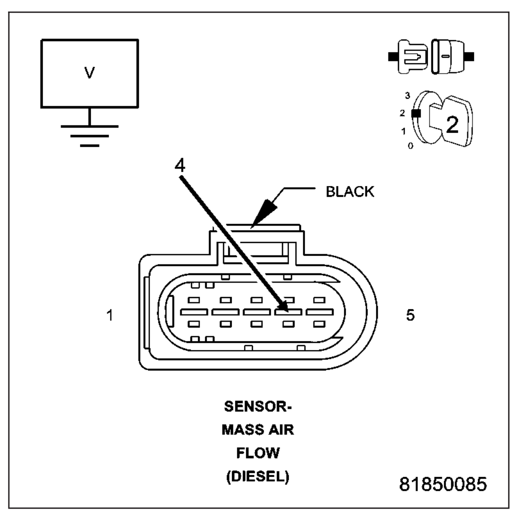
Turn the ignition on.

Measure the voltage of the (K854) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit at the Accelerator Pedal Position Sensor harness connector.

Is the voltage above 4.6 volts?

Yes >> Replace the Accelerator Pedal Position Sensor.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5



5. MASS AIRFLOW SENSOR

Turn the ignition off.

Disconnect the Mass Airflow Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F855) Mass Airflow Sensor 5 Volt Supply circuit at the Mass Air Flow Sensor harness connector.

Is the voltage above 4.6 volts?

Yes >> Replace the Mass Airflow Sensor.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 6

6. 5-VOLT SUPPLY CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (K853) Crankshaft Position Sensor 5 Volt Supply circuit.

Measure the resistance between ground and the (K854) Boost Pressure Sensor 5 Volt Supply circuit.

Measure the resistance between ground and the (K854) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit.

Measure the resistance between ground and the (F855) Mass Airflow Sensor 5 Volt Supply circuit.

Is the resistance above 1000 ohms for each circuit?

Yes >> Go To 7

No >> Repair the 5-Volt Supply circuit that measured below 1000 ohms for a short to ground.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Inspect the (K853) Crankshaft Position Sensor 5 Volt Supply circuit between the Crankshaft Position Sensor and the ECM.

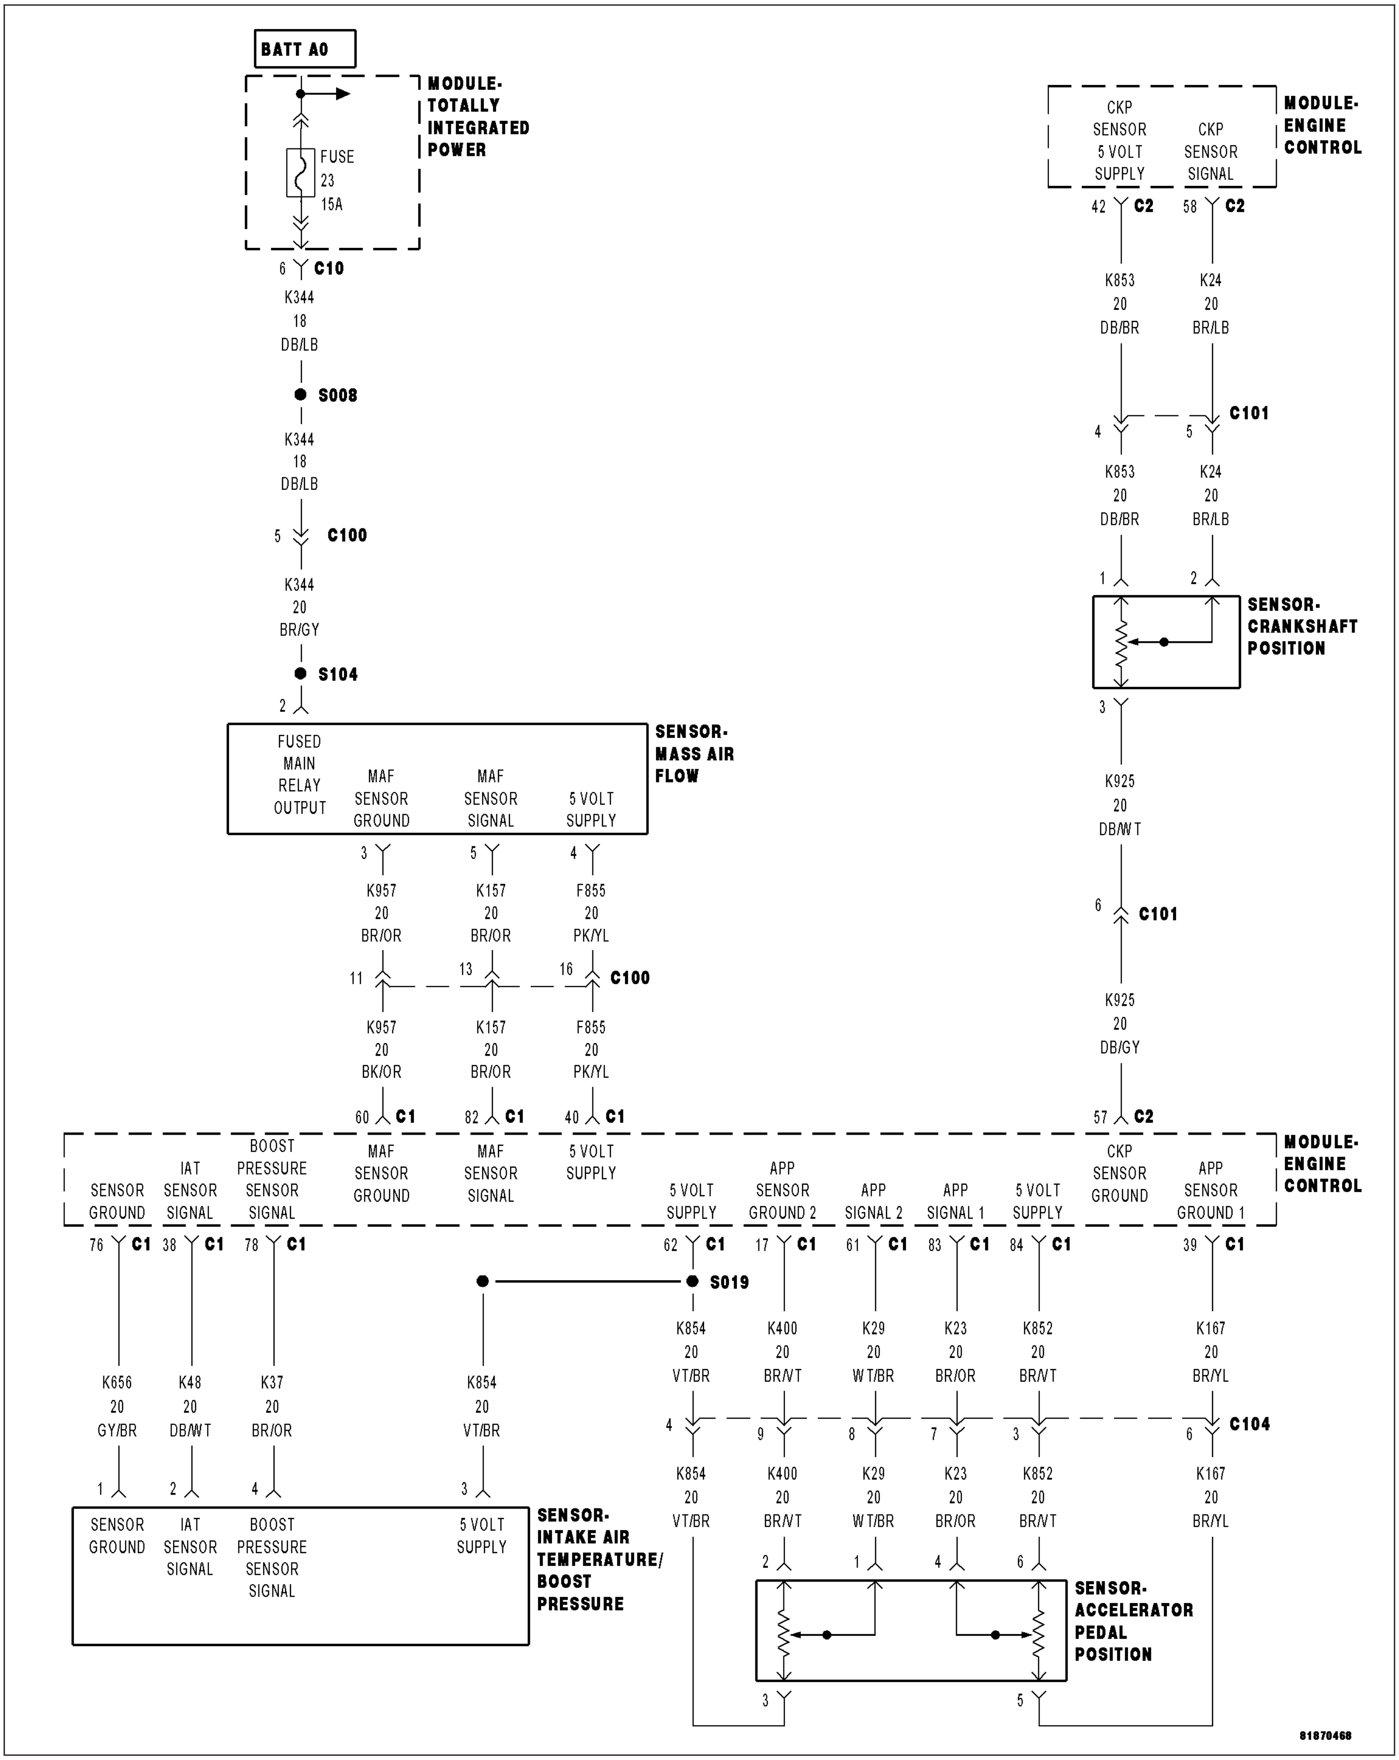
Inspect the (K854) Boost Pressure Sensor 5 Volt Supply circuit between the Intake Air Temperature/Boost Pressure Sensor and the ECM.

Inspect the (K854) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor and the ECM.

Inspect the (F855) Mass Airflow Sensor 5 Volt Supply circuit between the Mass Airflow Sensor and the ECM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0653-SENSOR REFERENCE VOLTAGE 2 TOO HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects a short to voltage on the Sensor Supply #2 circuit for 0.16 second.

Possible Causes
INTERMITTENT CONDITION
(K853) CRANKSHAFT POSITION SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K854) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(F855) MASS AIRFLOW SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Theory of Operation

The ECM contains 2 internal 5–Volt Sensor Supply sources. Each 5–Volt Supply source is split into parallel circuits to provide 5 volts to multiple sensors. Sensor Supply 2 provides 5 volts to the Crankshaft Position Sensor, the Boost Pressure Sensor, Accelerator Pedal Position Sensor No. 2, and the Mass Airflow Sensor.

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Turn the ignition off for 10 seconds.

Turn the ignition on.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

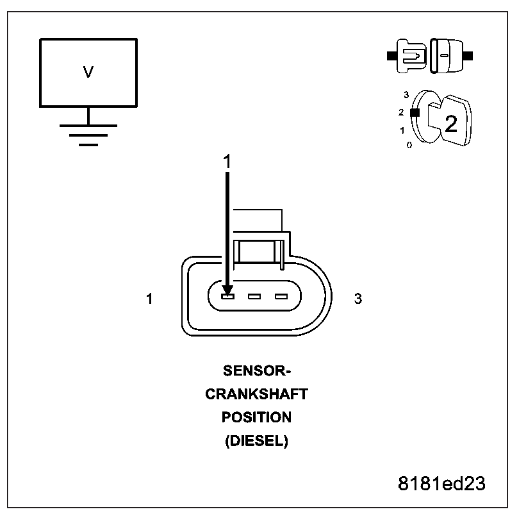
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K853) CRANKSHAFT POSITION SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Crankshaft Position Sensor harness connector.



Disconnect the ECM harness connectors.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

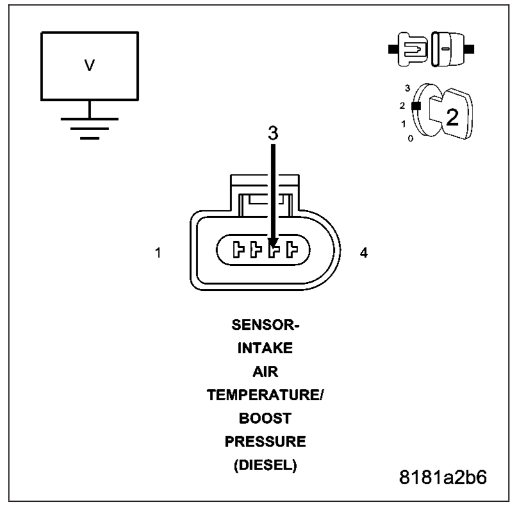
Turn the ignition on.

Measure the voltage of the (K853) Crankshaft Position Sensor 5 Volt Supply circuit at the Crankshaft Position Sensor harness connector.

Is there any voltage present?

Yes >> Repair the (K853) Crankshaft Position Sensor 5 Volt Supply circuit for a short to voltage.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 3



3. (K854) BOOST PRESSURE SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Intake Air Temperature/Boost Pressure Sensor harness connector.

Turn the ignition on.

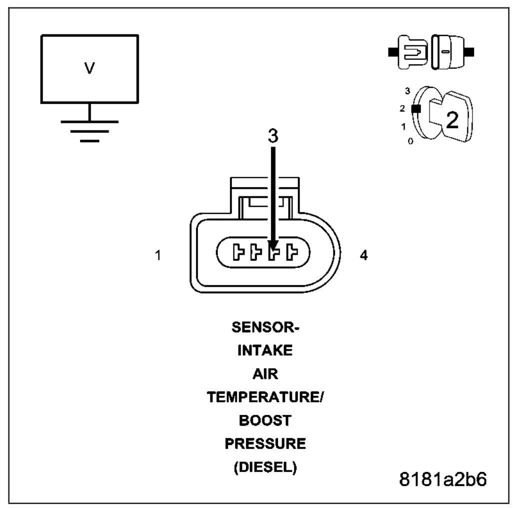
Measure the voltage of the (K854) Boost Pressure Sensor 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (K854) Boost Pressure Sensor 5 Volt Supply circuit for a short to voltage at the Intake Air Temperature/ Boost Pressure Sensor harness connector.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4



4. (K854) ACCELERATOR PEDAL POSITION SENSOR NO. 2 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

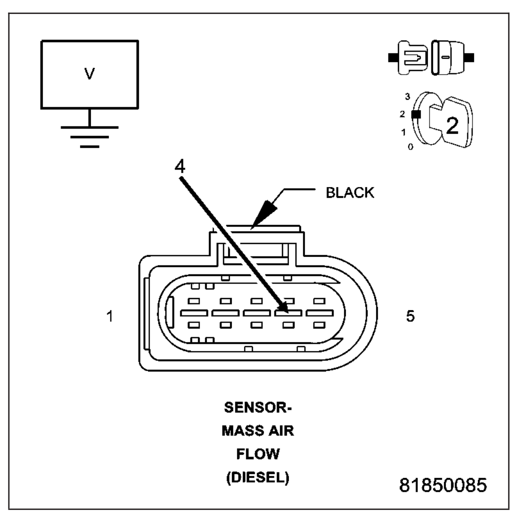
Measure the voltage of the (K854) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (K854) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit for a short to voltage at the Accelerator Pedal Position Sensor harness connector.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5



5. (F855) MASS AIRFLOW SENSOR 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Mass Airflow Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (F855) Mass Airflow Sensor 5 Volt Supply circuit.

Is there any voltage present?

Yes >> Repair the (F855) Mass Airflow Sensor 5 Volt Supply circuit for a short to voltage at the Mass Air Flow Sensor harness connector.

Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 6

6. ENGINE CONTROL MODULE (ECM)

Turn the ignition off.

Inspect the (K853) Crankshaft Position Sensor 5 Volt Supply circuit between the Crankshaft Position Sensor and the ECM.

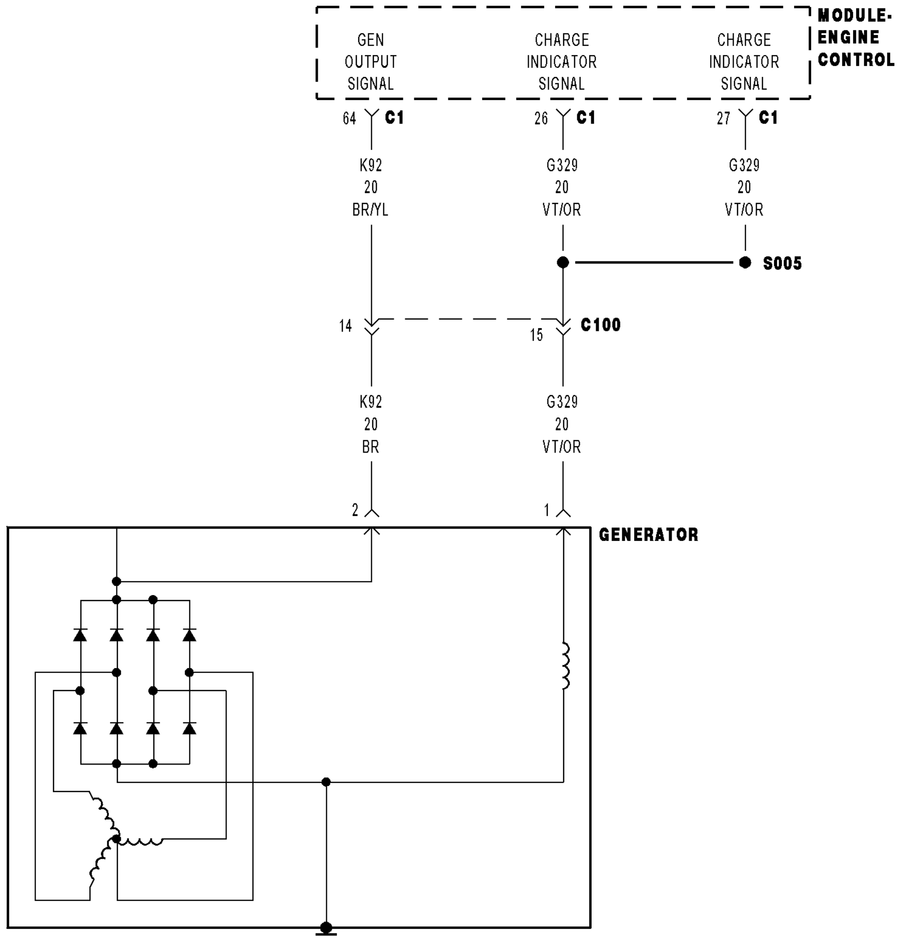
Inspect the (K854) Boost Pressure Sensor 5 Volt Supply circuit between the Intake Air Temperature/Boost Pressure Sensor and the ECM.

Inspect the (F855) Accelerator Pedal Position Sensor No. 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor and the ECM.

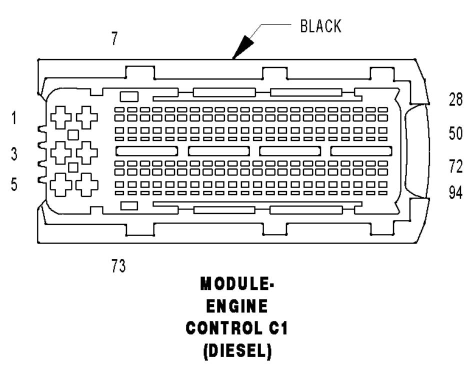
Inspect the (F851) Mass Airflow Sensor 5 Volt Supply circuit between the Mass Airflow Sensor and the ECM.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.



Were any problems found?

Yes >> Repair as necessary.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM VERIFICATION TEST. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P065A- GENERATOR PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects that the Generator output is not within specifications.

Possible Causes
GENERATOR BELT
GENERATOR BELT TENSIONER
(k92) GENERATOR OUTPUT SIGNAL CIRCUIT SHORT TO VOLTAGE
(k92) GENERATOR OUTPUT SIGNAL CIRCUIT OPEN
(A801) GENERATOR B+ CIRCUIT OPEN

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR OTHER DTC'S

Turn the ignition on.
With the scan tool, check the ECM for Generator Lamp/L Terminal related DTC's.

Are there any Generator Lamp/L Terminal related DTCs?

Yes >> Repair other DTCs before continuing.

No >> Go To 2

2. (A801) GENERATOR B+ CIRCUIT

Turn the ignition off.
Using a test light connected to ground, probe the (A801) B+ circuit at the generator.

Does the test tight illuminate brightly?

Yes >> Go To 3

No >> Repair the (A801) Generator B+ circuit for an open.

3. CHECK GENERATOR DRIVE BELT

Visually inspect the generator drive belt for glazing, cracks and other problems.
Inspect the generator drive belt and tensioner for proper tension.

Were any problems found?

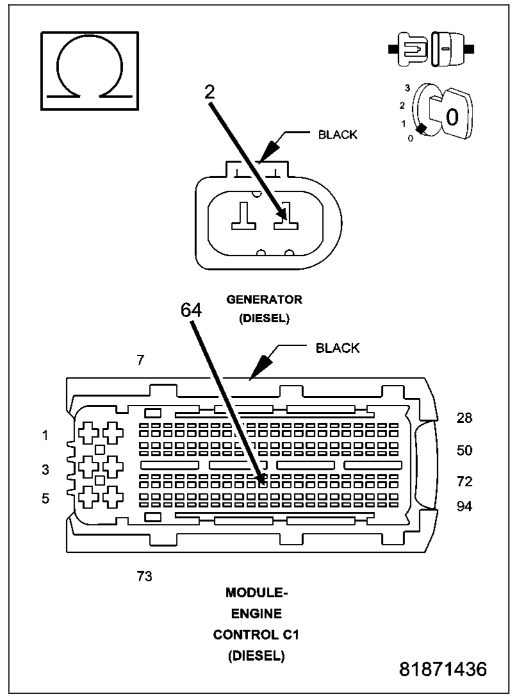
Yes >> Repair or replace as necessary.

No >> Go To 4

4. (K92) GENERATOR OUTPUT SIGNAL CIRCUIT OPEN

Disconnect the Generator harness connector.

Disconnect the ECM harness connectors.



Measure the resistance of the (K92) Generator Output Signal circuit.

Is the resistance below 10.0 ohms?

Yes >> Go To 5

No >> Repair the (K92) Generator Output Signal circuit for an open.

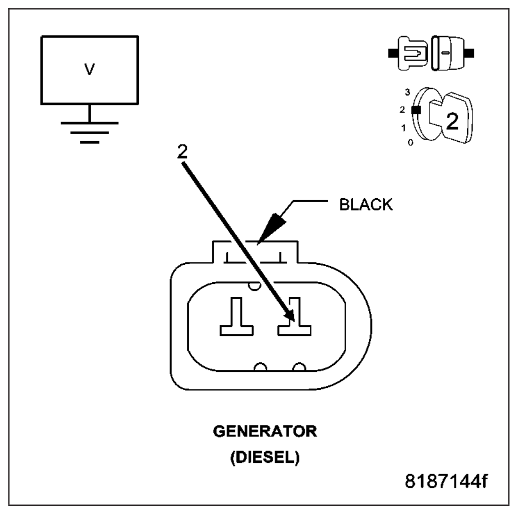
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K92) GENERATOR OUTPUT SIGNAL CIRCUIT SHORT TO VOLTAGE

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.



Measure the voltage of the (K92) Generator Output Signal circuit.

Is the voltage above 1.0 volt?

Yes >> Repair the (K92) Generator Output Signal circuit for a short to voltage.

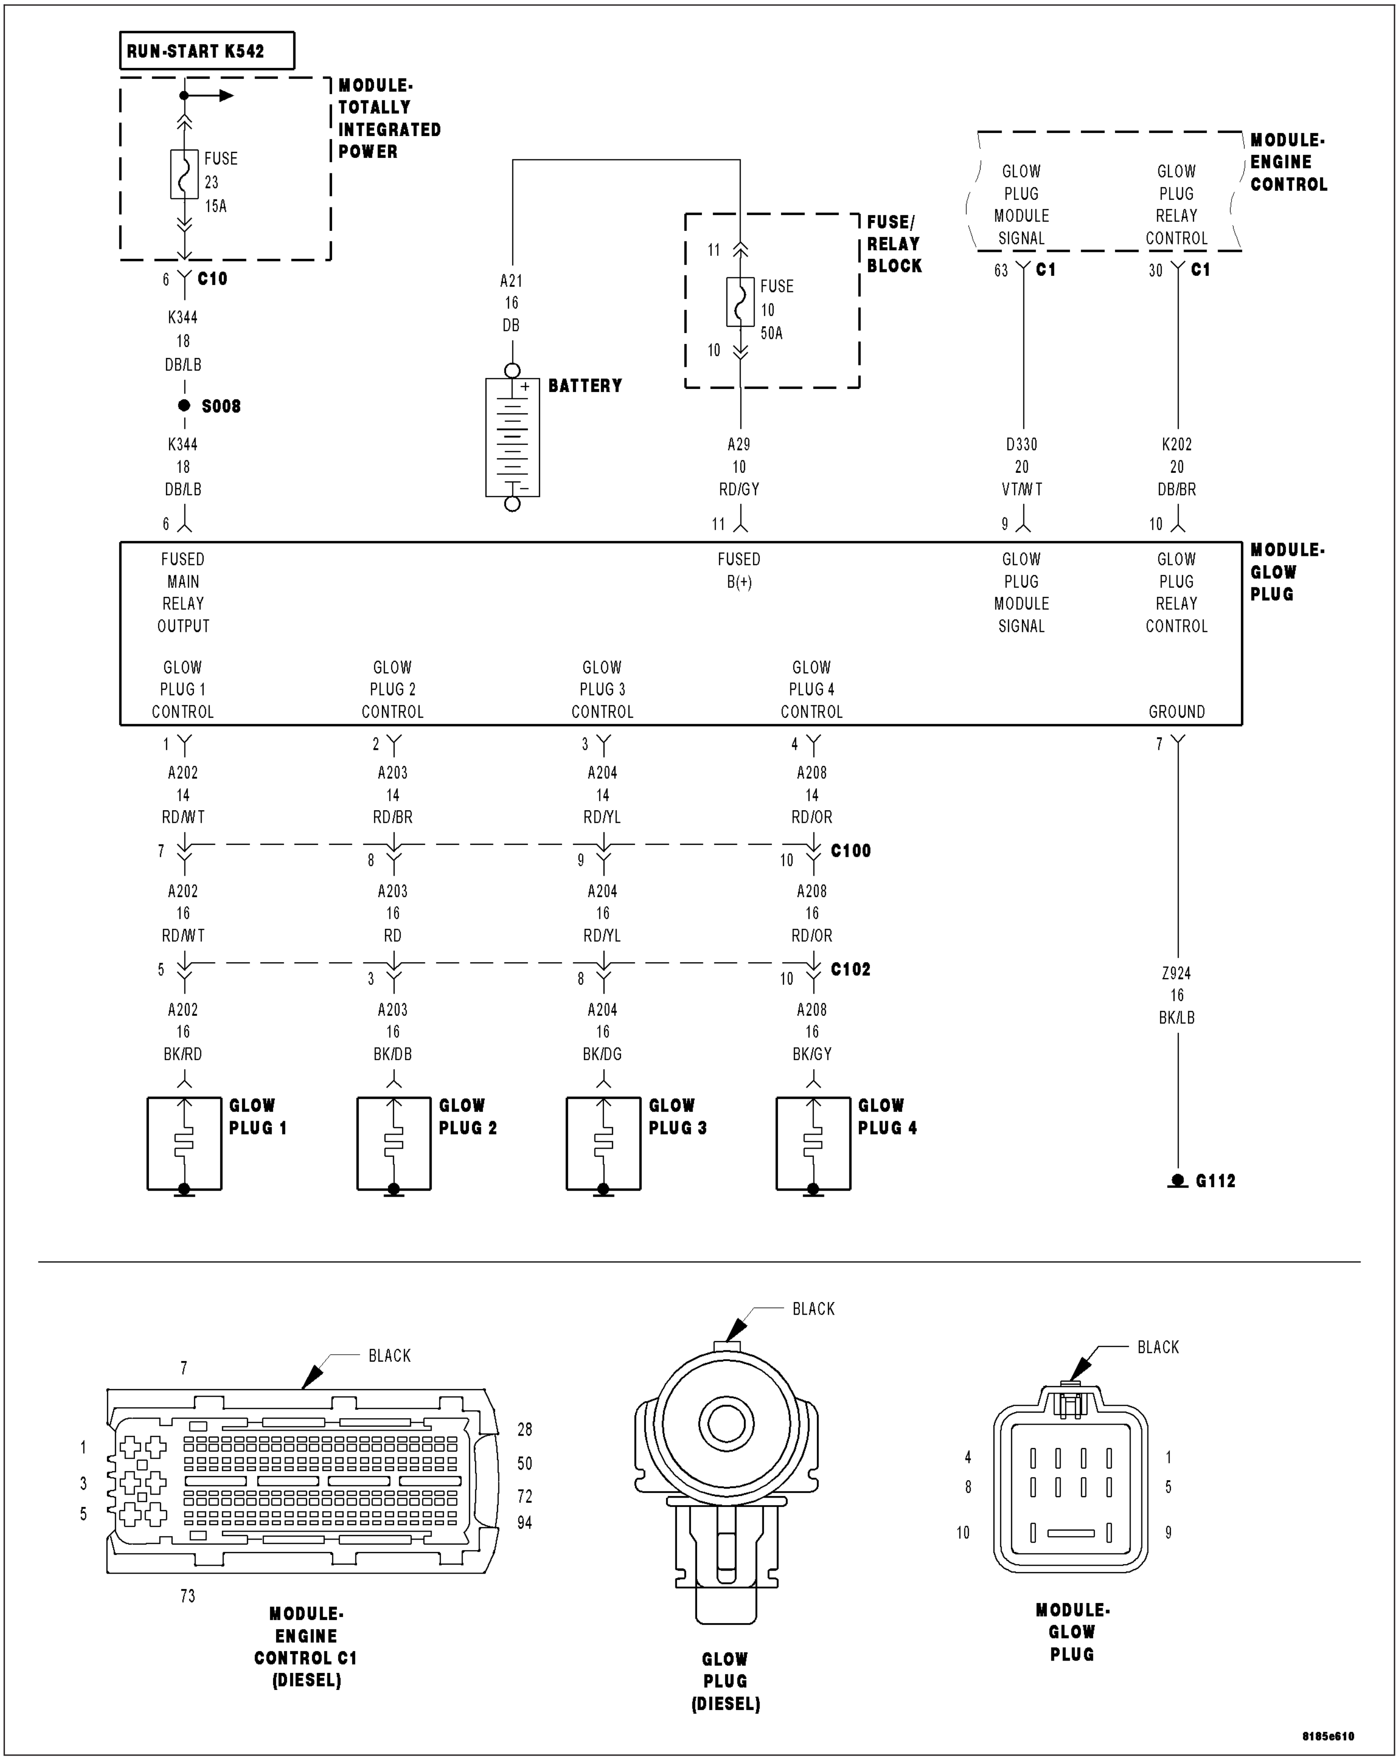
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 6

6. TEST DRIVE THE VEHICLE

With the scan tool, erase DTC's.

Test drive the vehicle.



With the scan tool, read DTC's.

Does the scan tool display this DTC?

Yes >> Replace the Generator.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P066A-CYLINDER 1 GLOW PLUG CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command off.
- **Set Condition:**
  The ECM detects an open or shorted to ground on the Cylinder 1 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 1
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

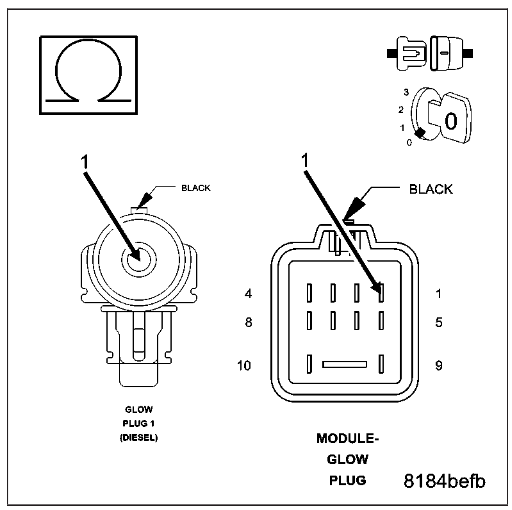
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



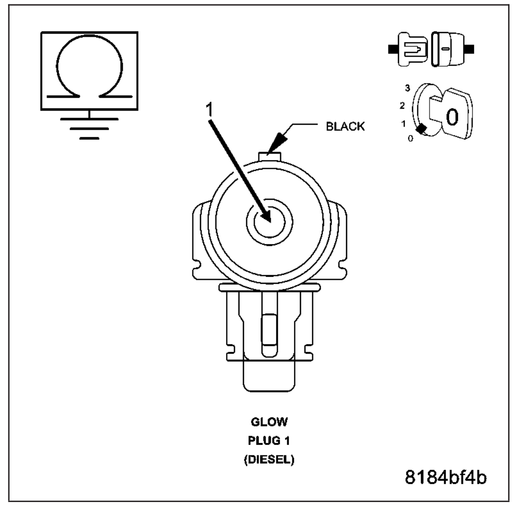
2. (A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug 1 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A202) Glow Plug 1 Control circuit between the Glow Plug 1 harness connector and the Glow Plug Module harness connector..



Is the resistance below 10.0 ohms?

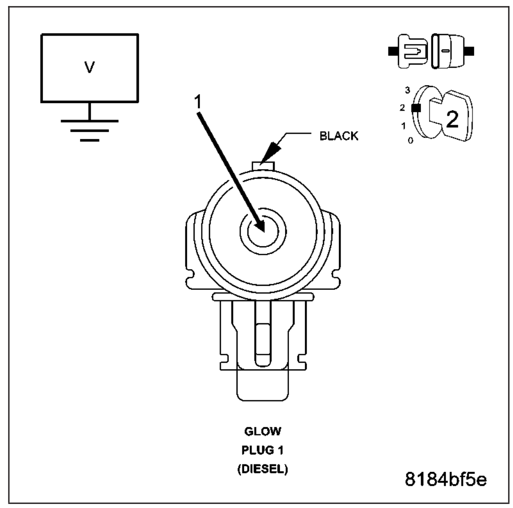
Yes >> Go To 3

No >> Repair the (A202) Glow Plug 1 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is the resistance below 1000 ohms?



Yes >> Repair the (A202) Glow Plug 1 Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is there voltage present on the (A202) Glow Plug 1 Control circuit?

Yes >> Repair the (A202) Glow Plug 1 Control circuit for a short to voltage
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG 1

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 1.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go to 6

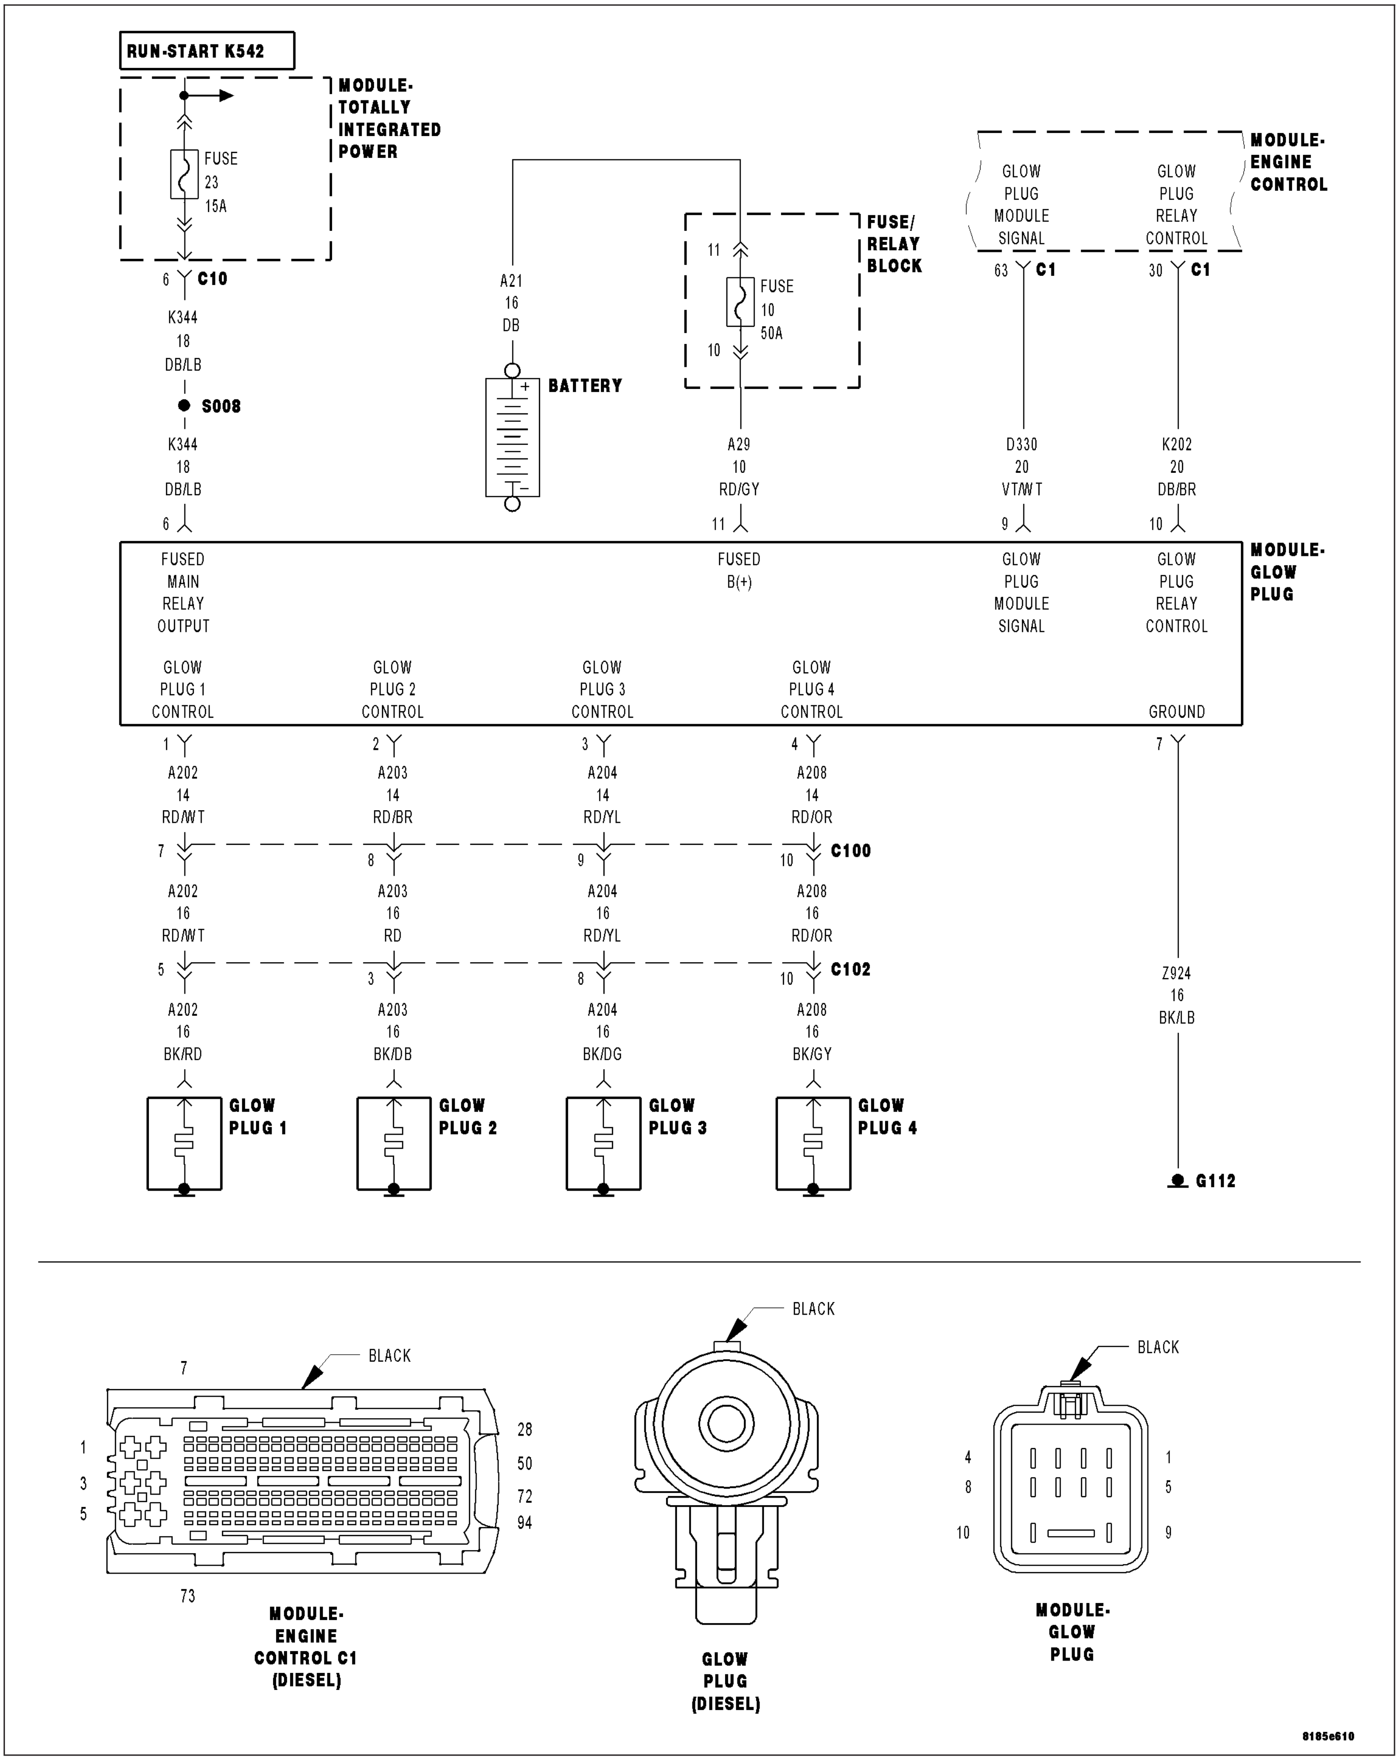
No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P066C-CYLINDER 2 GLOW PLUG CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command off.
- **Set Condition:**
  The ECM detects an open or shorted to ground on the Cylinder 2 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 2
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

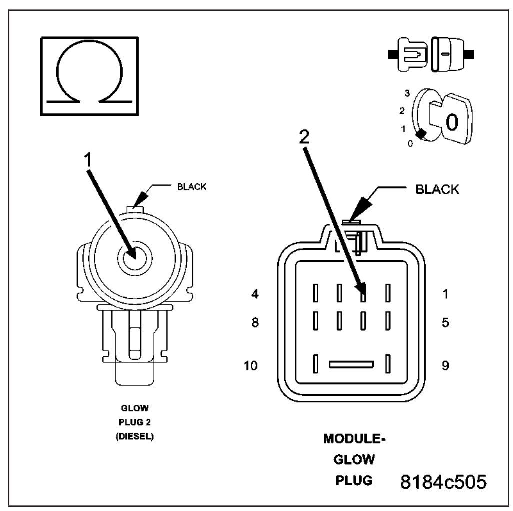
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



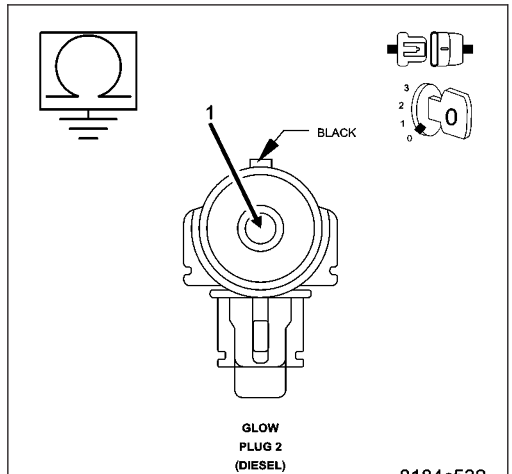
2. (A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug 2 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A203) Glow Plug 2 Control circuit between the Glow Plug 2 harness connector and the Glow Plug Module harness connector.



Is the resistance below 10.0 ohms?

Yes >> Go To 3

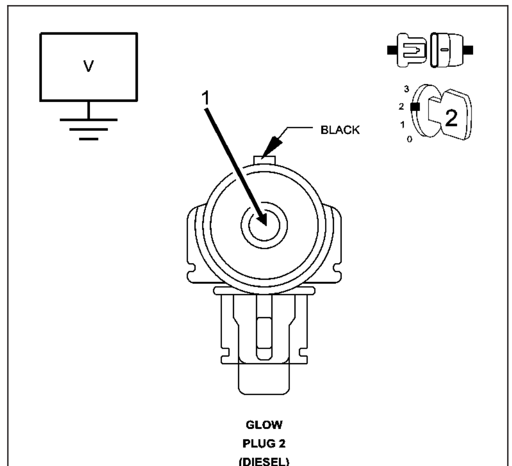
No >> Repair the (A203) Glow Plug 2 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

8184c532

Is the resistance below 1000 ohms?



Yes >> Repair the (A203) Glow Plug 2 Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

8184c54e

Is there voltage present on the (A203) Glow Plug 2 Control circuit?

Yes >> Repair the (A203) Glow Plug 2 Control circuit for a short to voltage
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG 2

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 2.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go to 6

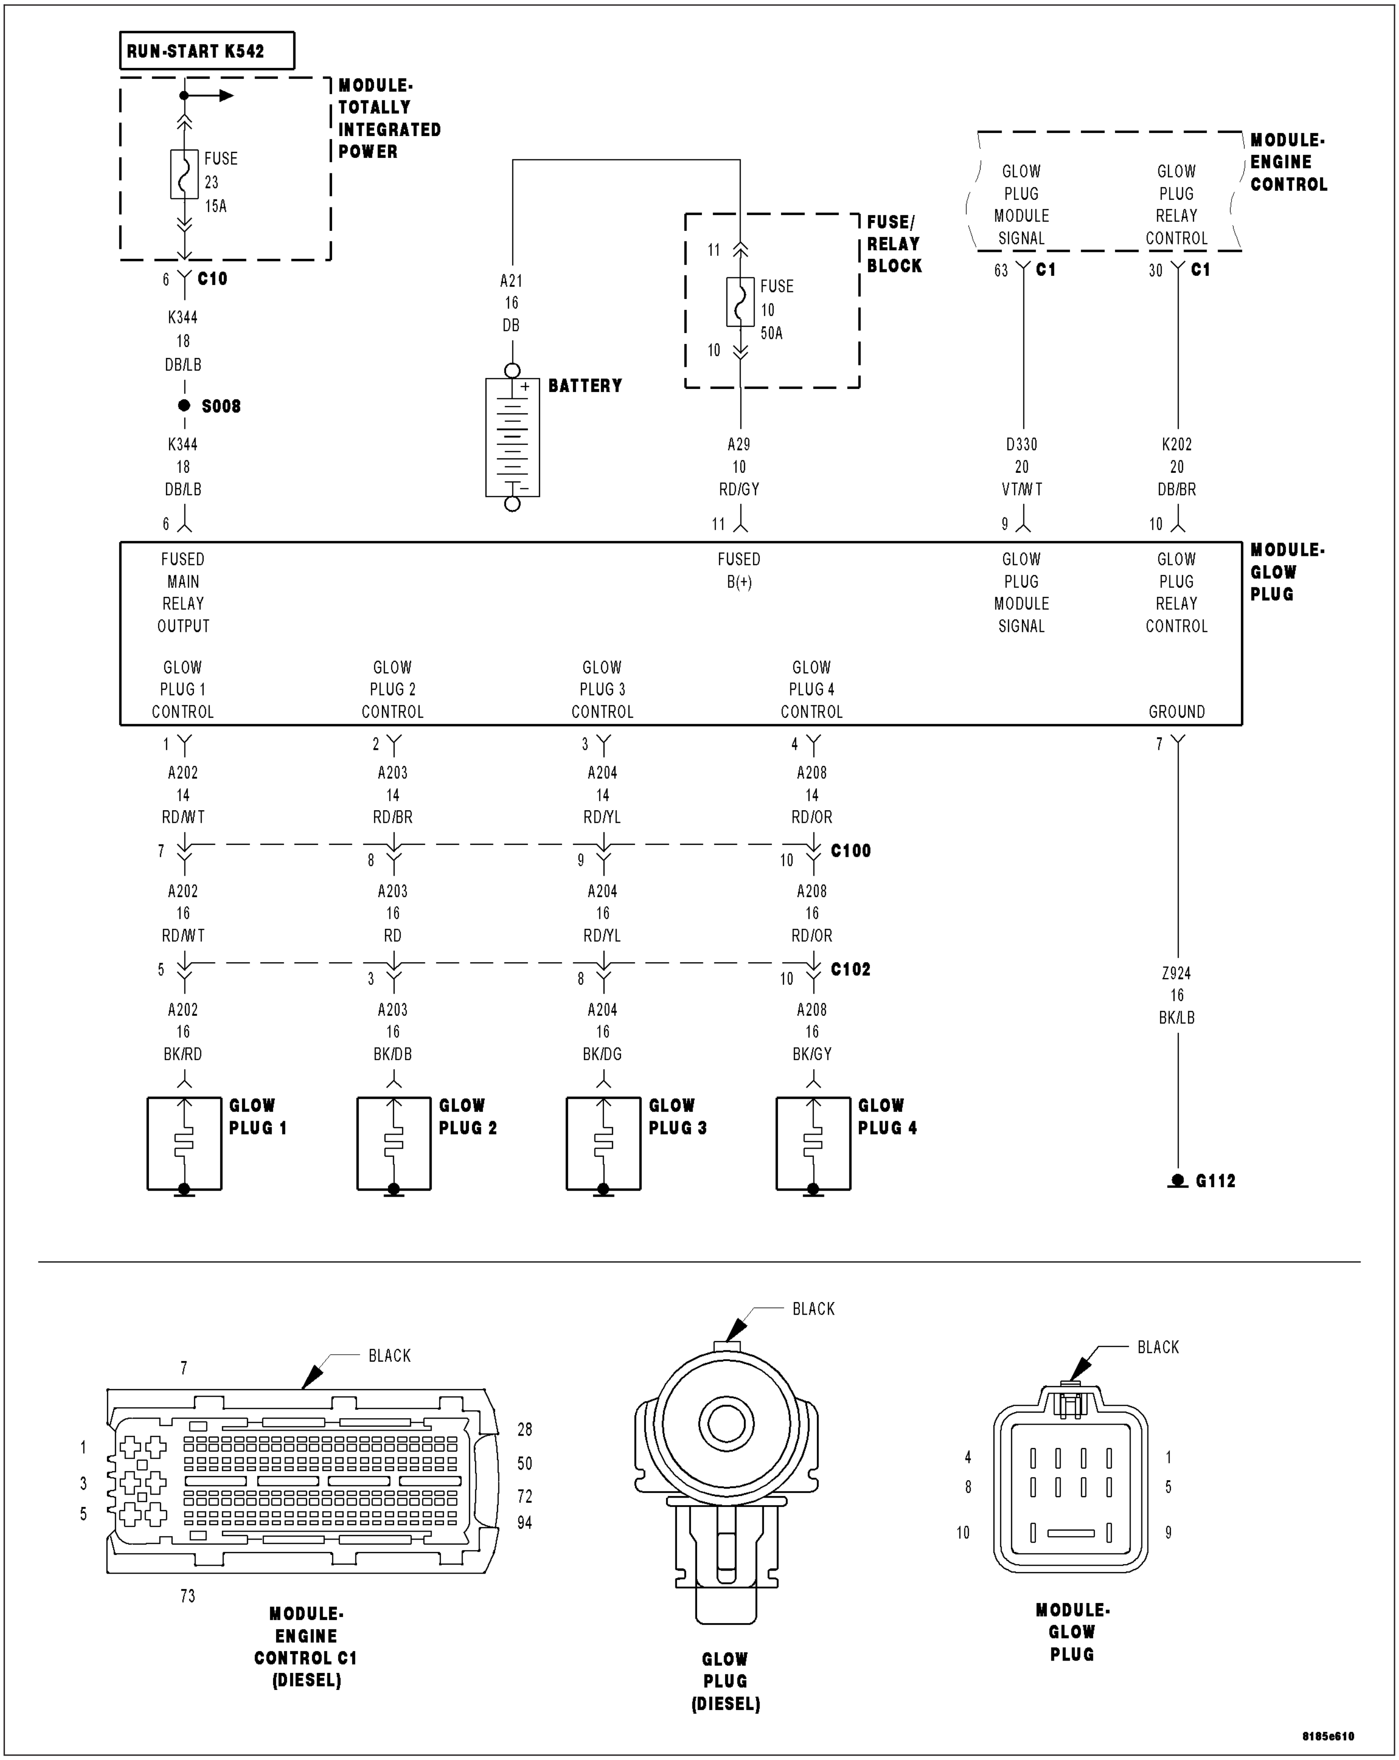
No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P066E-CYLINDER 3 GLOW PLUG CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command off.
- **Set Condition:**
  The ECM detects an open or shorted to ground on the Cylinder 3 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 3
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

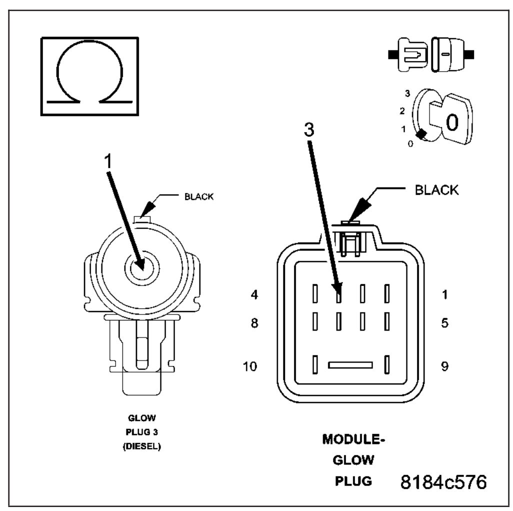
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



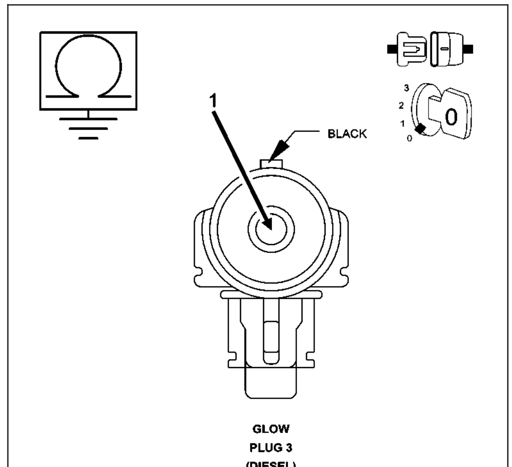
2. (A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug 3 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A204) Glow Plug 3 Control circuit between the Glow Plug 3 harness connector and the Glow Plug Module harness connector..



Is the resistance below 10.0 ohms?

Yes >> Go To 3

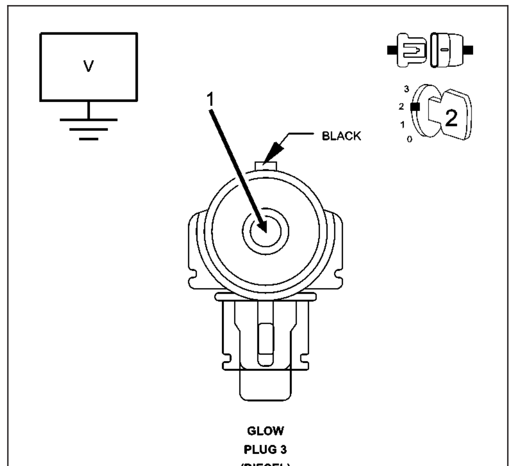
No >> Repair the (A204) Glow Plug 3 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

8184c583

Is the resistance below 1000 ohms?



Yes >> Repair the (A204) Glow Plug 3 Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

8184c589

Is there voltage present on the (A204) Glow Plug 3 Control circuit?

Yes >> Repair the (A204) Glow Plug 3 Control circuit for a short to voltage
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG 3

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 3.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go to 6

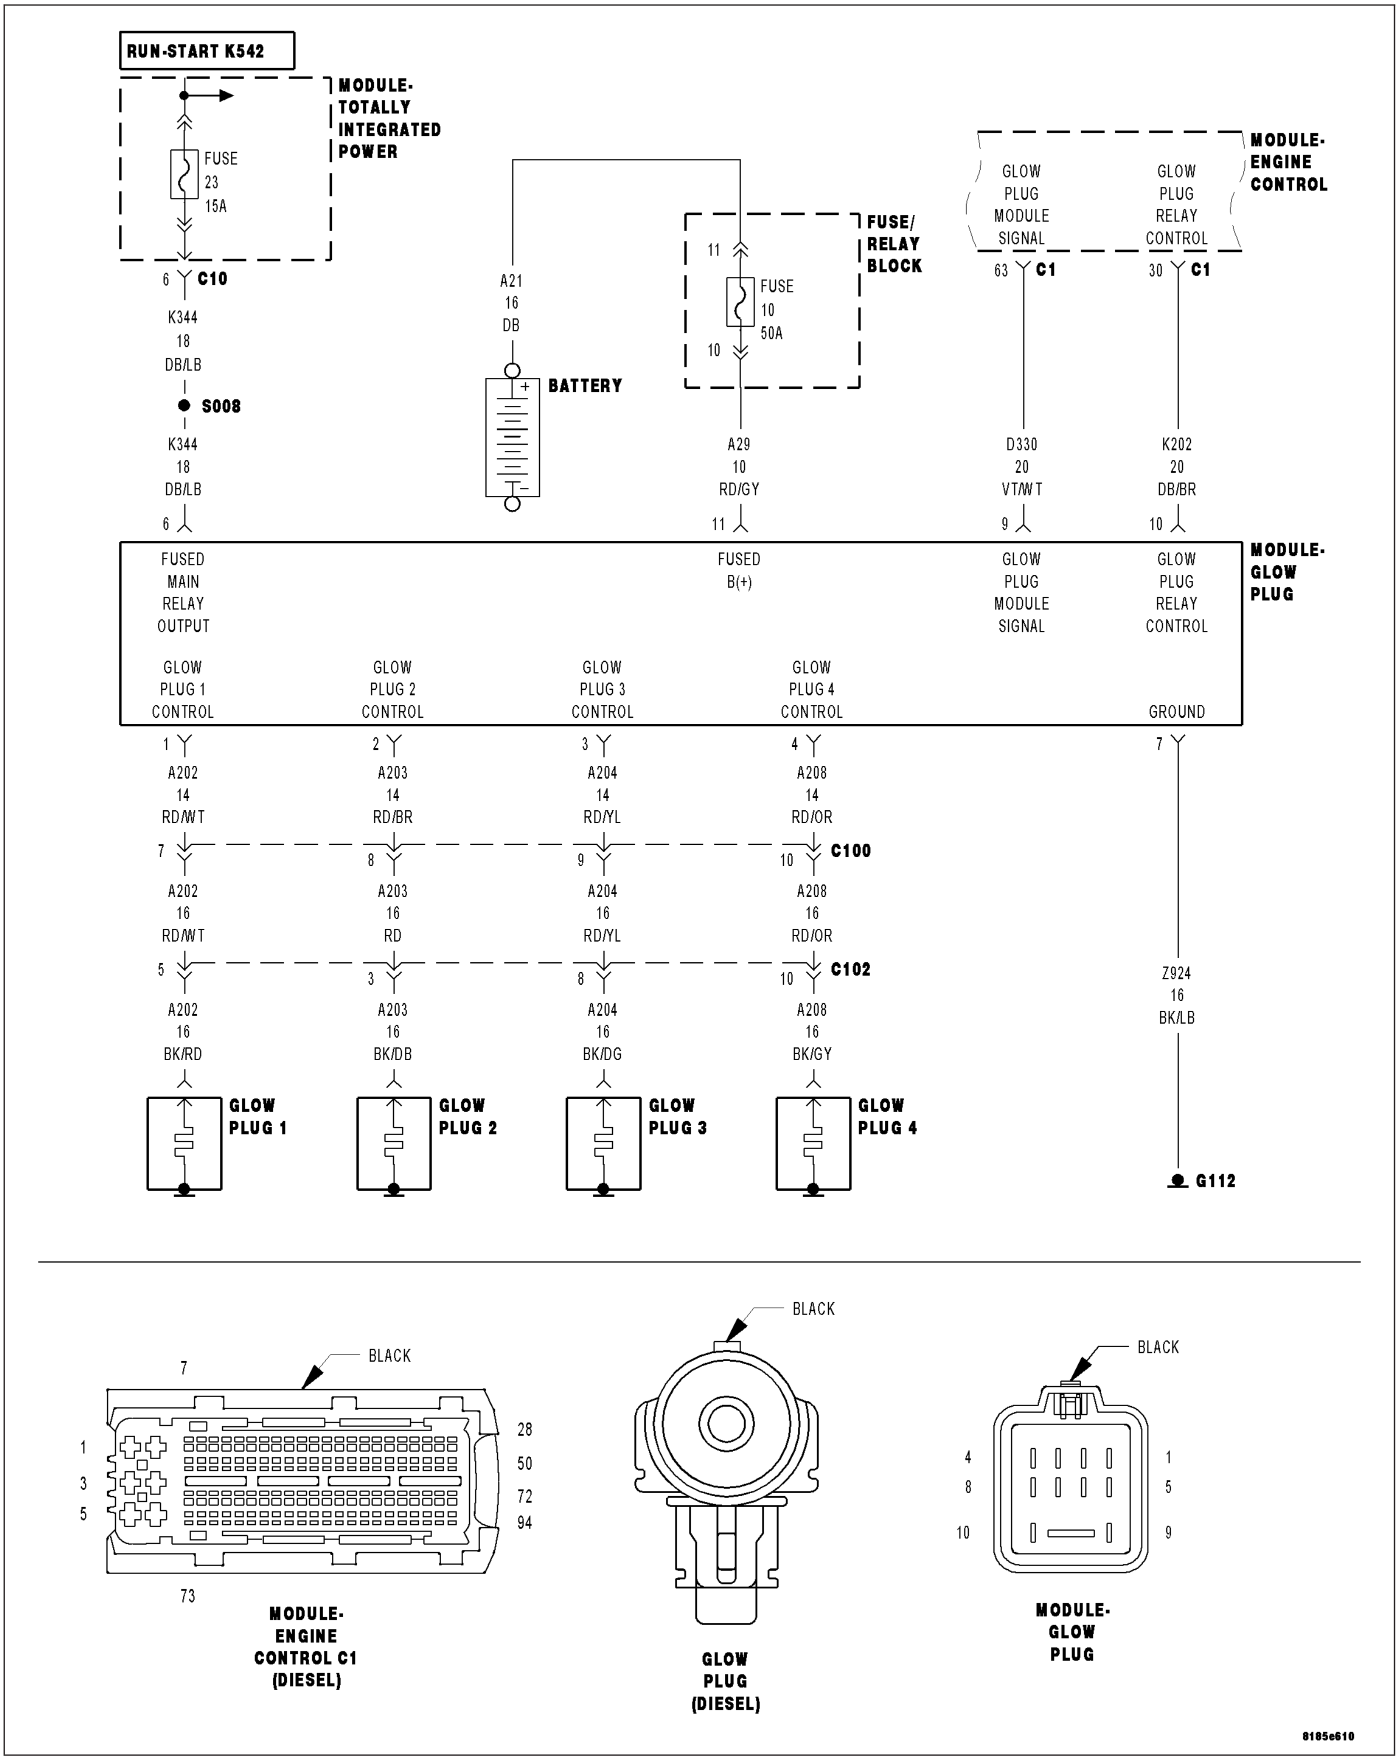
No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0383-GLOW PLUG CONTROL MODULE CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

A

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects an open on the (K202) Glow Plug Module Control circuit for 0.5 second.

Possible Causes
INTERMITTENT DTC
(K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND
(K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Glow Plugs.

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

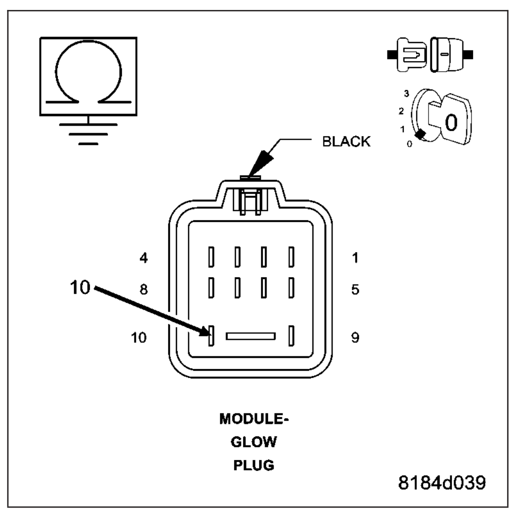
Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K202) GLOW PLUG MODULE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the Glow Plug Module harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K202) Glow Plug Module Control circuit in the Glow Plug Module harness connector.

Is the resistance below 1000.0 ohms?

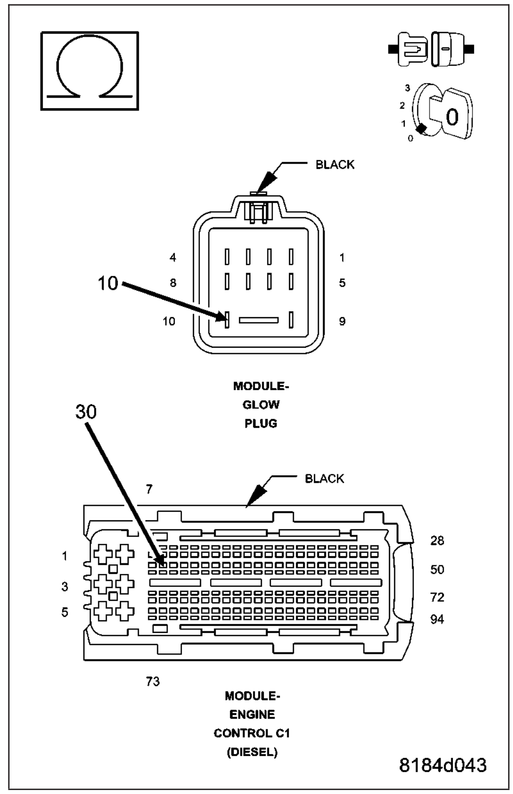
Yes >> Repair the (K202) Glow Plug Module Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

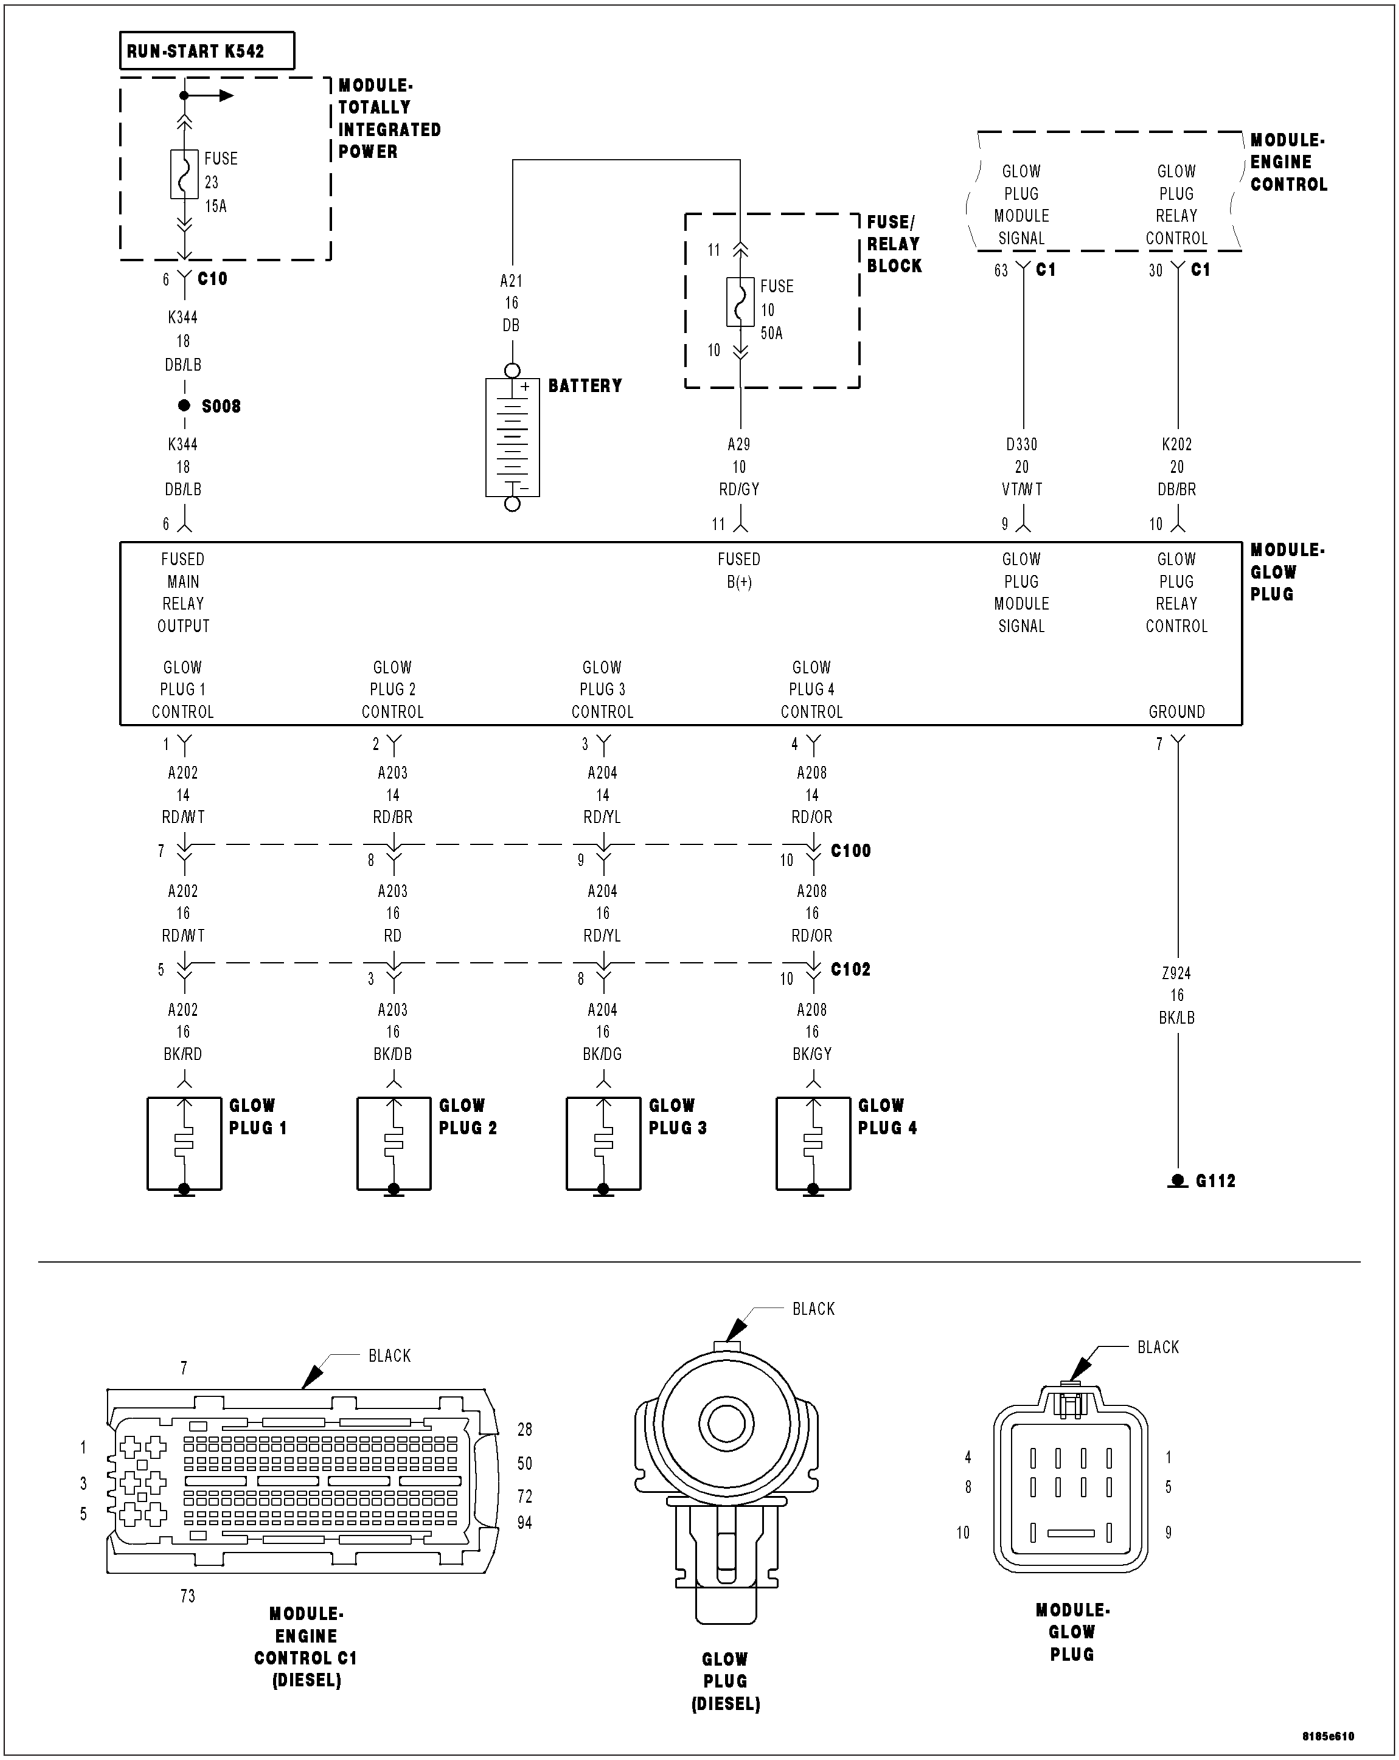
3. (K202) GLOW PLUG MODULE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K202) Glow Plug Module Control circuit between the Glow Plug Module harness connector and the Engine Control Module (ECM) harness connector.



Is the resistance below 10.0 ohms?

Yes >> Replace the Glow Plug Control Module.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K202) Glow Plug Module Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0671-CYLINDER 1 GLOW PLUG CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command on.
- **Set Condition:**
  The ECM detects an open or short on the Cylinder 1 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND
(A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 1
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

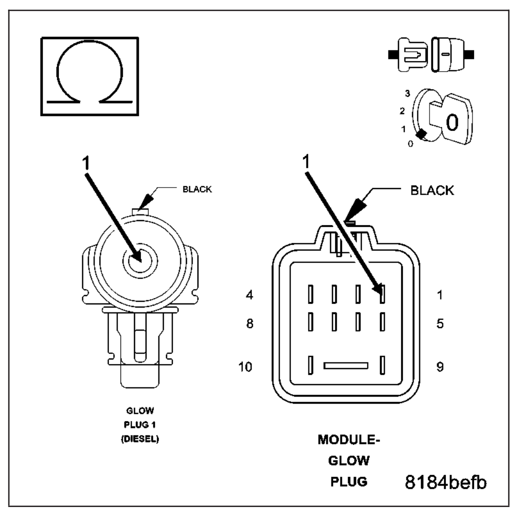
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



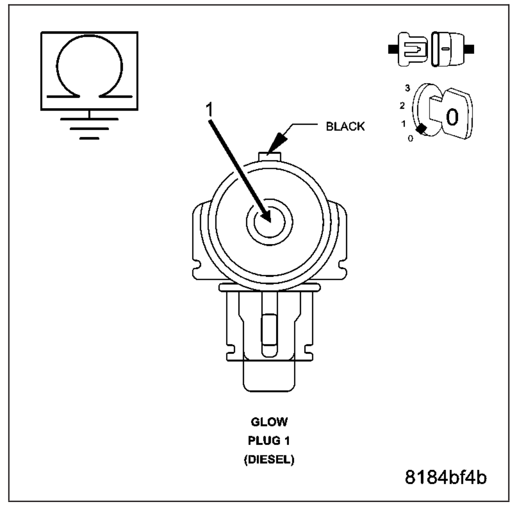
2. (A202) GLOW PLUG 1 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug 1 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A202) Glow Plug 1 Control circuit between the Glow Plug 1 harness connector and the Glow Plug Module harness connector.



Is the resistance below 10.0 ohms?

Yes >> Go To 3

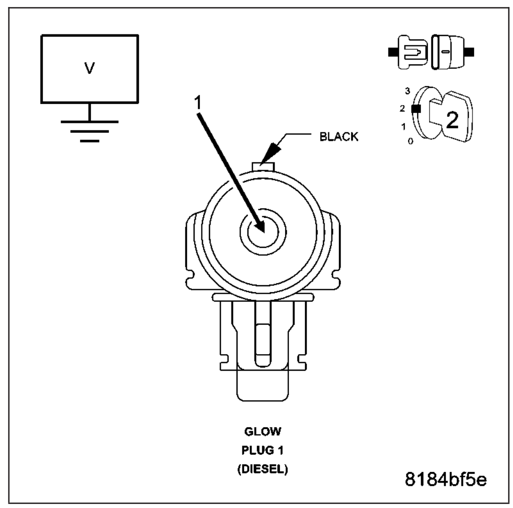
No >> Repair the (A202) Glow Plug 1 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is the resistance below 1000 ohms?

Yes >> Repair the (A202) Glow Plug 1 Control circuit for a short to ground.



Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A202) GLOW PLUG 1 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A202) Glow Plug 1 Control circuit at the Glow Plug 1 harness connector.

Is there voltage present on the (A202) Glow Plug 1 Control circuit?

Yes >> Repair the (A202) Glow Plug 1 Control circuit for a short to voltage

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG 1

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 1.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go to 6

No >> Test complete.

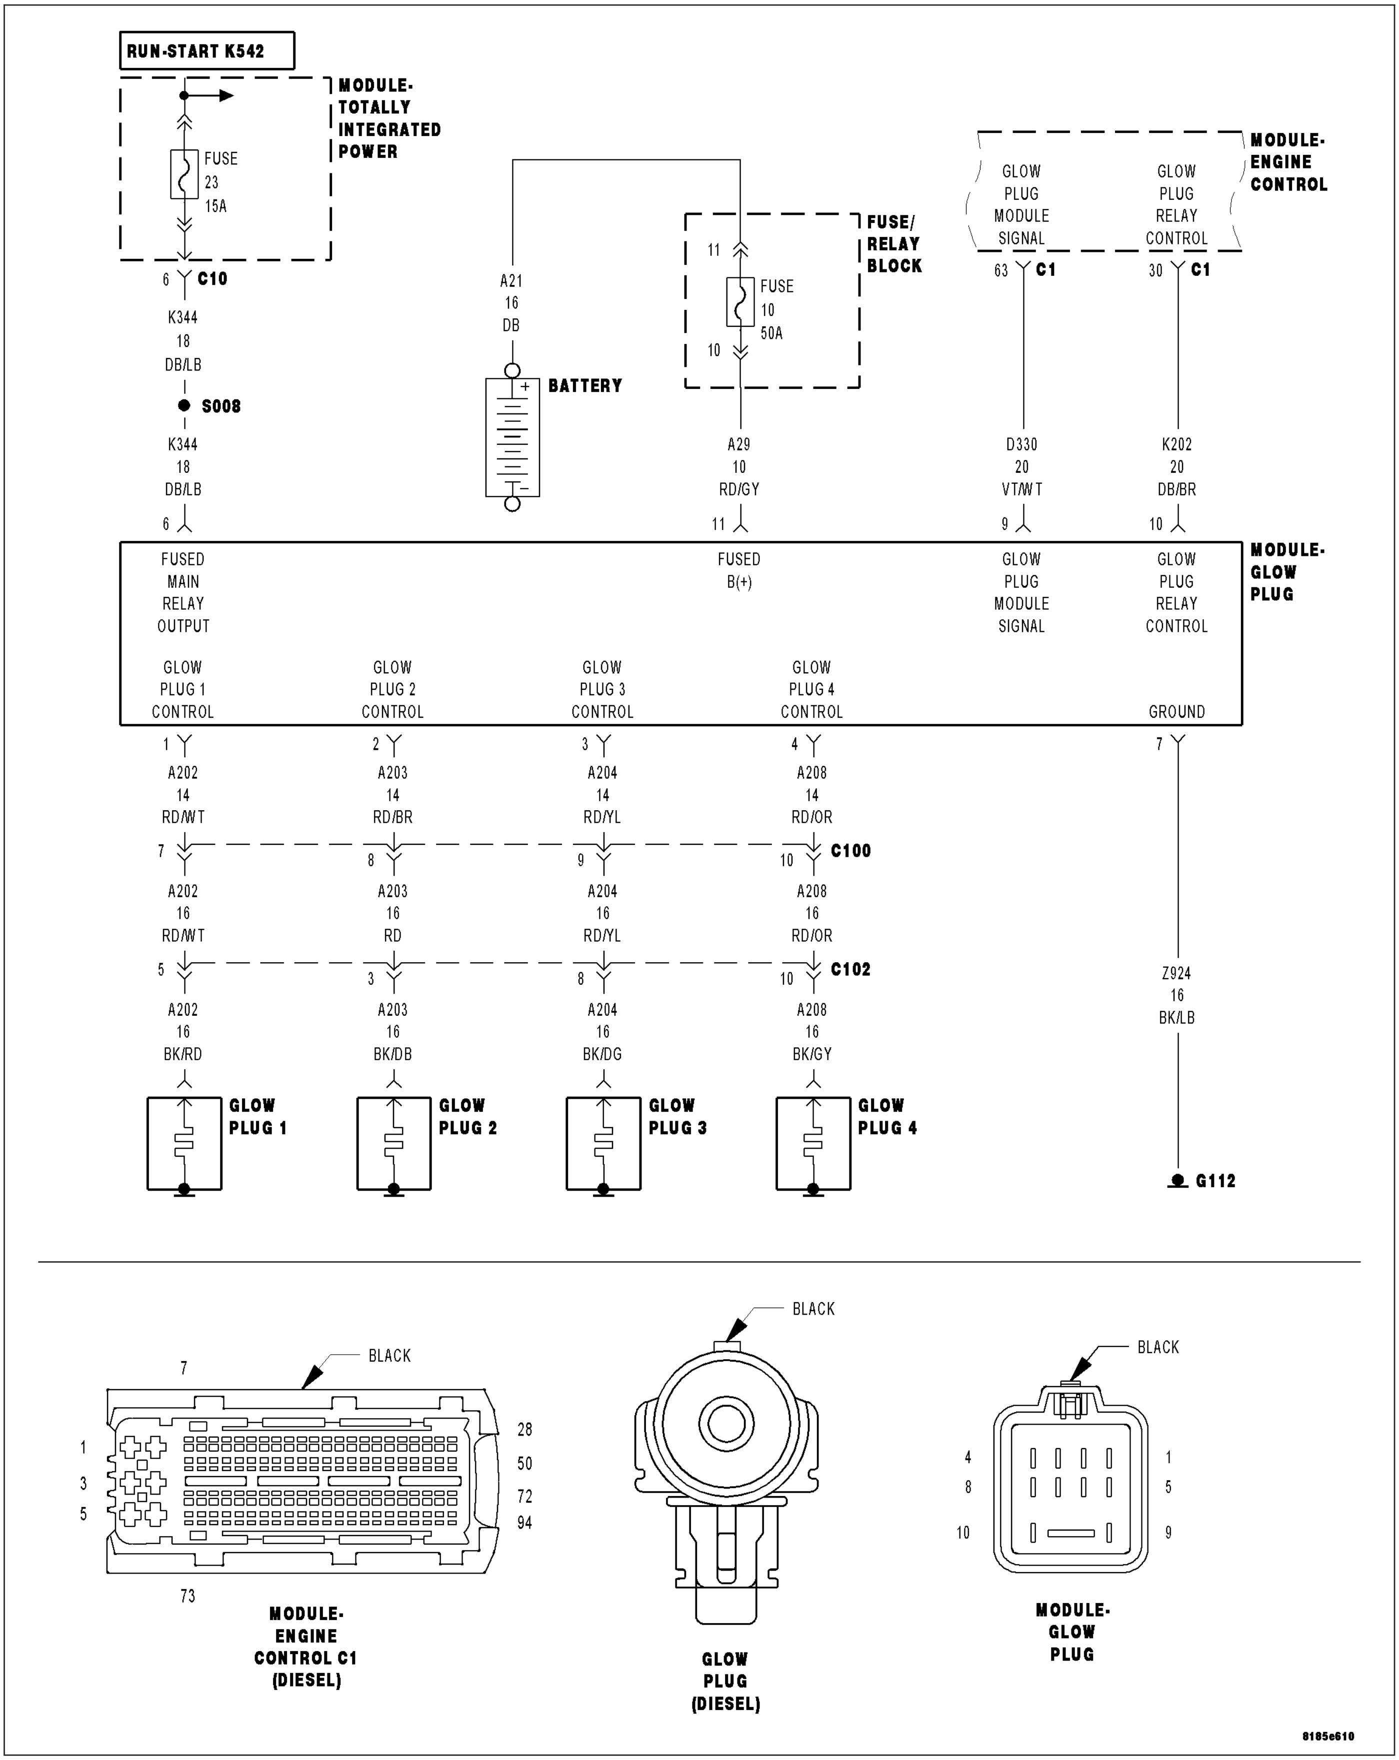
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0672-CYLINDER 2 GLOW PLUG CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command on.
- **Set Condition:**
  The ECM detects an open or short on the Cylinder 2 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND
(A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 2
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

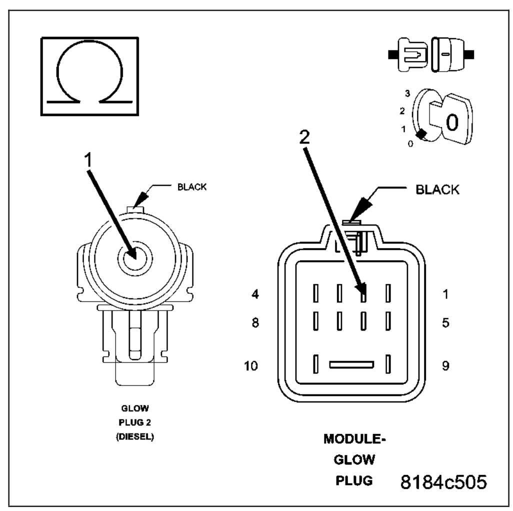
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



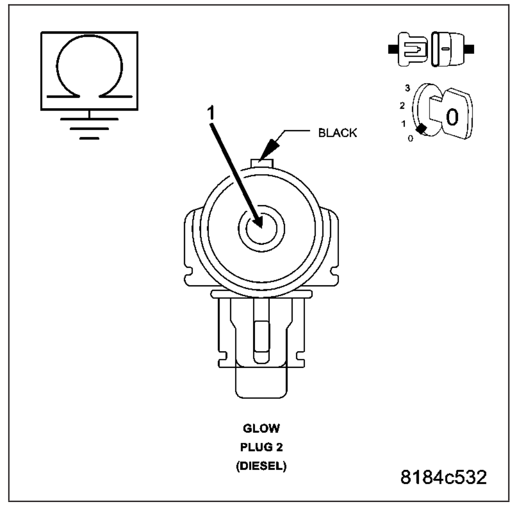
2. (A203) GLOW PLUG 2 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug 2 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A203) Glow Plug 2 Control circuit between the Glow Plug 2 harness connector and the Glow Plug Module harness connector.



Is the resistance below 10.0 ohms?

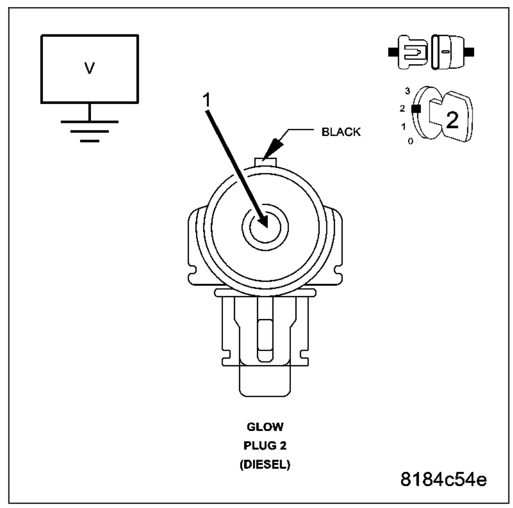
Yes >> Go To 3

No >> Repair the (A203) Glow Plug 2 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

Is the resistance below 1000 ohms?



Yes >> Repair the (A203) Glow Plug 2 Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A203) GLOW PLUG 2 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A203) Glow Plug 2 Control circuit at the Glow Plug 2 harness connector.

Is there voltage present on the (A203) Glow Plug 2 Control circuit?

Yes >> Repair the (A203) Glow Plug 2 Control circuit for a short to voltage
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG 2

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 2.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go to 6

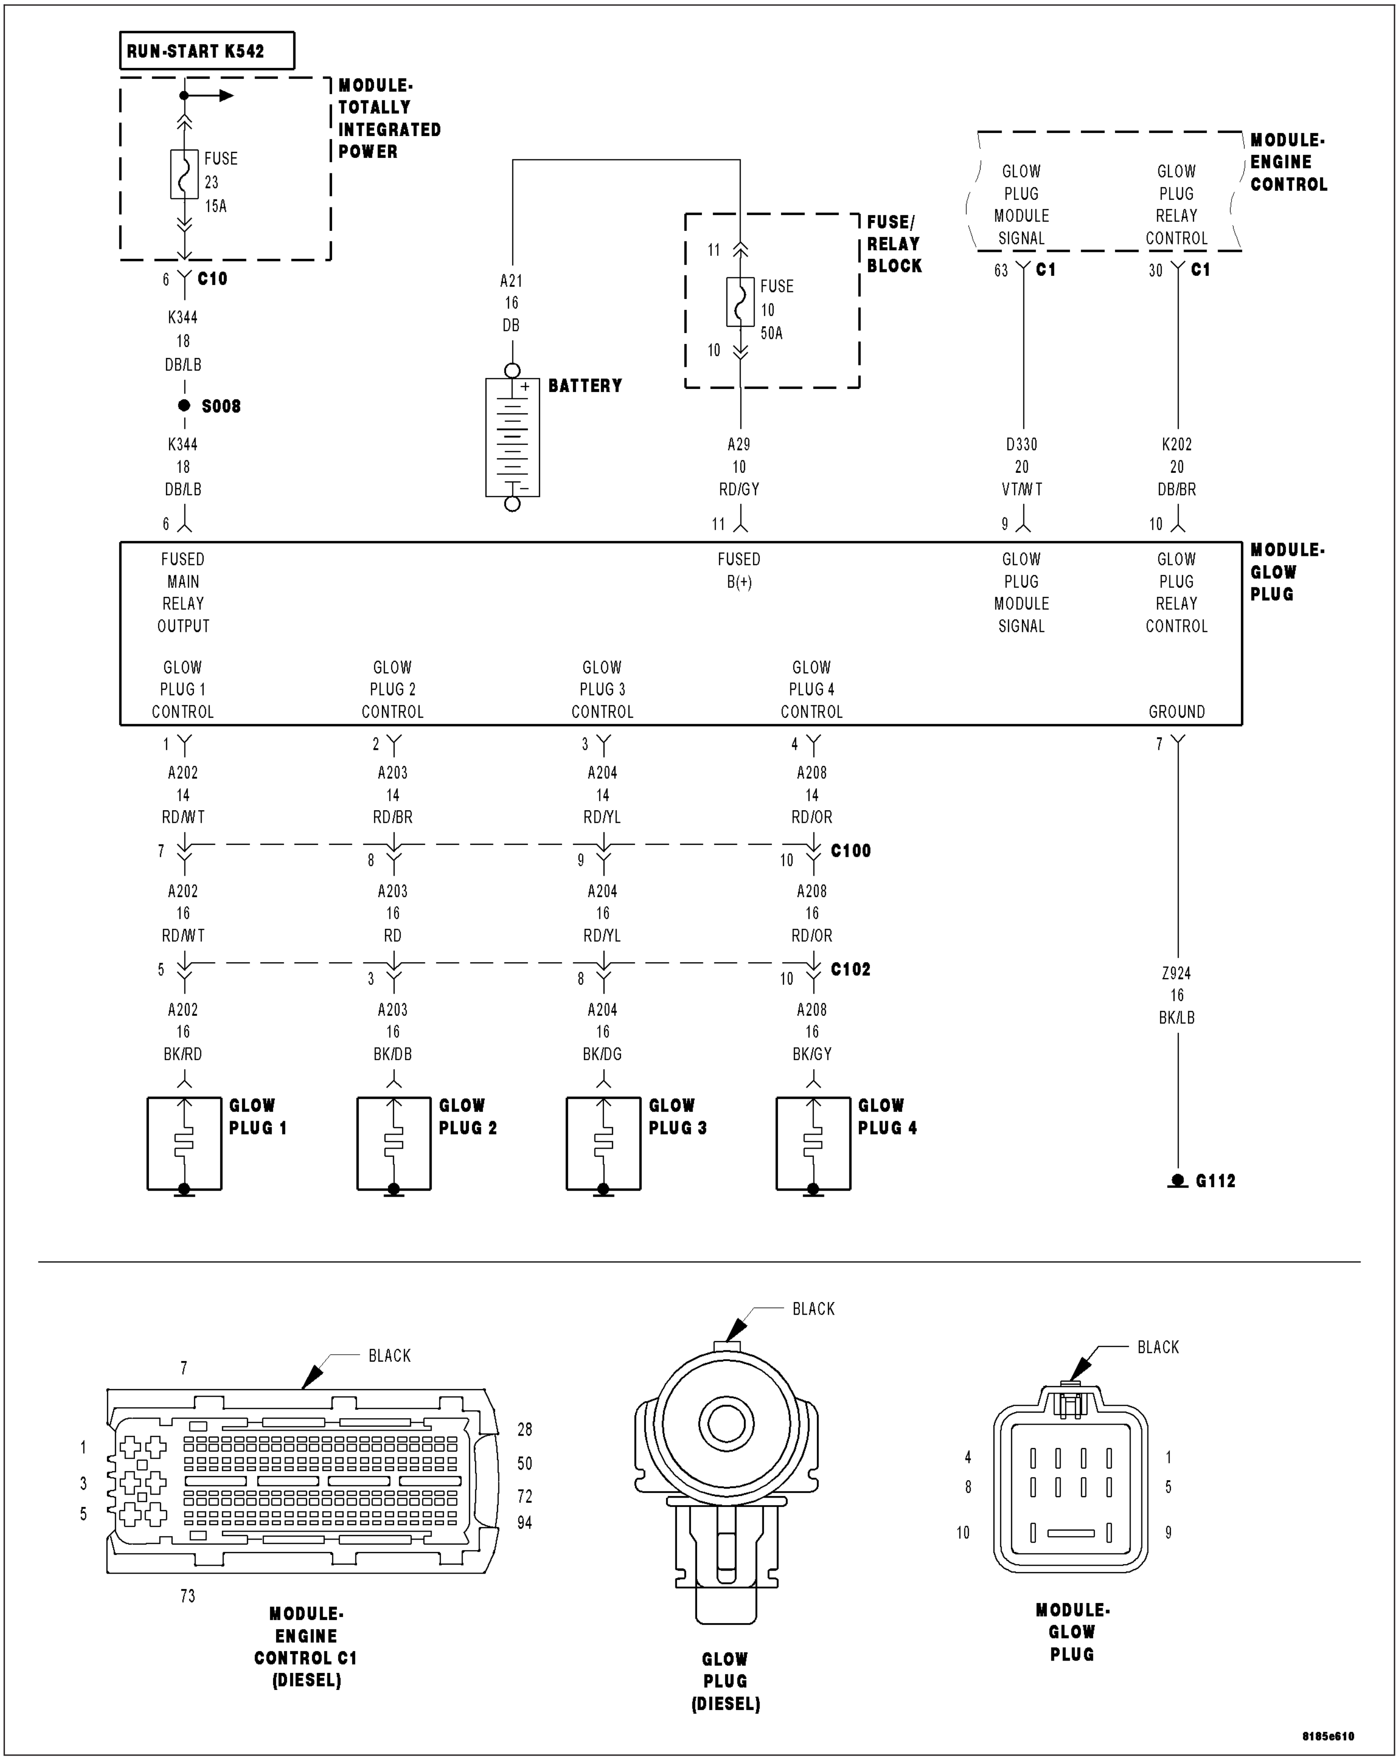
No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0673-CYLINDER 3 GLOW PLUG CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command on.
- **Set Condition:**
  The ECM detects an open or short on the Cylinder 3 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND
(A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 3
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

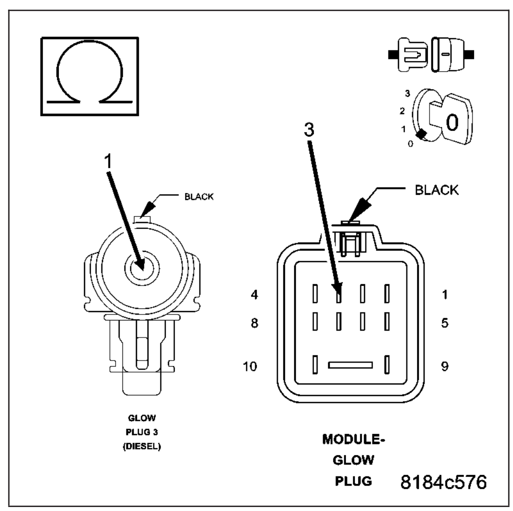
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



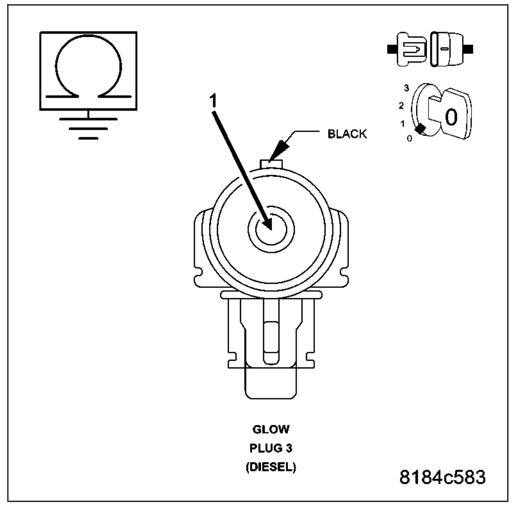
2. (A204) GLOW PLUG 3 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug 3 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A204) Glow Plug 3 Control circuit between the Glow Plug 3 harness connector and the Glow Plug Module harness connector.



Is the resistance below 10.0 ohms?

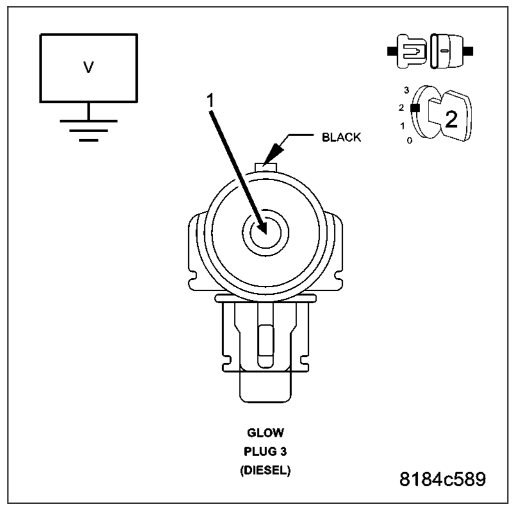
Yes >> Go To 3

No >> Repair the (A204) Glow Plug 3 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

Is the resistance below 1000 ohms?



Yes >> Repair the (A204) Glow Plug 3 Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A204) GLOW PLUG 3 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A204) Glow Plug 3 Control circuit at the Glow Plug 3 harness connector.

Is there voltage present on the (A204) Glow Plug 3 Control circuit?

Yes >> Repair the (A204) Glow Plug 3 Control circuit for a short to voltage
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG 3

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 3.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go to 6

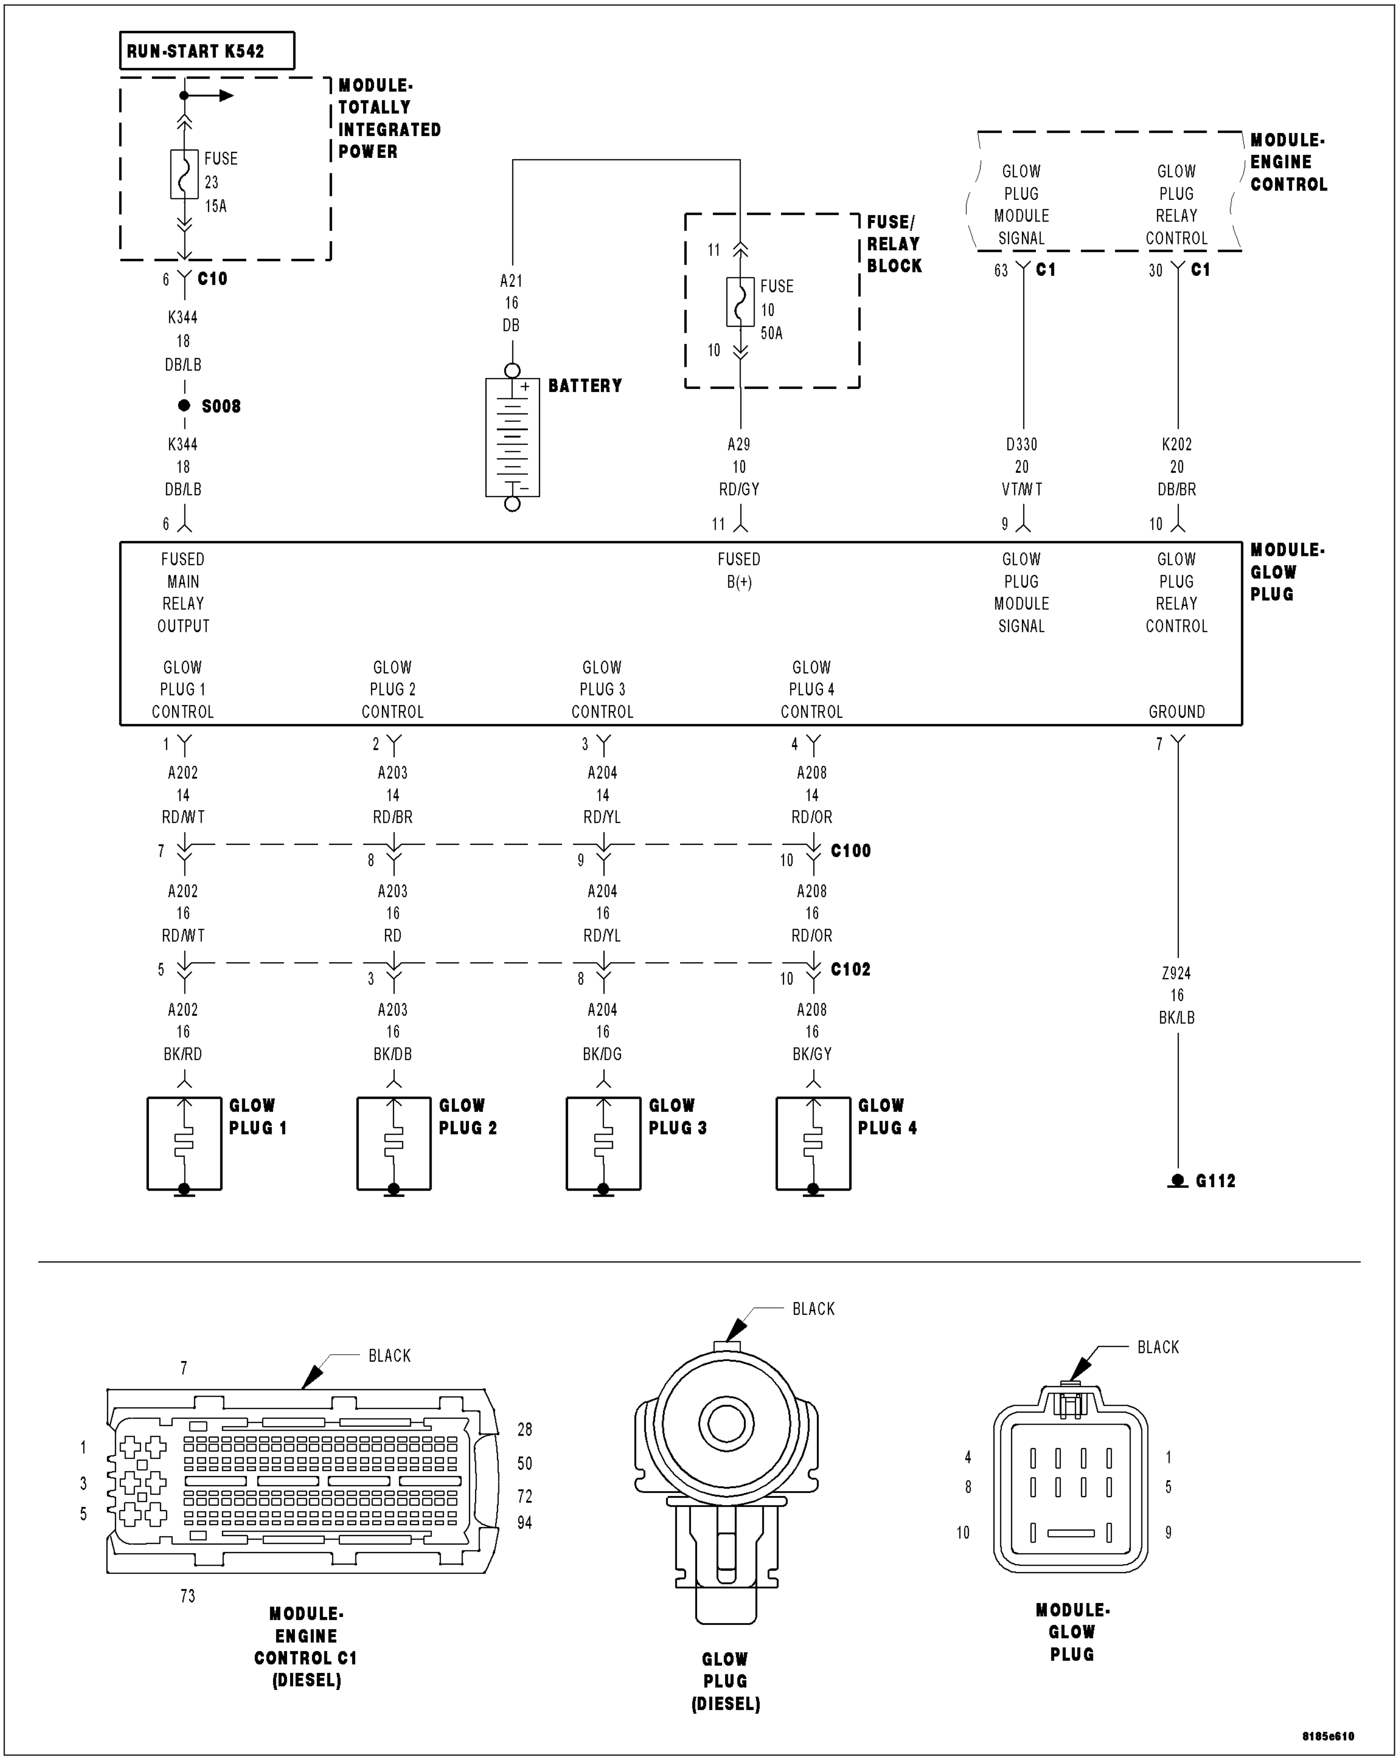
No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0674-CYLINDER 4 GLOW PLUG CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command on.
- **Set Condition:**
  The ECM detects an open or short on the Cylinder 4 Glow Plug circuit for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 4
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

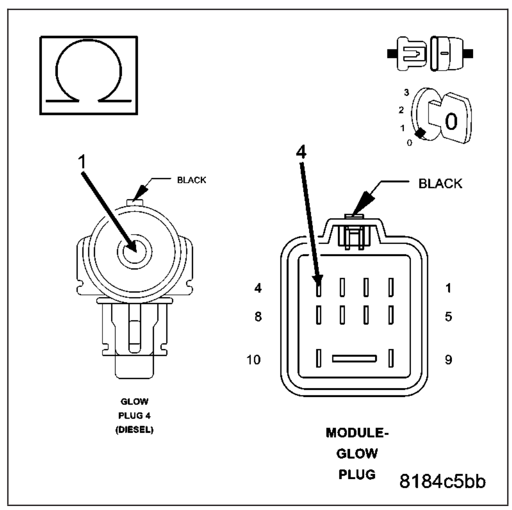
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



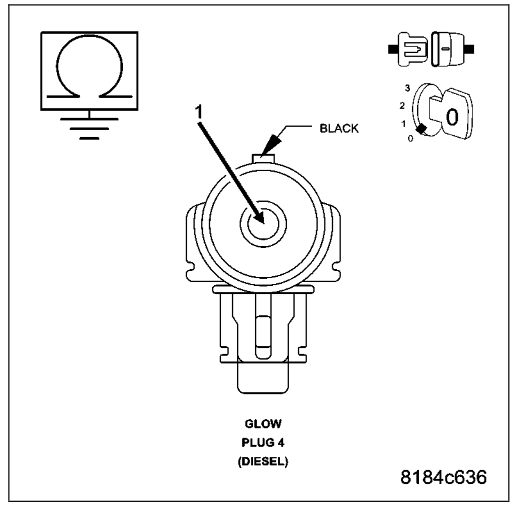
2. (A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect Glow Plug 4 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A208) Glow Plug Control circuit between the Glow Plug 4 harness connector and the Glow Plug Module harness connector.



Is the resistance below 10.0 ohms for each circuit?

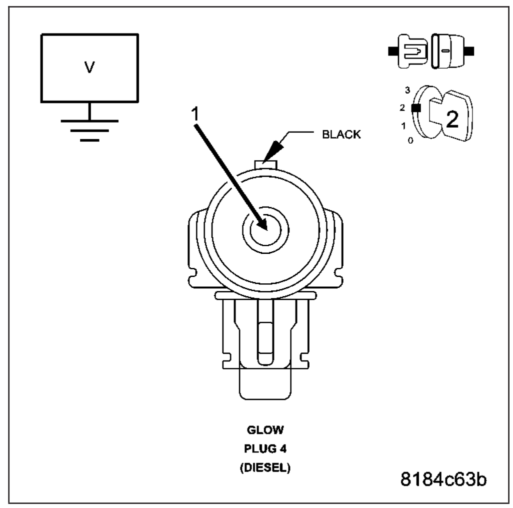
Yes >> Go To 3

No >> Repair the (A208) Glow Plug 4 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A208) Glow Plug Control circuit at the Glow Plug 4 harness connector.

Is the resistance below 1000 ohms for any of the measurements?



Yes >> Repair the (A208) Glow Plug 4 Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A208) Glow Plug 4 Control circuit at the Glow Plug 4 harness connector.

Is there voltage present on any of the Glow Plug Control circuits?

Yes >> Repair the (A208) Glow Plug 4 Control circuit for a short to voltage
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG

Turn the ignition off.

Connect each Glow Plug connector.

Connect the Glow Plug Module connector.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Refer to the Service Information and perform the Glow Plug Test on each Glow plug.

Did each Glow Plug pass the test?

Yes >> Go to 6

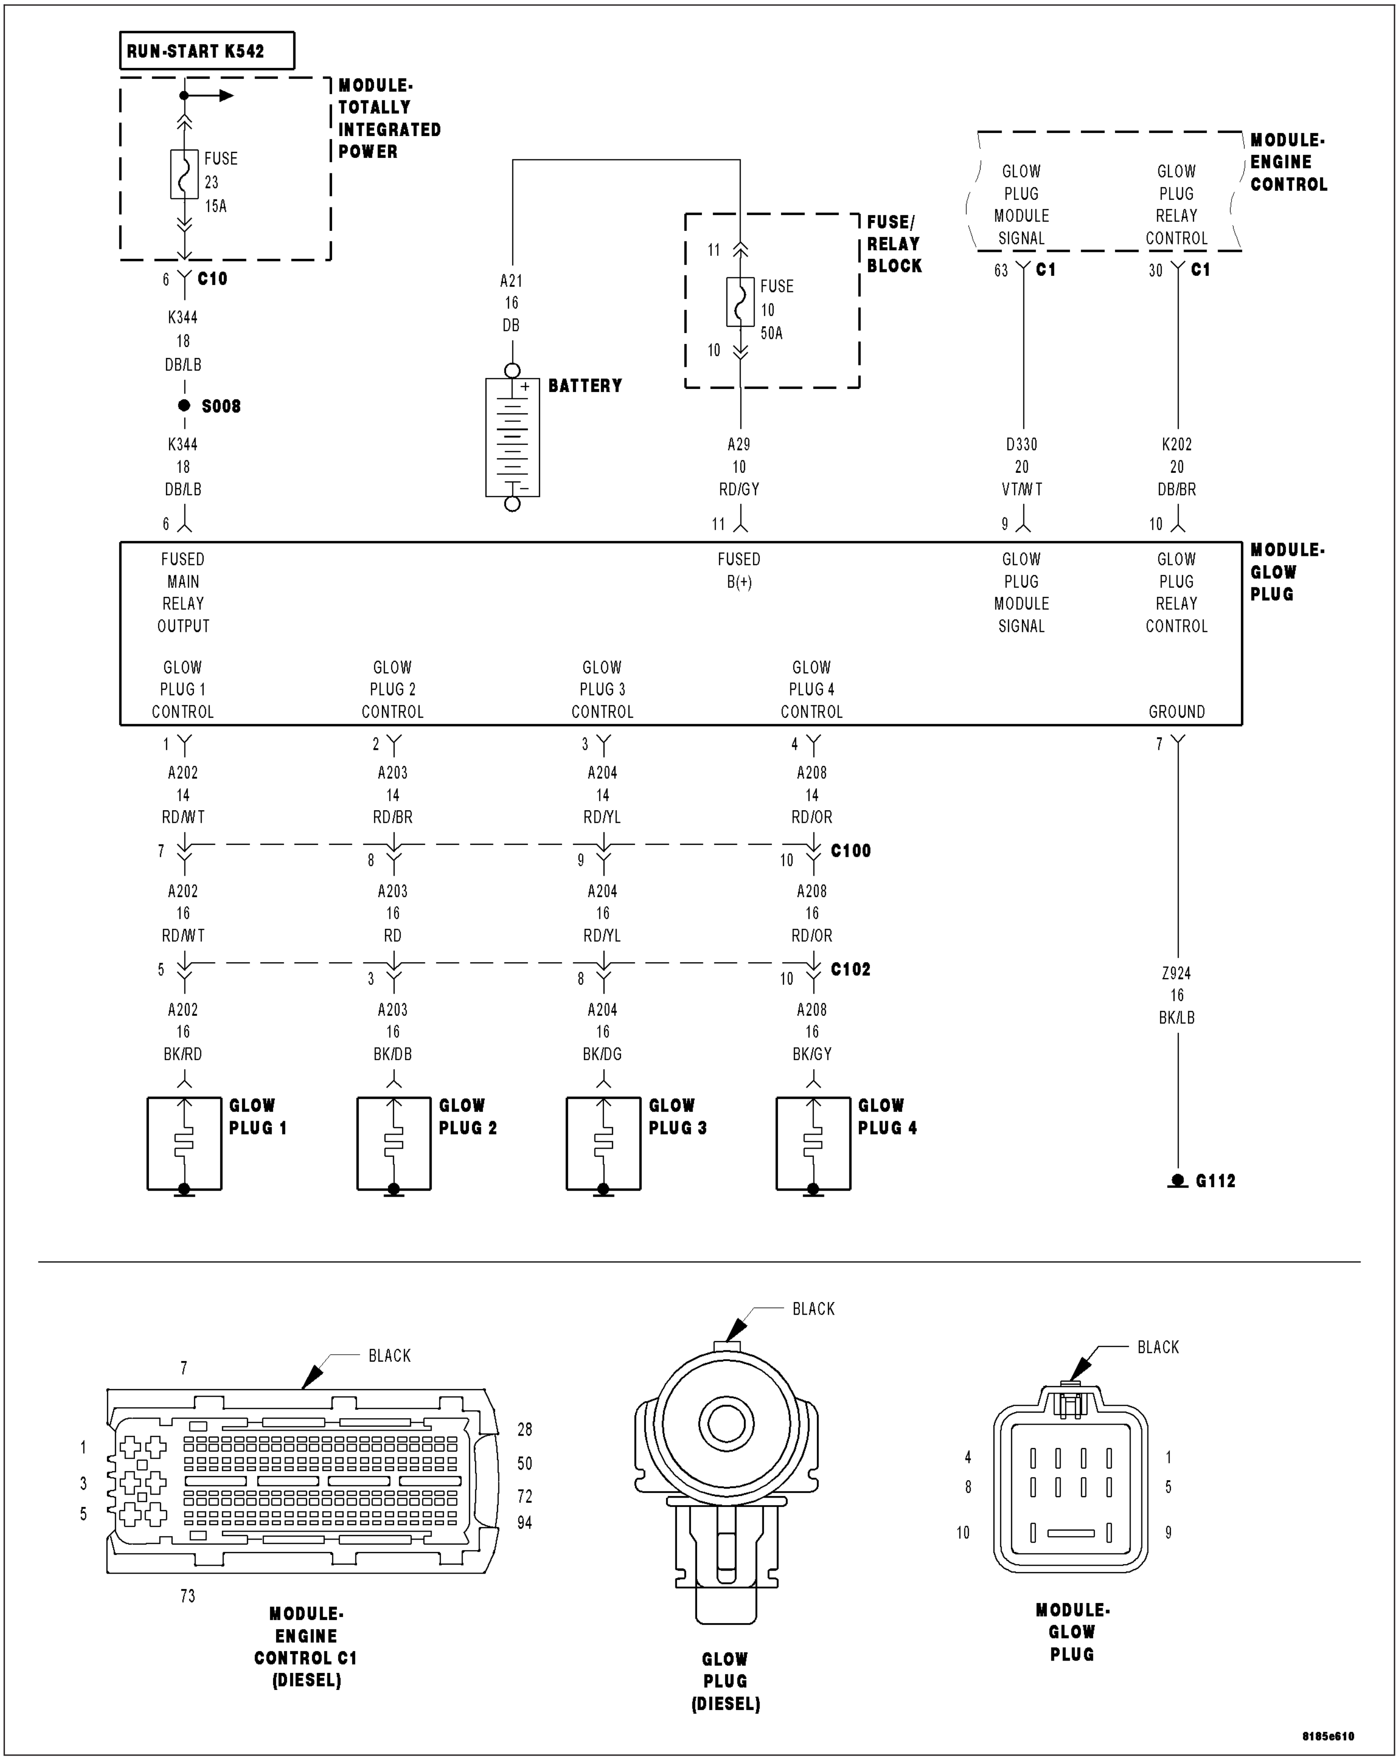
No >> Replace the appropriate Glow Plug in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P067A-CYLINDER 4 GLOW PLUG CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the Glow Plug Module Glow Plug command off.
- **Set Condition:**
  The ECM detects an open or shorted to ground on the Cylinder 4 Glow Plug circuit.

Possible Causes
INTERMITTENT DTC
(A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND
(A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG 4
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

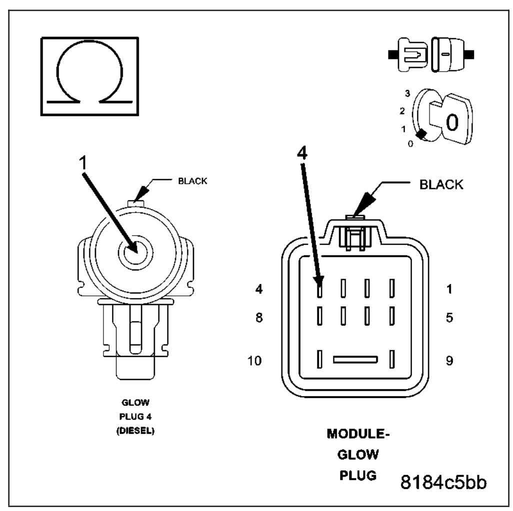
Perform several ignition cycles leaving the ignition on for at least 10 seconds then off for 10 seconds.

With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



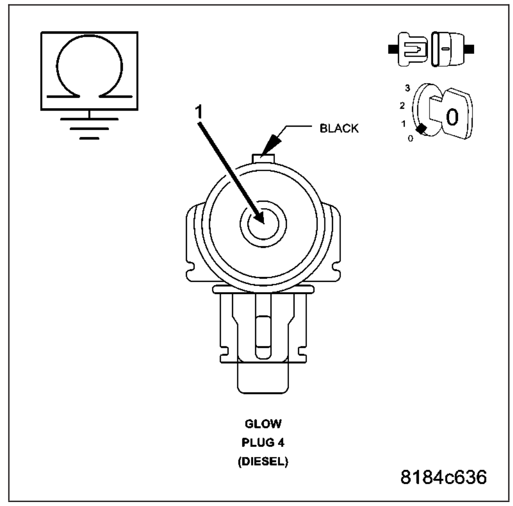
2. (A208) GLOW PLUG 4 CONTROL CIRCUIT OPEN

Turn the ignition off.

Disconnect the Glow Plug 4 harness connector.

Disconnect the Glow Plug Module harness connector.

Measure the resistance of the (A208) Glow Plug 4 Control circuit between the Glow Plug 4 harness connector and the Glow Plug Module harness connector.



Is the resistance below 10.0 ohms?

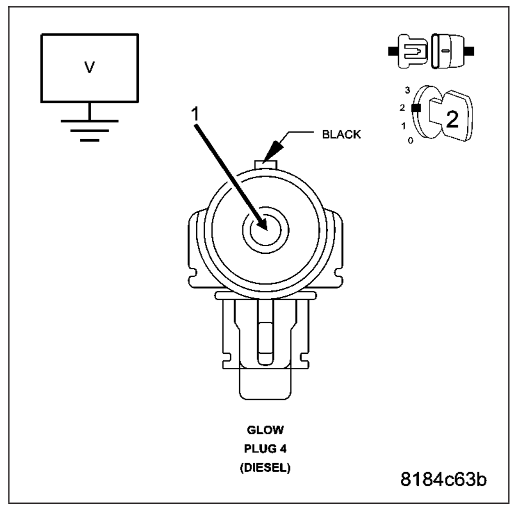
Yes >> Go To 3

No >> Repair the (A208) Glow Plug 4 Control circuit for an open. Perform ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (A208) Glow Plug 4 Control circuit at the Glow Plug 4 harness connector.

Is the resistance below 1000 ohms?



Yes >> Repair the (A208) Glow Plug 4 Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 4

4. (A208) GLOW PLUG 4 CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (A208) Glow Plug 4 Control circuit at the Glow Plug 4 harness connector.

Is there voltage present on the (A208) Glow Plug 4 Control circuit?

Yes >> Repair the (A208) Glow Plug 4 Control circuit for a short to voltage
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. GLOW PLUG 4

Turn the ignition off.

Refer to the Service Information and replace the Glow Plug 4.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles leaving the ignition on for at least 10 seconds per cycle.

With the scan tool, read ECM DTCs.

Does the scan tool display this DTC?

Yes >> Go to 6

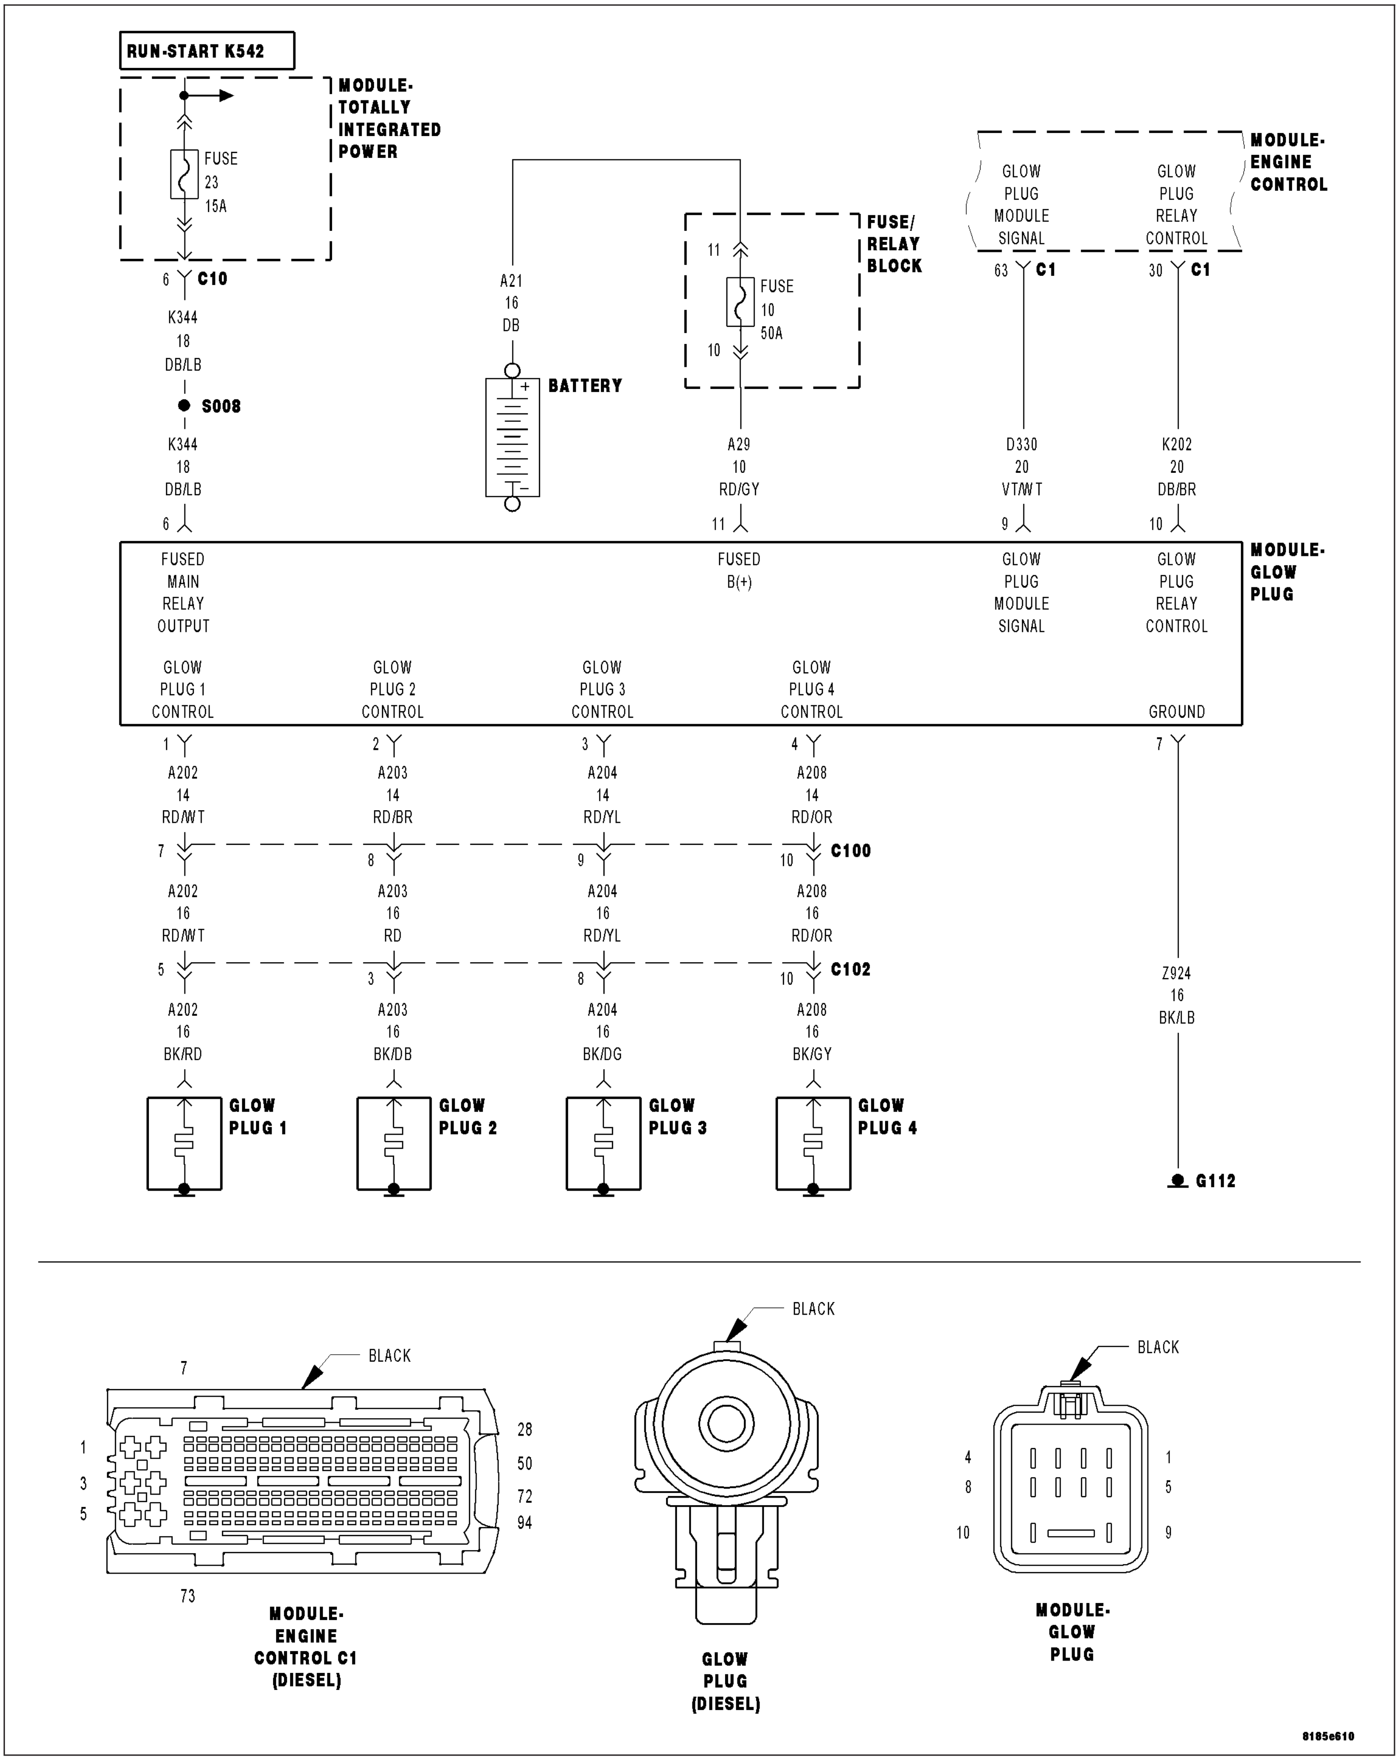
No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. GLOW PLUG MODULE

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Glow Plugs and the Glow Plug Module.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P0683-GLOW PLUG CONTROL MODULE TO PCM COMMUNICATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects a fault on the (D330) Glow Plug Module Signal circuit for 0.5 second.

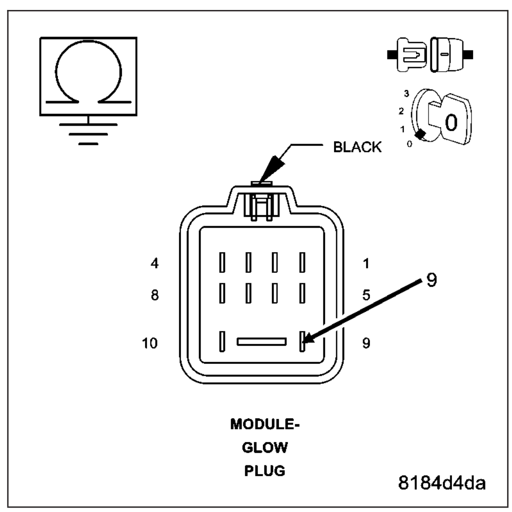
Possible Causes
INTERMITTENT DTC
(D330) GLOW PLUG MODULE SIGNAL CIRCUIT SHORTED TO GROUND
(D330) GLOW PLUG MODULE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K202) GLOW PLUG RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(D330) GLOW PLUG MODULE SIGNAL CIRCUIT SHORTED TO VOLTAGE
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, Clear DTCs in the Engine Control Module (ECM).
With the scan tool, actuate the Glow Plugs.
Monitor the scan tool for at least two minutes.
Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
Start the engine.
Allow the engine to reach normal operating temperature.
Test drive the vehicle.
With the scan tool, select View DTCs.



Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (D330) GLOW PLUG MODULE SIGNAL CIRCUIT SHORTED TO GROUND

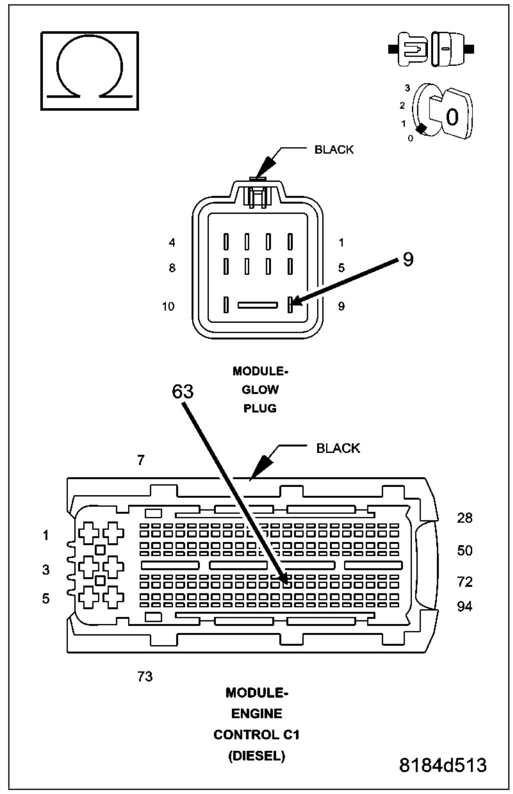
Turn the ignition off.
Disconnect the Glow Plug Module harness connector.
Disconnect the Engine Control Module (ECM) harness connector.
Measure the resistance between ground and the (D330) Glow Plug Module Signal circuit in the Glow Plug Module harness connector.

Is the resistance below 1000 ohms?

Yes >> Repair the (D330) Glow Plug Module Signal circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (D330) GLOW PLUG MODULE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (D330) Glow Plug Module Signal circuit between the Glow Plug Module harness connector and the Engine Control Module (ECM) harness connector.

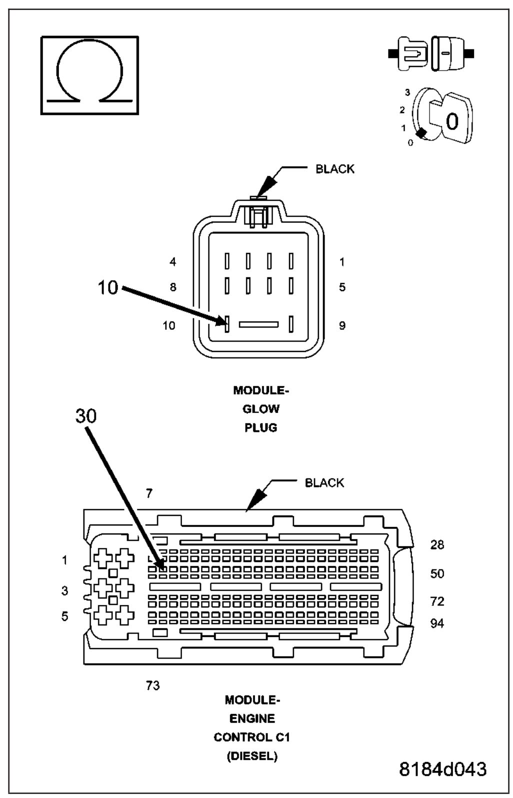
Is the resistance below 10.0 ohms?

Yes >> Go To 4

No >> Repair the (D330) Glow Plug Module Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K202) GLOW PLUG RELAY CONTROL CIRCUIT OPEN OR HIGH RESISTANCE



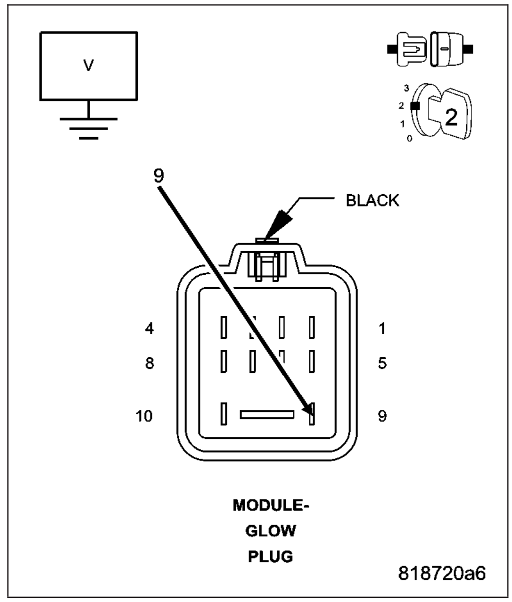
Measure the resistance of the (K202) Glow Plug Relay Control circuit between the Glow Plug Module harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 5

No >> Repair the (K202) Glow Plug Relay Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



5. (D330) GLOW PLUG MODULE SIGNAL CIRCUIT SHORTED TO VOLTAGE

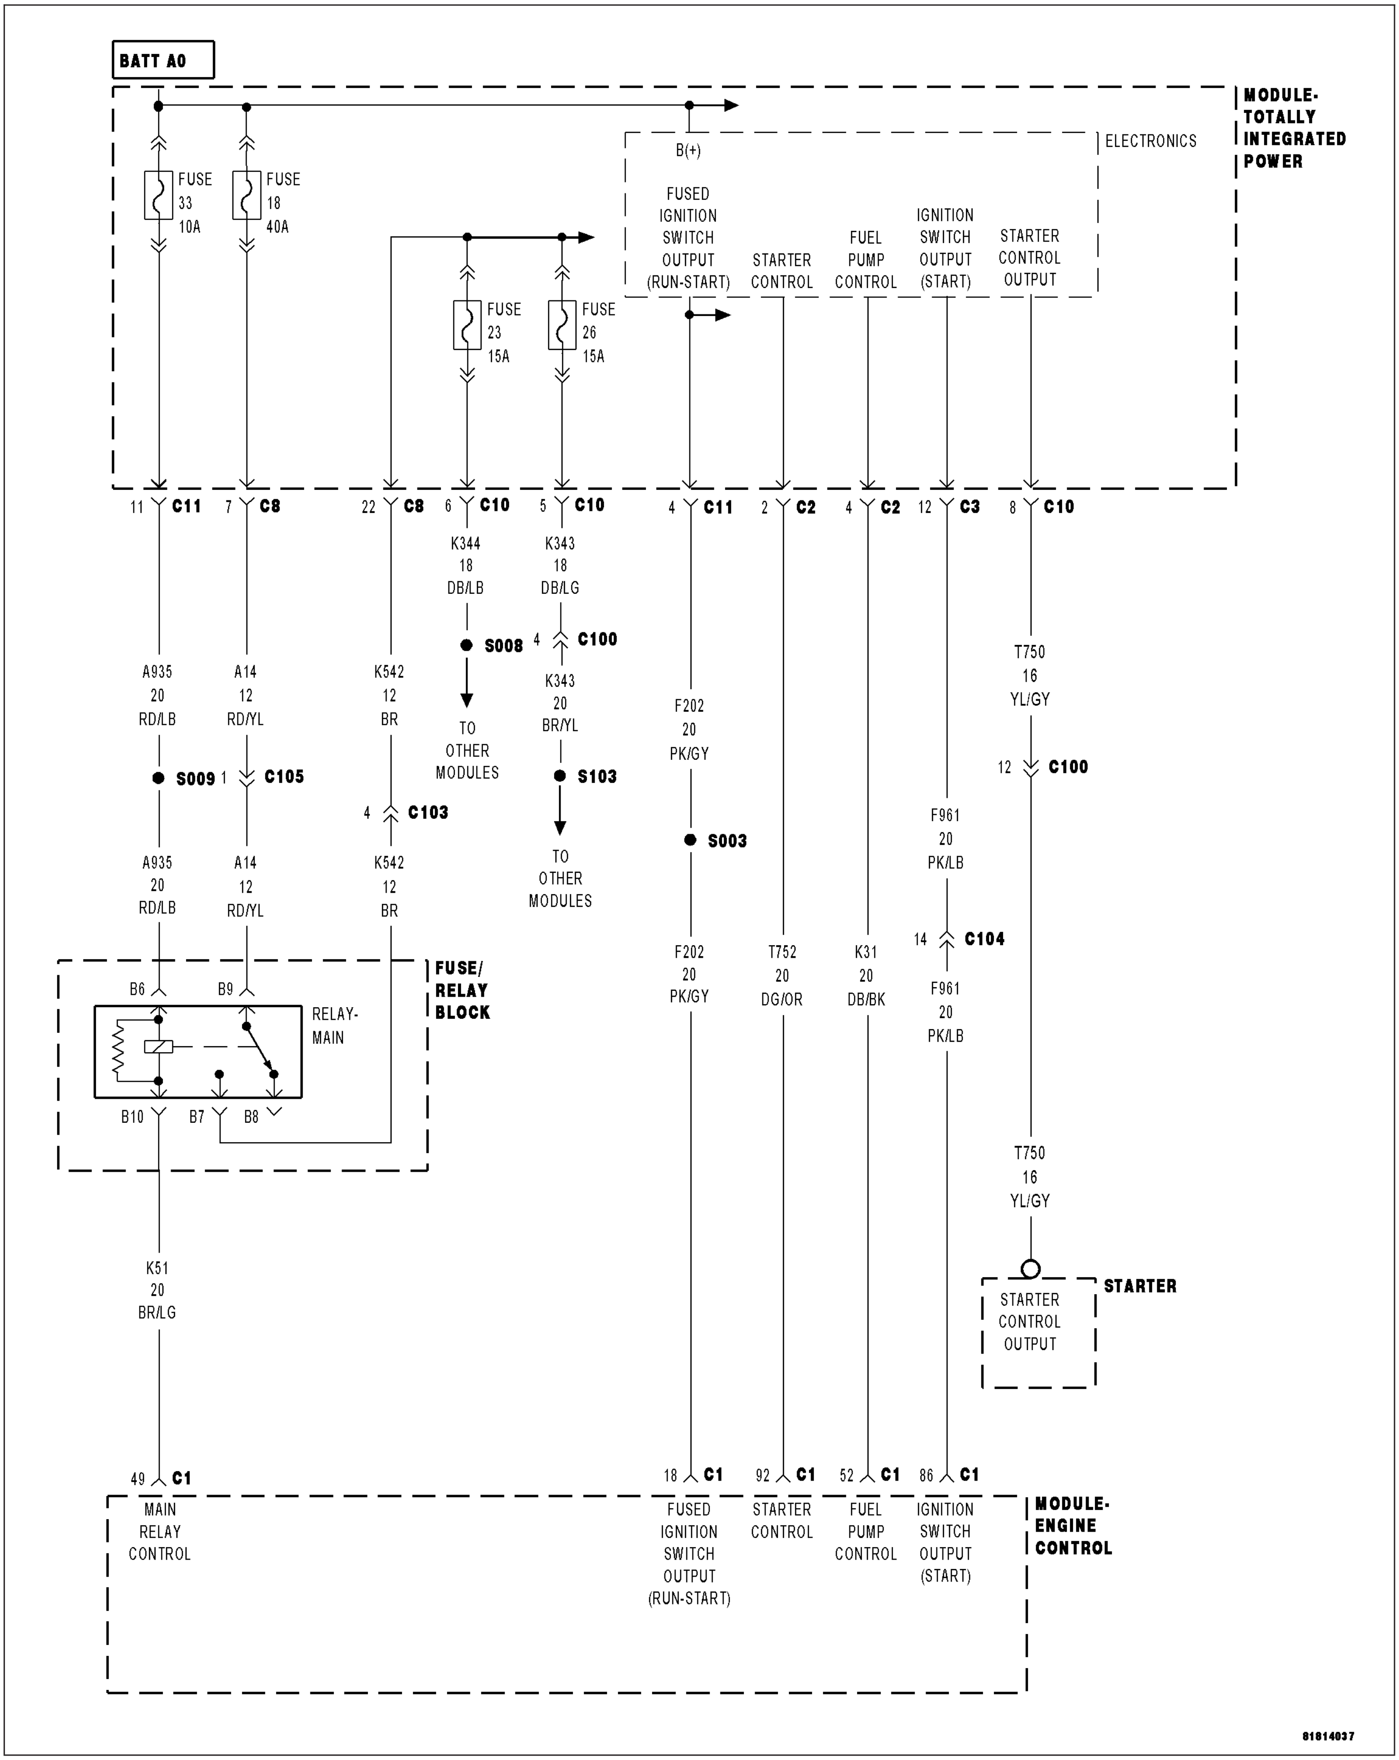
Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (D330) Glow Plug Module Signal circuit.

Is the voltage above 1.0 volt?



Yes >> Repair the (D330) Glow Plug Module Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Glow Plug Control Module.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P068A-ASD/MAIN RELAY OFF TOO EARLY

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  When the ignition is turned off, during after-run mode of operation.
- **Set Condition:**
  The internal ECM timer determines that the Main Relay has shut off before the AFTER-RUN mode of operation has been completed.

Possible Causes
CHECK FOR OTHER DTCS
INTERMITTENT CONDITION
SUBSTITUTE MAIN RELAY
(K51) MAIN RELAY CONTROL CIRCUIT OPEN INTERMITTENTLY
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR OTHER DTCS

Turn the ignition on.

With the scan tool, check for additional DTCs.

Are other DTCs present?

Yes >> Refer to the Symptom List for diagnosis of the other DTCs before continuing.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2

2. CLEAR CODE AND CHECK IF THE DTC RESETS

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles, pausing for at least 10 seconds between each cycle.

Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 3

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. MAIN RELAY

Turn the ignition off.

Install a known good relay in place of the Main Relay.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition key cycles, pausing for at least 10 seconds between each cycle.

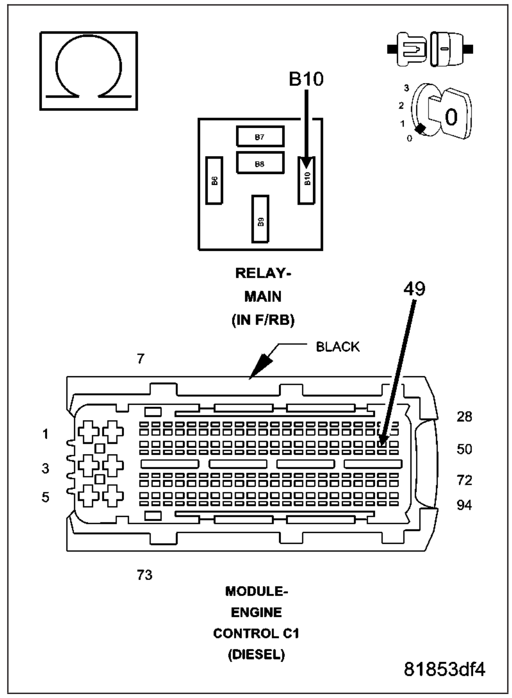
Turn the ignition on.

With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 4

No >> Replace the Main Relay.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



4. (K51) MAIN RELAY CONTROL CIRCUIT OPEN INTERMITTENTLY

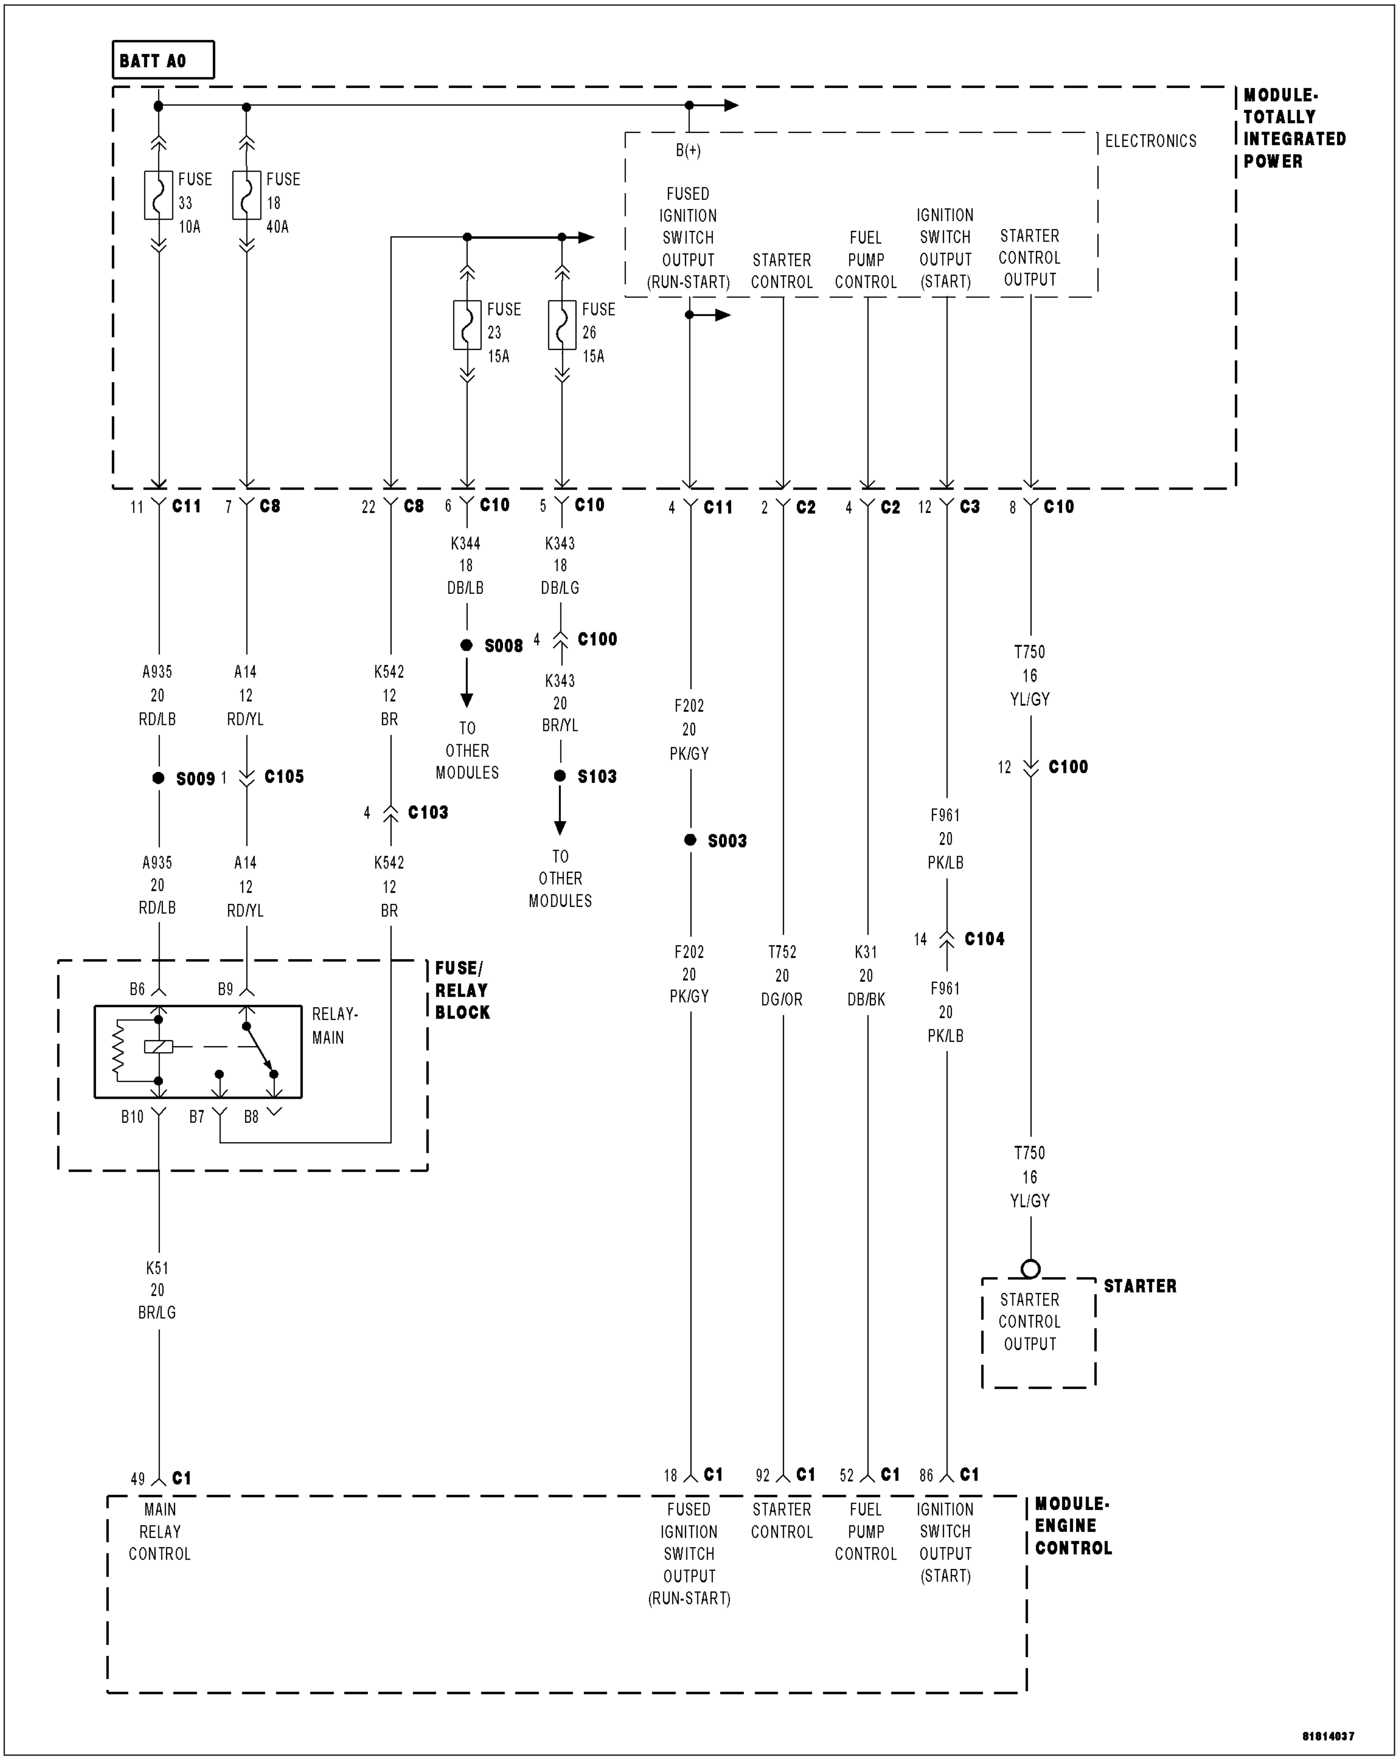
Turn the ignition off.

Remove the Main Relay.

Disconnect the ECM harness connectors.

Measure the resistance of the Main Relay Control circuit while wiggling the wiring harness and connectors between the ECM and Main Relay connector.

Was the resistance above 10.0 ohms at any time while wiggling the wiring harness and connectors?



Yes >> Repair the Main Relay Control circuit for an intermittent open.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P068B-ASD/MAIN RELAY OFF TOO LATE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  When the ignition is turned off, during AFTER-RUN mode of operation.
- **Set Condition:**
  The internal ECM timer determines that the Main Relay remained on too long once AFTER-RUN mode of operation has been completed.

Possible Causes
CHECK FOR OTHER DTCS
INTERMITTENT CONDITION
SUBSTITUTE MAIN RELAY
(K51) MAIN RELAY CONTROL CIRCUIT SHORTED TO GROUND INTERMITTENTLY
(K542) MAIN RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE
ENGINE CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR OTHER DTCS

Turn the ignition on.
With the scan tool, check for additional DTCs.

Are other DTCs present?

Yes >> Refer to the Symptom List for diagnosis of the other DTCs before continuing.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2

2. CLEAR CODE AND CHECK IF THE DTC RESETS

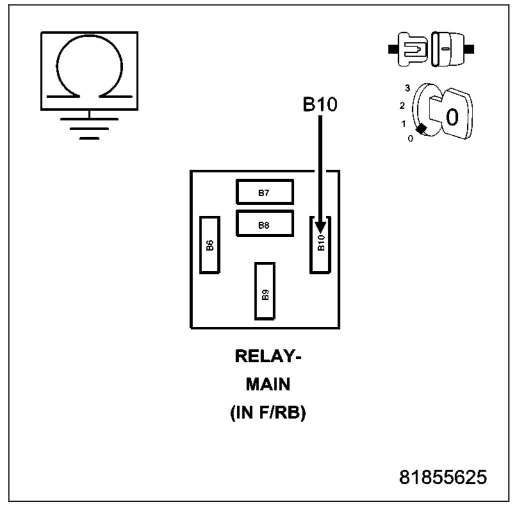
Perform several ignition key cycles, pausing for at least 10 seconds between each cycle.
Turn the ignition on.
With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 3

No >> Go To 6

3. MAIN RELAY



Turn the ignition off.
Install a known good relay in place of the Main Relay.
Turn the ignition on.
With the scan tool, erase DTCs.
Perform several ignition key cycles, pausing for at least 10 seconds between each cycle.
Turn the ignition on.
With the scan tool, read ECM DTCs.

Did this DTC set again?

Yes >> Go To 4

No >> Replace the Main Relay.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

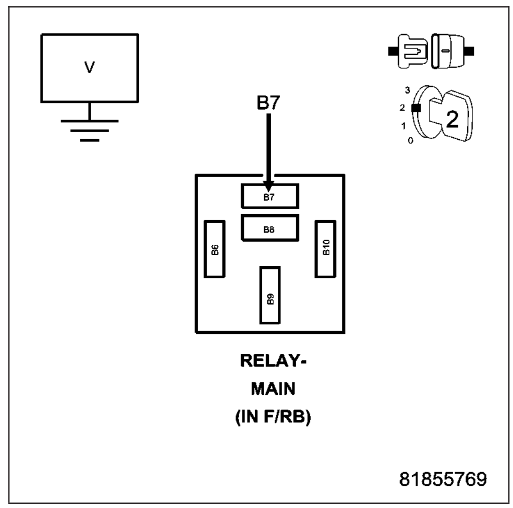
4. (K51) MAIN RELAY CONTROL CIRCUIT SHORTED TO GROUND INTERMITTENTLY

Turn the ignition off.

Remove the Main Relay.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (K51) Main Relay Control circuit while wiggling the wiring harness and connectors between the ECM and Main connector.



Was the resistance below 1000 ohms at any time while wiggling the wiring harness and connectors?

Yes >> Repair the (K51) Main Relay Control circuit for an intermittent short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. (K542) MAIN RELAY OUTPUT CIRCUIT SHORTED TO VOLTAGE

Turn the ignition on.

Measure the voltage of the (K542) Main Relay Output circuit at the Main Relay connector.

Is the voltage below 1.0 volt?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (K542) Main Relay Output circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. INTERMITTENT CONDITION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

NOTE: The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

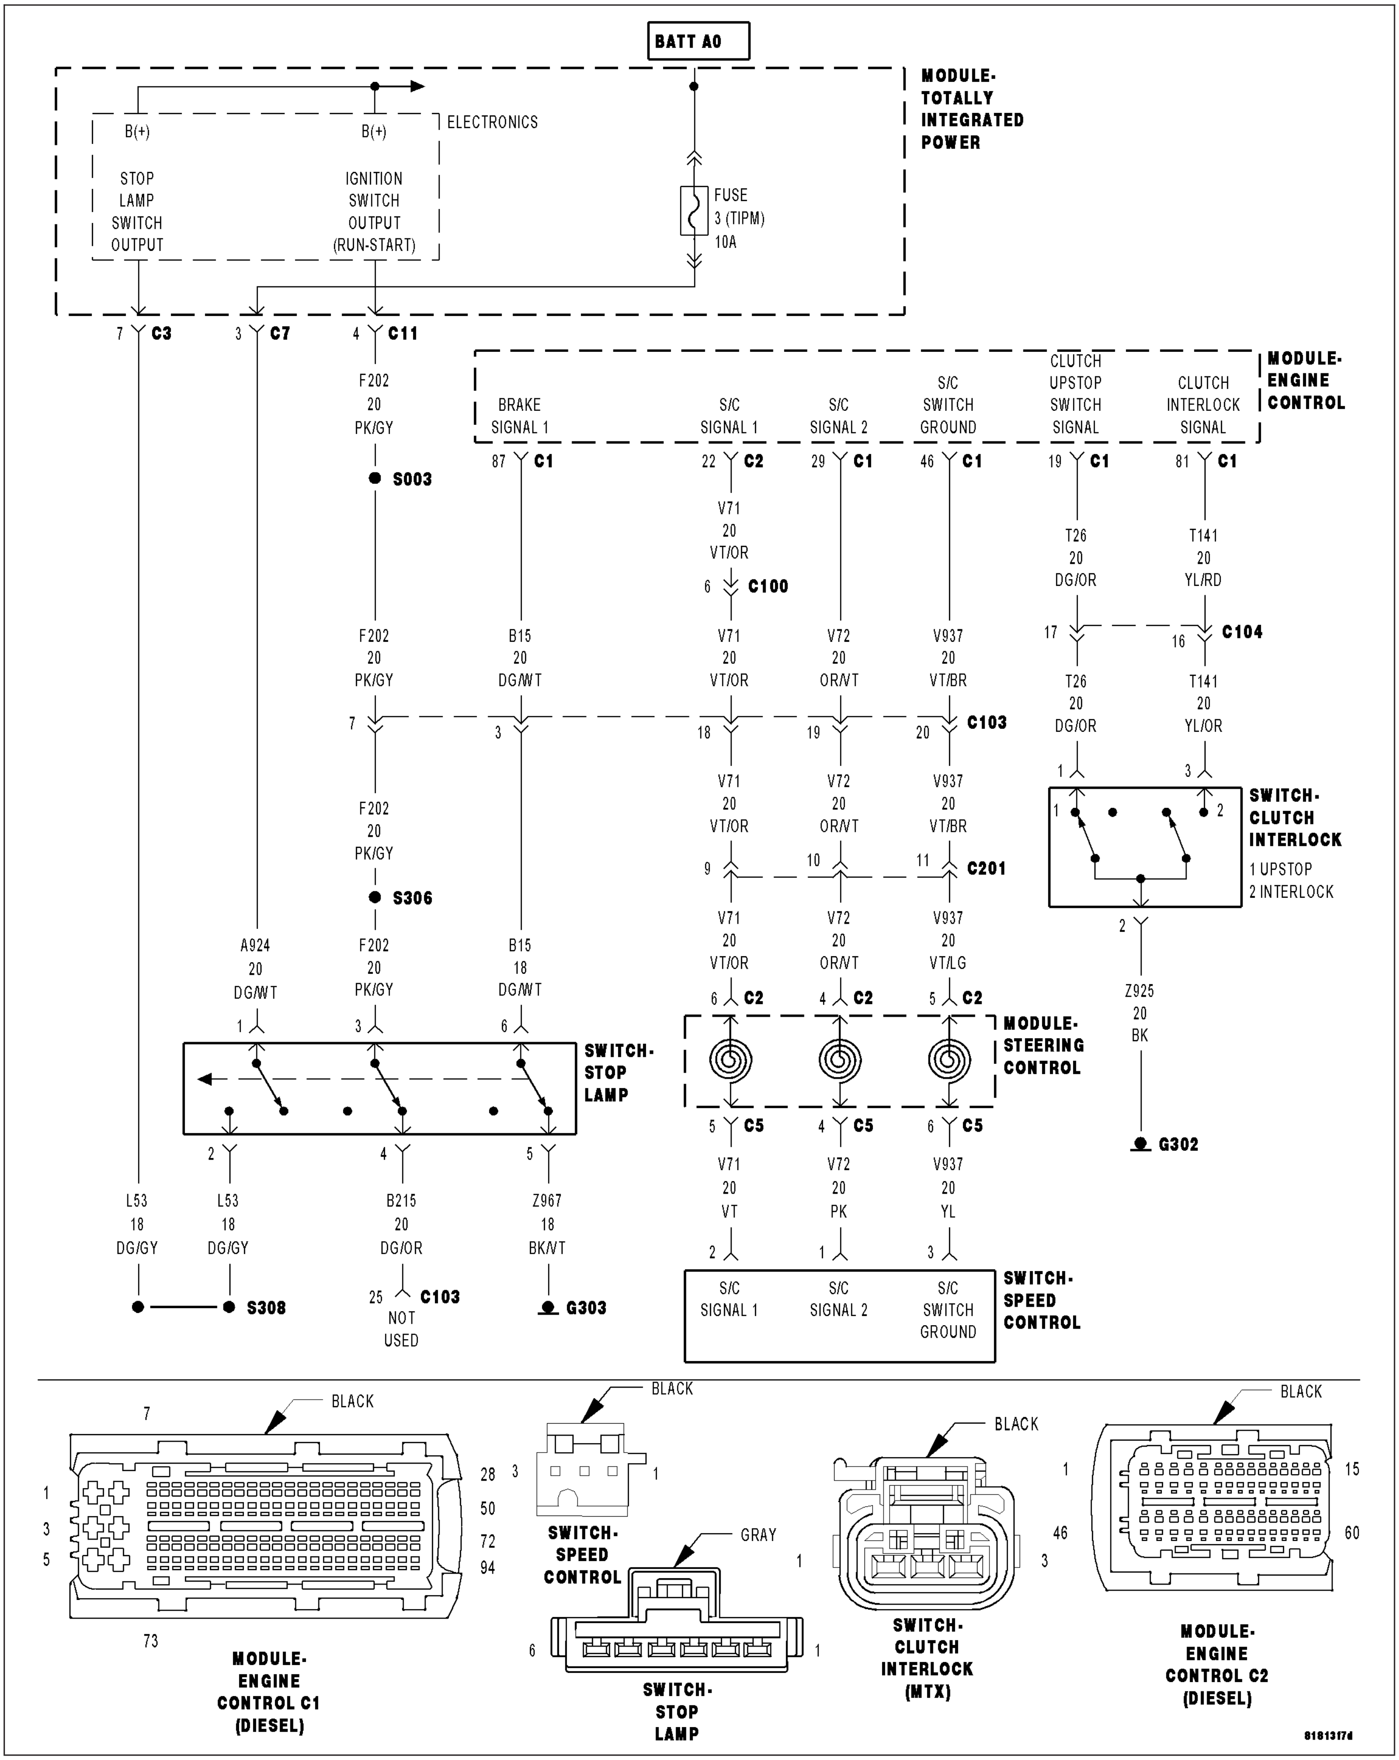
With the engine running at normal operating temperature, monitor the scan tool parameters related to the DTC while wiggling the wiring harness. Look for parameter values to change and/or a DTC to set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the conditions under which the DTC was set.

Refer to any Technical Service Bulletins (TSB) that may apply.

Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.



Were any of the above conditions present?

Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

P0830-CLUTCH PEDAL SWITCH CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  While driving the vehicle and shifting gears.
- **Set Condition:**
  The Engine Control Module (ECM) does not detect changes in the (T141) Clutch Interlock Switch Signal circuit voltage while CAN messages from the Transmission Control Module indicate transmission gear changes.

Possible Causes
INTERMITTENT DTC
(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE
(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO GROUND
(T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(Z925) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
CLUTCH INTERLOCK SWITCH
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Press and release the clutch pedal several times.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

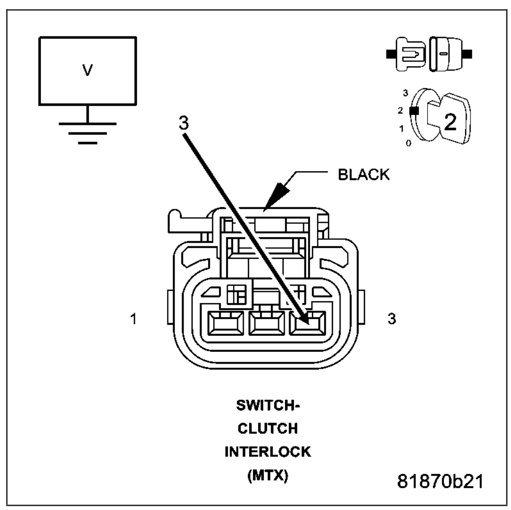
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Clutch Interlock Switch harness connector.



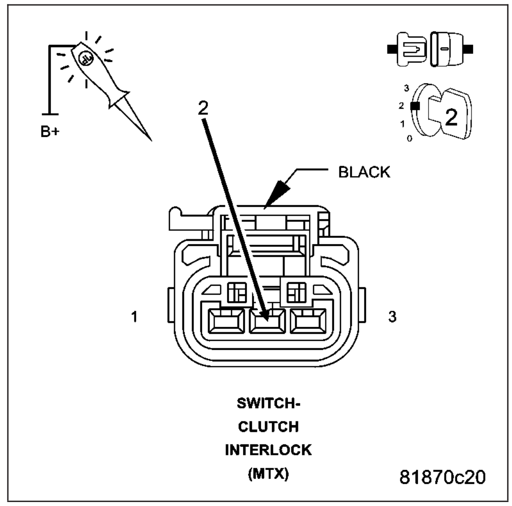
Turn the ignition on.

Measure the voltage of the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is the voltage between 4.5 and 5.5 volts?

Yes >> Go to 3

No >> Go to 5



3. (Z925) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to 12 volts, check the (Z925) Ground circuit between the Clutch Interlock Switch harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Go to 4

No >> Repair the (Z925) Ground for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

4. CLUTCH INTERLOCK SWITCH

Turn the ignition off.

Connect a jumper wire between the (Z925) Ground circuit and the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

Turn the ignition on.

With the scan tool, monitor the Clutch Interlock status.

NOTE: The scan tool should display the Clutch Interlock status as pressed with the jumper wire in place and not pressed with the jumper wire removed.

Does the scan tool display the status as described above?

Yes >> Replace the Clutch Interlock Switch in accordance with the Service Information.

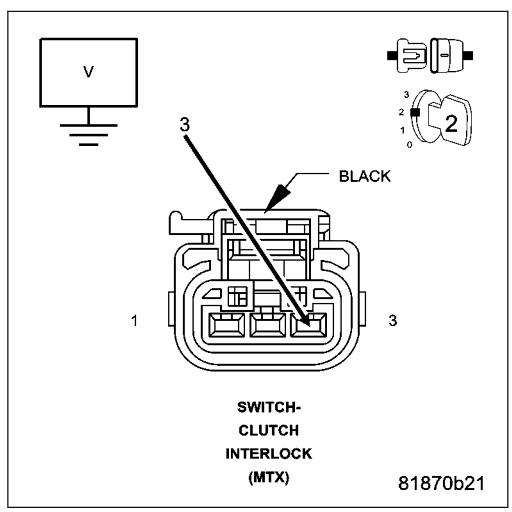
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 8

5. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.



Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

Is there any voltage present?

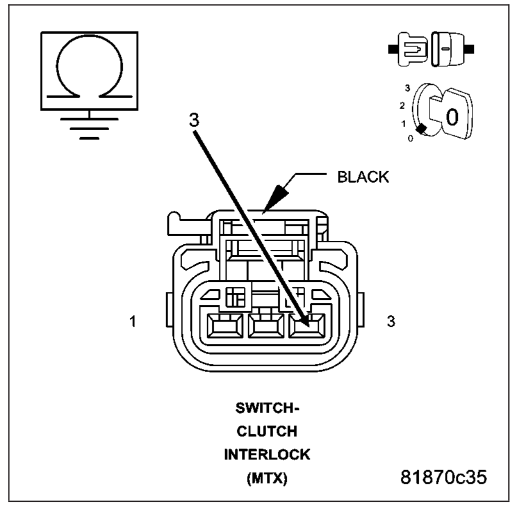
Yes >> Repair the (T141) Clutch Interlock Switch Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go to 6

6. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.



Measure the resistance between ground and the (T141) Clutch Interlock Switch Signal circuit in the Clutch Interlock Switch harness connector.

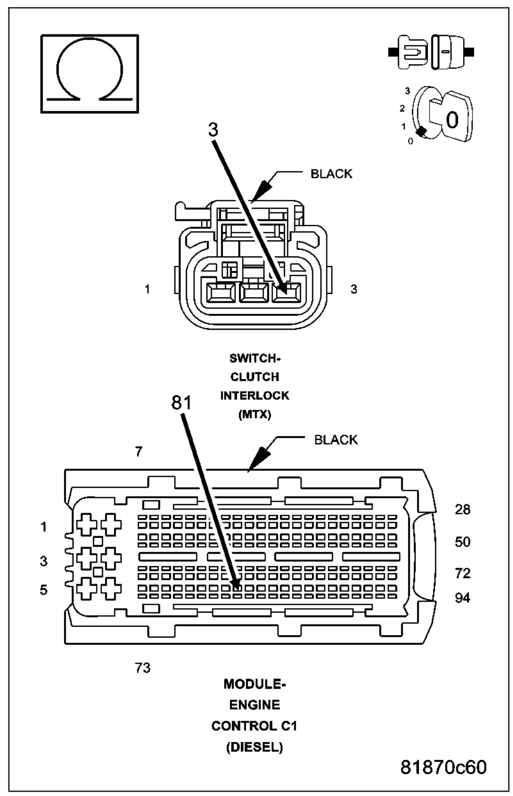
Is the resistance above 1000 ohms?

Yes >> Go to 7

No >> Repair the (T141) Clutch Interlock Switch Signal circuit for a short to ground.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (T141) CLUTCH INTERLOCK SWITCH SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE



Measure the resistance of the (T141) Clutch Interlock Switch Signal circuit between the Clutch Interlock Switch harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 8

No >> Repair the (T141) Clutch Interlock Switch Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. ENGINE CONTROL MODULE (ECM)

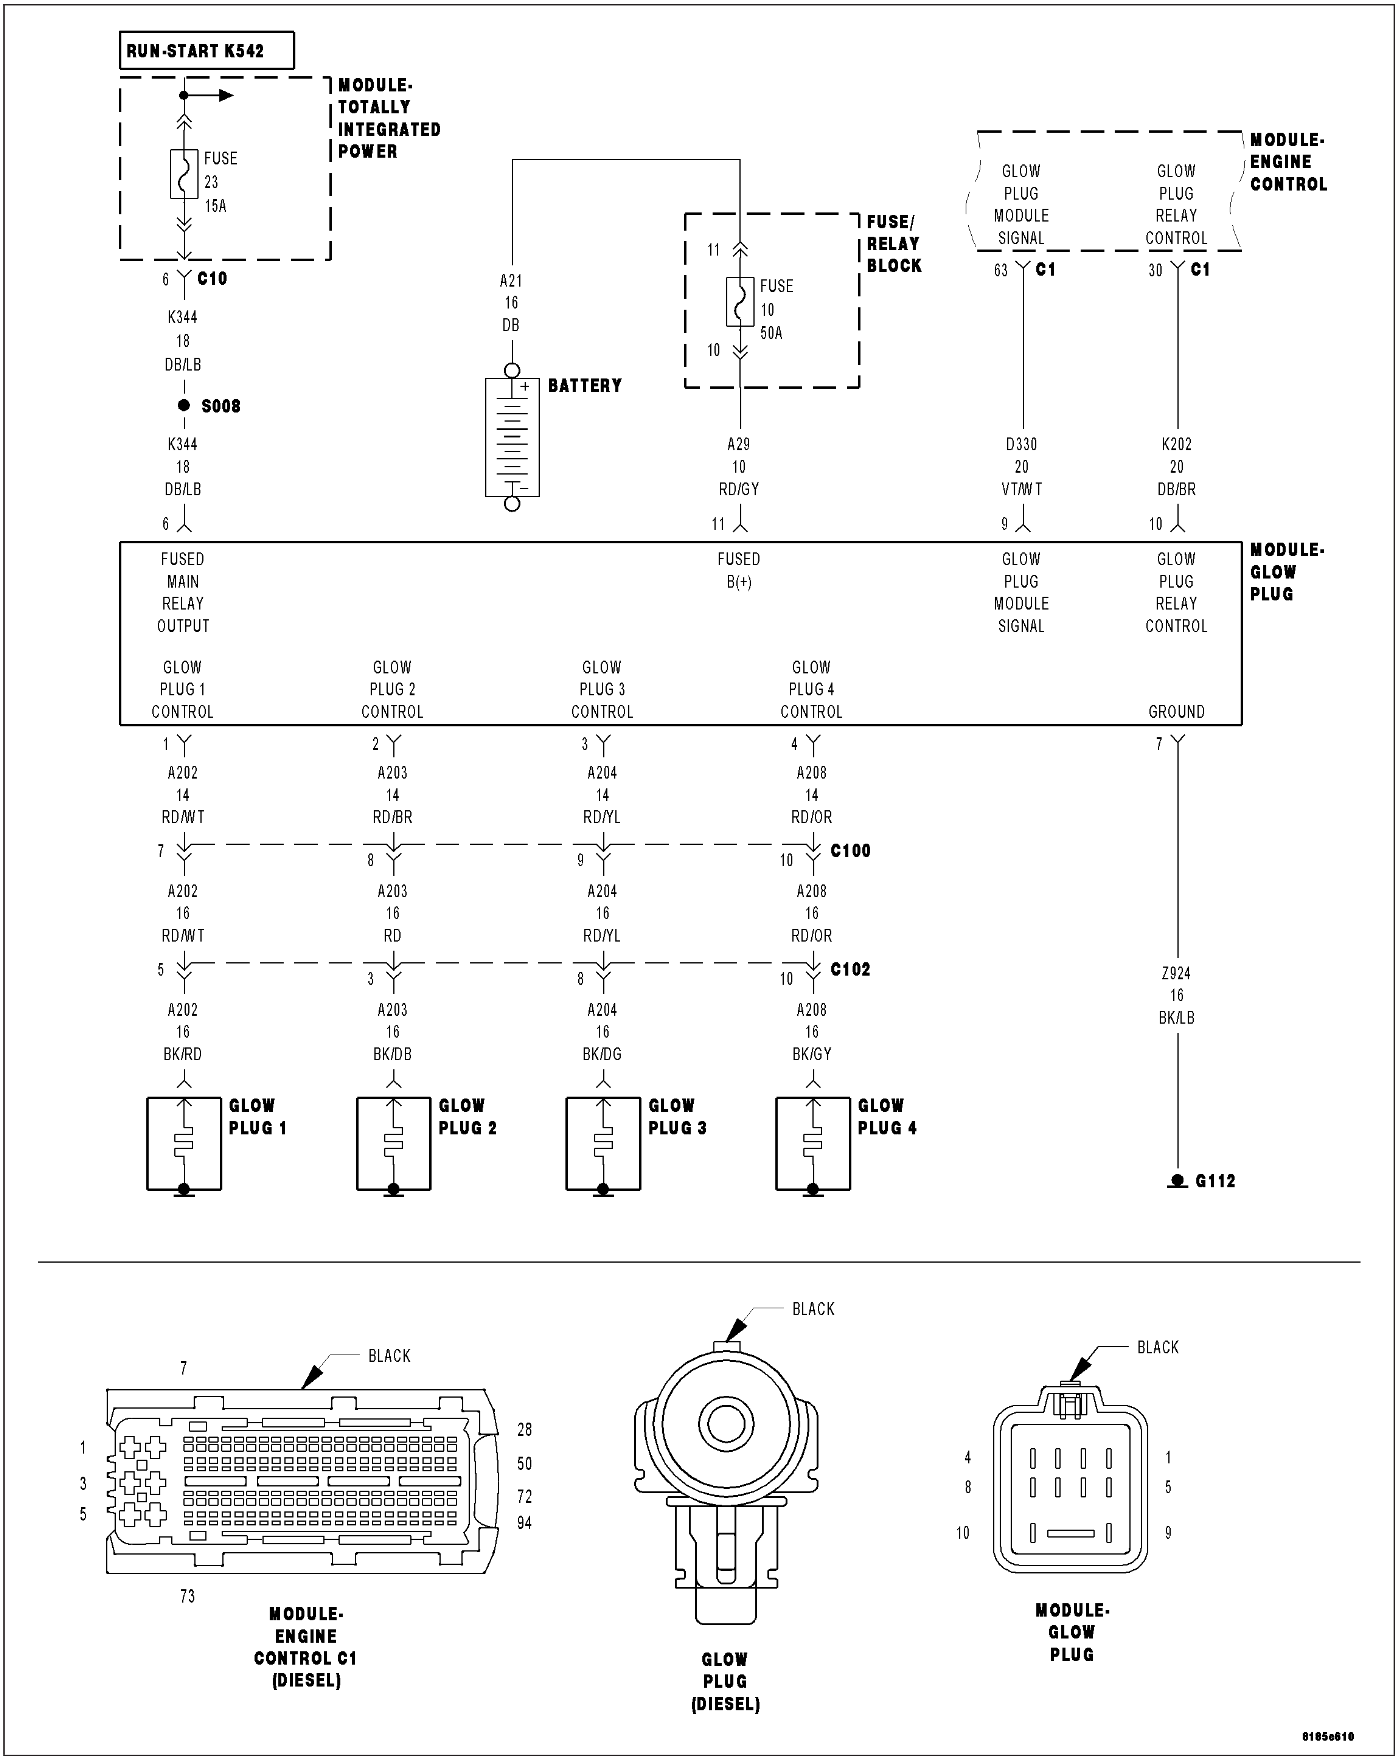
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Clutch Interlock Switch and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P1649-GLOW PLUG MODULE POWER SUPPLY CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Glow Plug Control Module reports a power supply circuit fault to the ECM.

Possible Causes
INTERMITTENT DTC
(K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE
(A29) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE
(Z924) GROUND CIRCUIT OPEN OR HIGH RESISTANCE
GLOW PLUG MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: Diagnose and repair any system voltage or Main Relay DTCs before continuing with this test.
Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the Glow Plugs.

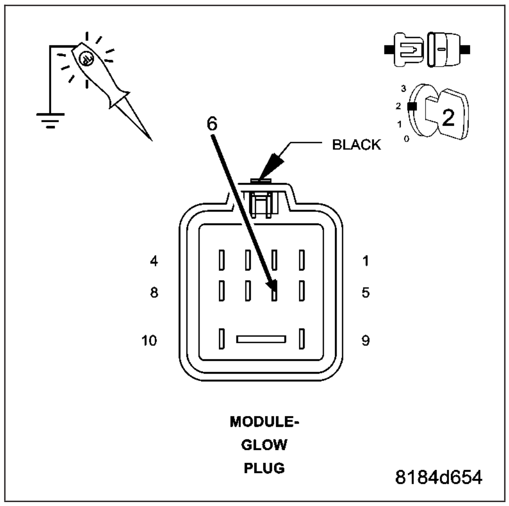
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K344) FUSED MAIN RELAY OUTPUT CIRCUIT OPEN OR HIGH RESISTANCE

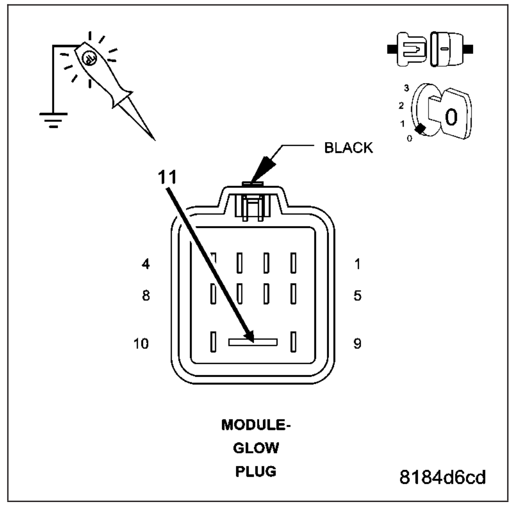
Turn the ignition off.

Disconnect the Glow Plug Module harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, check the (K344) Fused Main Relay Output circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.



Is the test light illuminated and bright?

Yes >> Go to 3

No >> Repair the (K344) Fused Main Relay Output circuit for an open circuit or high resistance.

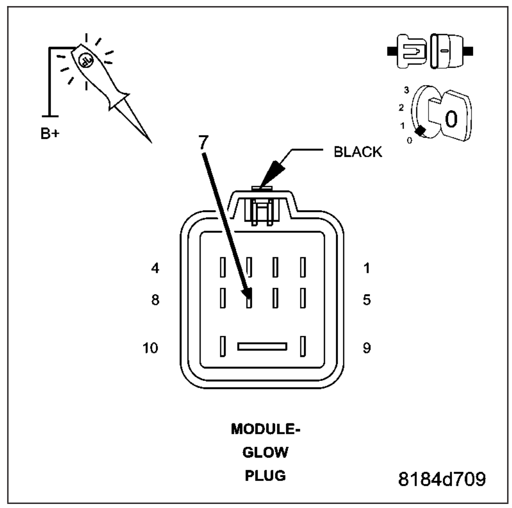
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (A29) FUSED B+ CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Using a 12 volt test light connected to ground, check the (A29) Fused B+ circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.



Is the test light illuminated and bright?

Yes >> Go To 4

No >> Repair the (A29) Fused B+ circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (Z924) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

Using a 12 volt test light connected to B+, check the (Z924) Ground circuit in the Glow Plug Module harness connector.

NOTE: The test light should be illuminated and bright. Compare the brightness to that of a direct connection to the battery.

Is the test light illuminated and bright?

Yes >> Replace the Glow Plug Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Repair the (Z924) Ground circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P1670-TORQUE CURVE CALIBRATION

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The Engine Control Module (ECM) detects an internal programming failure.

Possible Causes
INTERMITTENT DTC
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the Engine Control Module (ECM) wiring and connectors.

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

Check for proper ECM power supply from the ignition switch and the Main relay. Check the ECM for proper ground supply.

Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P1685-SKIM SYSTEM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  A communication error occurs between the ECM and SKREEM.

Possible Causes
INTERMITTENT DTC
SKREEM
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR SKREEM COMMUNICATION AND DTCS

Ignition on, engine not running.

With the scan tool, check for proper communication and active DTCs in the SKREEM.

Are any SKREEM communication problems or DTCs present?

Yes >> Refer to the symptom list for problems related to SKREEM Communication and DTCs before continuing.

No >> Go To 2

2. CHECK FOR ACTIVE DTC

Turn the ignition on.

With the scan tool, clear all ECM DTCs.

Turn the ignition on and off several times pausing 10 seconds between key cycles leaving the ignition on.

With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes >> Go to 3

No >> Refer to *CHECKING FOR INTERMITTENT DTC in the symptom list. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. REPLACE THE SKREEM AND RETEST

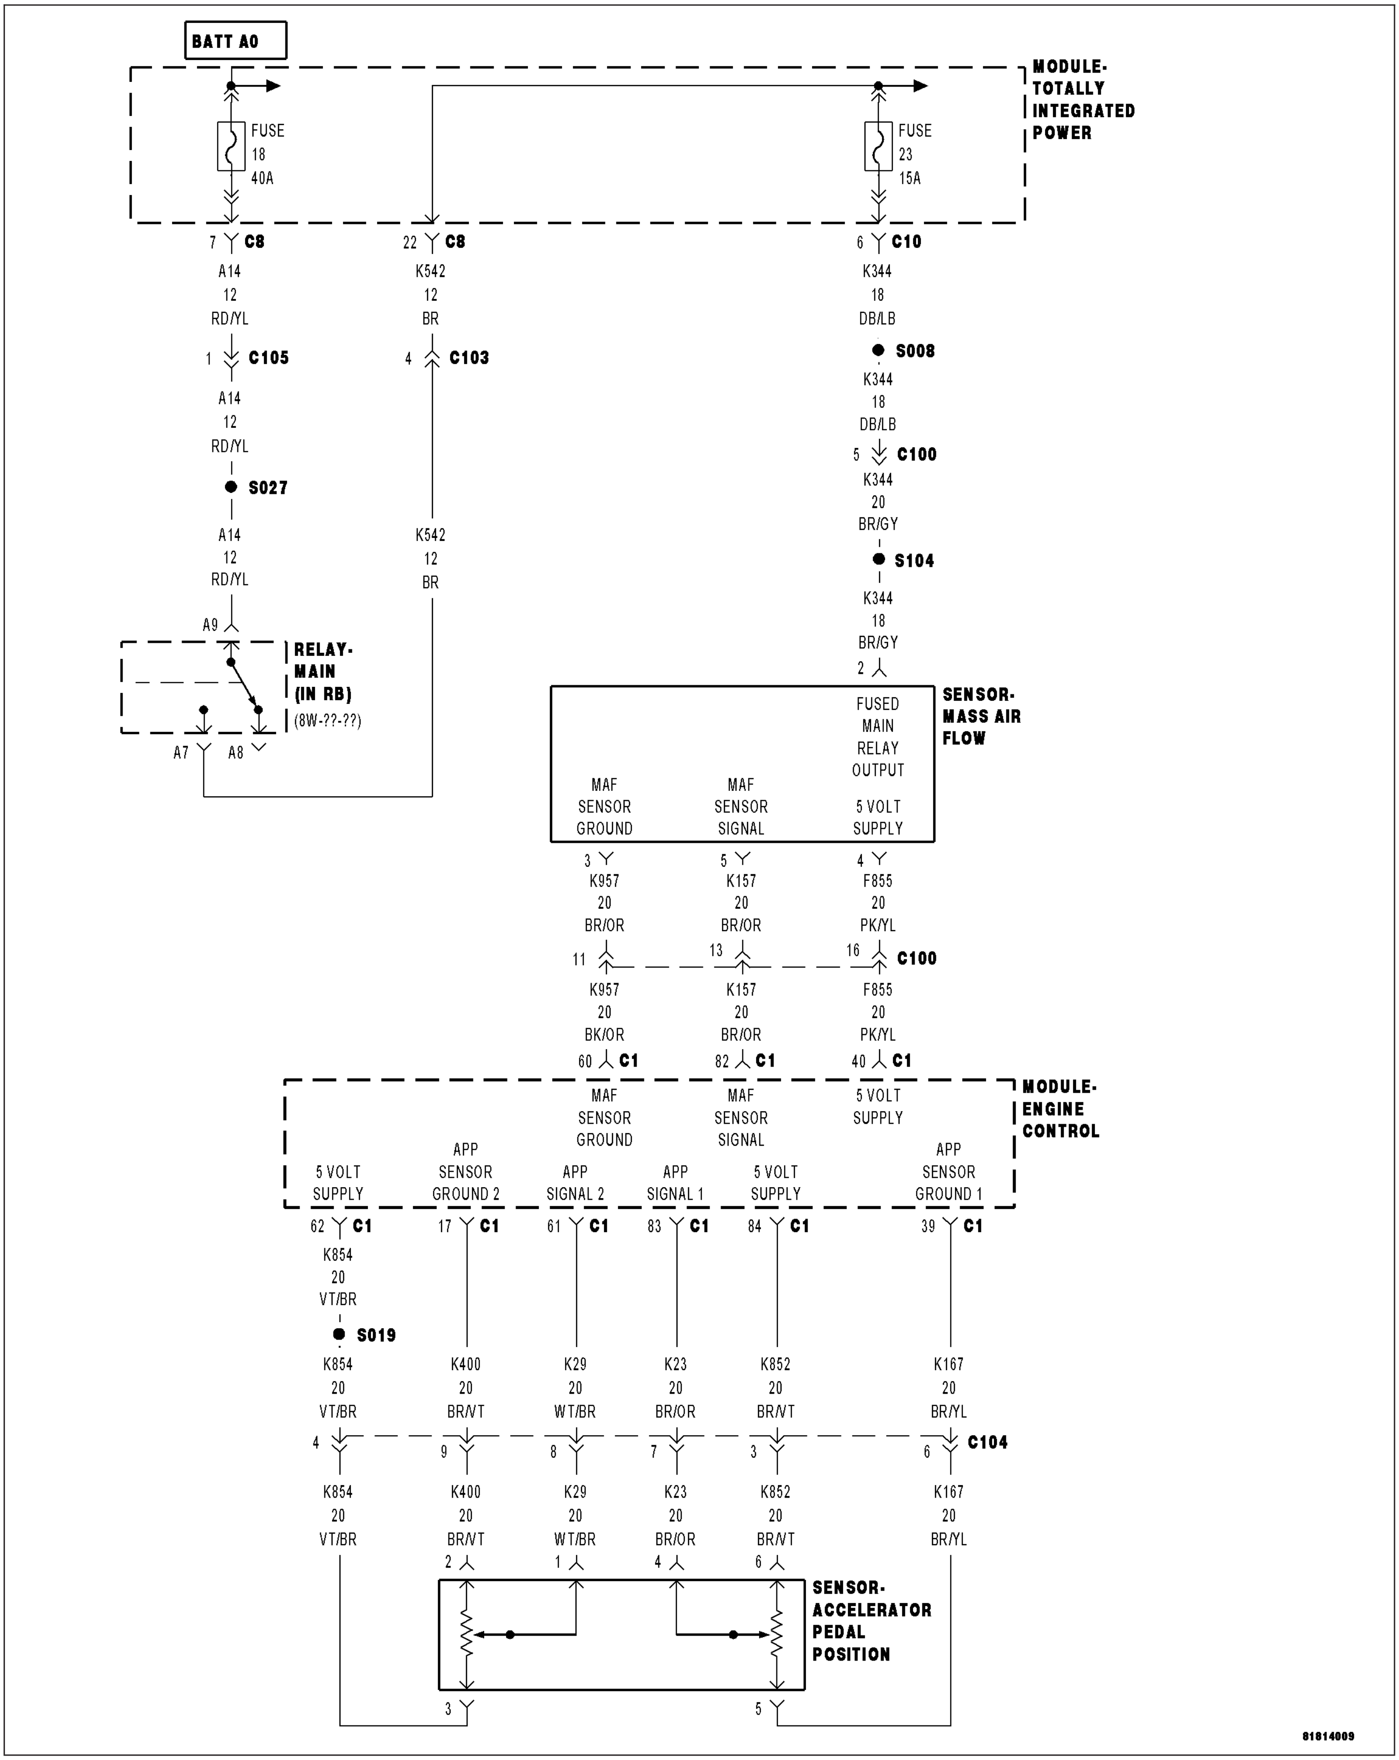
Turn the ignition off.

Replace and program the SKREEM in accordance with the Service Information.

Turn the ignition on.

With the scan tool, clear all ECM DTCs.

Turn the ignition on and off several times pausing 10 seconds between key cycles leaving the ignition on.



With the scan tool, select View DTCs in the ECM.

Is the status Active for this DTC?

Yes >> Replace and program the Engine Control Module in accordance the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test complete.

P2121-ACCELERATOR PEDAL POSITION SENSOR 1 PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  APP Sensor #1 and APP Sensor #2 signals do not agree.

Possible Causes
INTERMITTENT DTC
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K854) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K400) ACCELERATOR PEDAL POSITION SENSOR 2 SENSOR GROUND CIRCUIT
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

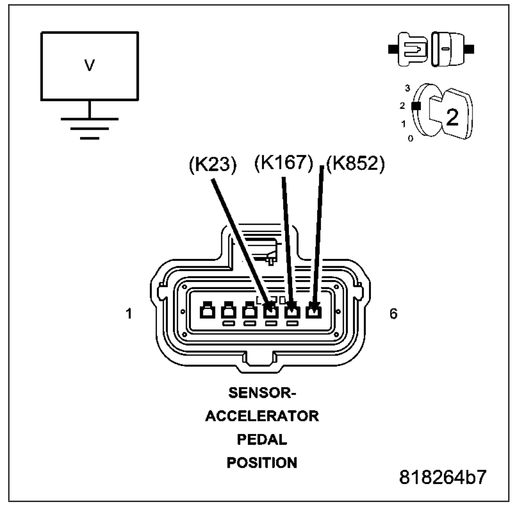
NOTE: If any Sensor reference or supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.
Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.



With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUITS SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

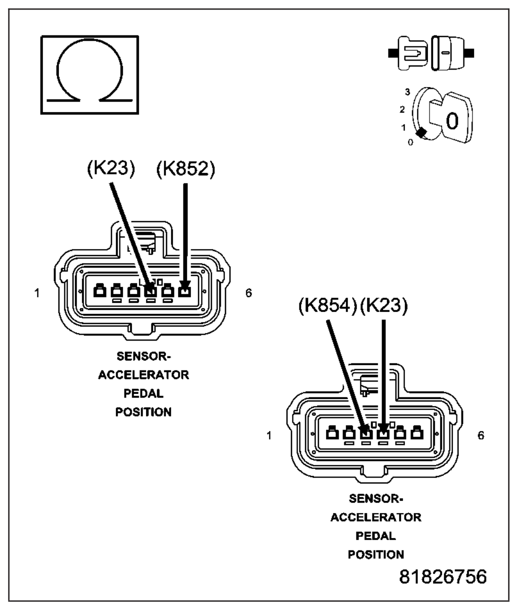
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.



Is there voltage present on any of the circuits?

Yes >> Repair the appropriate circuit that has voltage present.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

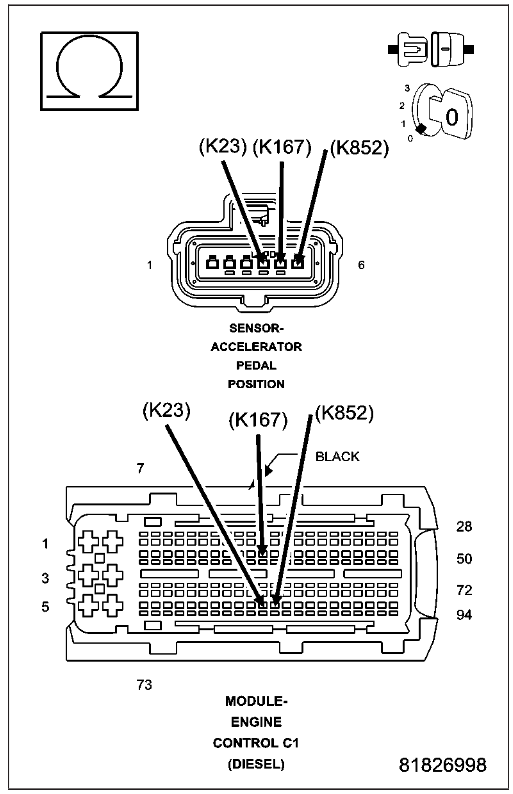
No >> Go to 3

3. (K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO 5 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.



Is the resistance above 1000.0 ohms for both of the circuits?

Yes >> Go to 4

No >> Repair the shorted (K23) Accelerator Pedal Position Sensor 1 Signal circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

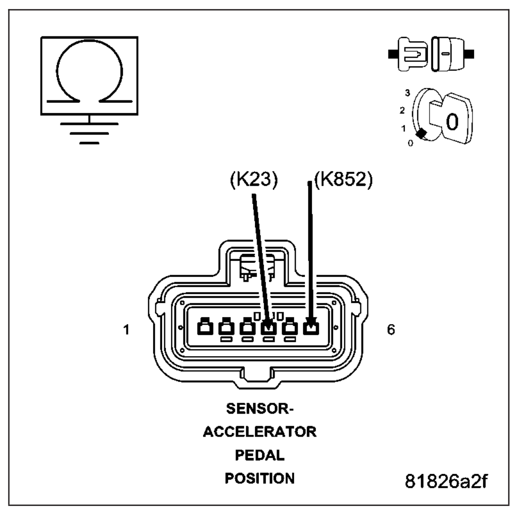
4. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K23) Accelerator Pedal Position Sensor 1 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.



Is the resistance below 10.0 ohms for each of the circuits?

Yes >> Go to 5

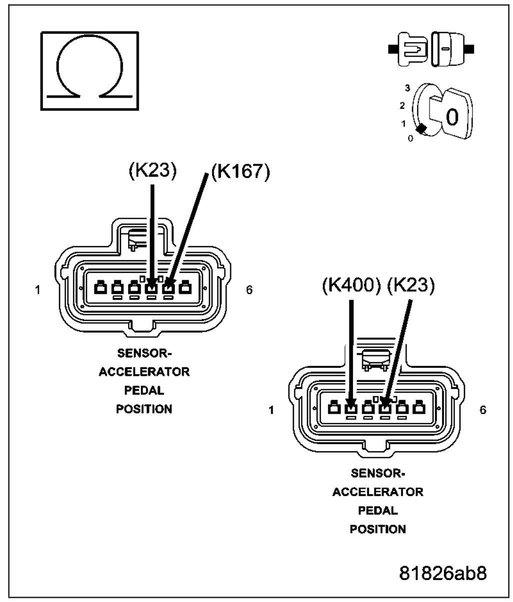
No >> Repair the appropriate circuit that has a resistance greater than 10.0 ohms.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between ground and the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.



Is the resistance between ground and both of the circuits above 1000.0 ohms?

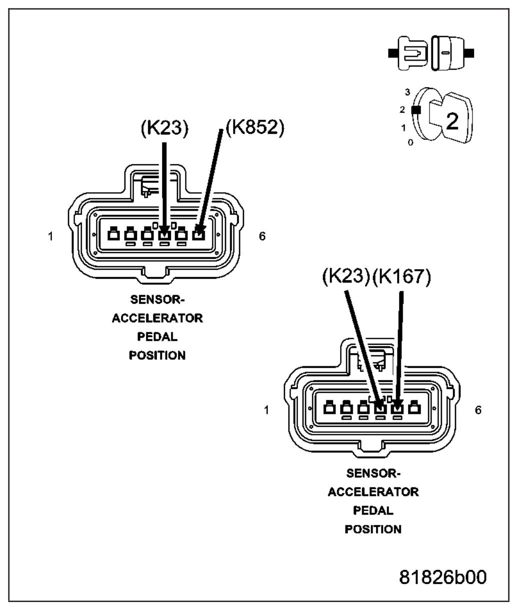
Yes >> Go to 6

No >> Repair the appropriate circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. (K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO SENSOR GROUND CIRCUIT

Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.



Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000.0 ohms?

Yes >> Go to 7

No >> Repair the appropriate circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Remove the jumper wire and install the Main Relay.

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit and the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor 1 low voltage or short to ground DTC with the jumper wire in place.

Turn the ignition off.

Connect a jumper wire between the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit and the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor 1 high voltage or open DTC with the Accelerator Pedal Position Sensor connector disconnected.

Does the scan tool display the DTCs as described in BOTH cases listed above?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 8

8. ENGINE CONTROL MODULE (ECM)

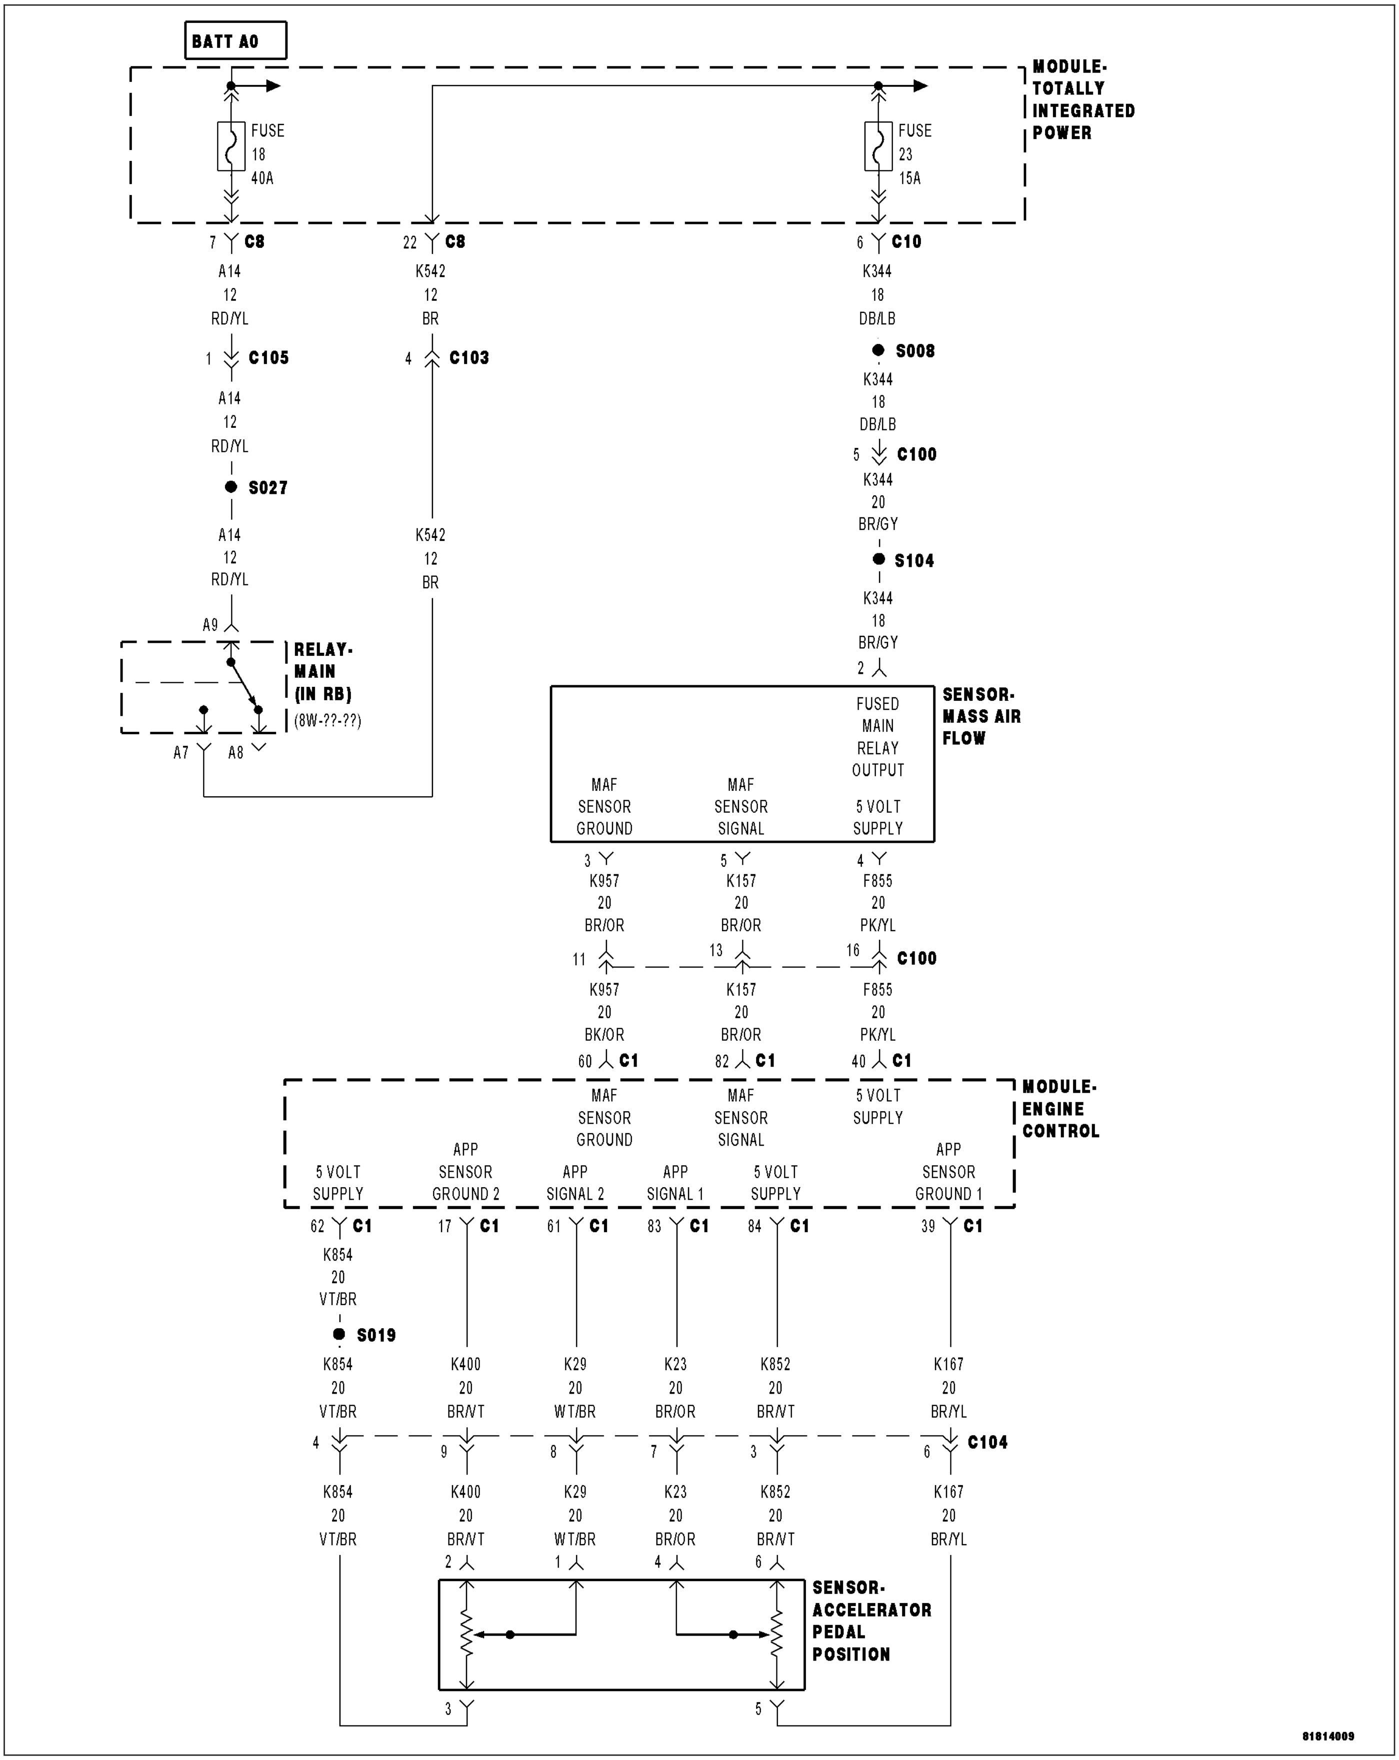
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2122-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The APP Sensor #1 Signal circuit is below 0.5 volts for 0.32 seconds.

Possible Causes
INTERMITTENT DTC
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K400) ACCELERATOR PEDAL POSITION SENSOR 2 SENSOR GROUND CIRCUIT
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If a Sensor reference or supply voltage DTC is also present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.

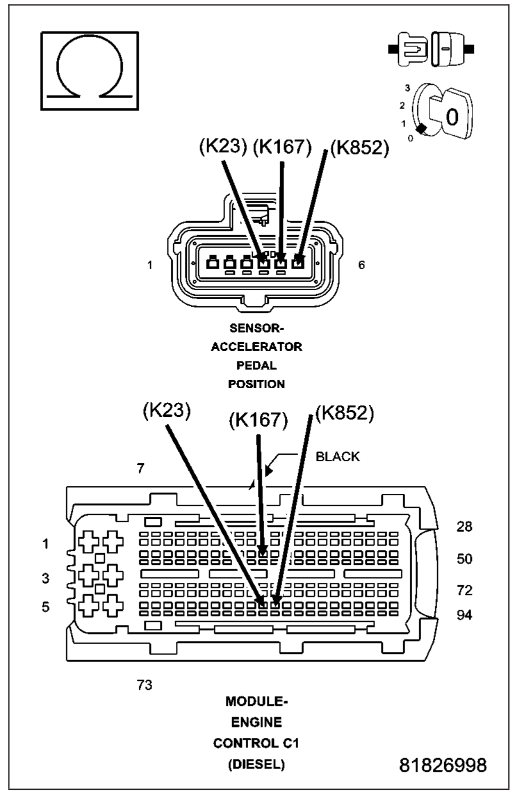
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE



Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

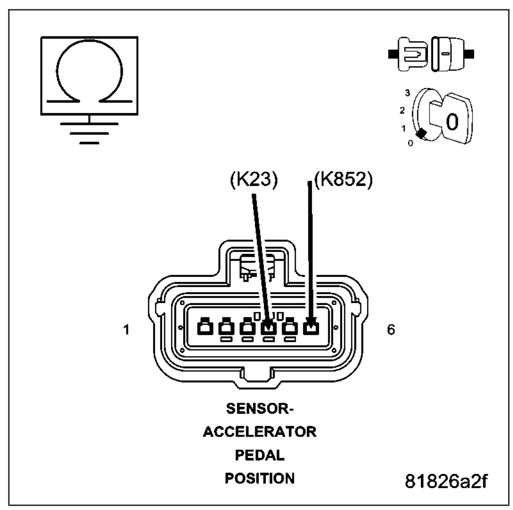
Measure the resistance of the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K23) Accelerator Pedal Position Sensor 1 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes >> Go to 3



No >> Repair the appropriate circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

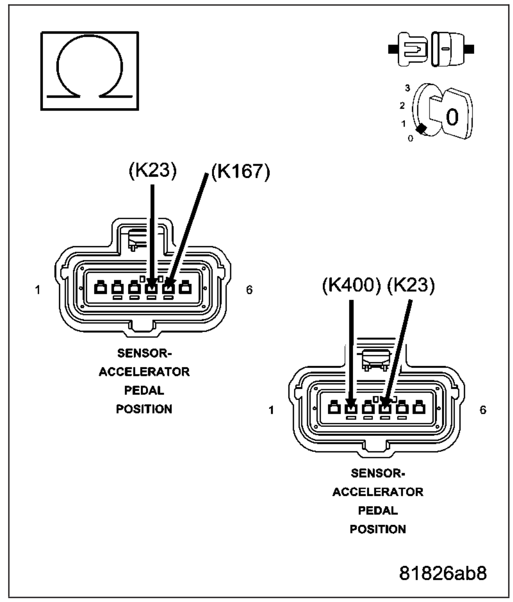
3. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between ground and the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

Yes >> Go to 4



No >> Repair the appropriate circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT

Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

Yes >> Go to 5

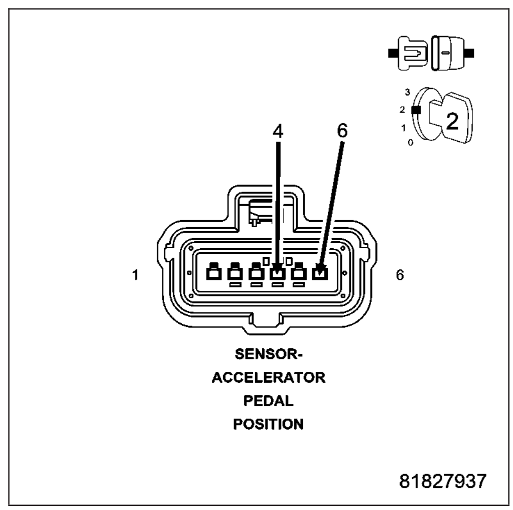
No >> Repair the appropriate circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.



Connect a jumper wire between the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit and the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor 1 high voltage or open DTC with the Accelerator Pedal Position Sensor connector disconnected.

Does the scan tool display the DTC as described above?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

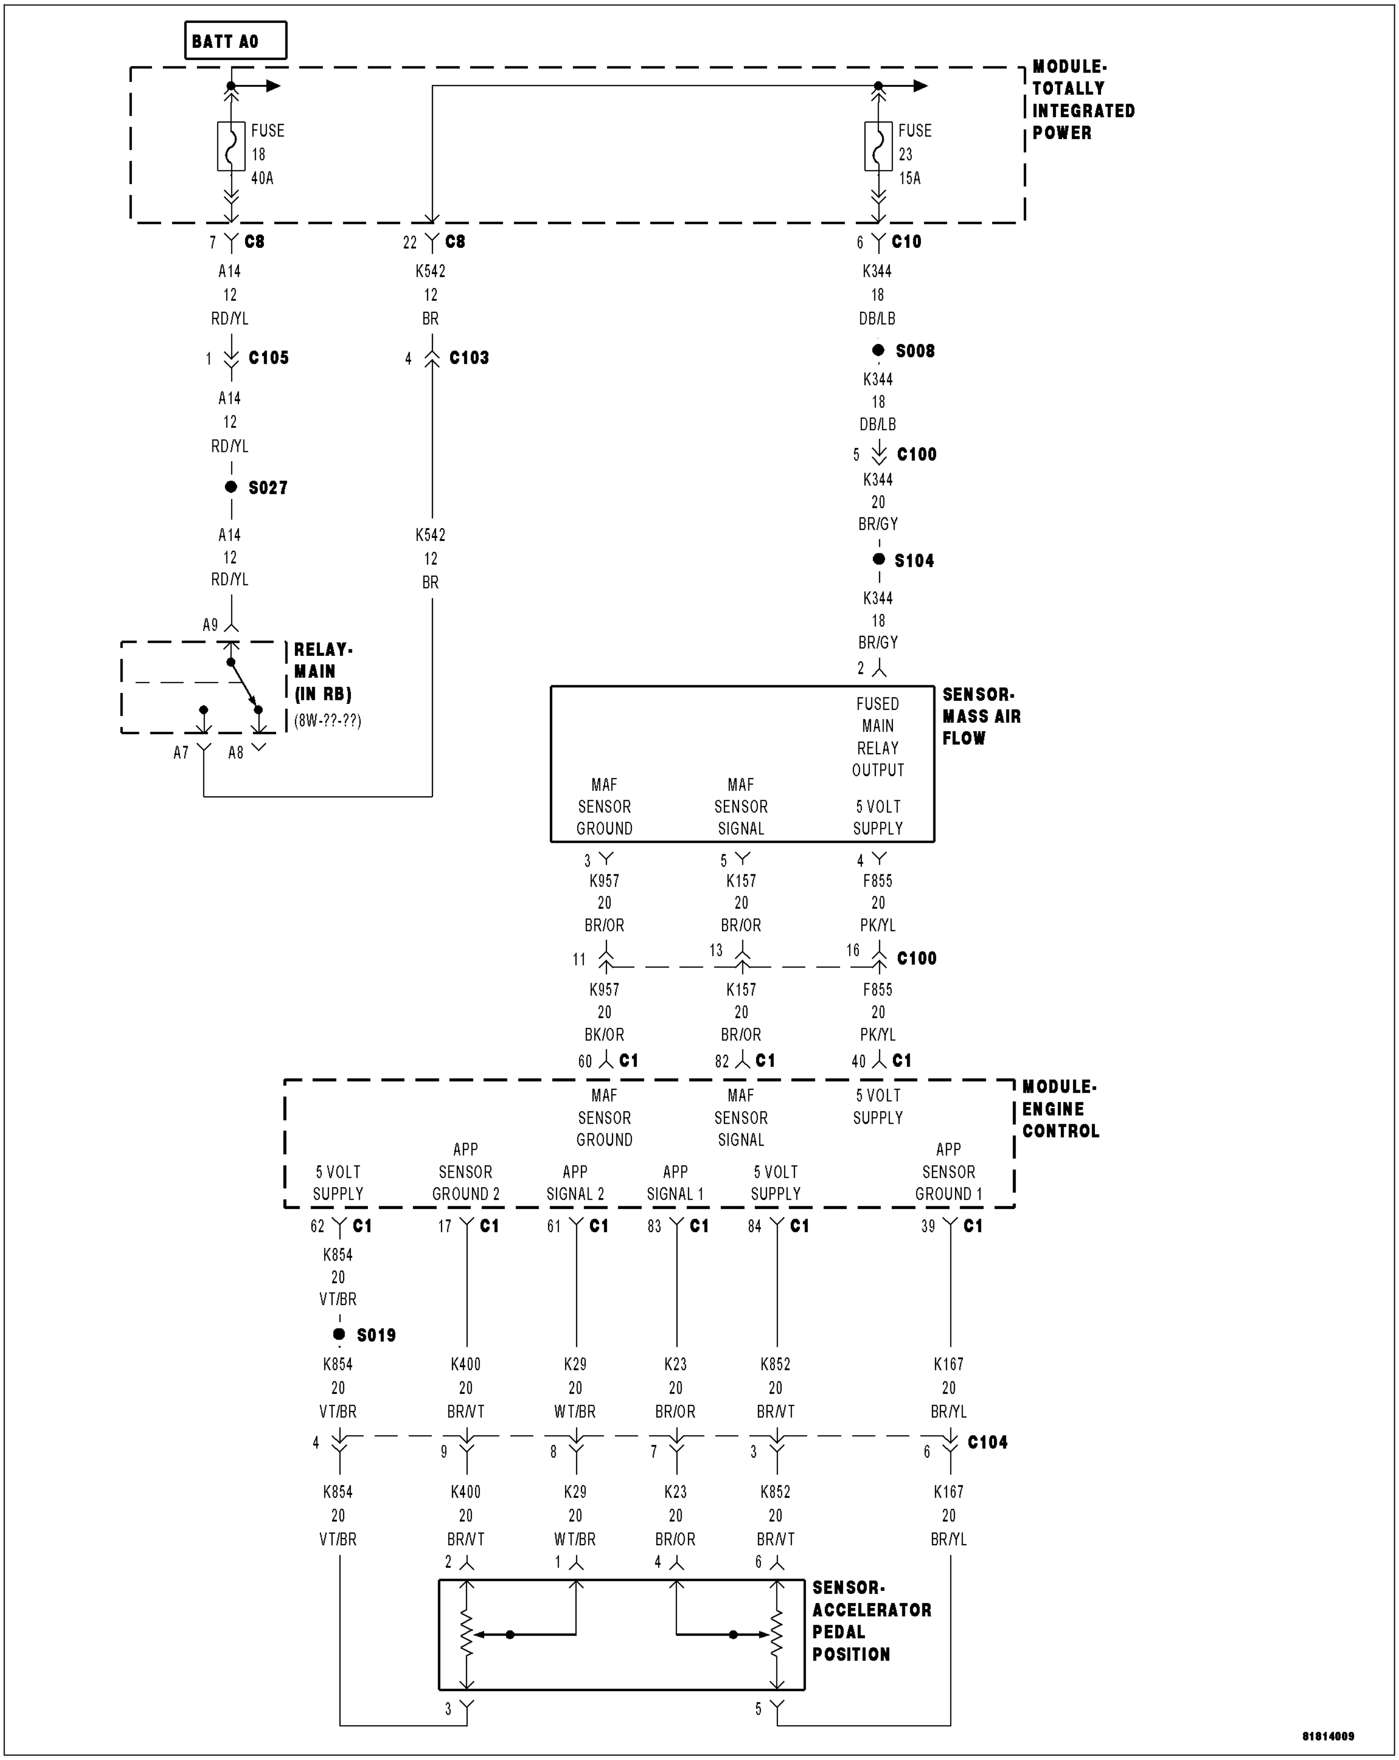
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2123-ACCELERATOR PEDAL POSITION SENSOR 1 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The APP Sensor #1 signal circuit is above 4.6 volts for 0.32 seconds.

Possible Causes
INTERMITTENT DTC
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE (K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT OR (F856) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor reference or supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

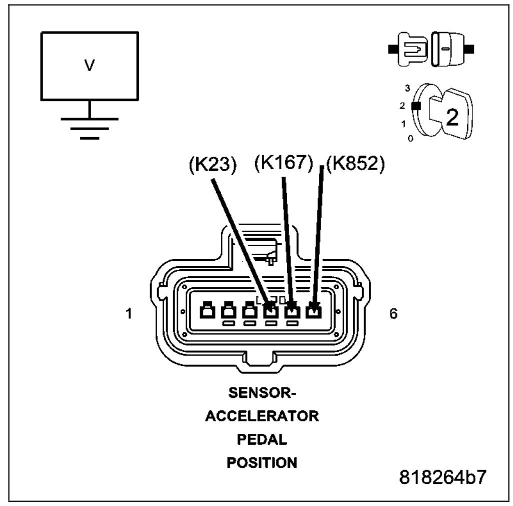
NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.



With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

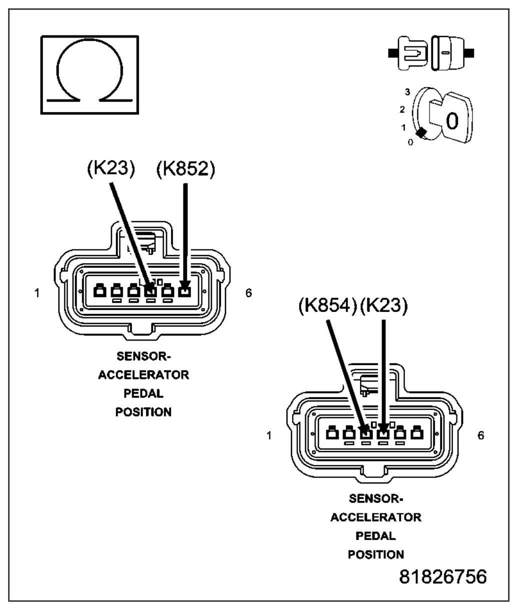
Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.



Measure the voltage of the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is there voltage present on any of the circuits?

Yes >> Repair the appropriate circuit that has voltage present.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT SHORTED TO THE 5 VOLT SUPPLY CIRCUIT

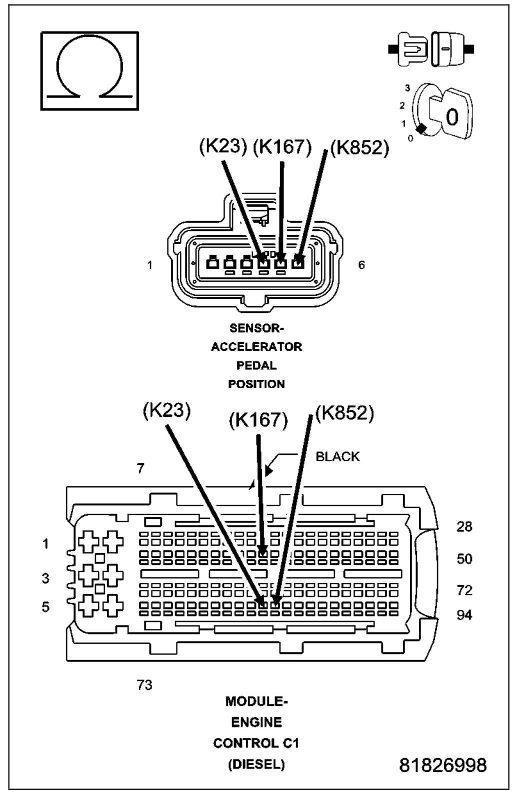
Turn the ignition off.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K23) Accelerator Pedal Position Sensor 1 Signal circuit and the (F856) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance above 10.0 ohms for both of the circuits?

Yes >> Go to 4



No >> Repair the shorted (K23) Accelerator Pedal Position Sensor 1 Signal circuit.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K23) Accelerator Pedal Position Sensor 1 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes >> Go to 5

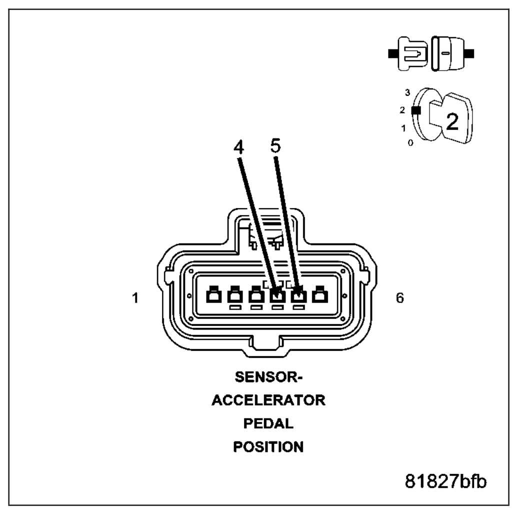
No >> Repair the appropriate circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ACCELERATOR PEDAL POSITION SENSOR

Remove the jumper wire and install the Main Relay.

Connect the Engine Control Module (ECM) harness connector.



Connect a jumper wire between the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit and the (K23) Accelerator Pedal Position Sensor 1 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor 1 low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

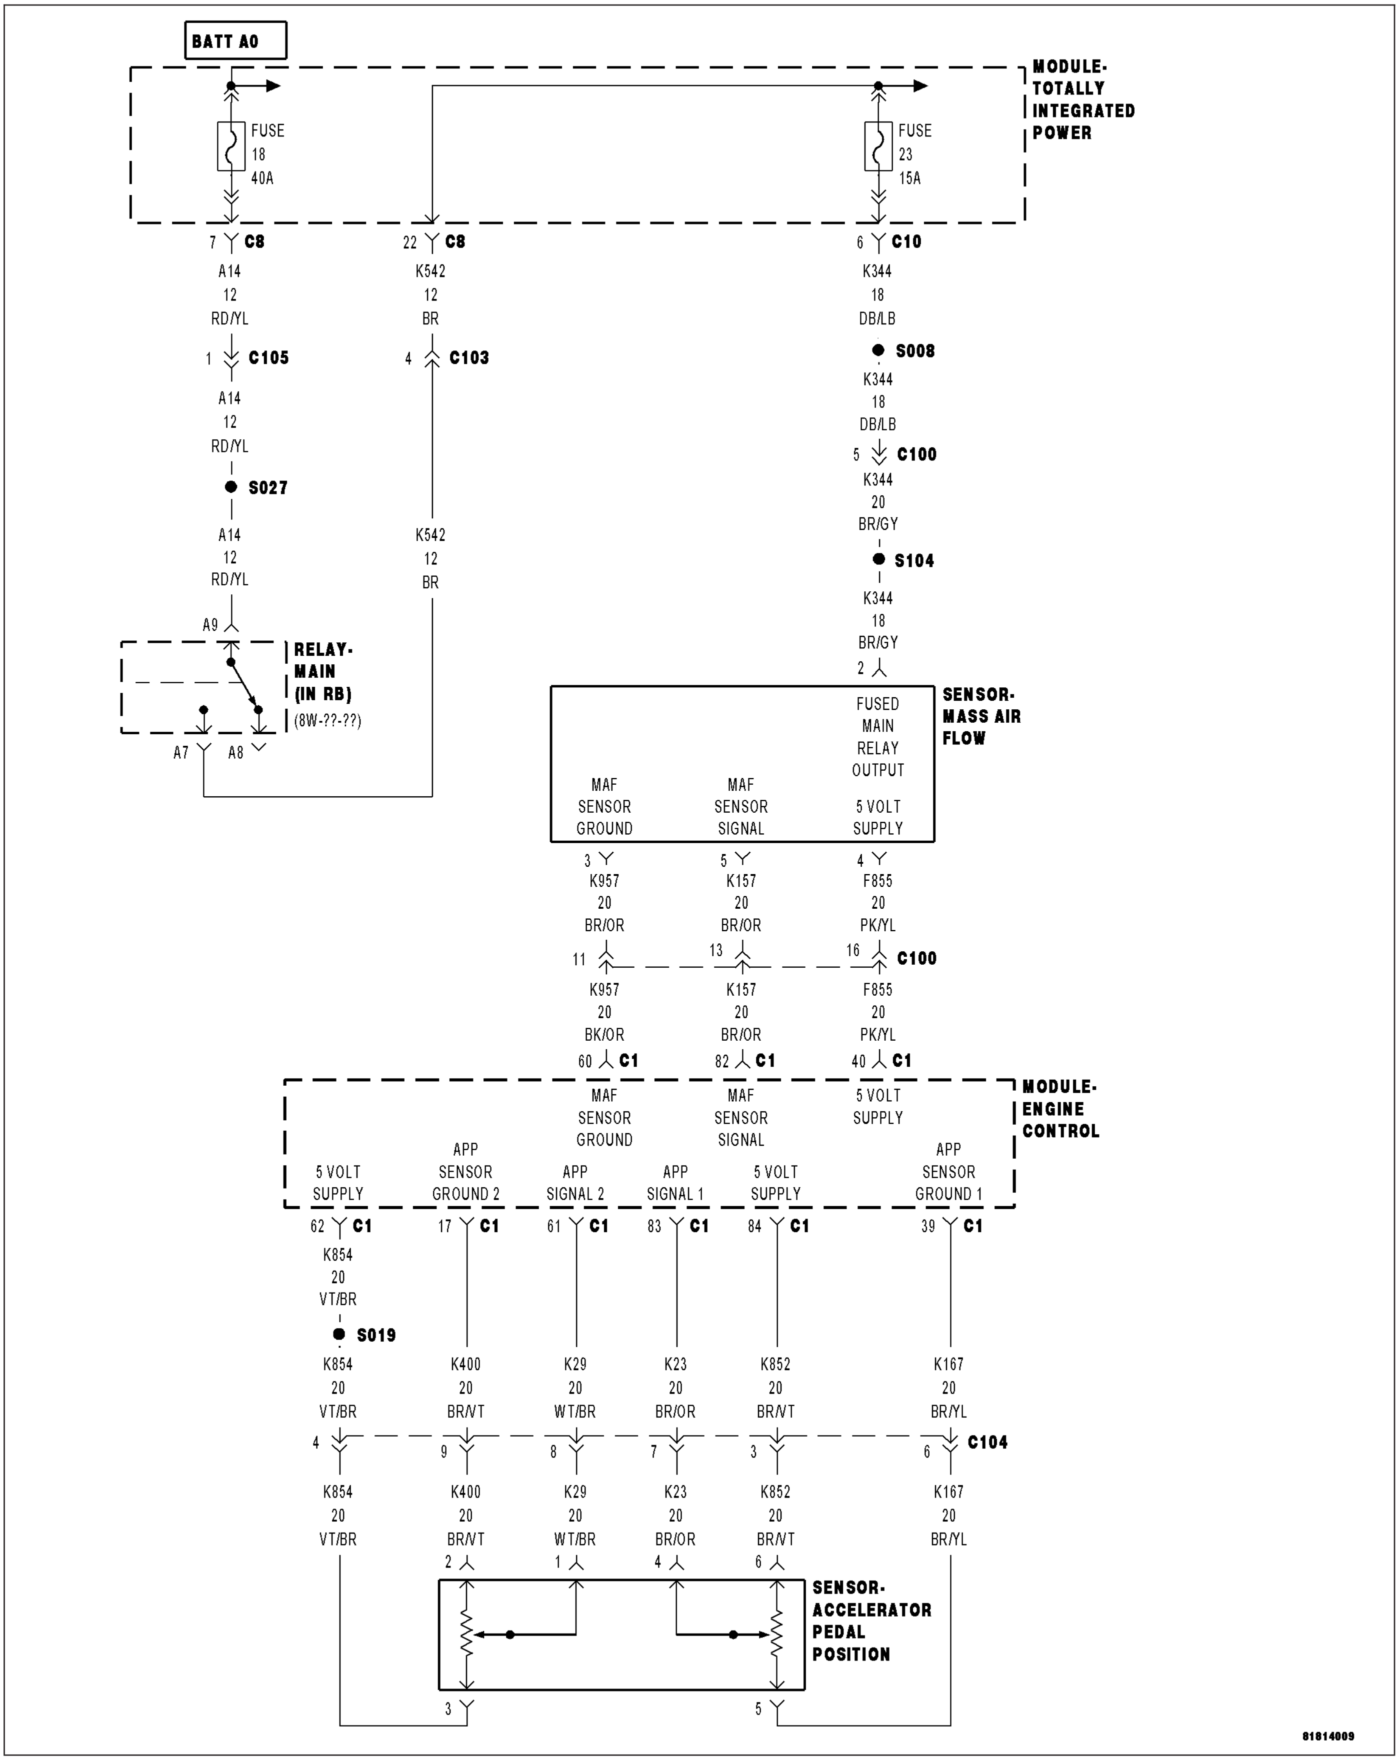
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2127-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The APP Sensor #2 Signal circuit is below 0.2 volts for 0.32 seconds.

Possible Causes
INTERMITTENT DTC
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K400) ACCELERATOR PEDAL POSITION SENSOR 2 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND
(K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
(K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K400) ACCELERATOR PEDAL POSITION SENSOR 2 SENSOR GROUND CIRCUIT
(K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If a Sensor reference or supply voltage DTC is also present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.

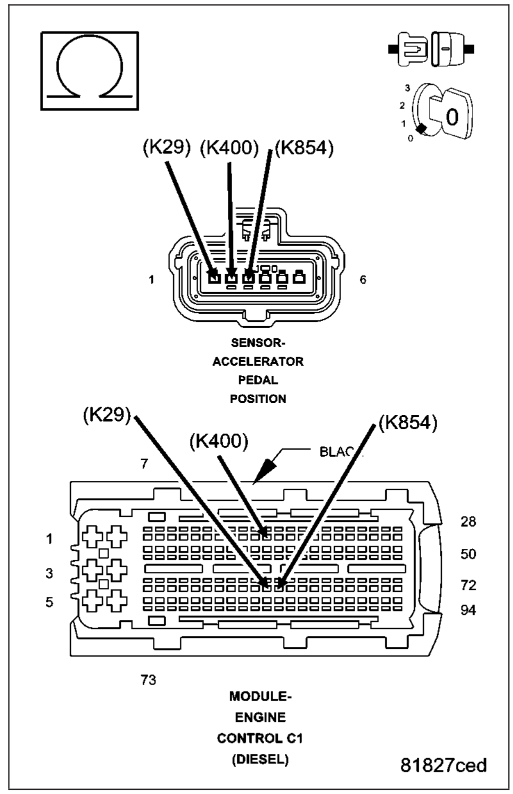
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE



Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

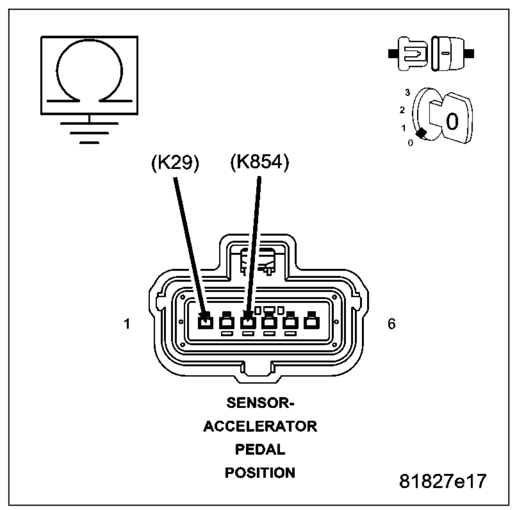
Measure the resistance of the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K29) Accelerator Pedal Position Sensor 2 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes >> Go to 3



No >> Repair the appropriate circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

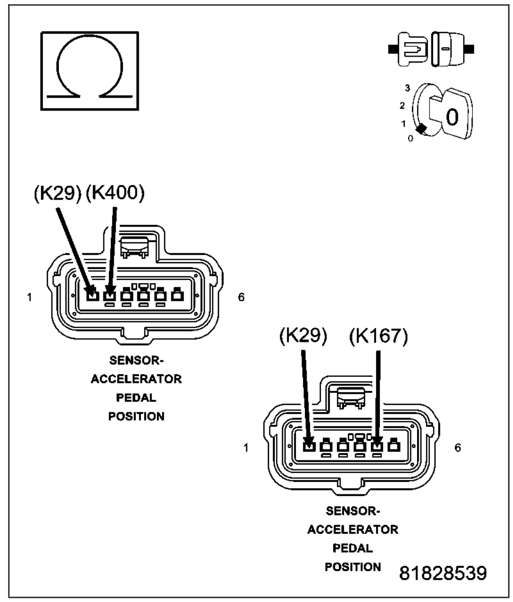
3. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between ground and the (K29) Accelerator Pedal Position Sensor 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

Yes >> Go to 4



No >> Repair the appropriate circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE SENSOR GROUND CIRCUIT

Measure the resistance between the (K29) Accelerator Pedal Position Sensor 2 Signal circuit and the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K29) Accelerator Pedal Position Sensor 2 Signal circuit and the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.

Is the resistance between ground and both of the circuits above 1000 ohms?

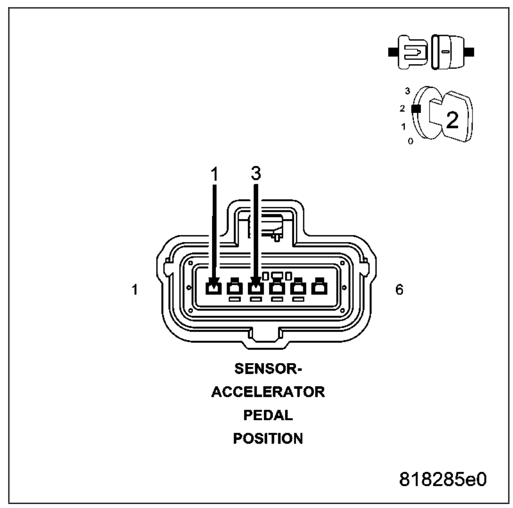
Yes >> Go to 5

No >> Repair the appropriate circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ACCELERATOR PEDAL POSITION SENSOR

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.



Connect a jumper wire between the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit and the (K29) Accelerator Pedal Position Sensor 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor 2 high voltage or open DTC with the Accelerator Pedal Position Sensor connector disconnected and the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

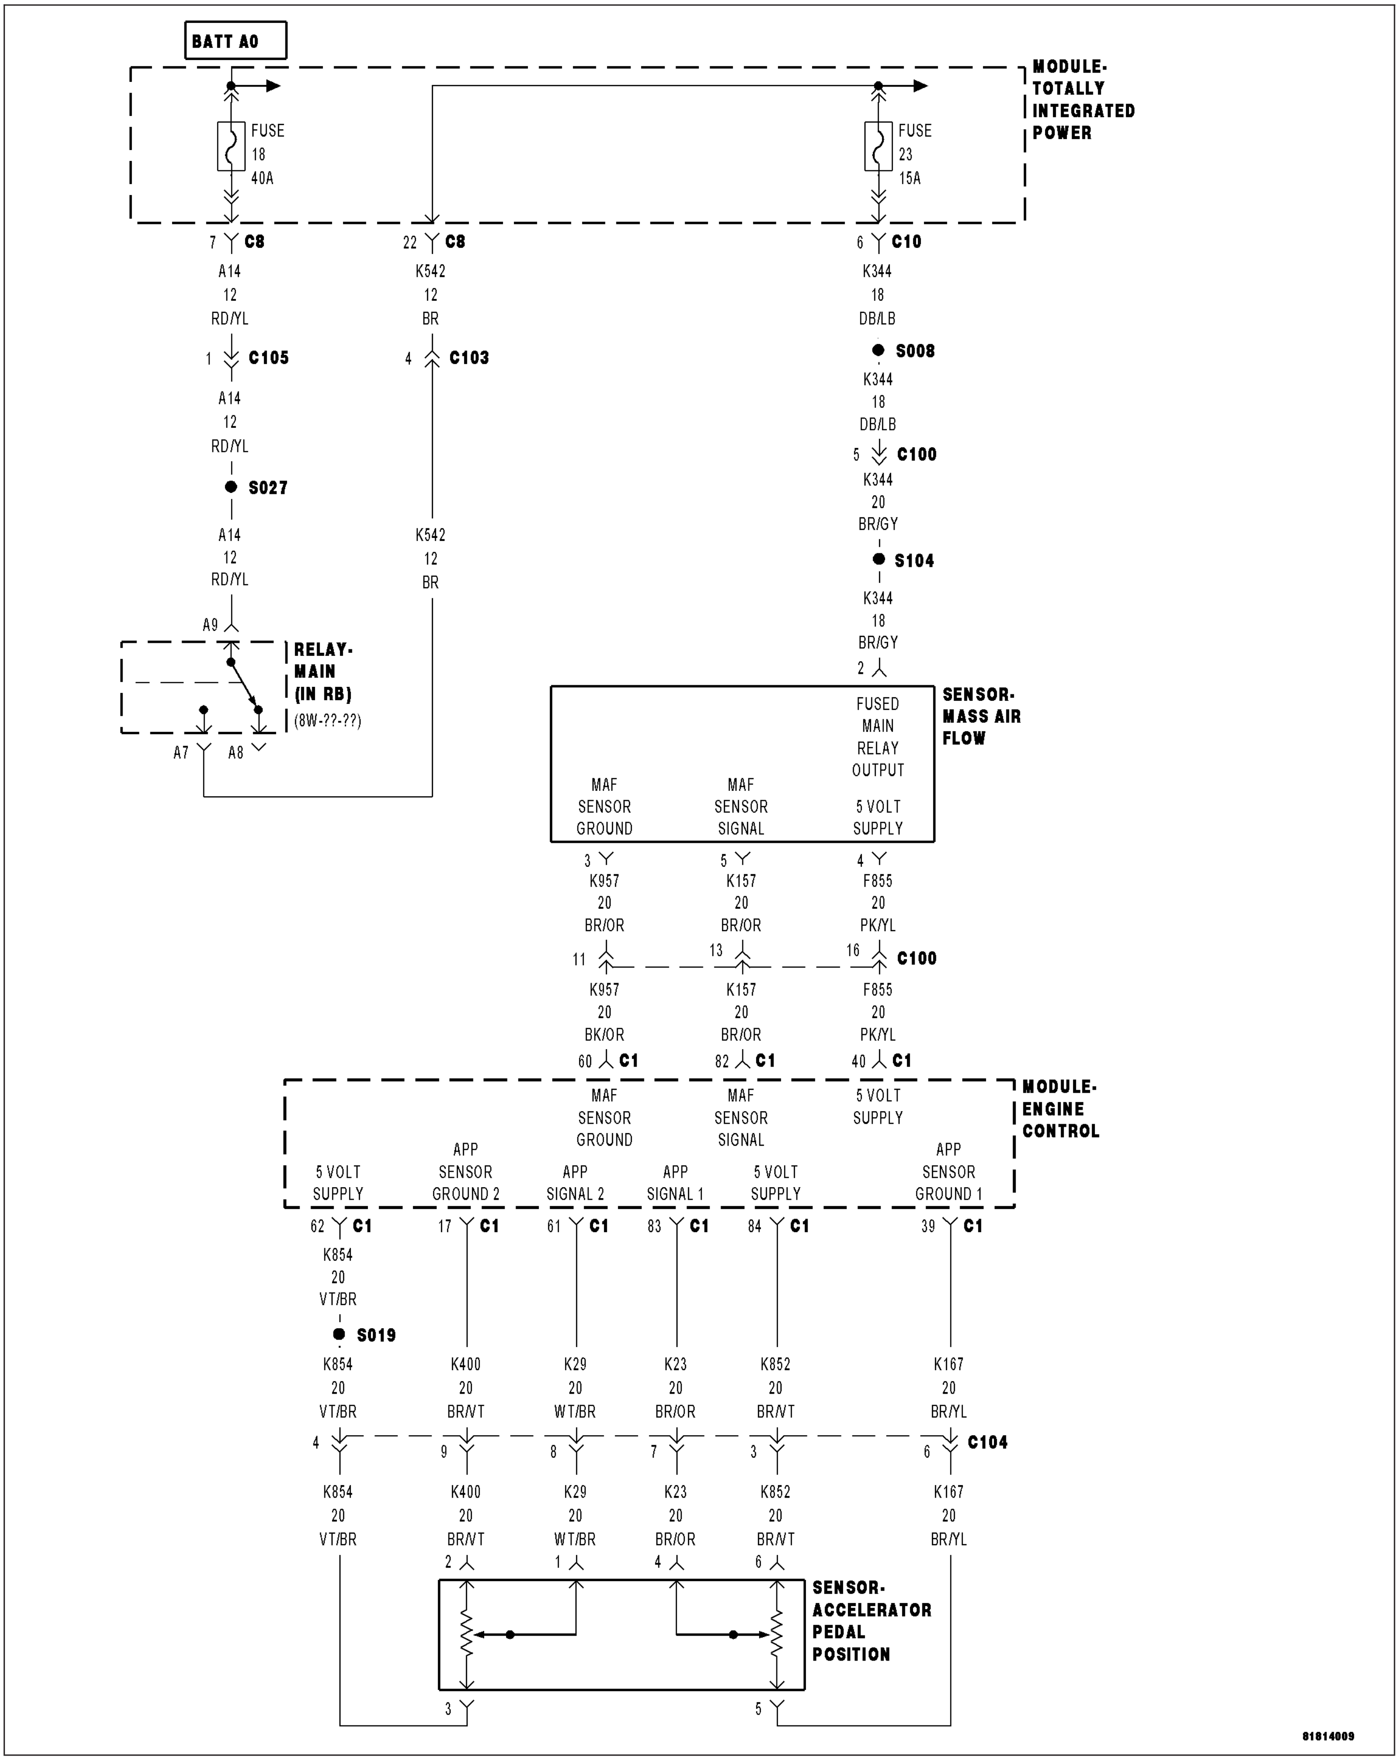
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2128-ACCELERATOR PEDAL POSITION SENSOR 2 CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The APP Sensor #2 signal circuit is above 2.5 volts for 0.32 seconds.

Possible Causes
INTERMITTENT DTC
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE
(K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K400) ACCELERATOR PEDAL POSITION SENSOR 2 SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE
(K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE (K854) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT OR (K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K400) ACCELERATOR PEDAL POSITION SENSOR 2 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor reference or supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

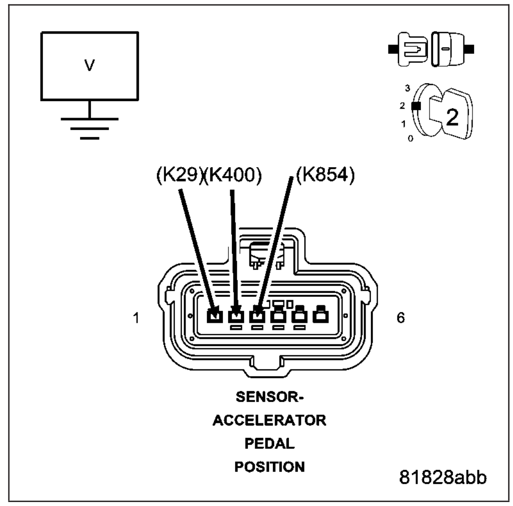
NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Fully depress and release the Accelerator Pedal several times.



With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Accelerator Pedal Position Sensor harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

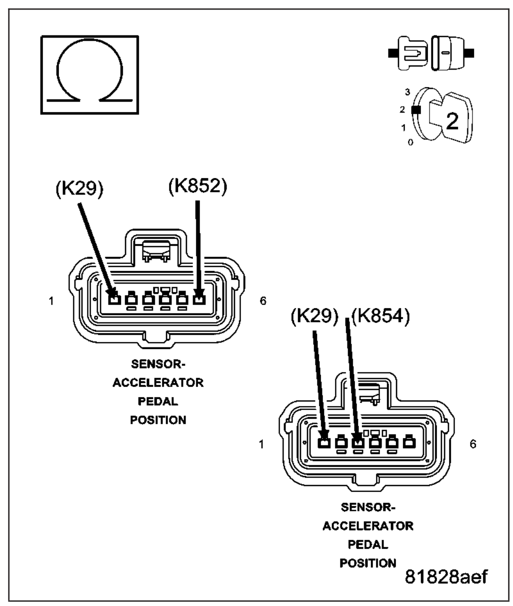
Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K29) Accelerator Pedal Position Sensor 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the voltage of the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit in the Accelerator Pedal Position Sensor harness connector.



Is there voltage present on any of the circuits?

Yes >> Repair the appropriate circuit that has voltage present.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

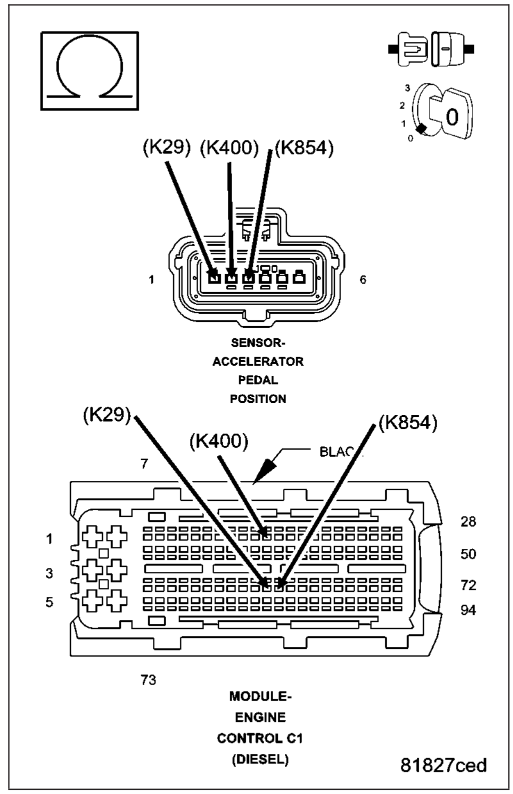
3. (K29) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT SHORTED TO THE 5 VOLT SUPPLY CIRCUIT

Turn the ignition off.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between the (K29) Accelerator Pedal Position Sensor 2 Signal circuit and the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.

Measure the resistance between the (K29) Accelerator Pedal Position Sensor 2 Signal circuit and the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit in the Accelerator Pedal Position Sensor harness connector.



Is the resistance above 1000.0 ohms for both of the circuits?

Yes >> Go to 4

No >> Repair the shorted (K29) Accelerator Pedal Position Sensor 2 Signal circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

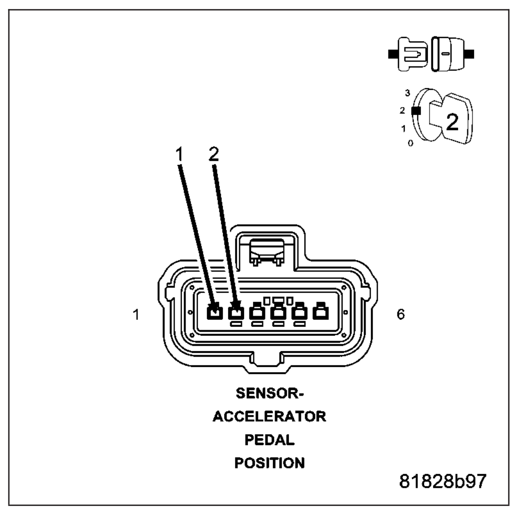
4. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K29) Accelerator Pedal Position Sensor 2 Signal circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.

Measure the resistance of the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit between the Accelerator Pedal Position Sensor harness connector and the Engine Control Module (ECM) harness connector.



Is the resistance below 10.0 ohms for each of the circuits?

Yes >> Go to 5

No >> Repair the appropriate circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ACCELERATOR PEDAL POSITION SENSOR

Remove the jumper wire and install the Main Relay.

Connect the Engine Control Module (ECM) harness connector.

Connect a jumper wire between the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit and the (K29) Accelerator Pedal Position Sensor 2 Signal circuit in the Accelerator Pedal Position Sensor harness connector.

Turn the ignition on.

With the scan tool, Clear DTCs.

Fully depress and release the Accelerator Pedal several times.

With the scan tool, select View DTCs.

NOTE: The scan tool should display an Accelerator Pedal Position Sensor 2 low voltage or short to ground DTC with the jumper wire in place.

Does the scan tool display the DTC as described above?

Yes >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 6

6. ENGINE CONTROL MODULE (ECM)

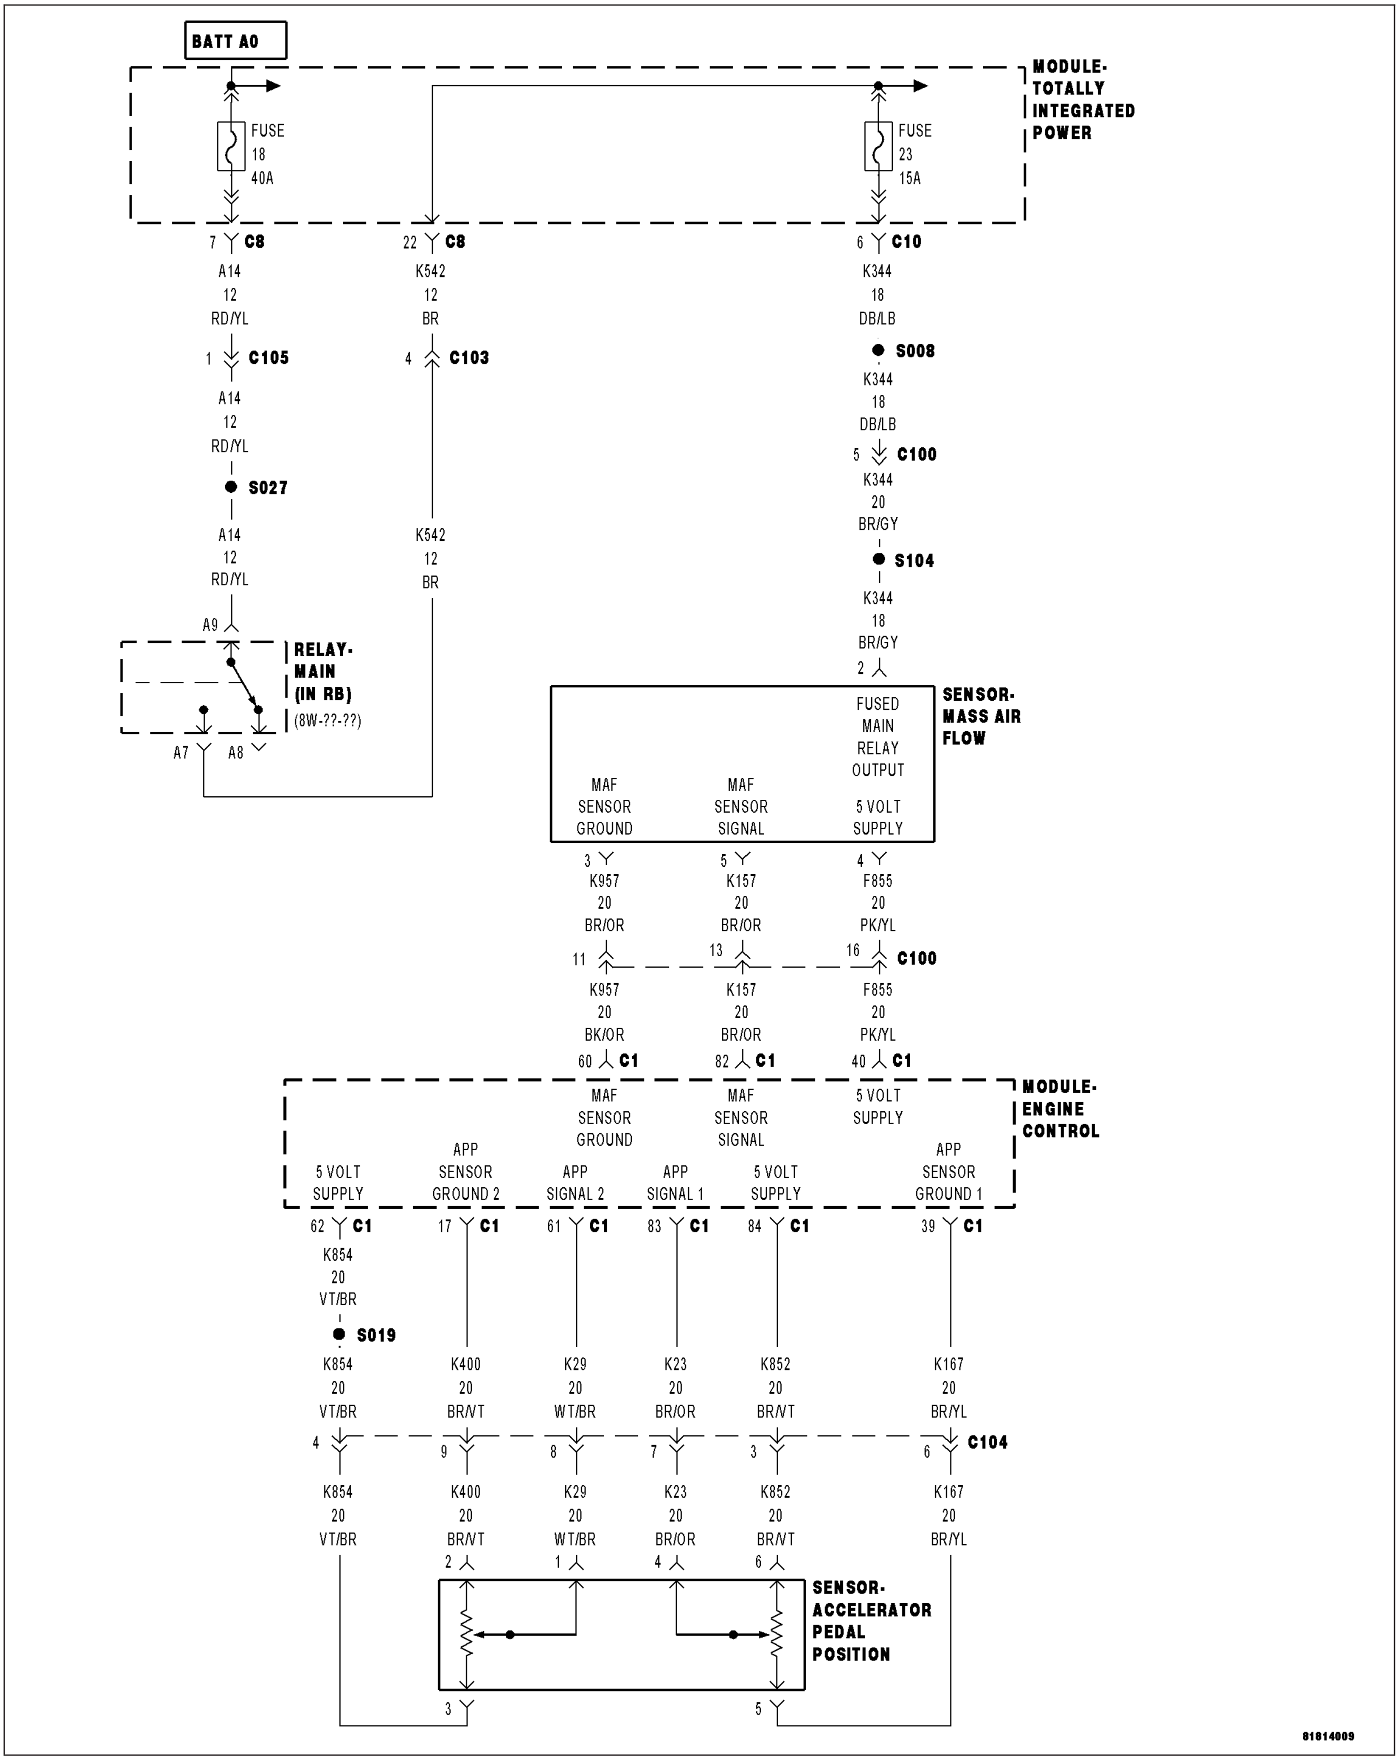
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Accelerator Pedal Position Sensor and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2138-ACCELERATOR PEDAL POSITION SENSOR 1 / 2 CORRELATION

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Accelerator Pedal Position Sensor contains two independent three wire sensors. Each sensor provides independent pedal position signals to the ECM. The raw voltage signal from APP #1 sensor is 2 times the raw voltage signal from APP #2. Although the raw voltage signals differ, the scan tool converts and displays these voltages as matching percentages of pedal travel.

- **When Monitored:**
  With the ignition on. No other APP DTC's set. No Sensor Reference Voltage DTC's set.
- **Set Condition:**
  APP Sensor #1 and APP Sensor #2 signals do not agree for 0.26 seconds.

Possible Causes
INTERMITTENT DTC
(K852) ACCELERATOR PEDAL POSITION SENSOR 1 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K23) ACCELERATOR PEDAL POSITION SENSOR 1 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K167) ACCELERATOR PEDAL POSITION SENSOR 1 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
(K854) ACCELERATOR PEDAL POSITION SENSOR 2 5 VOLT SUPPLY CIRCUIT OPEN OR HIGH RESISTANCE
(K12) ACCELERATOR PEDAL POSITION SENSOR 2 SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
(K400) ACCELERATOR PEDAL POSITION SENSOR 2 SENSOR GROUND CIRCUIT OPEN OR HIGH RESISTANCE
ACCELERATOR PEDAL POSITION SENSOR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: If any Sensor reference or supply voltage DTCs are present, perform the applicable diagnostic procedure before continuing with this test.

NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 2 signal should always be approximately 1/2 the voltage of the APP Sensor 1 signal.
Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ACCELERATOR PEDAL POSITION SENSOR CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Disconnect the APP Sensor harness connector.

Disconnect the ECM harness connectors.

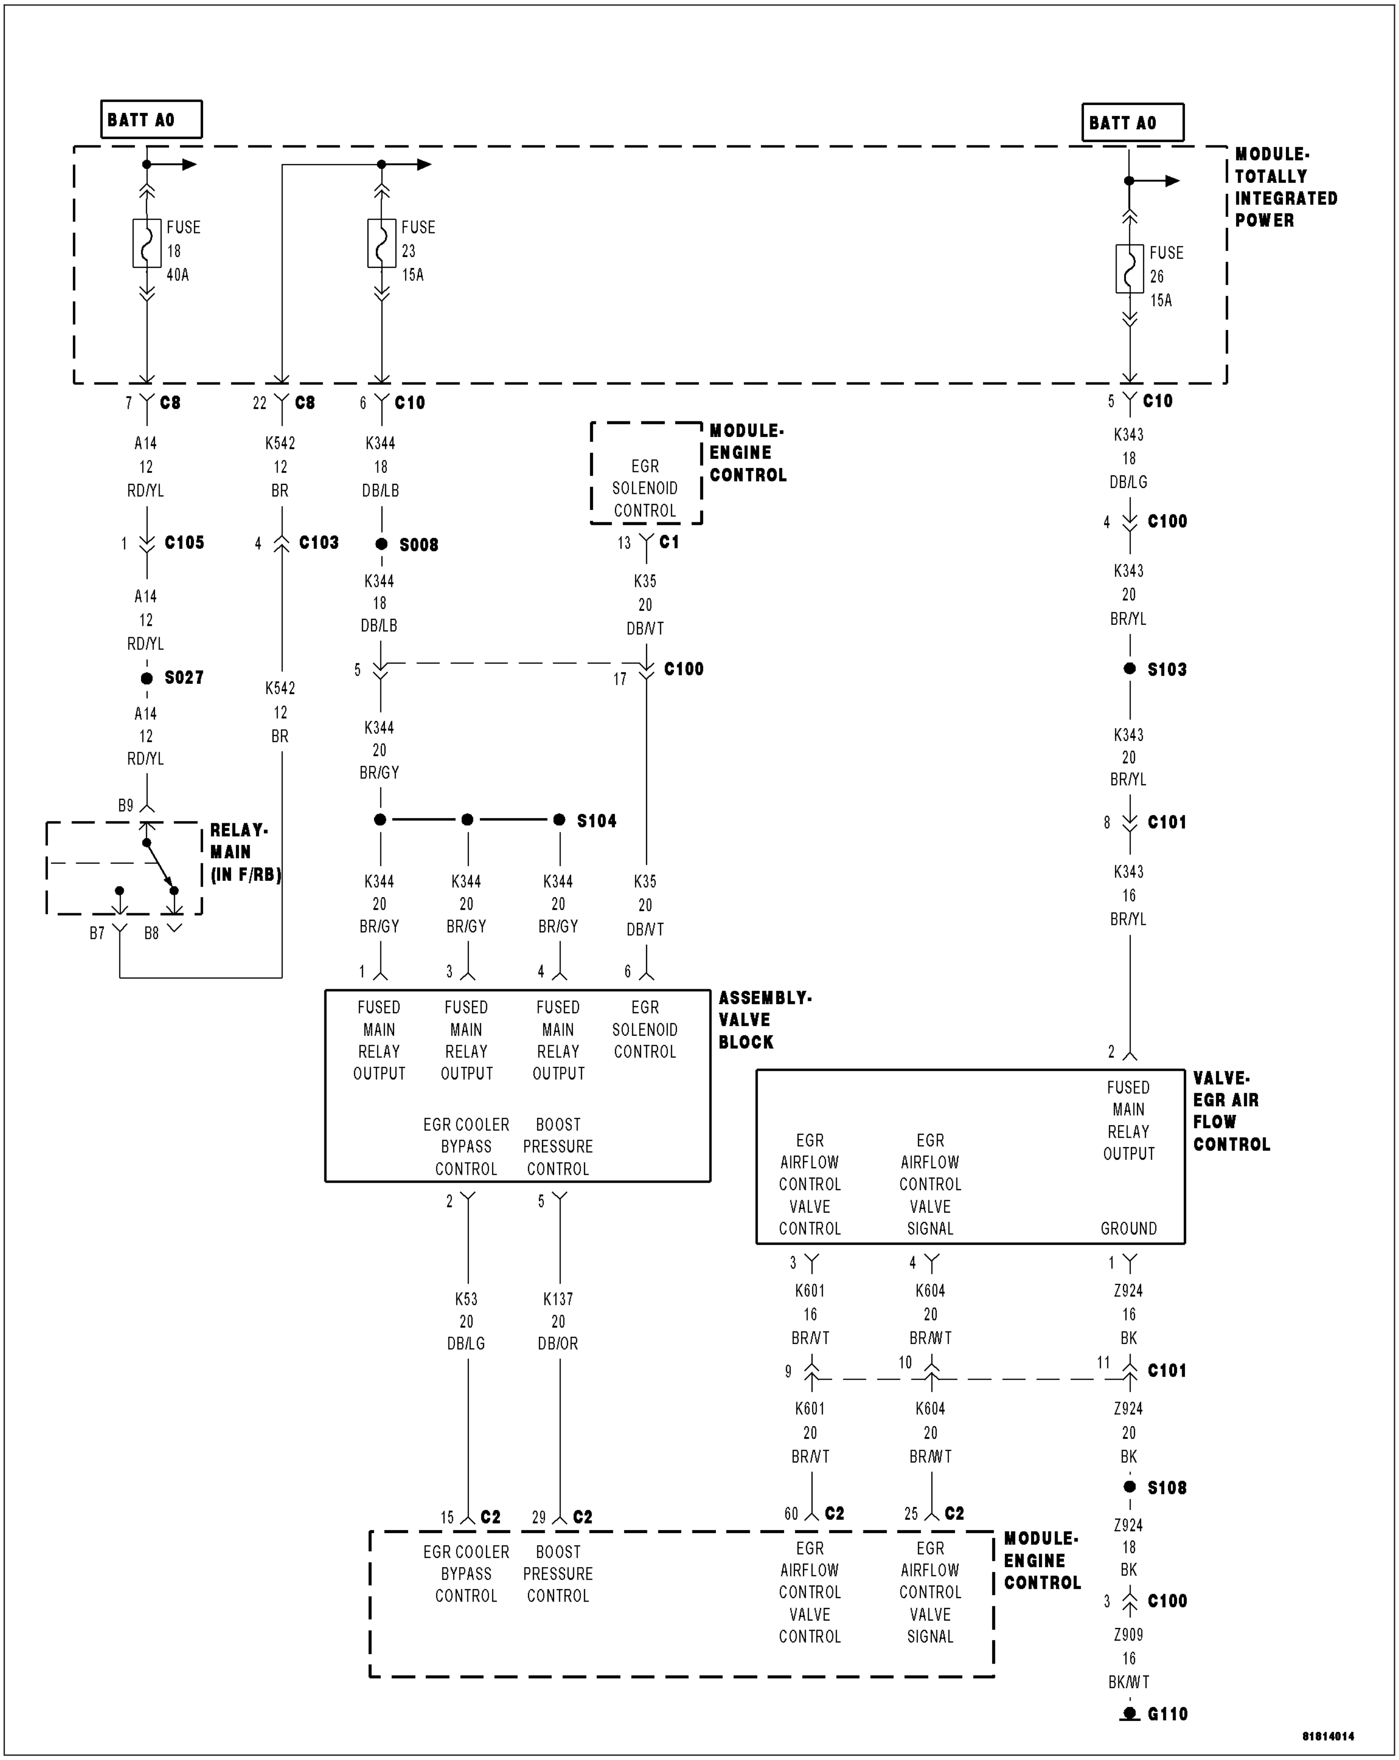
Measure the resistance of the (K852) Accelerator Pedal Position Sensor 1 5 Volt Supply circuit between the APP Sensor harness connector and the ECM harness connector.

Measure the resistance of the (K23) Accelerator Pedal Position Sensor 1 Signal circuit between the APP Sensor harness connector and the ECM harness connector.

Measure the resistance of the (K167) Accelerator Pedal Position Sensor 1 Sensor Ground circuit between the APP Sensor harness connector and the ECM harness connector.

Measure the resistance of the (K854) Accelerator Pedal Position Sensor 2 5 Volt Supply circuit between the APP Sensor harness connector and the ECM harness connector.

Measure the resistance of the (K29) Accelerator Pedal Position Sensor 2 Signal circuit between the APP Sensor harness connector and the ECM harness connector.



Measure the resistance of the (K400) Accelerator Pedal Position Sensor 2 Sensor Ground circuit between the APP Sensor harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each of the circuits?

Yes >> Replace the Accelerator Pedal Position Sensor.

No >> Repair the circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2141-EGR AIRFLOW THROTTLE CONTROL CIRCUIT A LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and the EGR Airflow Control Valve Motor command off.
- **Set Condition:**
  The (K601) EGR Airflow Control Valve Control circuit is shorted to ground for 0.5 seconds.

Possible Causes
INTERMITTENT DTC
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO (K604) EGR AIRFLOW CONTROL VALVE SIGNAL
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
EGR AIRFLOW CONTROL VALVE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Airflow Control Valve.

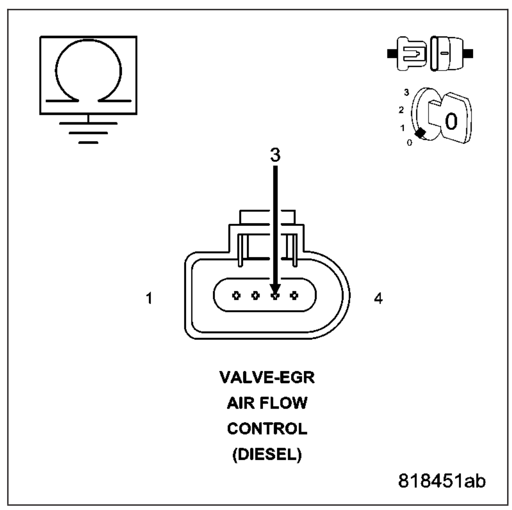
Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)



2. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO GROUND

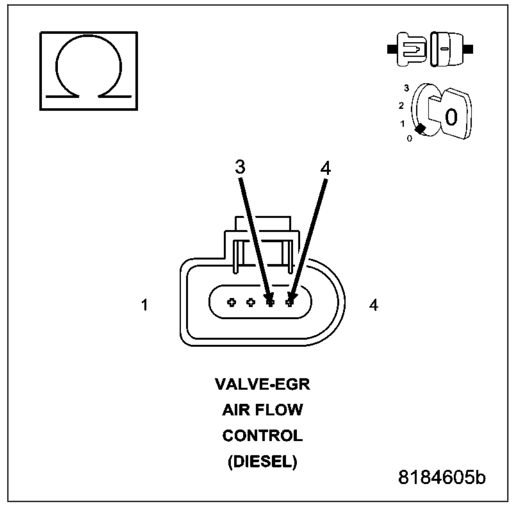
Turn the ignition off.

Disconnect the EGR Airflow Control Valve harness connector.

Disconnect the Engine Control Module (ECM) harness connector.

Measure the resistance between ground and the (K601) EGR Airflow Control Valve Control circuit in the EGR Airflow Control Valve harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 3

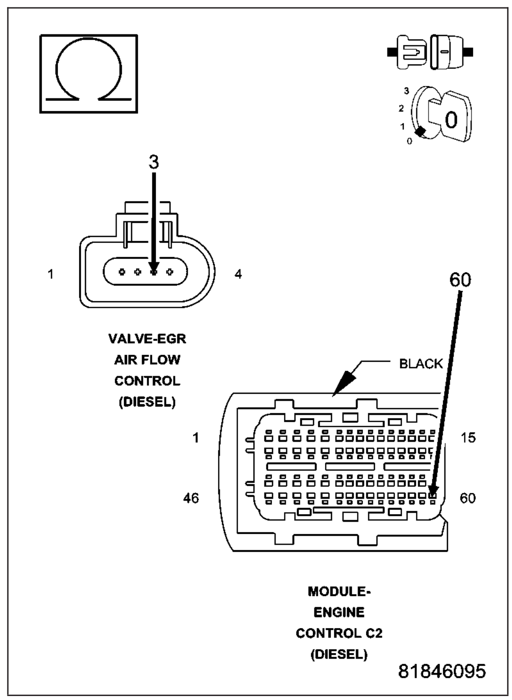
No >> Repair the (K601) EGR Airflow Control Valve Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT

Measure the resistance between the (K601) EGR Airflow Control Valve Control circuit and the (K604) EGR Airflow Control Valve Signal circuit in the EGR Airflow Control Valve harness connector.

Is the resistance above 1000 ohms?



Yes >> Go to 4

No >> Repair the (K601) EGR Airflow Control Valve Control circuit for a short to the (K604) EGR Airflow Control Valve Signal circuit.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT OPEN CIRCUIT OR HIGH RESISTANCE

Measure the resistance of the (K601) EGR Airflow Control Valve Control circuit between the EGR Airflow Control Valve harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 5

No >> Repair the (K601) EGR Airflow Control Valve Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. EGR AIRFLOW CONTROL VALVE

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the EGR Airflow Control Valve in accordance with the service information.

Turn the ignition on.

With the scan tool, clear DTCs.

With the scan tool, actuate the EGR Airflow Control Valve.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 6

No >> Test complete.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. ENGINE CONTROL MODULE (ECM)

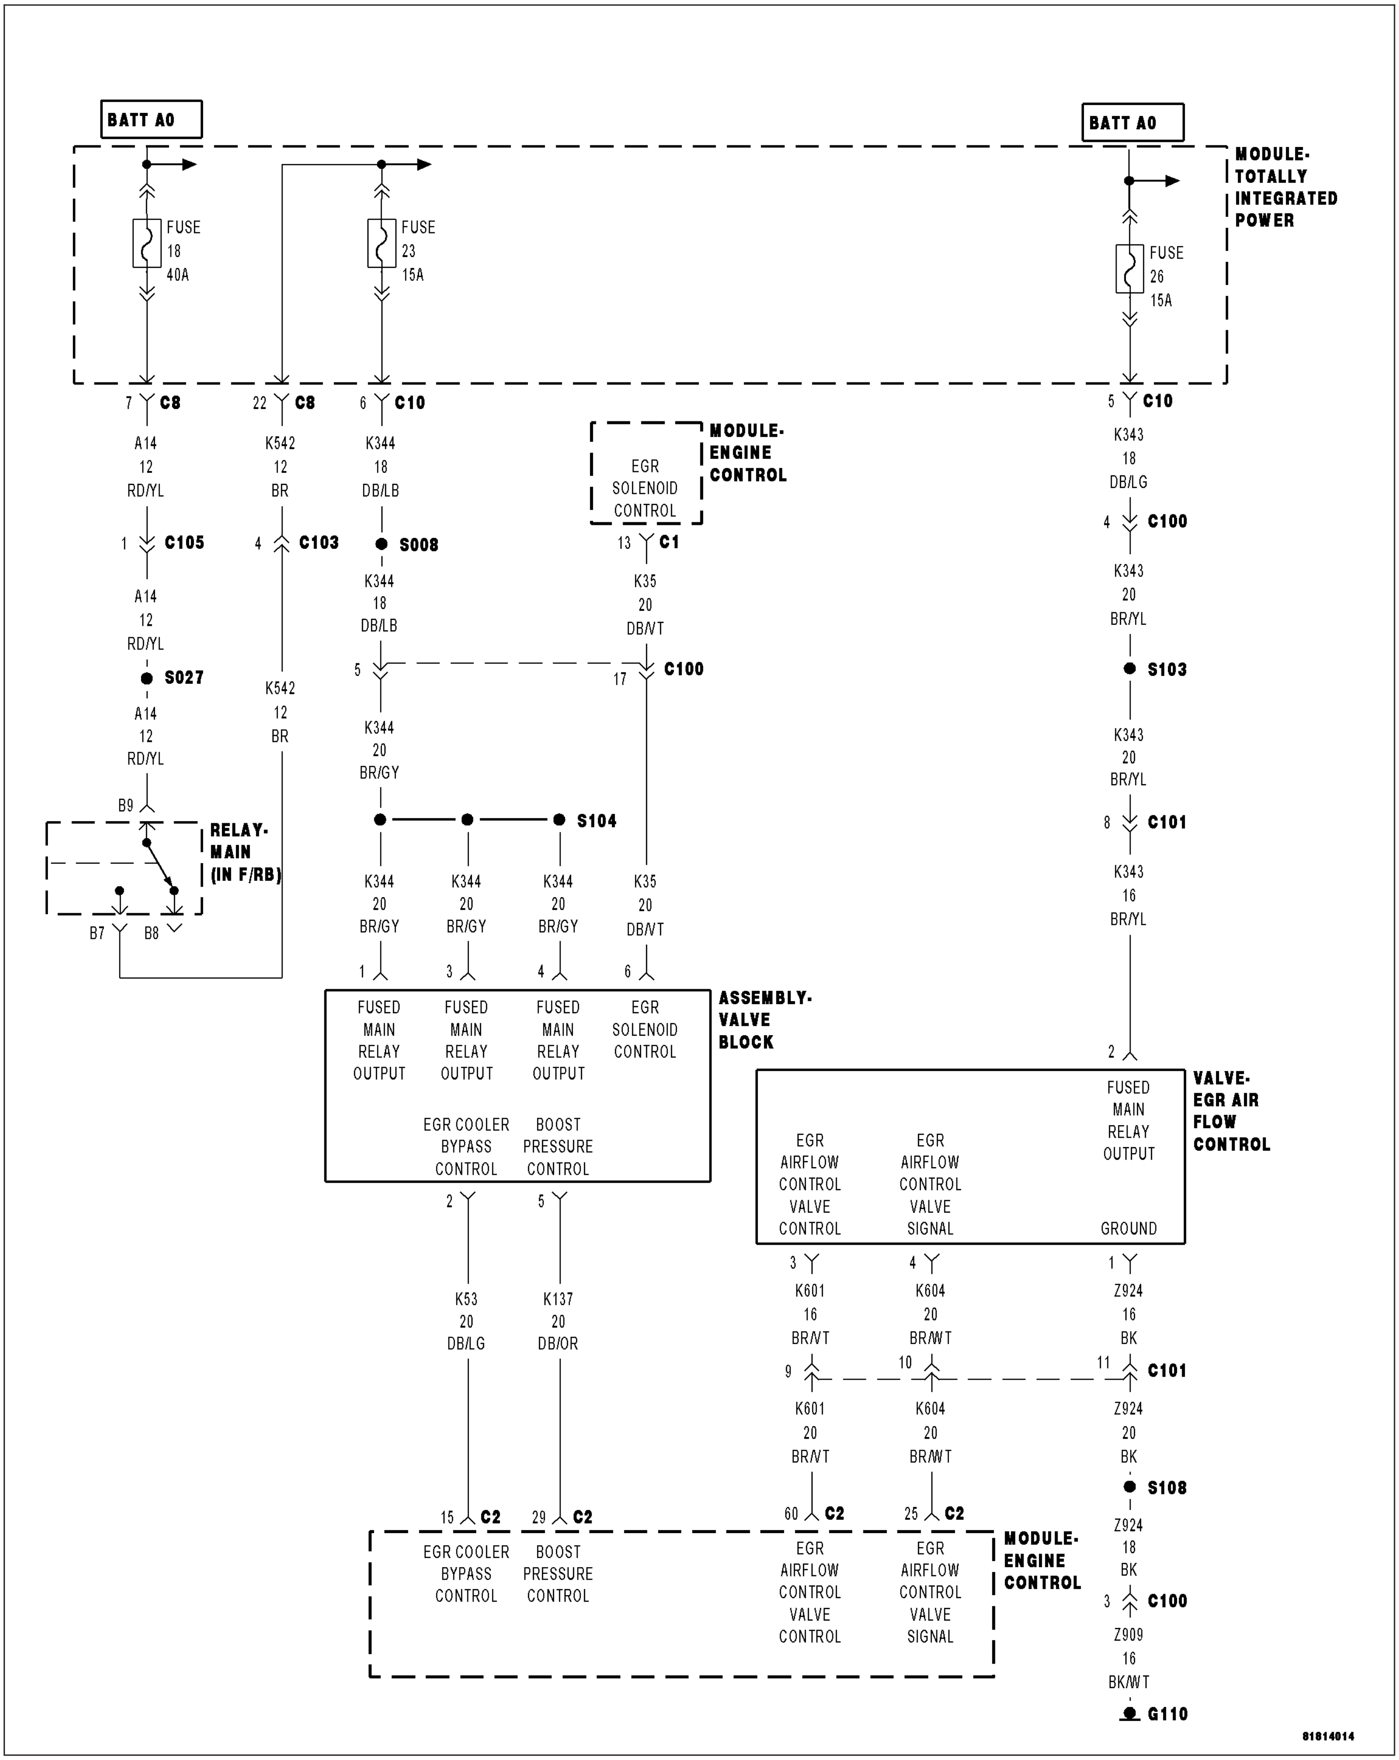
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Airflow Control Valve and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2142-EGR AIRFLOW THROTTLE CONTROL CIRCUIT A HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running and the EGR Airflow Control Valve Motor command on.
- **Set Condition:**
  The (K601) EGR Airflow Control Valve Motor (+) circuit is shorted to voltage for 0.2 second.

Possible Causes
INTERMITTENT DTC
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO VOLTAGE
(K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT SHORTED TO VOLTAGE
(K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
(K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
EGR AIRFLOW CONTROL VALVE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Airflow Control Valve.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

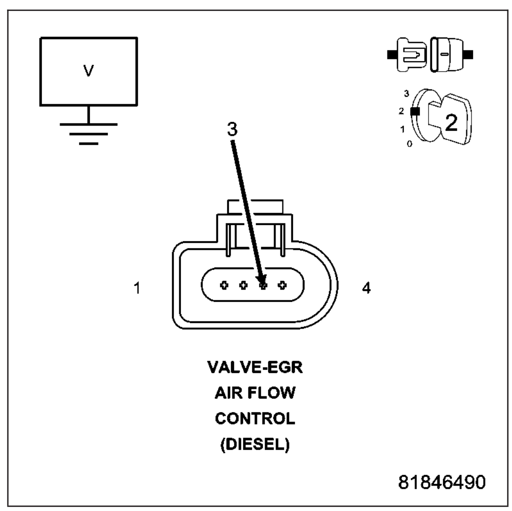
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (K601) EGR AIRFLOW CONTROL VALVE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the EGR Airflow Control Valve harness connector.



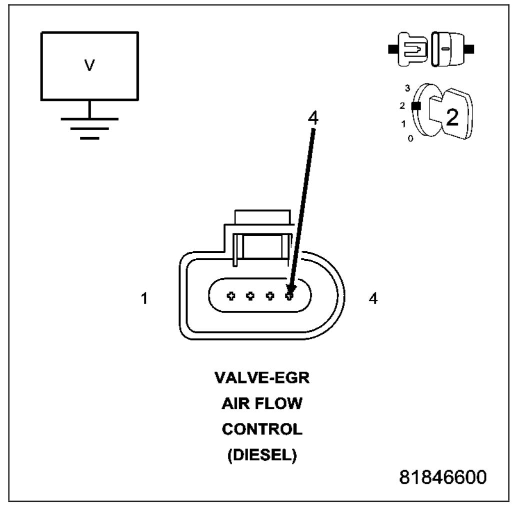
Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the (K601) EGR Airflow Control Valve Control circuit in the EGR Airflow Control Valve harness connector.



Is there any voltage present?

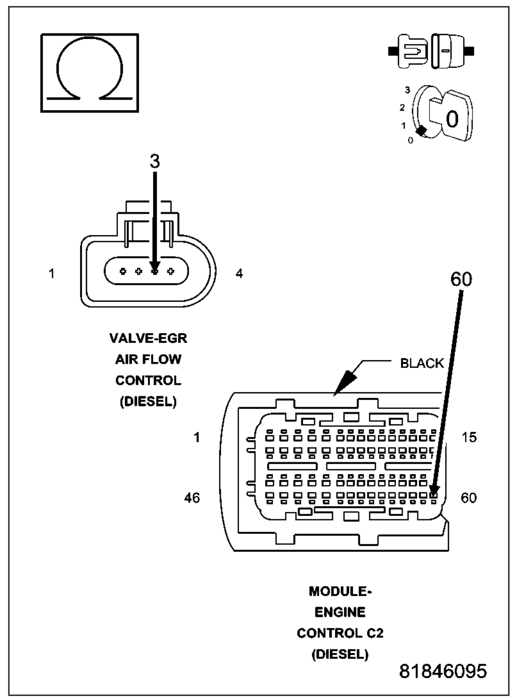
Yes >> Repair the (K601) EGR Airflow Control Valve Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT SHORTED TO VOLTAGE

Measure the voltage of the (K604) EGR Airflow Control Valve Signal circuit in the EGR Airflow Control Valve harness connector.

Is there any voltage present?



Yes >> Repair the (K604) EGR Airflow Control Valve Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

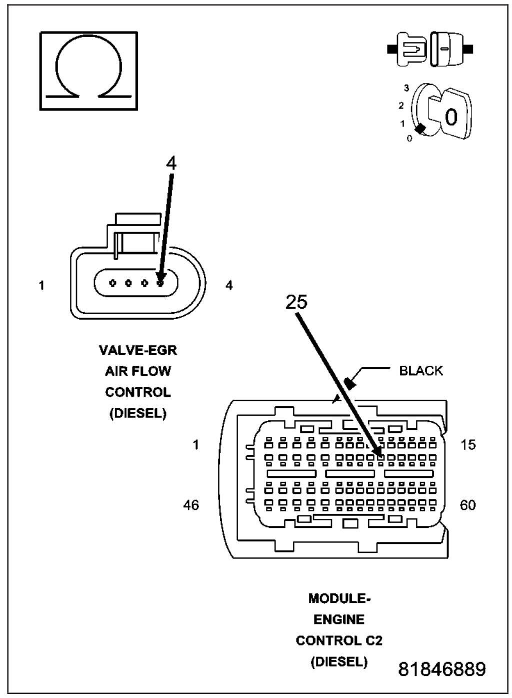
No >> Go to 4

4. (K601) EGR AIRFLOW CONTROL VALVE CONTROL OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of the (K601) EGR Airflow Control Valve Control circuit between the EGR Airflow Control Valve harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?



Yes >> Go to 5

No >> Repair the (K601) EGR Airflow Control Valve Control circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. (K604) EGR AIRFLOW CONTROL VALVE SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (K604) EGR Airflow Control Valve Signal circuit between the EGR Airflow Control Valve harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 6

No >> Repair the (K604) EGR Airflow Control Valve Signal circuit for an open circuit or high resistance.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. EGR AIRFLOW CONTROL VALVE

Turn the ignition off.

Connect the Engine Control Module (ECM) harness connector.

Replace the EGR Airflow Control Valve in accordance with the Service Information.

Turn the ignition on.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the EGR Airflow Control Valve.

Monitor the scan tool for at least two minutes.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 7

No >> Test complete.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

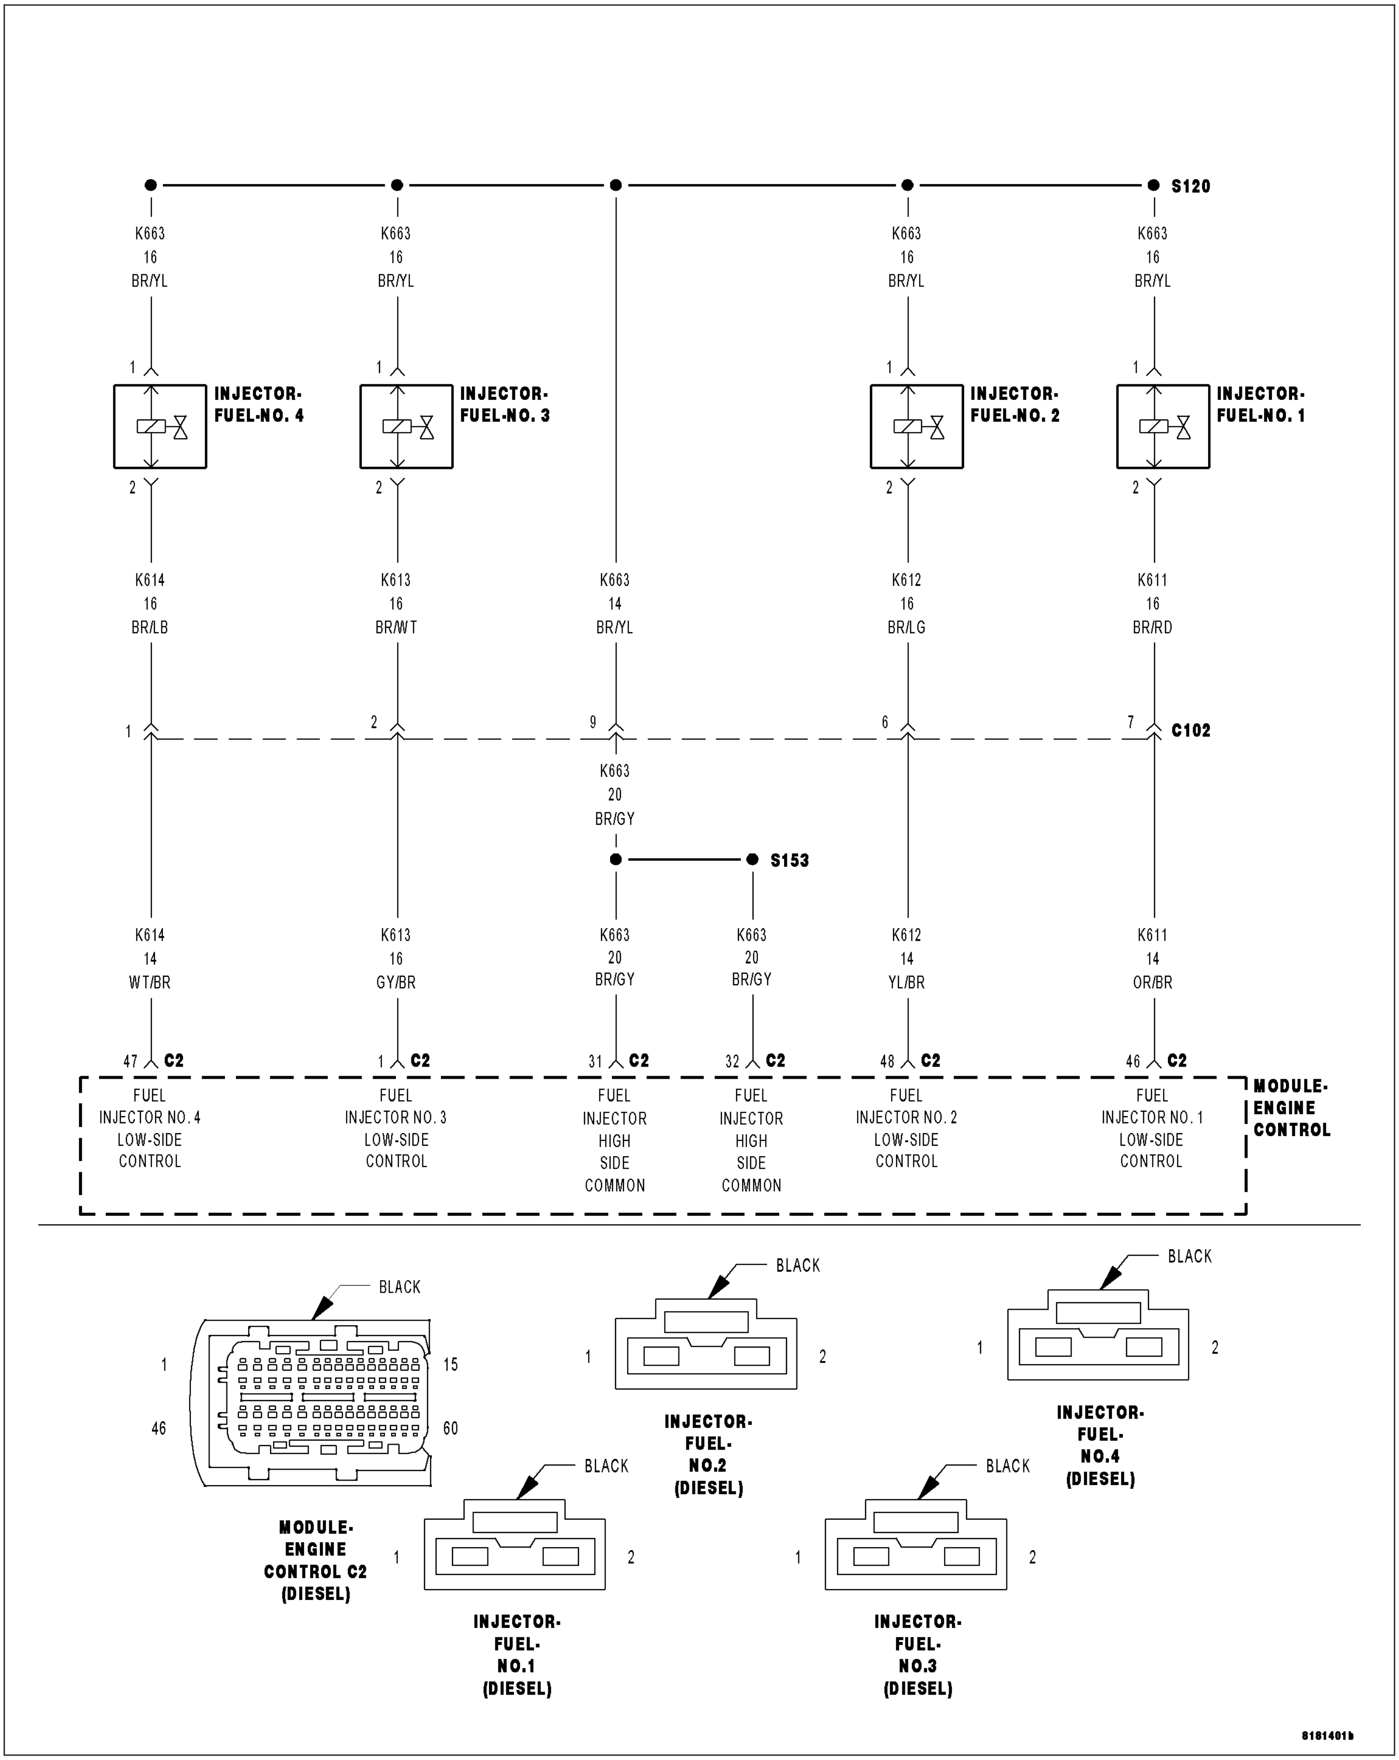
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the EGR Airflow Control Valve and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2147-FUEL INJECTOR GROUP 1 SUPPLY VOLTAGE CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects a short to ground in the fuel injector circuitry.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect all Fuel Injector harness connectors.

Disconnect the Engine Control Module harness connectors.

Measure the resistance between ground and the Fuel Injector High-Side Control circuit in any Fuel Injector harness connector.

Is the resistance above 1000 ohms?

Yes >> Go to 3

No >> Repair the Fuel Injector High-Side Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO GROUND

Measure the resistance between ground and the Fuel Injector Low-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms for each measurement?

Yes >> Go to 4

No >> Repair the Fuel Injector Low-Side Control circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT

Measure the resistance between the Fuel Injector High-Side Control circuit and the Fuel Injector Low-Side Control circuit in each Fuel Injector harness connector.

Is the resistance above 1000 ohms between the circuits in each harness connector?

Yes >> Go to 5

No >> Repair the Fuel Injector High-Side Control circuit for a short to the Fuel Injector Low-Side Control circuit.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Go to 6

No >> Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Go to 7

No >> Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance approximately 185k ohms (+/- 0.5%) for each injector?

Yes >> Go to 8

No >> Replace Fuel Injector in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. ENGINE CONTROL MODULE (ECM)

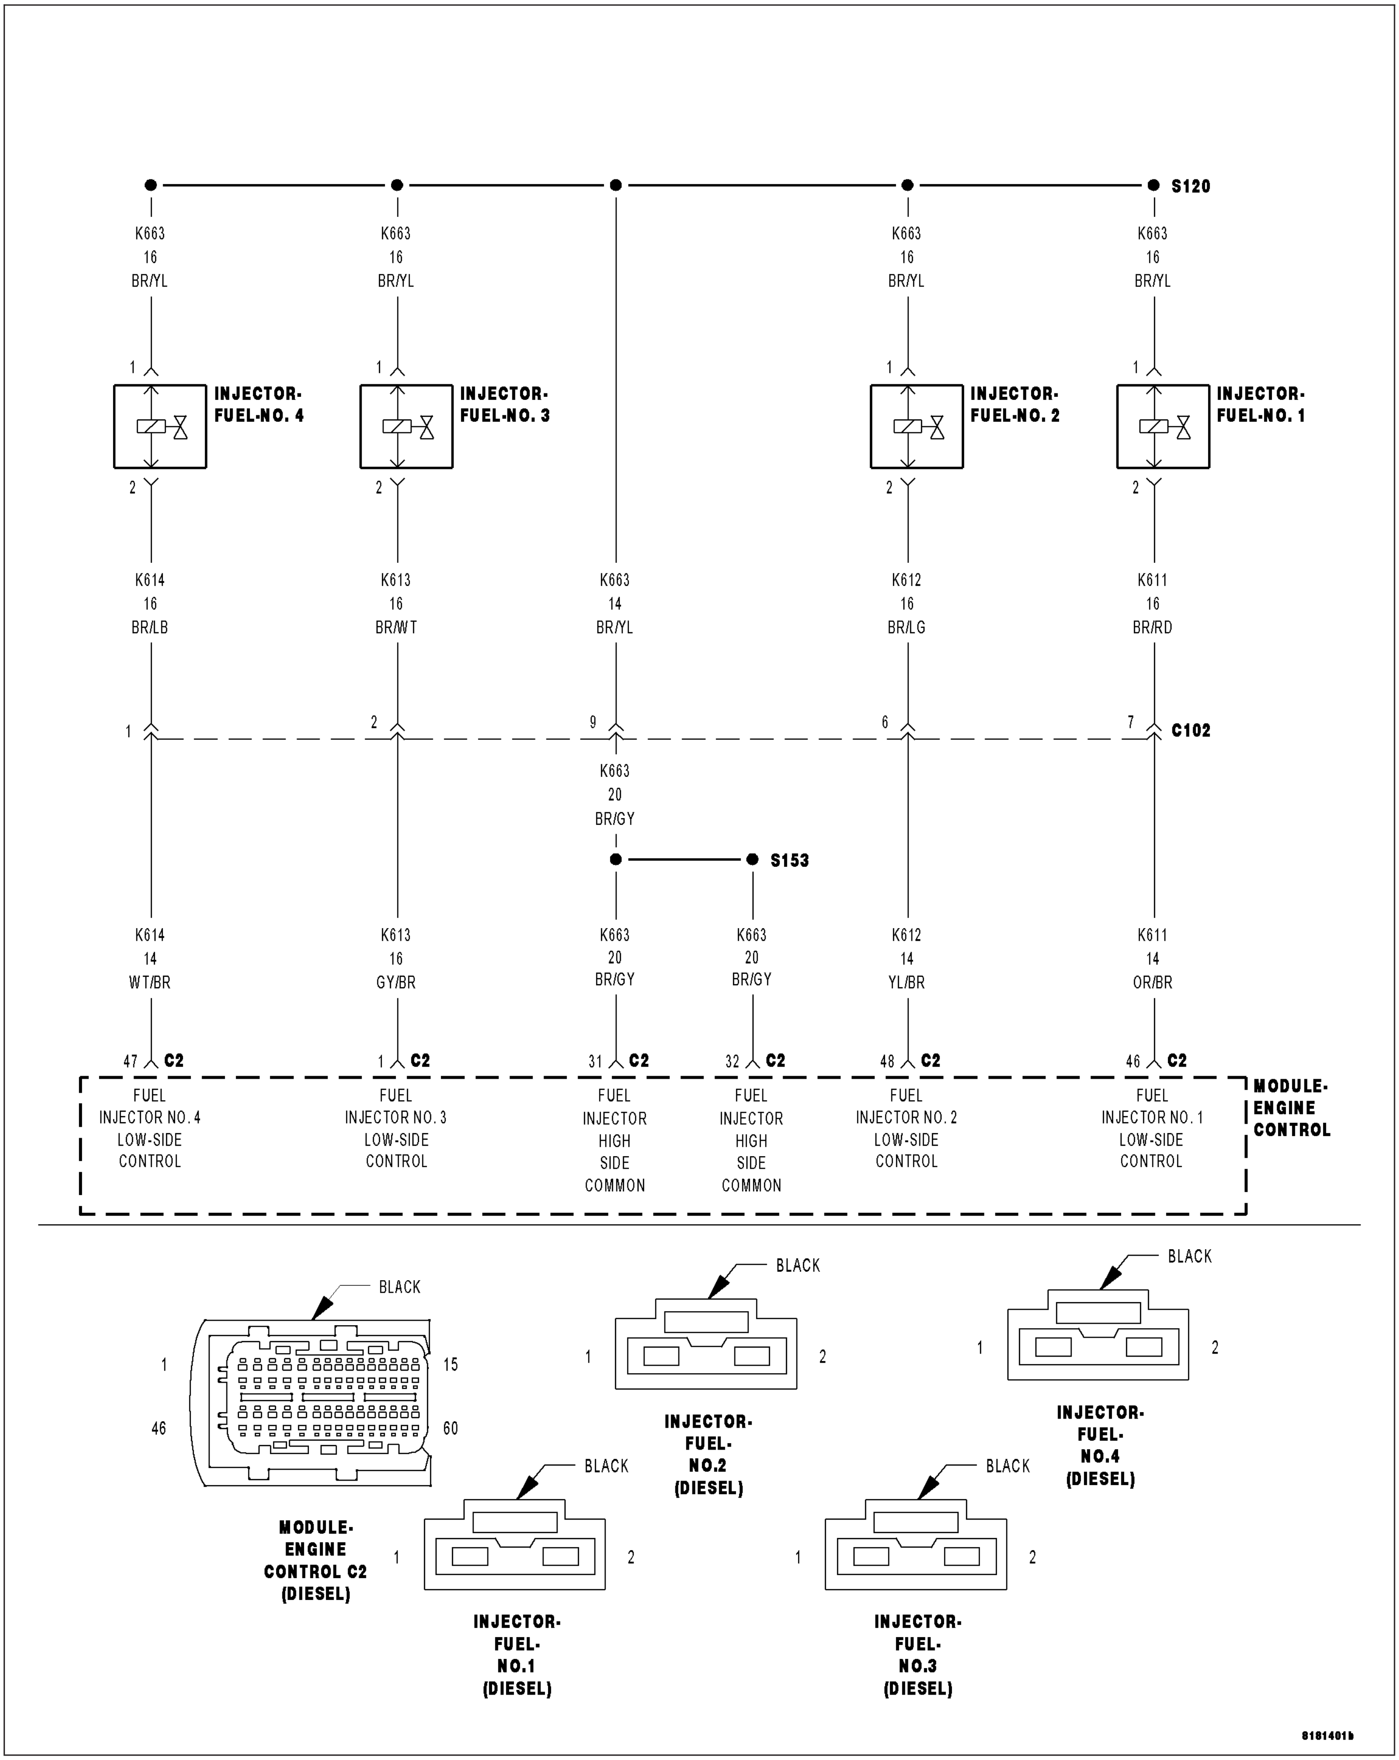
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between each Fuel Injector and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2148-FUEL INJECTOR GROUP 1 SUPPLY VOLTAGE CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the engine running.
- **Set Condition:**
  The ECM detects a short to voltage in the fuel injector circuitry.

Possible Causes
INTERMITTENT DTC
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE
FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE
FUEL INJECTOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC can set as a result of a fault in any of the injector circuits. Be sure to check all injector circuits before replacing an injector and all injectors before replacing a module.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Attempt to start the engine and test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect each Fuel Injector connector.

Disconnect the ECM harness connectors.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay Connector.

Turn the ignition on.

Measure the voltage of the Fuel Injector High-Side Control circuit in any Fuel Injector harness connector.

Is there voltage present?

Yes >> Repair the Fuel Injector High-Side Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT SHORTED TO VOLTAGE

NOTE: The jumper wire should still be in place.

Measure the voltage of each Fuel Injector Low-Side Control circuit.

Is there voltage present on any of the circuits?

Yes >> Repair the Fuel Injector Low-Side Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. FUEL INJECTOR HIGH-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Turn the ignition off.

Measure the resistance of each Fuel Injector High-Side Control circuit between the Fuel Injector harness connector and the ECM connector.

Is the resistance below 10.0 ohms for each measurement?

Yes >> Go to 5

No >> Repair the Fuel Injector High-Side Control circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. FUEL INJECTOR LOW-SIDE CONTROL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of each Fuel Injector Low-Side Control circuit between the Fuel Injector harness connector and the ECM connector.

Is the resistance below 10.0 ohms for each circuit?

Yes >> Go to 6

No >> Repair the Fuel Injector Low-Side Control circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. FUEL INJECTOR

Measure the resistance between the terminals of each Fuel Injector.

Is the resistance approximately 185k ohms (+/- 0.5%) for all injectors?

Yes >> Go to 7

No >> Replace Fuel Injector in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. ENGINE CONTROL MODULE (ECM)

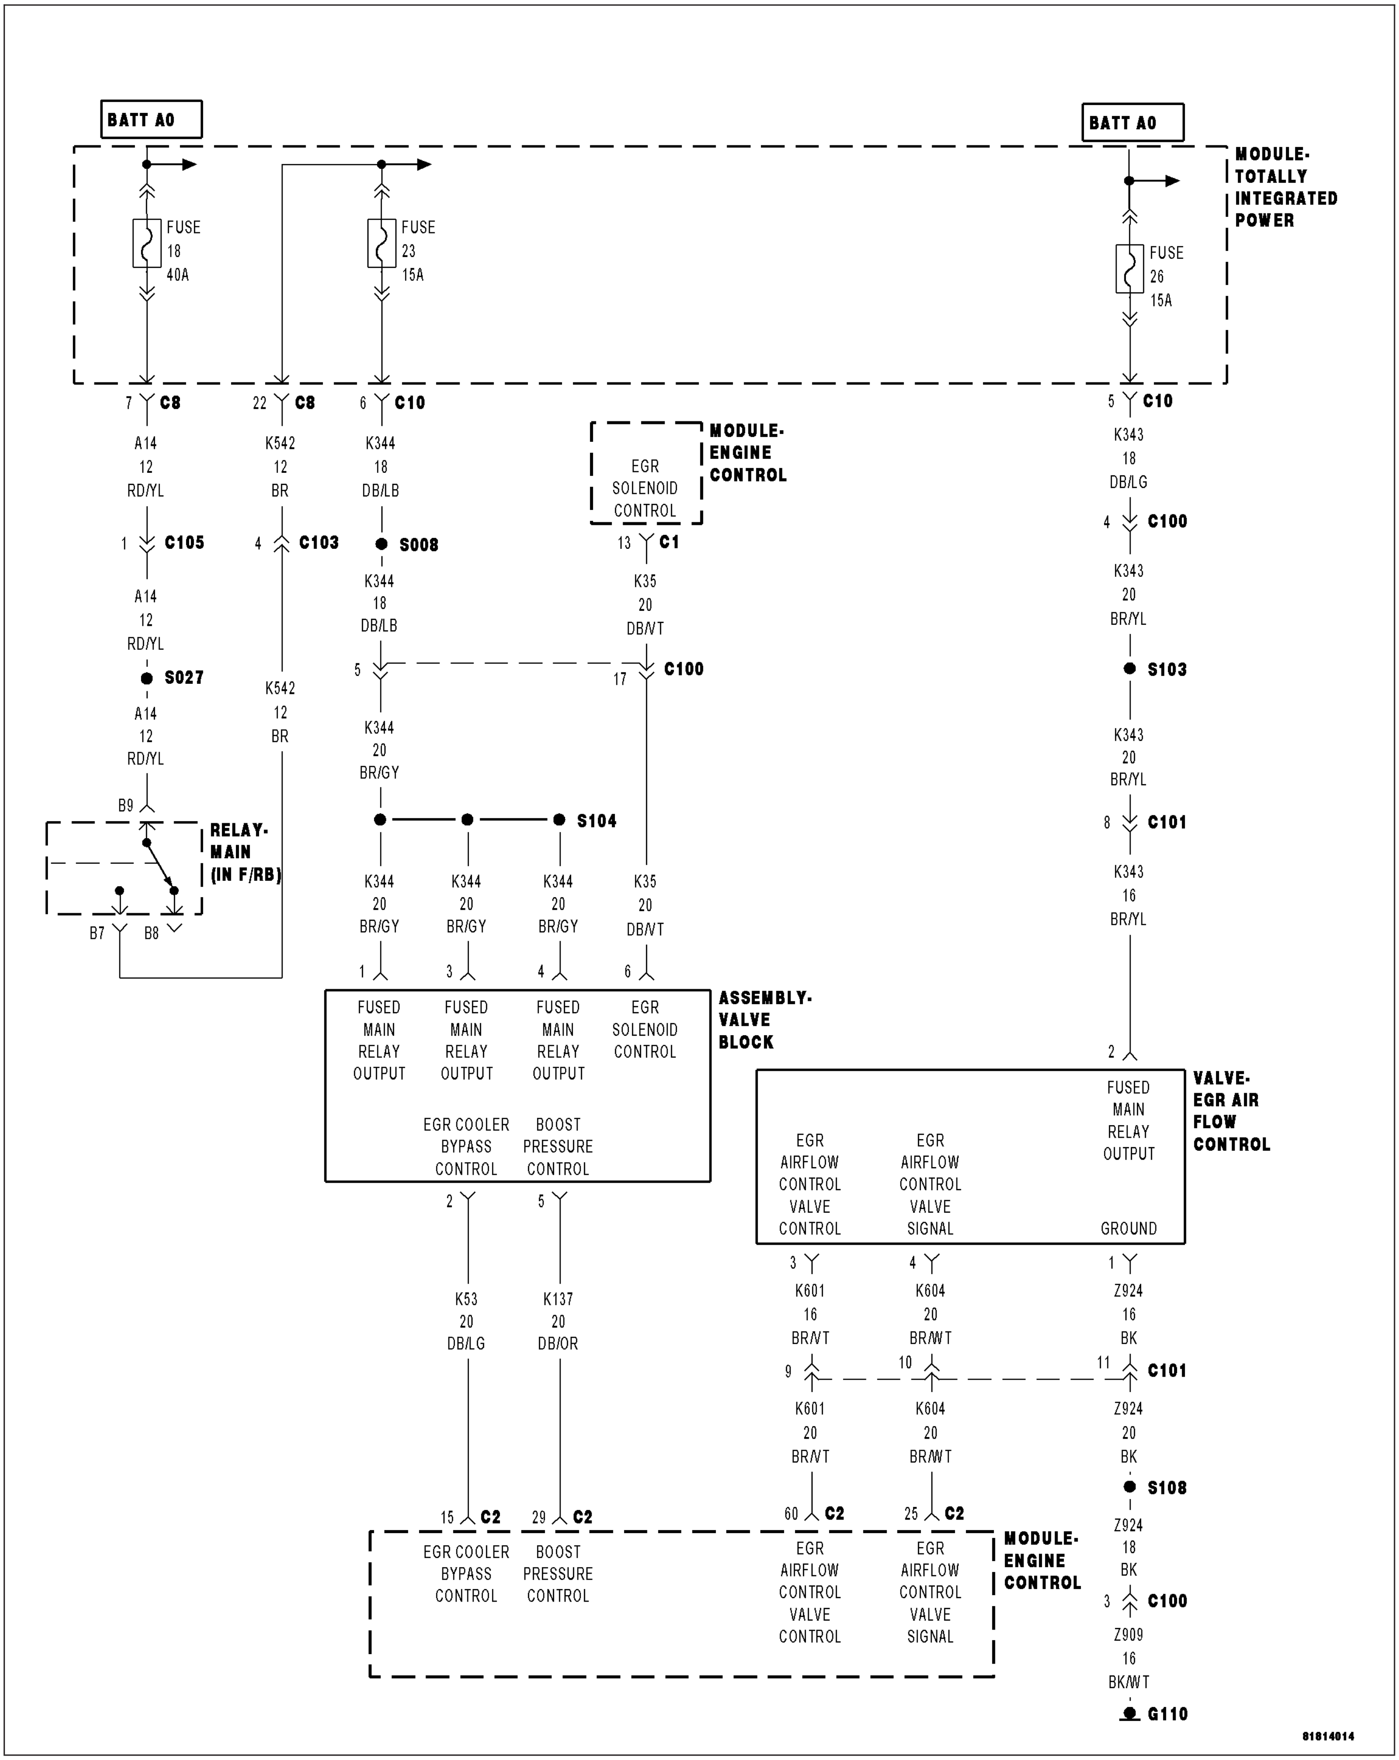
Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Fuel Injectors and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2425-EGR COOLING VALVE CONTROL CIRCUIT OPEN

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the ECM EGR Cooler Bypass command off.
- **Set Condition:**
  The ECM does not detect voltage on the EGR Cooler Bypass Control circuit.

Possible Causes
INTERMITTENT CONDITION
(K344) MAIN RELAY OUTPUT CIRCUITS OPEN
(K53) EGR COOLER BYPASS CONTROL CIRCUIT SHORTED TO GROUND
(K53) EGR COOLER BYPASS CONTROL CIRCUIT OPEN
VALVE BLOCK ASSEMBLY
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition cycles, turning the ignition off for at least 10 seconds between each ignition cycle.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

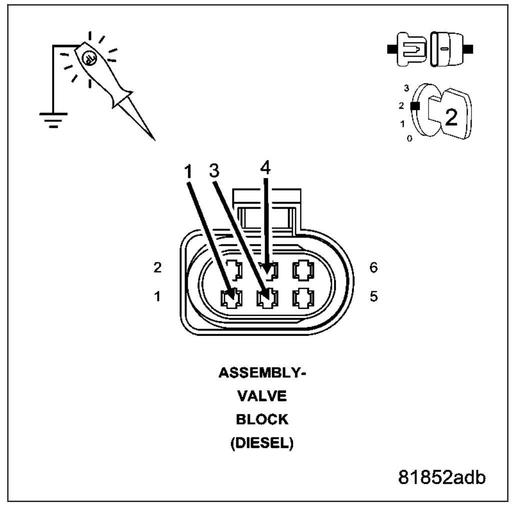
2. CHECKING FOR OTHER DTCS

NOTE: An open MAIN Relay power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes >> Go To 3



3. (K344) MAIN RELAY OUTPUT CKTS OPEN

Turn the ignition off.

Disconnect the Valve Block Assembly harness connector.

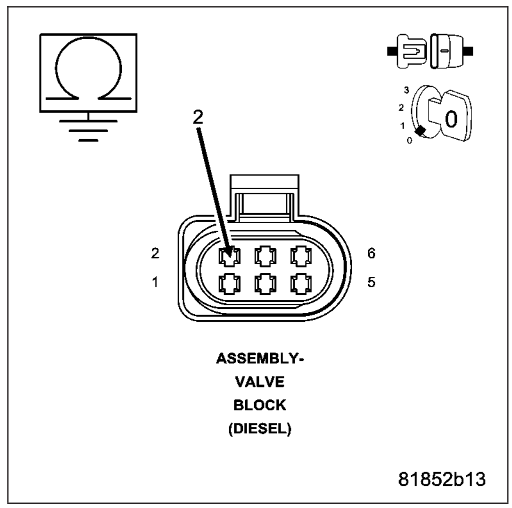
Turn the ignition on.

Using a 12-volt test light connected to ground, check all the (K344) Main Relay Output circuits at the Valve Block Assembly harness connector.

Does the test light illuminate brightly on all circuits?

Yes >> Go To 4

No >> Repair the (K344) Main Relay Output circuit for an open.



Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

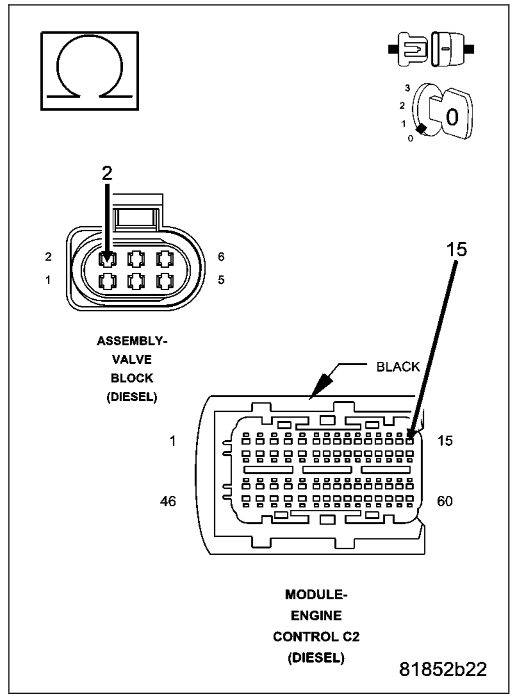
4. (K53) EGR COOLER BYPASS CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and the (K53) EGR Cooler Bypass Control circuit at the Valve Block Assembly harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 5

No >> Repair the (K53) EGR Cooler Bypass Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K53) EGR COOLER BYPASS CONTROL CIRCUIT OPEN

Measure the resistance of the (K53) EGR Cooler Bypass Control circuit between the Valve Block Assembly harness connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 6

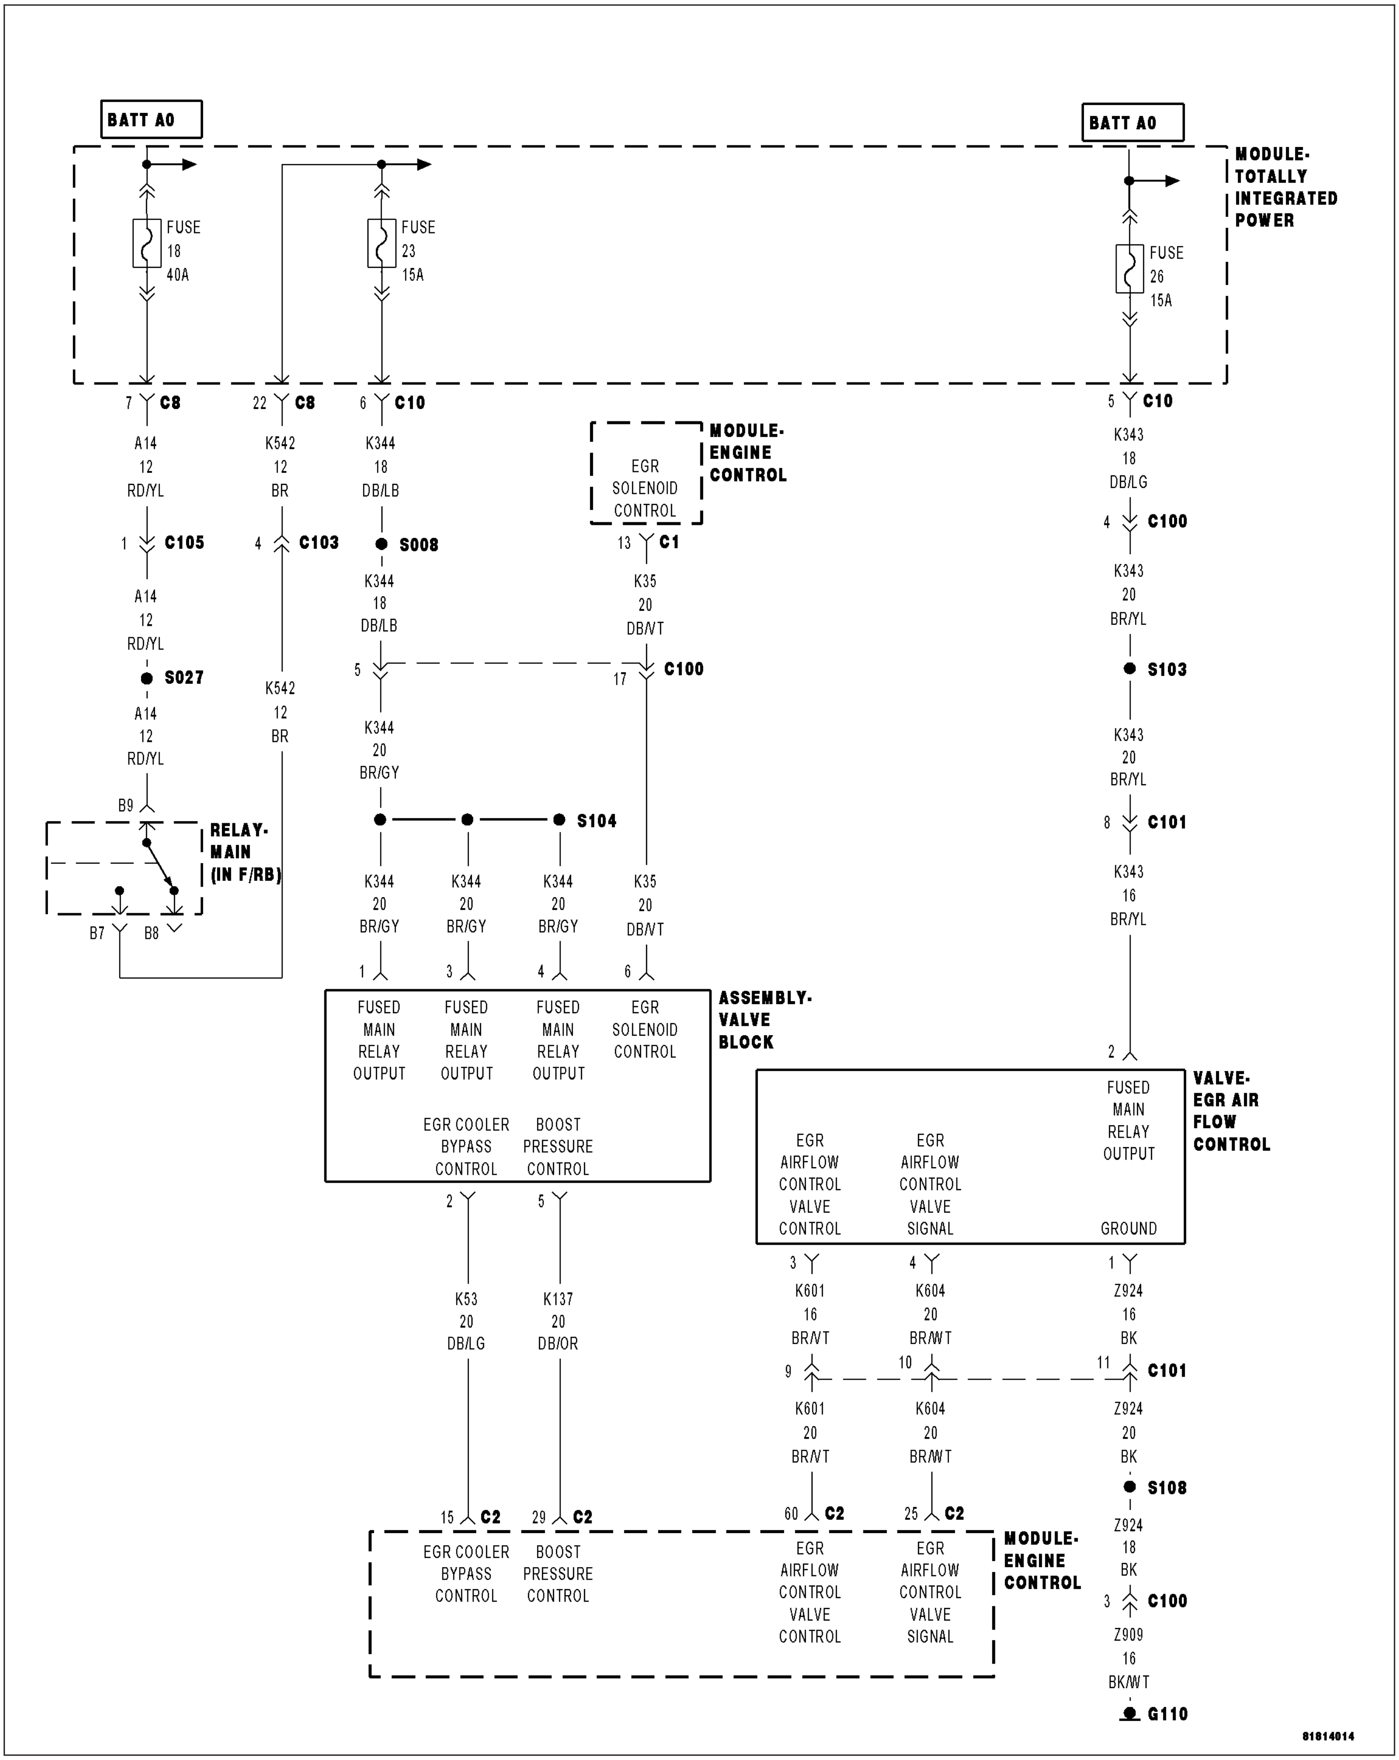
No >> Repair the (K53) EGR Cooler Bypass Control circuit for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. VALVE BLOCK ASSEMBLY

Install a substitute Valve Block Assembly in place of the vehicle's Valve Block Assembly.

NOTE: Ensure the ECM and Valve Block Assembly harness connectors are connected.

Turn the ignition on.



With the scan tool, check for this DTC to set again.

Did this DTC set again?

Yes >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Valve Block Assembly.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2426-EGR COOLING VALVE CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the ECM EGR Cooler Bypass command off.
- **Set Condition:**
  The ECM detects a short to ground on the EGR Cooler Bypass Control circuit.

Possible Causes
INTERMITTENT CONDITION
(K344) MAIN RELAY OUTPUT CIRCUITS OPEN
(K53) EGR COOLER BYPASS CONTROL CIRCUIT SHORTED TO GROUND
(K53) EGR COOLER BYPASS CONTROL CIRCUIT OPEN
VALVE BLOCK ASSEMBLY
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition cycles, turning the ignition off for at least 10 seconds between each ignition cycle.

Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

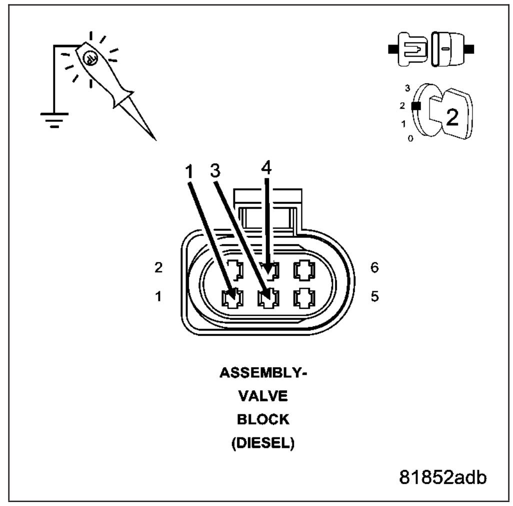
2. CHECKING FOR OTHER DTCS

NOTE: An open Main Relay power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes >> Go To 3



3. (K344) MAIN RELAY OUTPUT CIRCUITS OPEN

Turn the ignition off.

Disconnect the Valve Block Assembly harness connector.

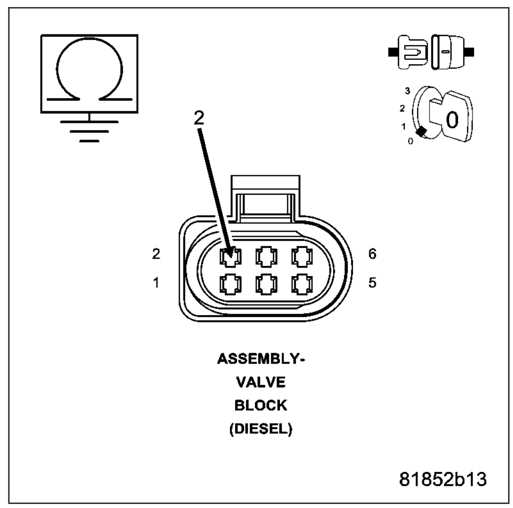
Turn the ignition on.

Using a 12-volt test light connected to ground, check the (K344) Main Relay Output circuits at the Valve Block Assembly harness connector.

Does the test light illuminate brightly?

Yes >> Go To 4

No >> Repair the (K344) Main Relay Output circuit for an open.



Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

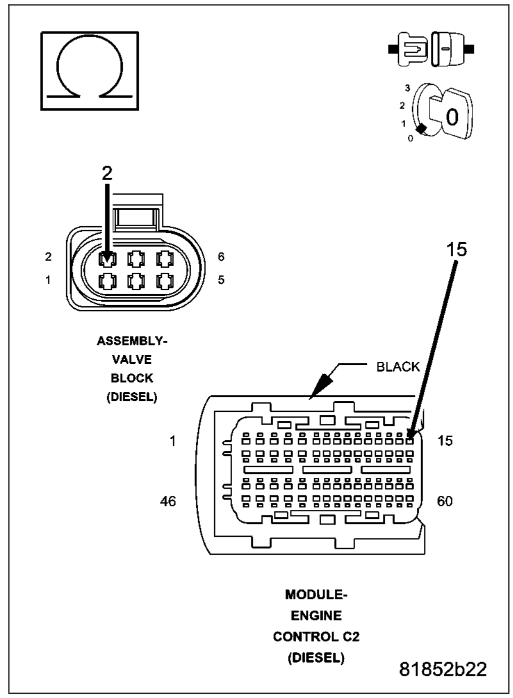
4. (K53) EGR COOLER BYPASS CONTROL CIRCUIT SHORTED TO GROUND

Turn the ignition off.

Disconnect the ECM harness connectors.

Measure the resistance between ground and (K53) EGR Cooler Bypass Control circuit at Valve Block Assembly harness connector.

Is the resistance above 1000 ohms?



Yes >> Go To 5

No >> Repair (K53) EGR Cooler Bypass Control circuit for a short to ground.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

5. (K53) EGR COOLER BYPASS CONTROL CIRCUIT OPEN

Measure the resistance of (K53) EGR Cooler Bypass Control circuit between Valve Block Assembly harness connector and ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 6

No >> Repair (K53) EGR Cooler Bypass Control circuit for an open.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. VALVE BLOCK ASSEMBLY

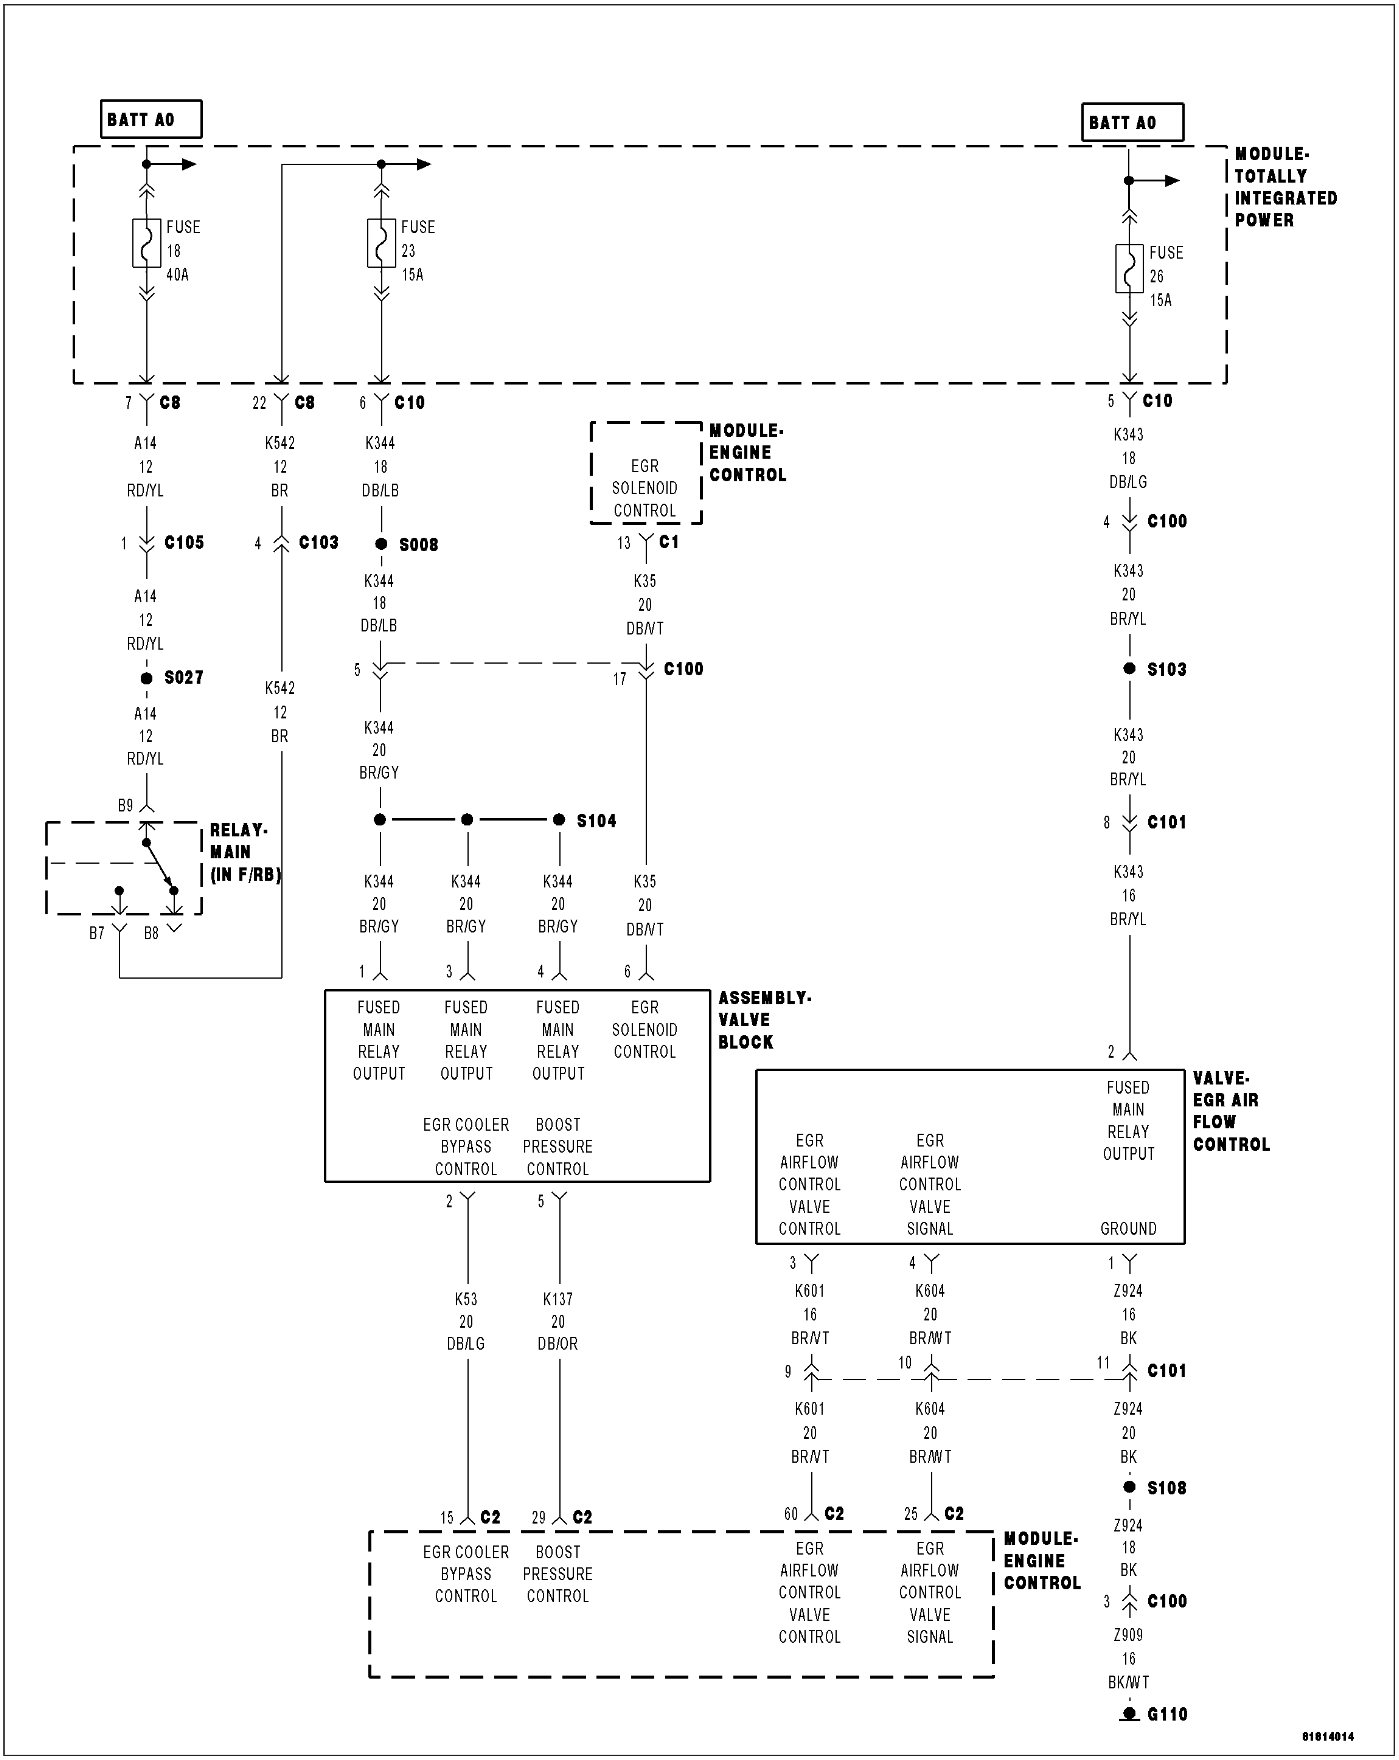
Install a substitute Valve Block Assembly in place of the vehicle's Valve Block Assembly.

NOTE: Ensure the ECM and Valve Block Assembly harness connectors are connected.

Turn the ignition on.

With the scan tool, check for this DTC to set again.

Did this DTC set again?



Yes >> Replace and program the Engine Control Module in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Valve Block Assembly.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2427-EGR EGR COOLING VALVE CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on and the ECM EGR Cooler Bypass command on.
- **Set Condition:**
  The ECM detects excessive current on the EGR Cooler Bypass Control circuit.

Possible Causes
INTERMITTENT CONDITION
(K53) EGR COOLER BYPASS CONTROL CIRCUIT SHORTED TO VOLTAGE
VALVE BLOCK ASSEMBLY
ENGINE CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC

NOTE: If the ECM detects and stores a DTC, the ECM also stores the engine/vehicle operating conditions under which the DTC was set. Some of these conditions are displayed on the scan tool at the same time the DTC is displayed.

NOTE: Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several ignition cycles, turning the ignition off for at least 10 seconds between each ignition cycle.

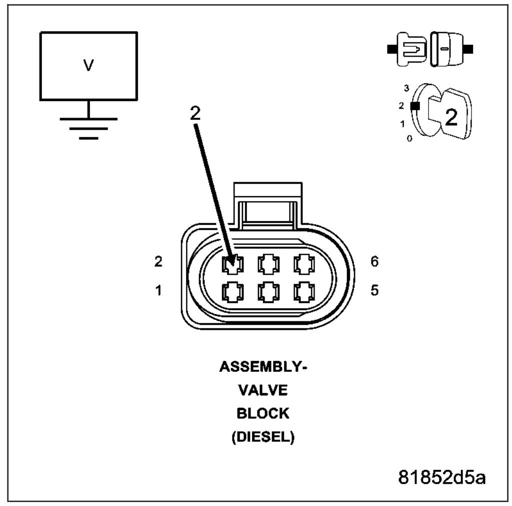
Monitor the scan tool for ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECKING FOR OTHER DTCS



NOTE: An open Main Relay power supply to the ECM will cause multiple DTC's including this DTC to set.

NOTE: Check the ECM for other DTC's. If other DTC's are set with this DTC refer to the symptom list and perform the CHECKING THE ECM POWER AND GROUND CIRCUITS test before continuing.

If the ECM power and ground circuits are functioning properly continue with this test.

Yes >> Go To 3

3. (K53) EGR COOLING VALVE CONTROL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Valve Block Assembly harness connector.

Disconnect the ECM harness connector.

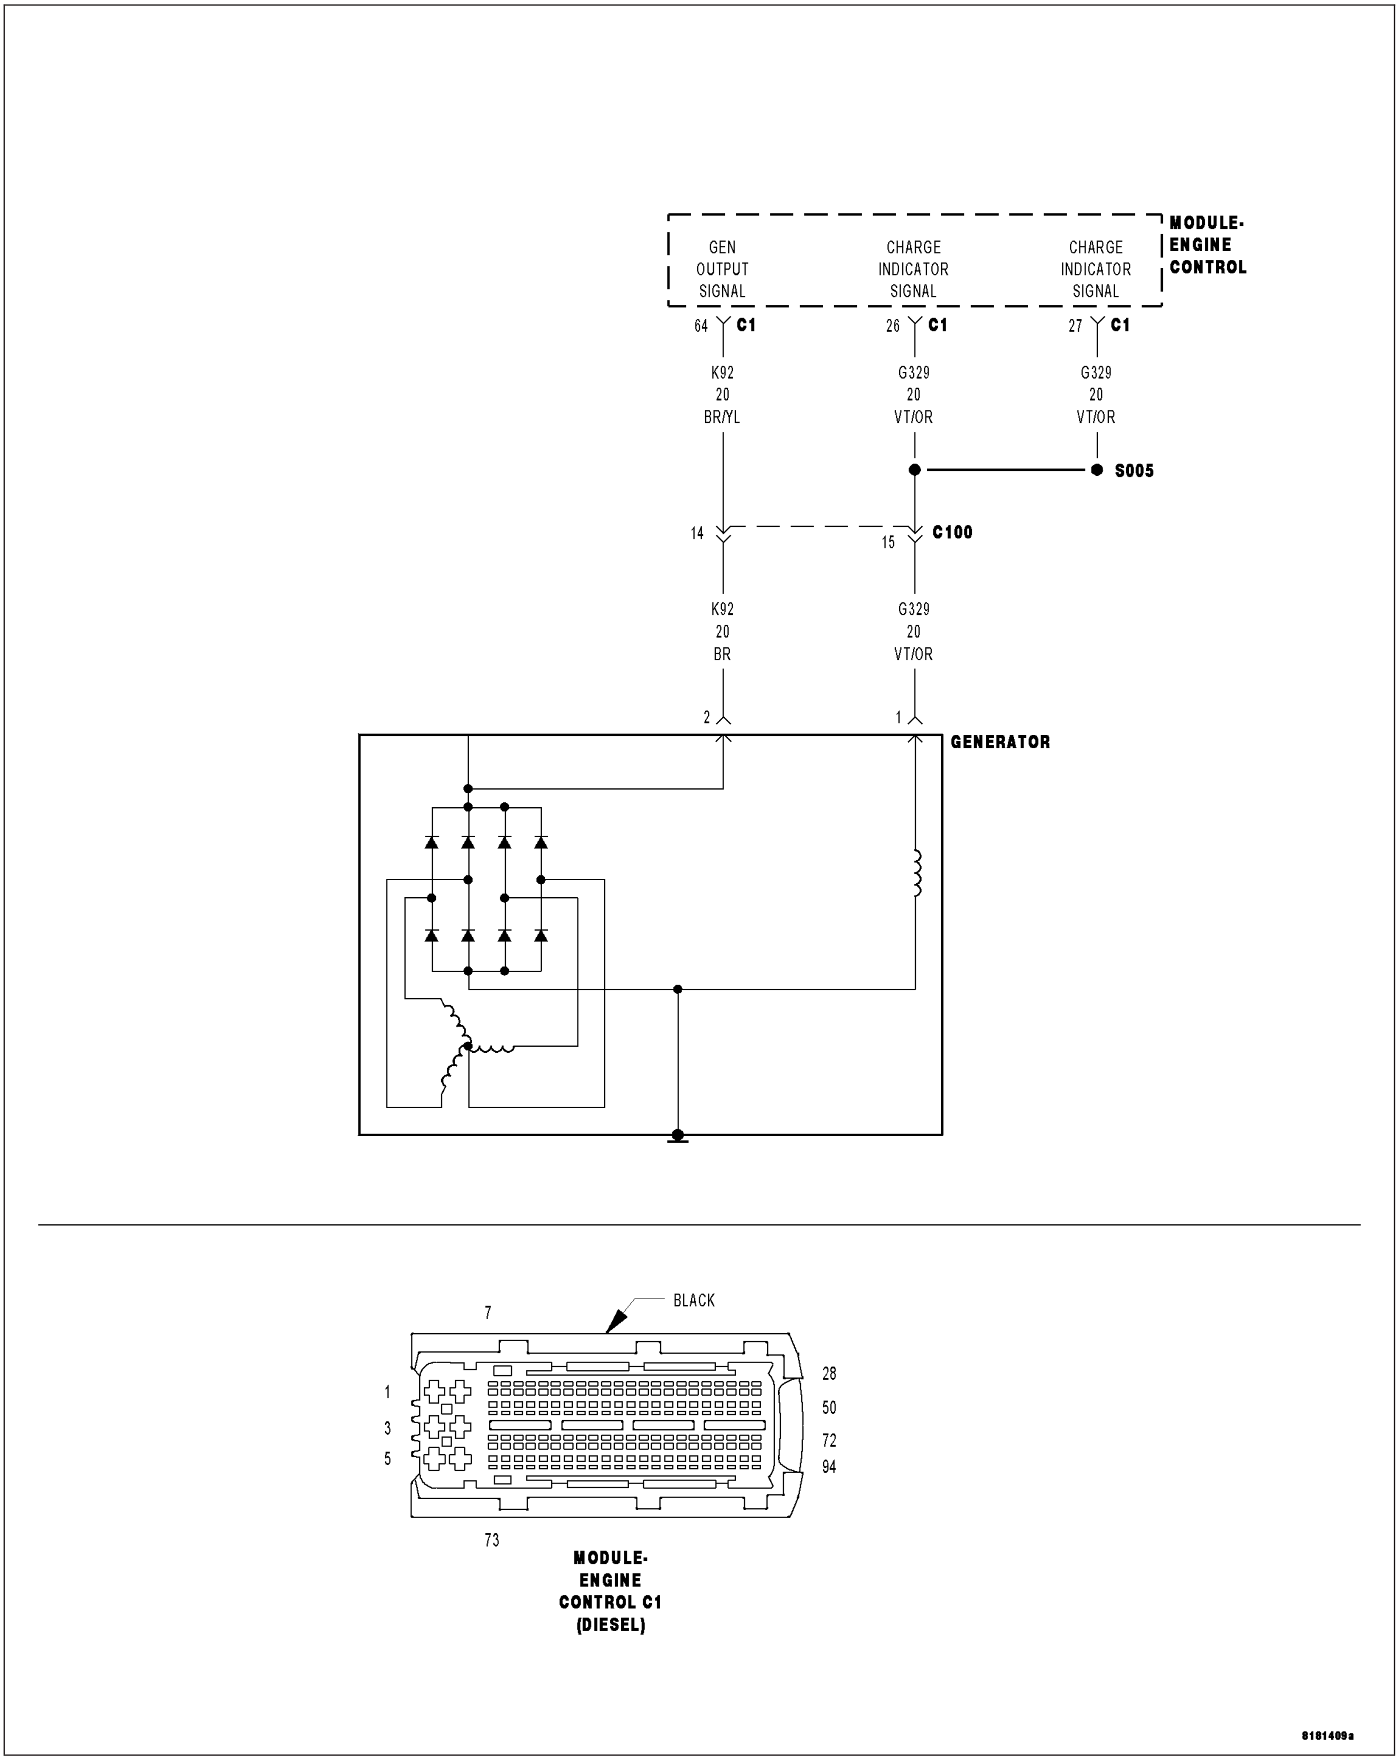
Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (K53) EGR Cooler Bypass Control circuit at the Valve Block Assembly harness connector.

Is the voltage above 1.0 volt?



Yes >> Repair the (K53) EGR Cooler Bypass Control circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the Valve Block Assembly in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2500-GENERATOR LAMP/L-TERMINAL CONTROL CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects an open or short to ground on the Charge Indicator Signal circuit.

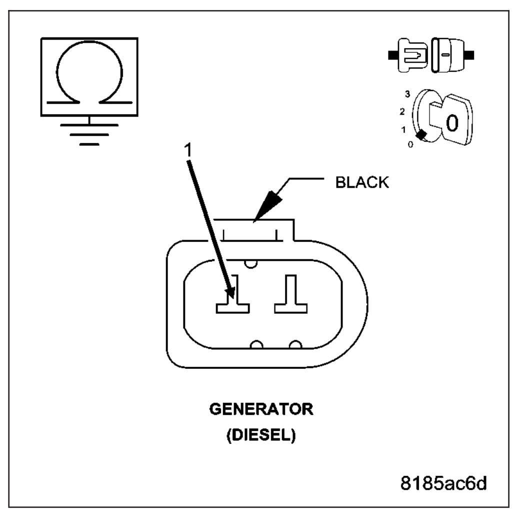
Possible Causes
INTERMITTENT DTC
(G329) CHARGE INDICATOR SIGNAL CIRCUIT SHORTED TO GROUND
(G329) CHARGE INDICATOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE
GENERATOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, Clear DTCs in the Engine Control Module (ECM).
Test drive the vehicle
With the scan tool, select View DTCs.



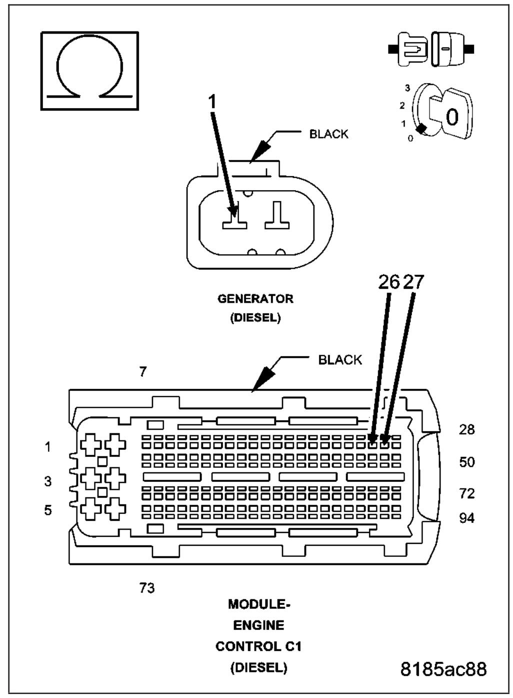
Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (G329) CHARGE INDICATOR SIGNAL CIRCUIT SHORTED TO GROUND

Turn the ignition off.
Disconnect the Generator harness connector.
Disconnect the Engine Control Module (ECM) harness connector.
Measure the resistance between ground and the (G329) Charge Indicator Signal circuit in the Generator harness connector.



Is the resistance above 1000 ohms?

Yes >> Go to 3

No >> Repair the (G329) Charge Indicator Signal circuit for a short to ground.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. (G329) CHARGE INDICATOR SIGNAL CIRCUIT OPEN OR HIGH RESISTANCE

Measure the resistance of the (G329) Charge Indicator Signal circuit between the Generator harness connector and the Engine Control Module (ECM) harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go to 4

No >> Repair the (G329) Charge Indicator Signal circuit for an open circuit or high resistance.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. GENERATOR

Turn the ignition off.

Replace the Generator.

With the scan tool, Clear DTCs.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 5

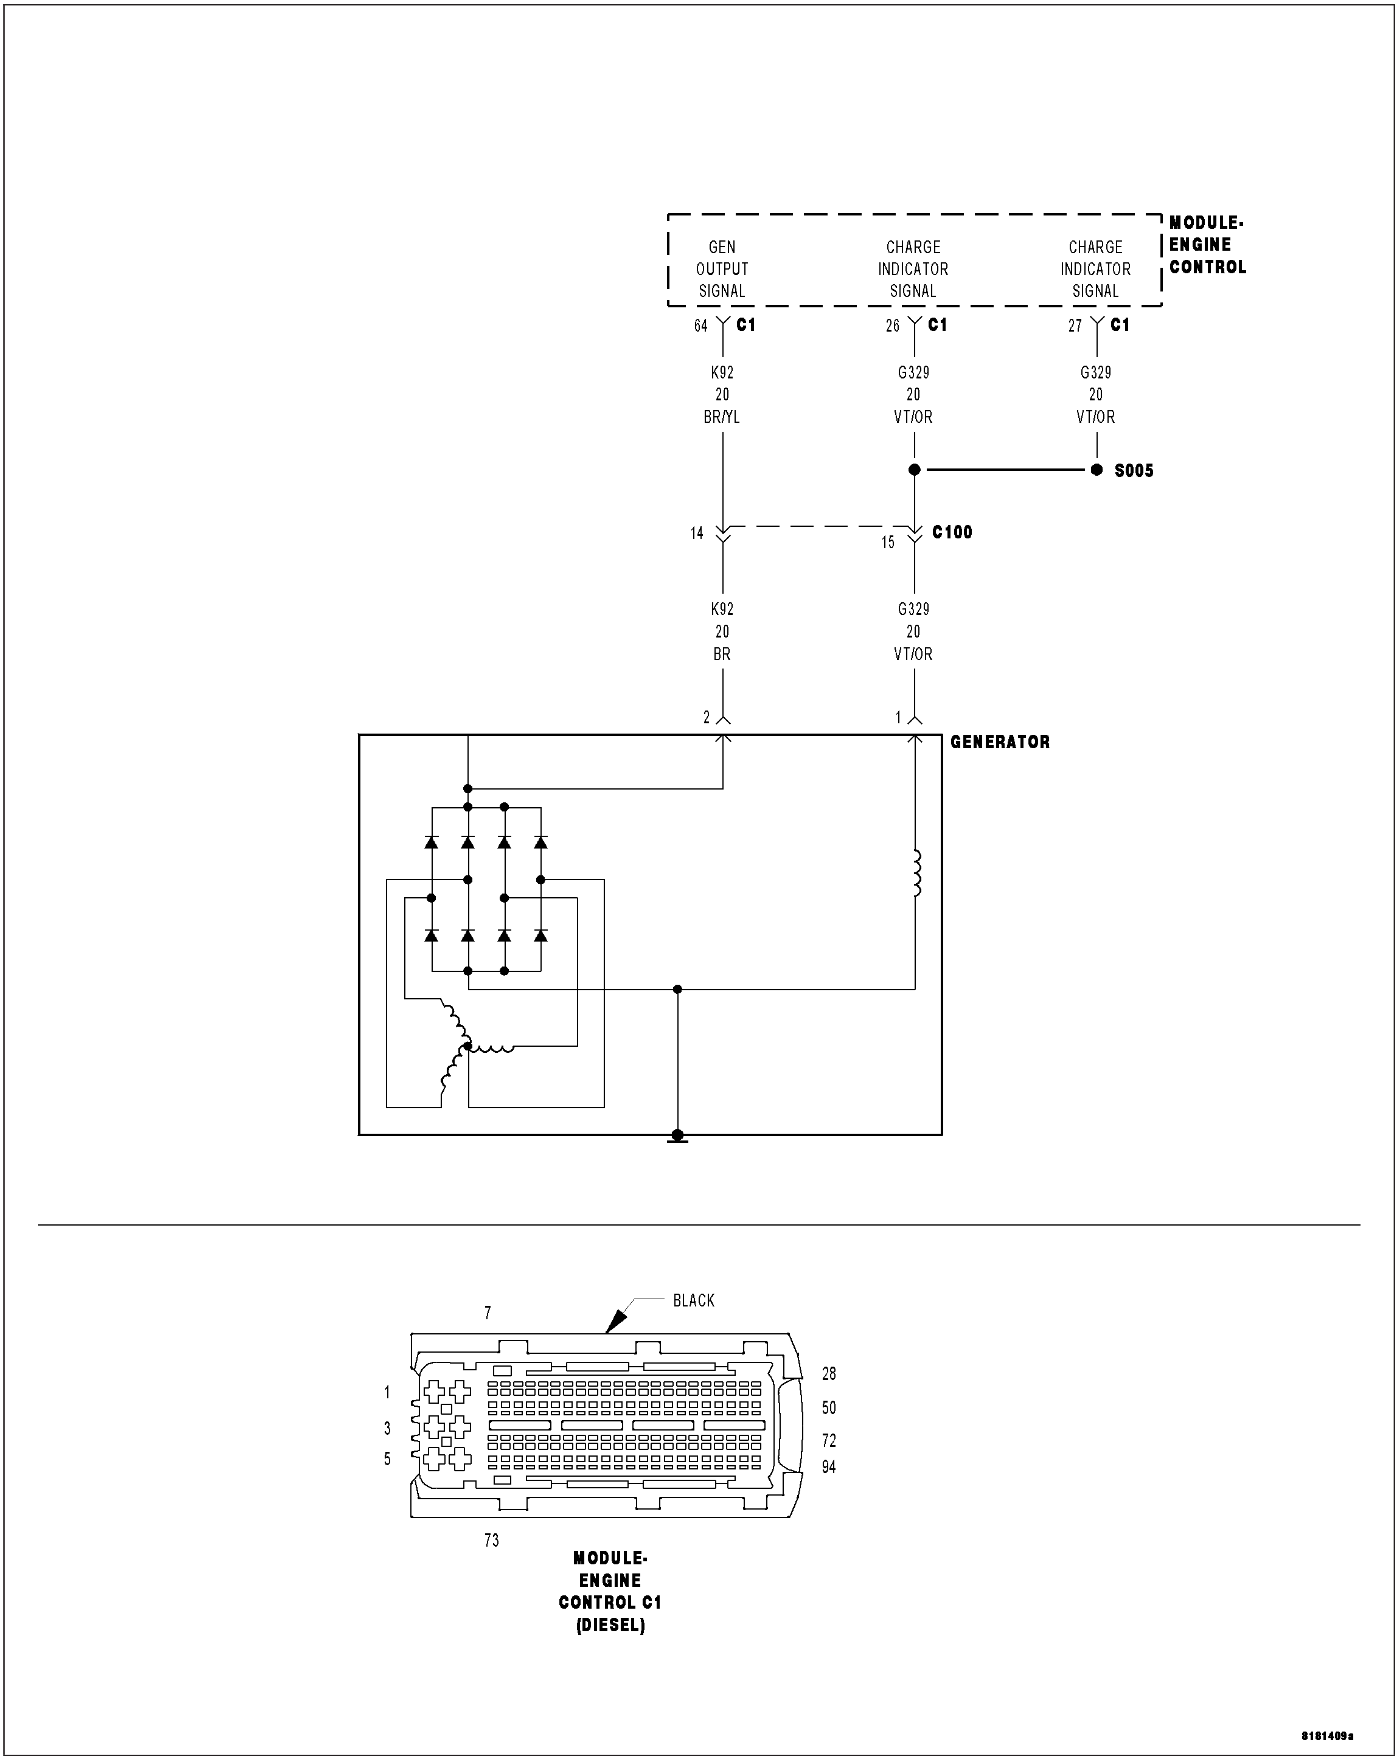
No >> Test complete
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2501-GENERATOR LAMP/L-TERMINAL CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ECM detects a short to voltage on the Charge Indicator Signal circuit.

Possible Causes
INTERMITTENT DTC
(G329) CHARGE INDICATOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
GENERATOR
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Test drive the vehicle

With the scan tool, select View DTCs.

Is the status Active for this DTC?

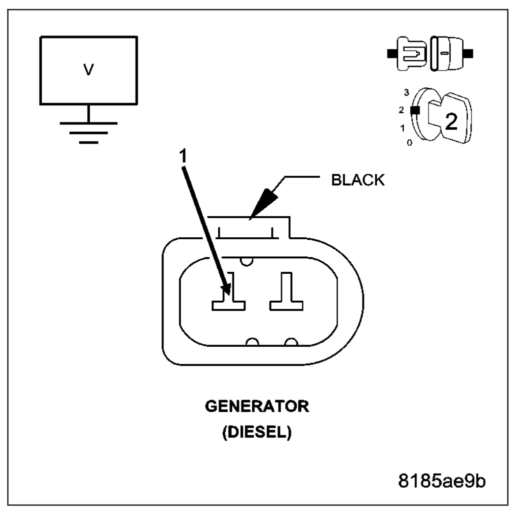
Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. (G329) CHARGE INDICATOR SIGNAL CIRCUIT SHORTED TO VOLTAGE

Turn the ignition off.

Disconnect the Generator harness connector.



Disconnect the Engine Control Module (ECM) harness connector.

Remove the Main Relay.

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage of the (G329) Charge Indicator Signal circuit at the Generator harness connector.

Is the voltage below 1.0 volt?

Yes >> Go to 3

No >> Repair the (G329) Charge Indicator Signal circuit for a short to voltage.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. GENERATOR

Turn the ignition off.

Replace the Generator.

With the scan tool, Clear DTCs.

Test drive the vehicle.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go to 4

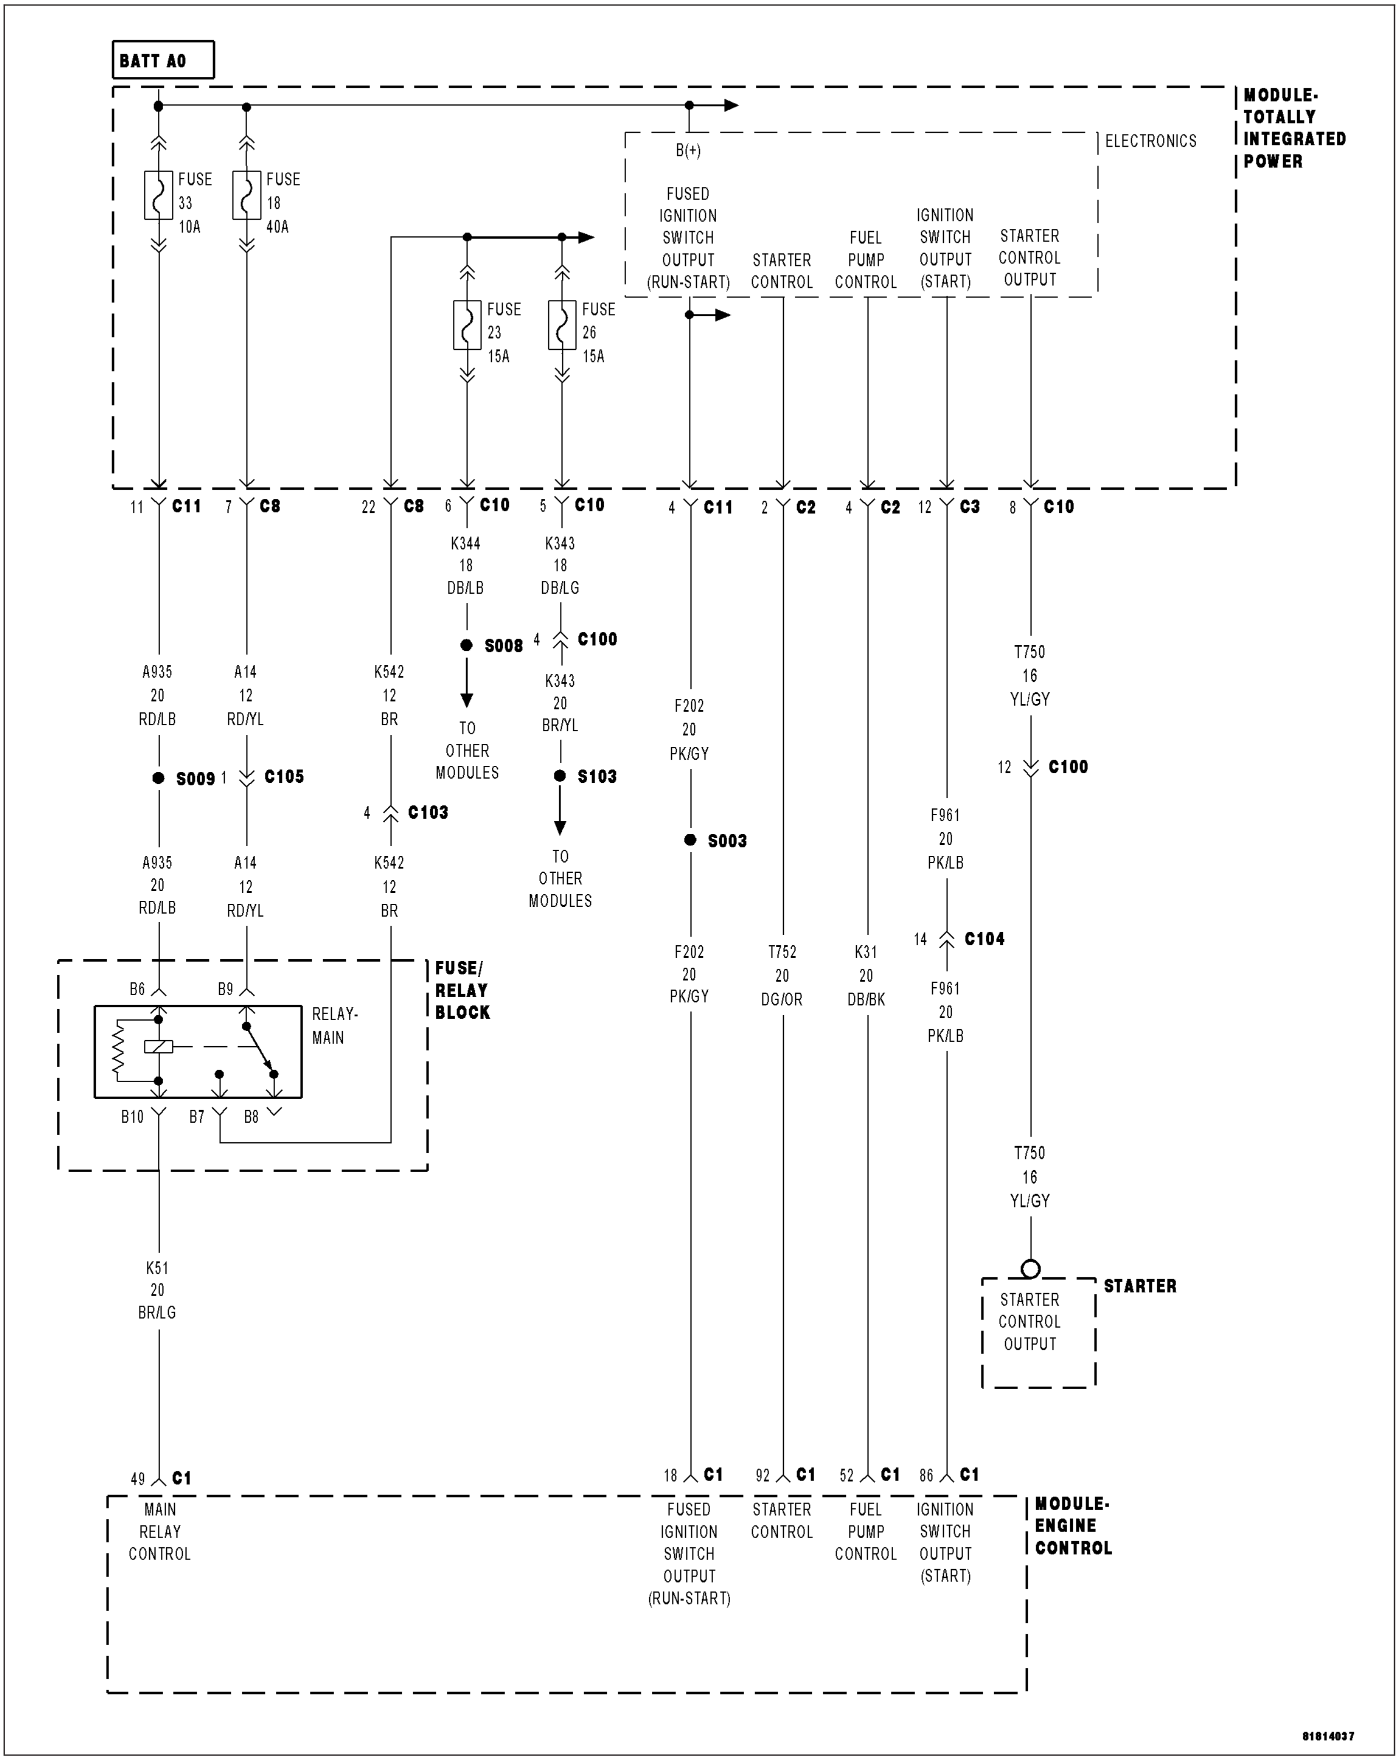
No >> Test complete
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. ENGINE CONTROL MODULE (ECM)

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the Generator and the Engine Control Module (ECM).

Look for any chafed, pierced, pinched, or partially broken wires.

Look for broken, bent, pushed out or corroded terminals.



Refer to any Technical Service Bulletins that may apply.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

P2533-IGNITION SWITCH RUN/START POSITION CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
CHECK THE ECM POWER AND GROUNDS
ENGINE CONTROL MODULE

Diagnostic Test

1. VERIFY CURRENT DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

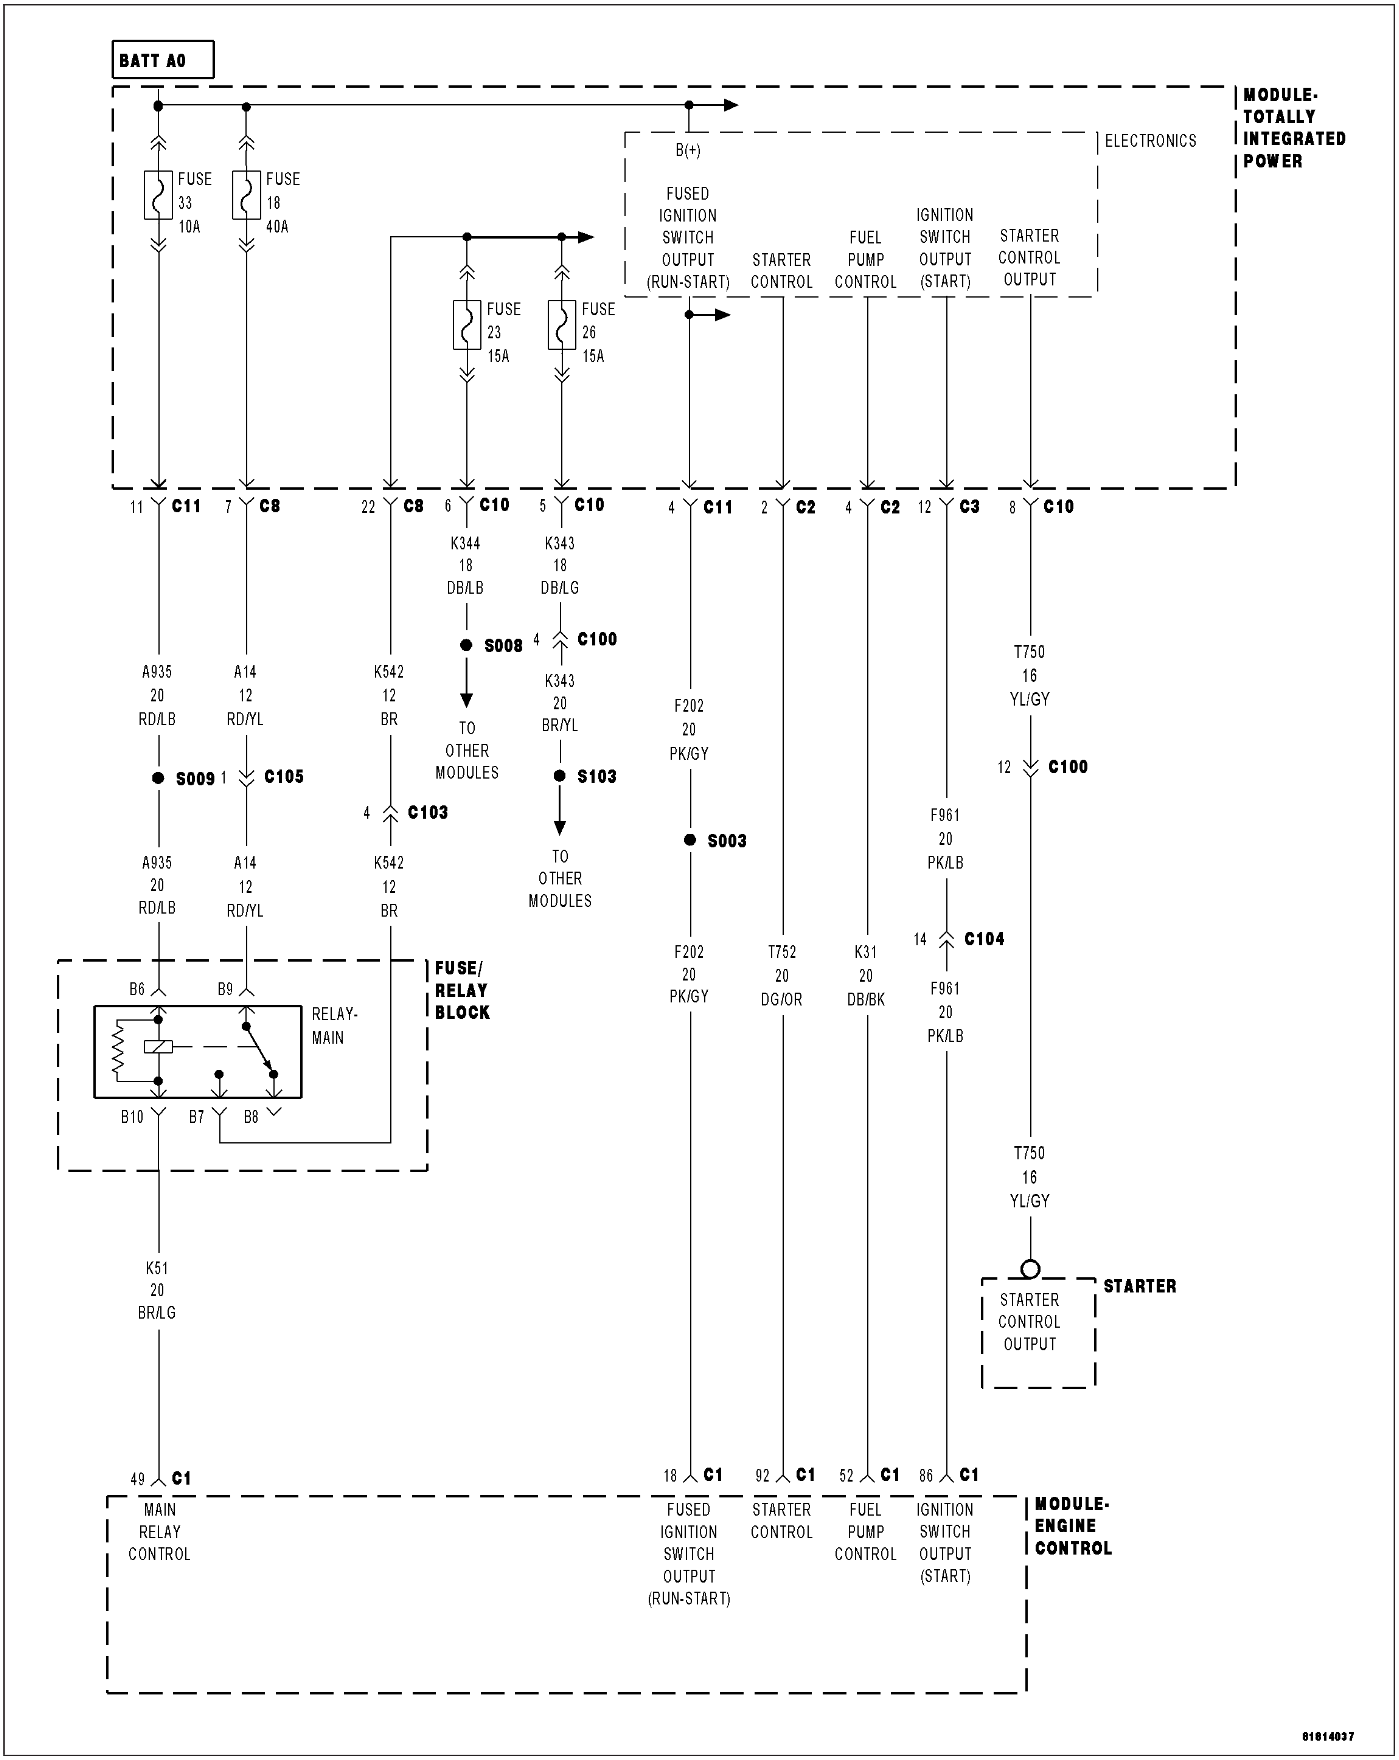
With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK POWER AND GROUNDS



Refer to symptom Checking the ECM Power and Grounds.

Are the ECM Power and Ground circuits o.k.?

Yes >> Replace the ECM in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2534-IGNITION SWITCH RUN/START POSITION CIRCUIT LOW

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
CHECK THE ECM POWER AND GROUNDS
ENGINE CONTROL MODULE

Diagnostic Test

1. VERIFY CURRENT DTC

Turn the ignition on.

With the scan tool, erase ECM DTCs.

Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.

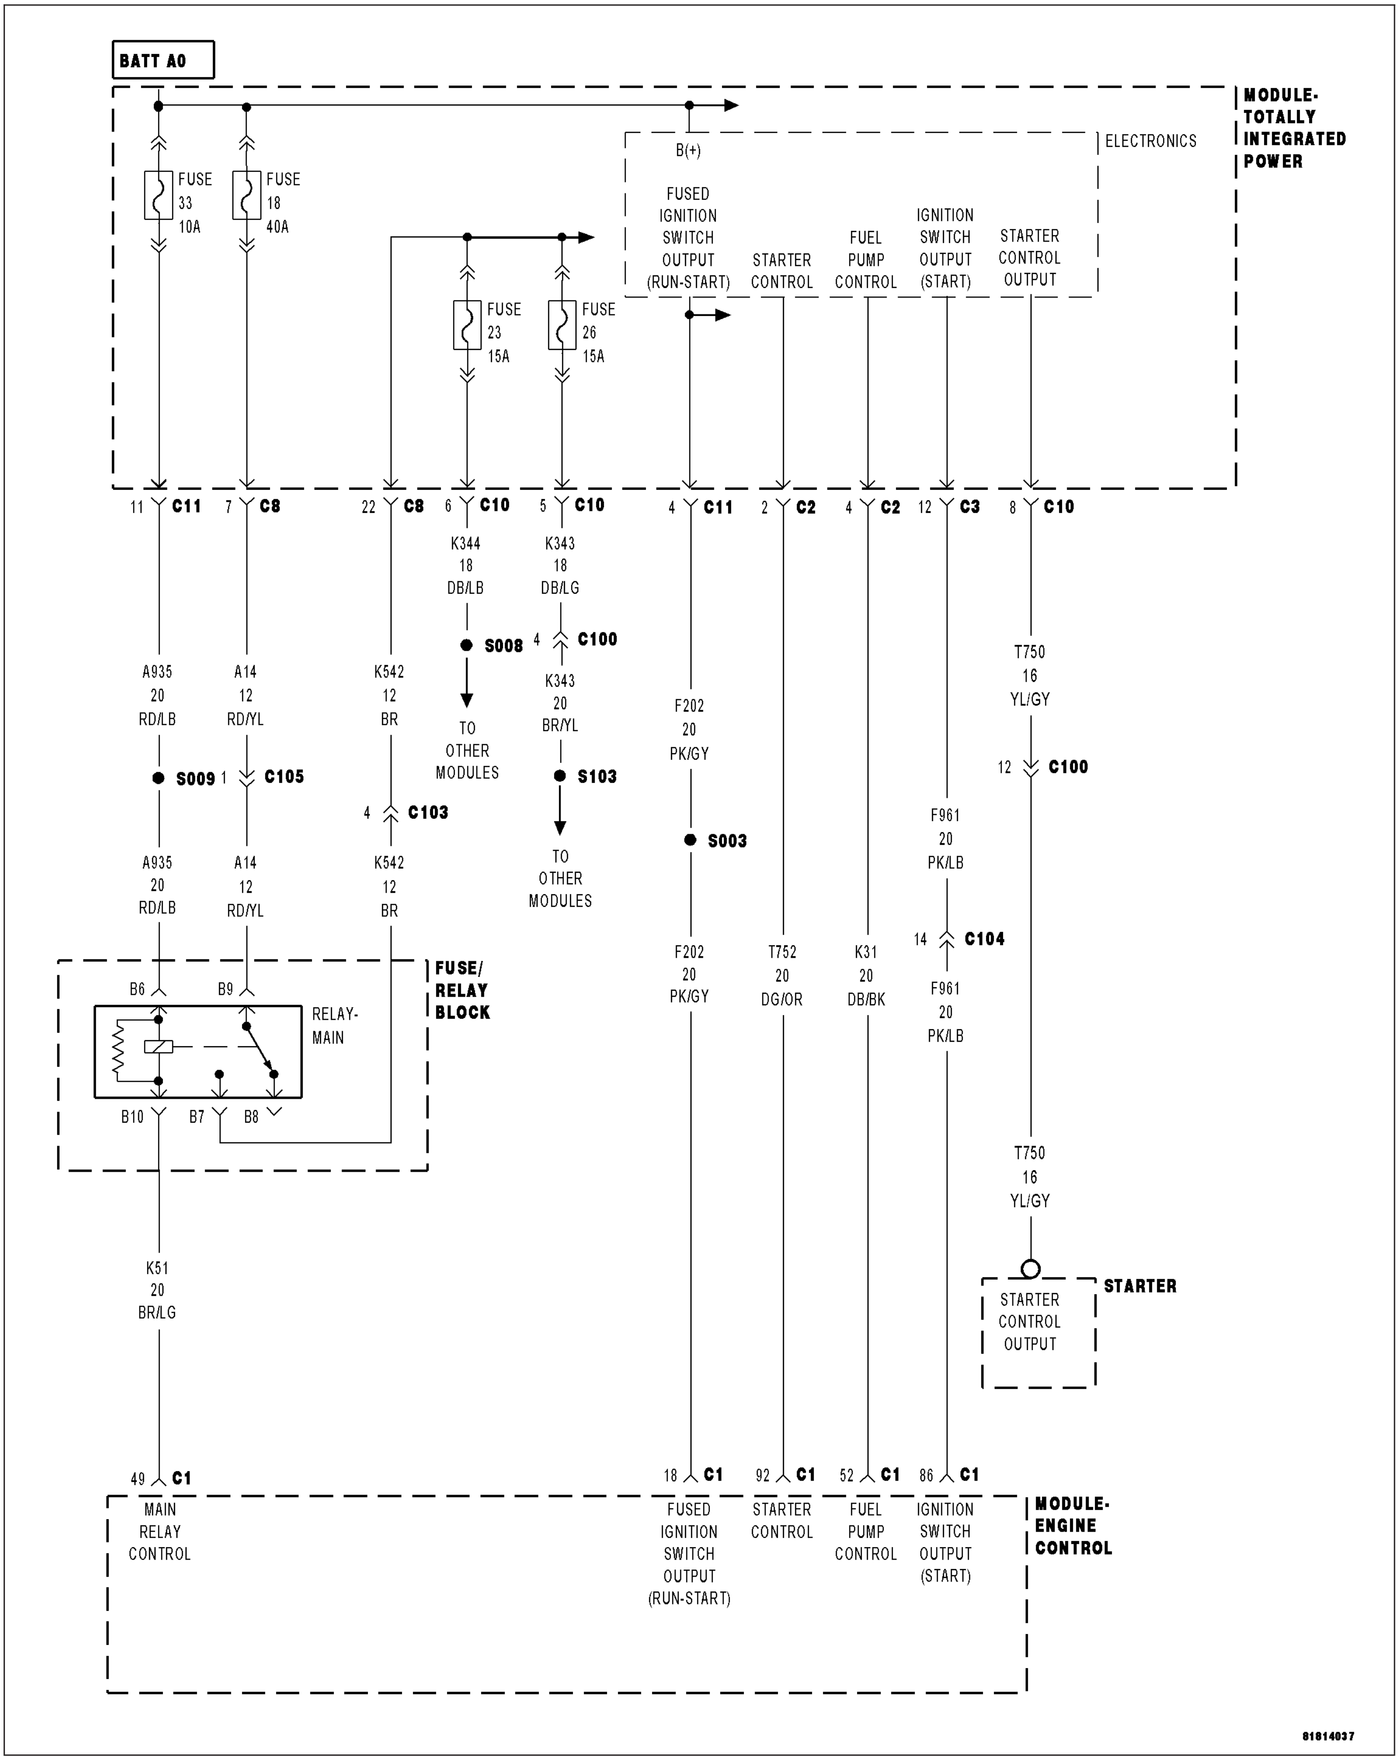
With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK POWER AND GROUNDS



Refer to symptom Checking the ECM Power and Grounds.

Are the ECM Power and Ground circuits o.k.?

Yes >> Replace the ECM in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

P2535-IGNITION SWITCH RUN/START POSITION CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
CHECK THE ECM POWER AND GROUNDS
ENGINE CONTROL MODULE

Diagnostic Test

1. VERIFY CURRENT DTC

Turn the ignition on.
With the scan tool, erase ECM DTCs.
Perform several engine run cycles, turning the ignition off for at least 20 seconds between each engine run cycle.
With the scan tool, read the ECM DTCs.

Did this DTC set again?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. CHECK POWER AND GROUNDS

Refer to symptom Checking the ECM Power and Grounds.

Are the ECM Power and Ground circuits o.k.?

Yes >> Replace the ECM in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

B10B3 - CABIN HEATER 1 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  A Cabin Heater (PTC) #1 error message has been received over the CAN bus from the TIPM.

Possible Causes
INTERMITTENT DTC
DTC SET IN TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC will set if the Engine Control Module (ECM) receives a message from the TIPM indicating that a PTC Heater Relay DTC is present.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the PTC Heater Relay 1.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

With the scan tool, select View DTCs in the Totally Integrated Power Module.

Is there a stored or active PTC Heater Relay DTC present in the TIPM?

Yes >> Refer to 24 - HVAC — ELECTRICAL DIAGNOSTICS for diagnostic procedures and for further possible causes.

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

B10B7 - CABIN HEATER 2 CONTROL CIRCUIT

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  A Cabin Heater (PTC) #2 error message has been received over the CAN bus from the Totally Integrated Power Module.

Possible Causes
INTERMITTENT DTC
DTC SET IN TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

NOTE: This DTC will set if the Engine Control Module (ECM) receives a message from the Totally Integrated Power Module indicating that a PTC Heater Relay DTC is present.

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

With the scan tool, actuate the PTC Heater Relay 2.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ENGINE CONTROL MODULE (ECM)

With the scan tool, select View DTCs in the Totally Integrated Power Module.

Is there a stored or active PTC Heater Relay DTC present in the Totally Integrated Power Module?

Yes >> Refer to 24 - HVAC — ELECTRICAL DIAGNOSTICS for diagnostic procedures and for further possible causes.

No >> Replace the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

B1C32- AIRBAG DEPLOYMENT DETECTED

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The ACM sends a CAN Bus message to the ECM indicating that the airbags have been deployed.

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. DTC EXPLANATION

NOTE: This DTC indicates that the vehicle has been in an accident and the airbag module has deployed the airbags.

View Repair.

Yes >> Test Complete.

B2189-IGNITION START CONTROL CIRCUIT HIGH

For a complete wiring diagram **Refer to Section 8W**.

- **When Monitored:**
  With the ignition on.
- **Set Condition:**
  The TIPM detects a short to voltage condition in the Fused Ignition Switch Output (Start) circuit.

Possible Causes
FUSED IGNITION SWITCH OUTPUT (START) CIRCUIT SHORT TO VOLTAGE
ENGINE CONTROL MODULE
TIPM

Diagnostic Test

1. CHECK FOR ACTIVE DTC

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 10 seconds.

With the scan tool, read the active DTC's.

Does the scan tool display this DTC as active?

Yes >> Go To 2

No >> If the DTC is stored, check for an intermittent condition. Using the wiring diagram/schematic as a guide, visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. ENGINE CONTROL MODULE

Turn the ignition off.

Disconnect the Engine Control Module harness connectors.

Turn the ignition on, wait 10 seconds.

With the scan tool, read TIPM DTCs.

Did DTC B2188-IGNITION START CONTROL CIRCUIT HIGH change from active to stored?

Yes >> Replace the Engine Control Module in accordance with the service information.

No >> Check the Fused Ignition Switch Output (START) circuit for a short to voltage. If this circuit is not shorted to voltage, replace the TIPM.

U0002–CAN C BUS OFF PERFORMANCE

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.
With the scan tool, Clear DTCs in the Engine Control Module (ECM).
Monitor the scan tool for at least two minutes.
Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.
Start the engine.
Allow the engine to reach normal operating temperature.
With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the system is active.
- **Set Condition:**
  The ECM doesn't receive a Bus Message from the Anti-lock Brake Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (TIPM)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the system is active.
- **Set Condition:**
  The ECM doesn't receive a Bus Message from the Totally Integrated Power Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. DTC IS ACTIVE

Ignition on, engine not running.

With the scan tool, Clear DTCs in the Engine Control Module (ECM).

Monitor the scan tool for at least two minutes.

Cycle the ignition key off and on several times, leaving the ignition on for at least 10 seconds at a time.

Start the engine.

Allow the engine to reach normal operating temperature.

With the scan tool, select View DTCs.

Is the status Active for this DTC?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for diagnostic procedures and for further possible causes.

No >> Refer to the *CHECKING FOR AN INTERMITTENT DTC Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0415-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the system is active.
- **Set Condition:**
  An error message has been received over the bus from the Anti-lock Brake Module.

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
ANTI-LOCK BRAKE MODULE
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.

With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. COMMUNICATION DTCS PRESENT IN THE ANTI-LOCK BRAKE MODULE

With a scan tool check for DTCs in the Anti-lock Brake Module.

Are there any CAN bus DTCs active in the Anti-lock Brake Module at this time?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for additional vehicle communication diagnostic procedures.
Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace and program the Engine Control Module (ECM) in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

U0431-IMPLAUSIBLE DATA RECEIVED FROM TIPM

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**
  Continuously while the system is active.
- **Set Condition:**
  An error message has been received over the bus from the Totally Integrated Power Module (TIPM).

Possible Causes
INTERMITTENT DTC
CAN BUS OPEN OR SHORTED CONDITION
TOTALLY INTEGRATED POWER MODULE (TIPM)
ENGINE CONTROL MODULE (ECM)

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Diagnostic Test

1. ACTIVE DTC

NOTE: Diagnose all CAN B and C communication DTCs before continuing.

Ignition on, engine not running.

With a scan tool, view DTCs.

Is the status Active for this DTC?

Yes >> Go To 2

No >> Refer to the INTERMITTENT CONDITION Diagnostic Procedure. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. COMMUNICATION DTCS PRESENT IN THE TOTALLY INTEGRATED POWER MODULE (TIPM)

With a scan tool check for DTCs in the Transmission Control Module (TIPM).

Are there any CAN bus DTCs active in the Totally Integrated Power Module (TIPM) at this time?

Yes >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for additional vehicle communication diagnostic procedures.

Perform BODY VERIFICATION TEST – VER 1. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - STANDARD PROCEDURE)

No >> Replace and program the Engine Control Module (ECM) in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*ENGINE CRANKS BUT WILL NOT START

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
INTAKE SYSTEM RESTRICTION
ECM CODES PRESENT
ECT SENSOR
ENGINE CONTROL MODULE
ENGINE DRIVE CHAIN/BELT
FUEL SUPPLY CONTAMINATION
SUPPLY SIDE FUEL SYSTEM PRESSURE
FUEL SYSTEM RESTRICTION
GLOW PLUGS
SKREEM CODES PRESENT

Diagnostic Test

1. ECM CODES PRESENT

NOTE: The ECM must have proper power and ground connections for the following tests to be valid. Refer to Checking the ECM Power and Grounds in the symptom list.

Turn the ignition on.

With the scan tool, read the ECM DTCs.

Does the scan tool display any ECM DTCs?

Yes >> Refer to symptom list for problems related to ECM DTC.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2

2. SKREEM CODES PRESENT

With the scan tool, read the SKREEM DTCs.

Does the scan tool display any SKREEM DTCs?

Yes >> Refer to symptom list for problems related to SKREEM DTC.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 3

3. CHECK FOR INTAKE SYSTEM RESTRICTIONS

Turn the ignition off.

Ensure vehicle has adequate fuel supply in fuel tank.

Inspect all air intake and turbocharger related hoses/tubes and connections.

Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 4

4. ECT SENSOR

Using a temperature probe, check the vehicle temperature near the ECT Sensor.
Turn the ignition on.
With the scan tool in Sensors, read the ECT Sensor temperature.
Compare the temperature probe reading with the scan tool reading.

Are the two readings within 10°C of each other?

Yes >> Go To 5

No >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. GLOW PLUGS

NOTE: Prior to performing this test, be sure to check the Glow Plug Relay operation. Refer to CHECKING GLOW PLUG OPERATION for the related symptom(s).
Refer to the Service Information and check the Glow Plugs for proper operation.

Are the Glow Plugs operating properly?

Yes >> Go To 6

No >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. FUEL SYSTEM RESTRICTION

Inspect the fuel system lines for restrictions, leaks or other problems.

NOTE: Refer to the Service Information to ensure that the fuel system is properly primed. An unprimed system or excessive air in the supply system will cause a no-start condition.

Is there any evidence of problems?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 7

7. FUEL CONTAMINATION

Inspect the fuel supply for contamination.

Is the fuel contaminated?

Yes >> Refer to the Service Information to remove and replace fuel throughout the fuel system.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 8

8. SUPPLY SIDE FUEL SYSTEM PRESSURE

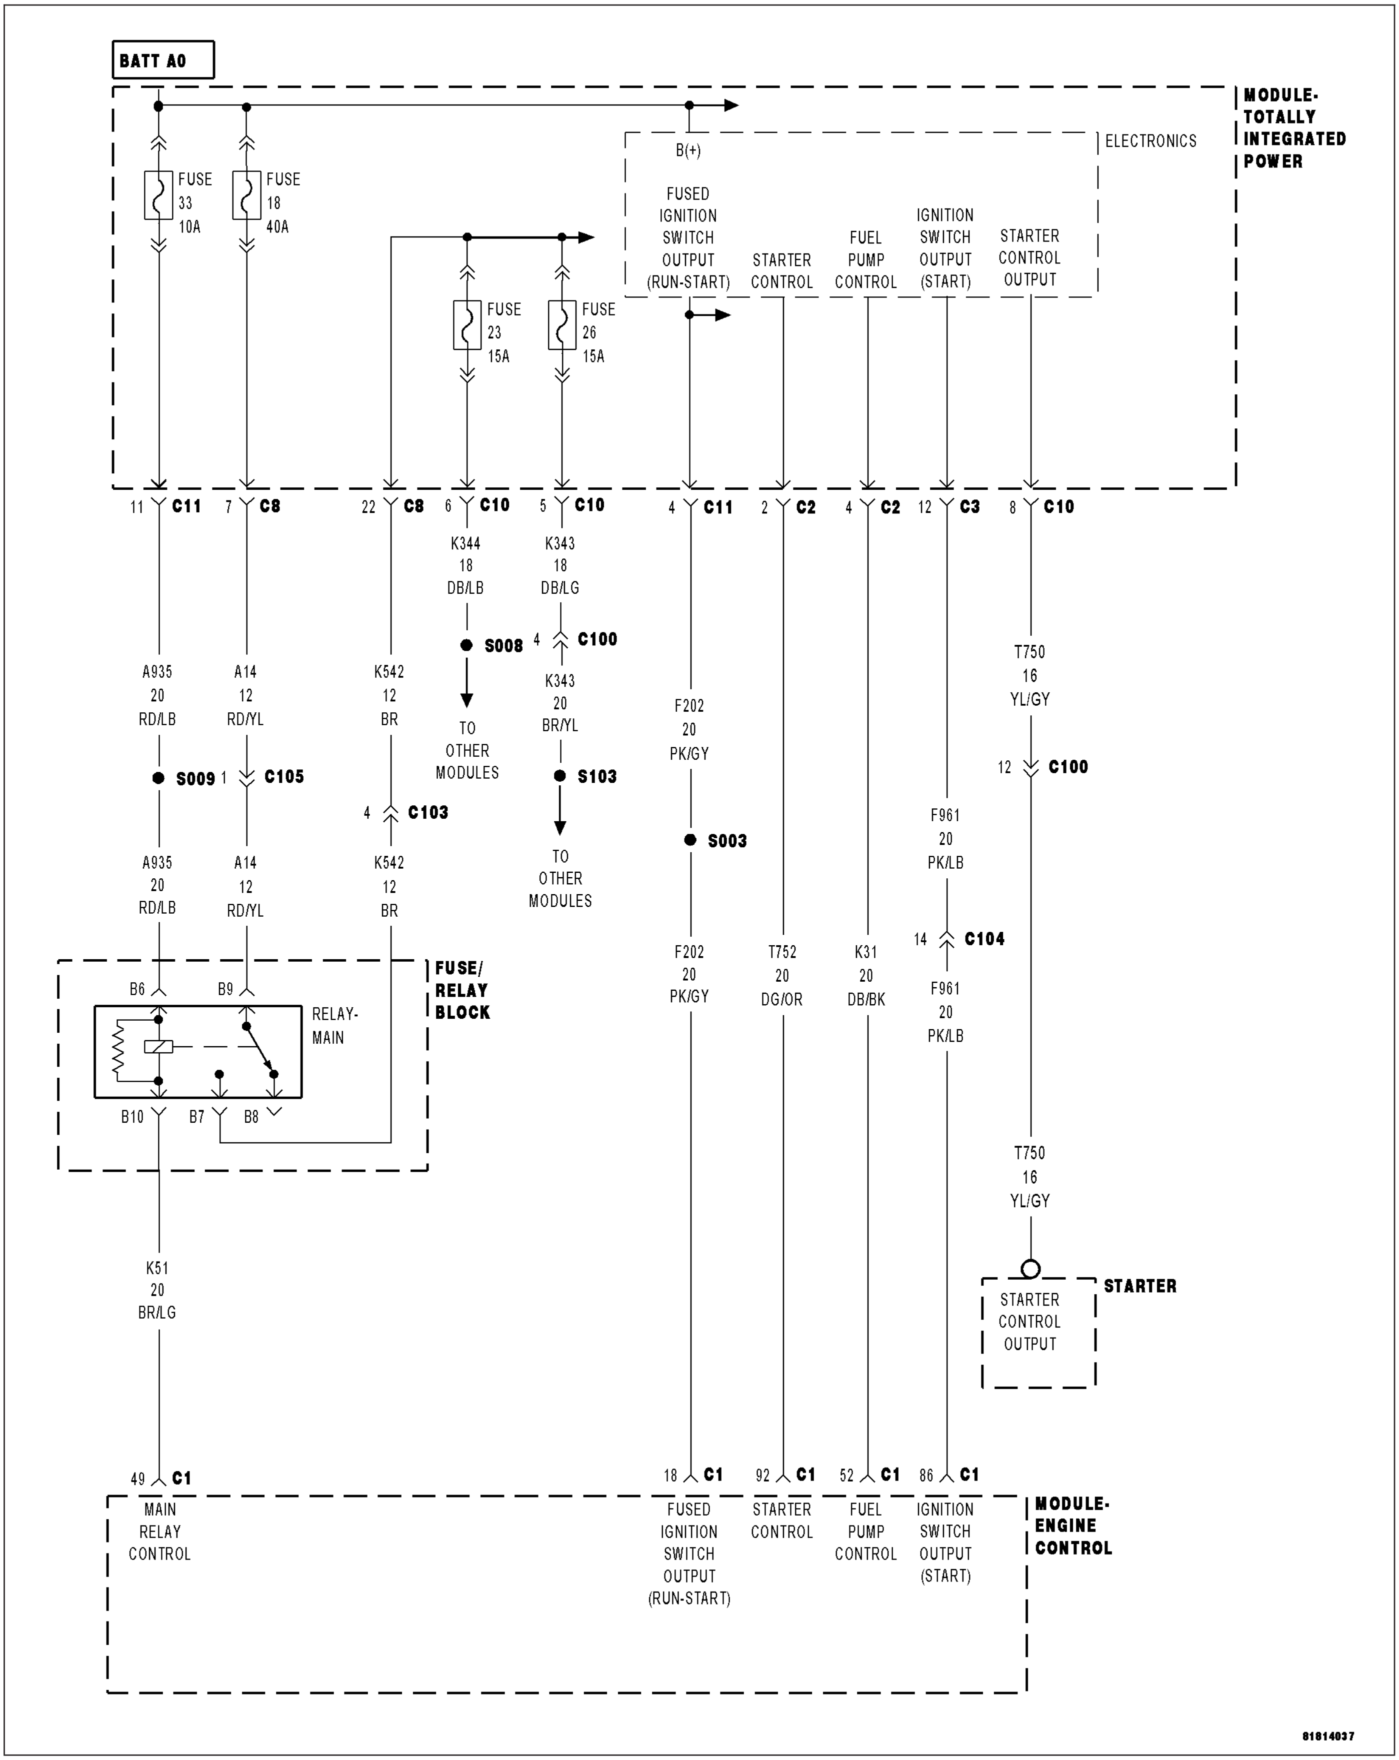
Refer to the Service Information and perform the Supply Side Fuel System Pressure Test.

Is the fuel pressure within specification?

Yes >> Go To 9

No >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. ENGINE DRIVE CHAINS



Refer to the Service Information to ensure the Engine Drive Chains are installed correctly and the camshaft and crankshaft gears are timed correctly.

Were any problems found?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Replace and program the Engine Control Module in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*ENGINE WILL NOT CRANK

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
BATTERY CABLES
LOW BATTERY/POOR BATTERY CONNECTION
CLUTCH INTERLOCK SWITCH INPUT
MECHANICAL PROBLEM
SKIM CODES PRESENT
STARTER MOTOR
TOTALLY INTEGRATED POWER MODULE
(T750) STARTER CONTROL OUTPUT CIRCUIT SHORT TO GROUND
(T750) STARTER CONTROL OUTPUT CIRCUIT OPEN

Diagnostic Test

1. BATTERY CABLES

NOTE: Ensure there are no Active DTC's in the ECM or TIPM. If the ECM or TIPM have Active DTC's, repair these DTC's before continuing with No Crank diagnosis.
Turn the ignition off.

NOTE: The battery must be fully charged before diagnosing a no crank condition.
Inspect the battery cables for corrosion, looseness or other problems.

Is there evidence of problems?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 2

2. ECM POWER AND GROUND CIRCUITS

Refer to CHECKING THE ECM POWER AND GROUNDS to check for proper ignition, battery and ground supply to the ECM.

Are the Ignition, Battery and Ground supply circuits functioning properly at the ECM?

Yes >> Go To 3
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair as necessary.

3. SKIM CODES PRESENT

Turn the ignition on.
With the scan tool, read the SKIM DTCs.

Does the scan tool display any SKIM DTCs?

Yes >> Refer to symptom list for problems related to SKIM.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Go To 4

4. CHECKING STARTER OPERATION

NOTE: The Starter Motor Fuse in the TIPM must not be open for this test to be valid. Check the condition of the Starter Motor Fuse in the TIPM. If the fuse is open, replace and attempt to crank the engine.

Turn the ignition off.

Disconnect the (T750) Starter Control Output circuit at the Starter Motor.

With a 12–volt test light connected to ground, probe the (T750) Starter Control Output circuit.

Fully depress the clutch pedal.

While observing the test light, turn the ignition switch to the Crank/Start position.

Is the test light illuminated brightly?

Yes >> Go To 5

No >> Go To 6

5. MECHANICAL PROBLEM

Turn the ignition off.

Attempt to manually rotate the crankshaft 360°.

Is the crankshaft able to rotate 360°?

Yes >> Replace the Starter Motor.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Repair the engine mechanical problem.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

6. VERIFY CLUTCH SWITCH INPUTS

Turn the ignition on.

With the scan tool, read the Clutch Upstop Switch and Clutch Interlock Switch inputs while fully depressing and releasing the clutch pedal.

Does the input for both switched change state while fully depressing and releasing the clutch pedal?

Yes >> Go To 7

No >> Refer to the Service Information related to the Clutch Switch. Repair or replace Clutch Switch or Clutch Switch circuitry as necessary to correct Clutch Switch input to the ECM.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

7. (T750) STARTER CONTROL OUTPUT CIRCUIT OPEN

Turn the ignition off.

Disconnect the TIPM C8 harness connector.

Connect the (T750) Starter Control Output wire (at the Starter) to ground.

Using a 12-volt test light connected to 12-volts, check the (T750) Starter Relay Output circuit at the TIPM C8 harness connector.

Does the test light illuminate brightly?

Yes >> Go To 8

No >> Repair the (T750) Starter Relay Output circuit for an open.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

8. (T750) STARTER CONTROL OUTPUT CIRCUIT SHORT TO GROUND

Measure the resistance between ground and the (T750) Starter Control Output circuit.

Is the resistance above 1000 ohms?

Yes >> Go To 9

No >> Repair the (T750) Starter Control Output circuit for a short to ground.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

9. CHECK WIRING, CONNECTORS AND TERMINALS

Turn the ignition off.

Check the wiring, connectors and terminals associated with the Starter Relay, Main Relay and Clutch Switch circuits. Check for poor terminal contact, corrosion, spread terminals, improper connections or other problems that could cause an intermittent condition.

Were any problems found?

Yes >> Repair or replace wiring, connector or terminals as necessary.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

No >> Replace the TIPM in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1 (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

*LACK OF ENGINE POWER

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
AIR IN FUEL SYSTEM
FUEL INJECTOR CLASSIFICATION
BRAKE SWITCH PROBLEM
EGR SYSTEM PROBLEM
BOOST PRESSURE PROBLEM
LOW ENGINE COMPRESSION
FUEL DELIVERY SYSTEM RESTRICTION
ENGINE DRIVE BELT/CHAIN
FUEL INJECTOR(S)
FUEL INJECTION PUMP
FUEL SYSTEM CONTAMINATION
FUEL SYSTEM LEAK
TURBOCHARGER

Diagnostic Test

1. CHECKING FOR ECM DTCS

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Turn the ignition on.

With the scan tool, read the ECM DTCs.

Are there any DTCs present?

Yes >> Refer to symptom list for problems related to this DTC.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 2

2. CHECKING THE BRAKE SWITCH ADJUSTMENT

Refer to the Service Information and check for proper Brake Switch adjustment.

Is the Brake Switch adjusted correctly?

Yes >> go to 3

No >> Adjust or replace the Brake Switch as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. EGR SYSTEM

Refer to the symptom list and perform the CHECKING THE EGR SYSTEM test.

Were any problems found during the EGR System test?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> 4

4. FUEL SYSTEM LEAK

Turn the ignition off.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the entire fuel system for leakage.

Is there any evidence of leakage?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 5

5. FUEL SYSTEM CONTAMINATION

NOTE: Mixing any other fuels such as gasoline or kerosine can cause this symptom to occur.

Turn the ignition off.

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 23,200 PSI (1600 BAR). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS.

WARNING: FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN CAUSING PERSONAL INJURY OR DEATH. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING WHEN SERVICING FUEL SYSTEM.

Inspect the fuel system for contamination.

Is the fuel contaminated?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 6

6. CHECKING BOOST PRESSURE

Turn the ignition on.

NOTE: This test requires two people. One person to test drive the vehicle while a technician observes the scan tool readings.

With the scan tool in Sensors, read and compare the Boost Pressure (PSI) with the Boost Pressure Desired/Setpoint (PSI) while test driving the vehicle under various load conditions such as idle, hard acceleration, and cruise.

NOTE: The Boost Pressure reading should directionally follow (trail) the Boost Pressure Desired/Setpoint reading.

Does the Boost Pressure reading follow the Boost Pressure Desired/Setpoint reading?

Yes >> Go To 7

No >> Refer to the symptom CHECKING THE BOOST PRESSURE.

7. FUEL INJECTOR CLASSIFICATION

NOTE: Each Fuel Injector is labeled with a code. This code determines the injector classification. Each Injector classification must be programmed into the ECM using the scan tool.

Turn the ignition off.

Refer to the Service Information to locate each fuel injector label and check for the correct classification for each fuel injector in the ECM.

Are all of the injectors classified correctly?

Yes >> Go To 8

No >> Using the scan tool, program the correct Fuel Injector classifications into the ECM.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

8. ENGINE COMPRESSION

Start and idle the engine.

With the scan tool, perform the Cylinder Compression Test.

Does the Cylinder Compression Test indicate low compression in any of the cylinders?

Yes >> Using the Service Information, repair the engine as necessary to regain proper cylinder compression.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 9

9. FUEL INJECTOR

NOTE: An injector that sticks open can cause this symptom. A sticking injector will cause the engine to misfire and emit excessive black smoke from the exhaust system.

Start and idle the engine.

With the scan tool, perform the Cylinder Fuel Quantity Correction Test.

NOTE: A problem injector will be indicated by a significant change in correction quantity as compared to the rest of the injectors.

Are any of the injectors displaying a significant amount of injection quantity correction?

Yes >> Using the Service Information, remove and inspect the Fuel Injectors for signs of damage or debris that may cause the injector to stick. Sticking injectors may cause the combustion chamber to become black and oil soaked. Replace Injector(s) as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 10

10. ENGINE DRIVE BELT/CHAIN

Refer to the Service Information to ensure the Engine Drive Belt/Chain is installed correctly and the camshaft and crankshaft gears are timed correctly.

Were any problems found?

Yes >> Repair as necessary.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

11. CHECKING THE SUPPLY SIDE FUEL DELIVERY SYSTEM

Refer to the appropriate Service Information and test for proper Fuel pressure and volume from the fuel tank to the high pressure Fuel Injection Pump.

NOTE: The following is a list of problems that can cause fuel pressure to deviate from specification: restricted fuel filter or fuel lines, air in fuel system, failed fuel sending unit, contaminated fuel.

Were there any problems with the Fuel Delivery System?

Yes >> Repair as necessary in accordance with the Service Information.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete

*CHECKING THE ACCELERATOR PEDAL POSITION SENSOR CALIBRATION

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
APP SENSOR 1
APP SENSOR 2

Diagnostic Test

1. APP SENSOR IDLE VOLTAGE

NOTE: If there are any Accelerator Pedal Position Sensor DTC's active in the ECM, diagnose DTC's before continuing this test.

NOTE: The APP Sensor is a device that contains two separate potentiometer type sensors. Each sensor has its own 5-volt supply circuit, sensor ground circuit and signal circuit. The APP Sensor no longer incorporates a low-idle switch.

NOTE: The APP Sensor 1 signal should always be double the voltage of the APP Sensor 2 signal.

NOTE: Ensure the accelerator pedal is free from any restriction or binding before continuing.

Turn the ignition on.

With the scan tool, read the APP Sensor 1 and APP Sensor 2 Volts with the accelerator pedal in the at rest position.

Does the scan tool display between 0.79 and 0.95 volt for sensor 1 and 0.39 and 0.48 volt for sensor 2?

Yes >> Go To 2

No >> Check the APP Sensor circuits for proper resistance. If o.k., replace the APP Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. APP SENSOR 1

While back probing, measure the voltage of the APP Sensor 1 Signal circuit at the ECM.

Monitor the voltmeter while slowly pressing the accelerator pedal completely down.

NOTE: APP signals are displayed in voltage and percentage on the scan tool. Although APP 1 voltage is double APP 2 voltage, the percentage display of APP 1 and APP 2 should be within 2.5% of each other during all phases of accelerator pedal travel.

Did the voltage increase smoothly with pedal travel?

Yes >> Go To 3

No >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. APP SENSOR 2

While back probing, measure the voltage of the APP Sensor 2 Signal circuit at the ECM.

Monitor the voltmeter while slowly pressing the accelerator pedal completely down.

NOTE: APP signals are displayed in voltage and percentage on the scan tool. Although APP 1 voltage is double APP 2 voltage, the percentage display of APP 1 and APP 2 should be equal during all phases of accelerator pedal travel.

Did the voltage increase smoothly with pedal travel?

Yes >> Go To 4

No >> Replace the Accelerator Pedal Position Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. APP SENSOR WIDE OPEN THROTTLE VOLTAGE

Fully depress the accelerator pedal.

With the scan tool, read the voltage for APP Sensor 1 and APP Sensor 2.

Does the scan tool display between 4.28 and 4.70 volts for sensor 1 and 2.14 and 2.35 volts for sensor 2?

Yes >> Test Complete.

No >> Check the APP Sensor circuits for proper resistance. If o.k., replace the APP Sensor in accordance with the Service Information.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*CHECKING THE BOOST PRESSURE SENSOR CALIBRATION

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
TURBOCHARGER BOOST PRESSURE SENSOR CALIBRATION

Diagnostic Test

1. BOOST PRESSURE SENSOR CALIBRATION

Turn the ignition on.

With the scan tool, read the Boost Pressure Voltage and Boost Pressure hpa.

NOTE: The Boost Pressure hpa and Intake/Inlet Air Pressure hpa readings should both match closely to the Atmoshperic Pressure hpa reading. These readings will change depending on altitude.

Is the Boost Pressure hpa within 2% or the Atmospheric pressure hpa?

Yes >> Test Complete.

No >> Replace the Turbocharger Boost Pressure Sensor.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*CHECKING THE BOOST PRESSURE SYSTEM

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
TURBOCHARGER ASSEMBLY
BOOST PRESSURE ACTUATOR SUPPLY HOSE
BOOST PRESSURE ACTUATOR
INTAKE OR EXHAUST SYSTEM PROBLEM

1. CHECKING THE BOOST PRESSURE ACTUATOR OPERATION

Turn the ignition off.

Disconnect the Valve Block vacuum hose connector.

Connect a vacuum pump to the Boost Pressure Actuator supply port of the disconnected Valve Block vacuum hose connector. This port is attached to the Gray colored vacuum tube at the Valve Block vacuum hose connector.

While standing at the right front of the vehicle (front of engine side), observe the position of the Boost Pressure Actuator armature.

NOTE: The armature should be in the 10 o'clock position with the ignition off (armature in rest position).
While observing the armature, apply 20 inches of vacuum.

NOTE: The armature should move counterclockwise from the 10 o'clock position to the 9 o'clock position.

Is the Boost Pressure Actuator operating from the 10 o'clock to the 9 o'clock position when 20 inches of vacuum is applied?

Yes >> Go to 4

No >> Go To 2

2. CHECKING THE BOOST PRESSURE ACTUATOR SUPPLY HOSE

Check the Gray colored vacuum hose between the Valve Block hose connector and the Boost Pressure Actuator for leaks, kinks, debris or other restrictions.

NOTE: Problems with this hose will cause incorrect vacuum to the EGR Valve resulting in driveability problems.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 3

3. CHECK FOR BOOST PRESSURE ACTUATOR LINKAGE PROBLEM

Disconnect the linkage from the Boost Pressure Actuator and inspect the linkage for foreign debris, binding or damage that could cause restricted movement.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Refer to the Service Information and replace the Boost Pressure Actuator or Turbocharger Assembly as necessary.

4. CHECK FOR INTAKE AND EXHAUST SYSTEM RESTRICTIONS

Inspect the exhaust system for damaged components that could cause exhaust flow blockage.

Inspect all air intake, crankcase vent and turbocharger related hoses/tubes and connections for damage, air leaks or blockage.

Inspect the air filter for excessive dirt, soiling or other problems that may cause restricted air flow.

Were any problems found?

Yes >> Repair or replace as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go to 5

5. CHECKING THE BOOST PRESSURE ACTUATOR OPERATION

NOTE: The engine temperature must be above 160°F for this test to be valid.

Turn the ignition off.

Disconnect the Valve Block vacuum hose connector.

Connect a vacuum pump to the Boost Pressure Actuator supply port of the disconnected Valve Block vacuum hose connector. This port is attached to the Gray colored vacuum tube at the valve Block vacuum hose connector.

Set the engine speed to 1,500 rpm.

With the scan tool, observe and note the Boost Pressure hpa reading.

While observing the scan tool, apply 15 inches of vacuum.

NOTE: The Boost Pressure hpa reading should increase more than 100 hpa as well as an audible engine tone change when 15 inches of vacuum is applied.

Does the Boost Pressure hpa reading increase more than 100 hpa when 15 inches of vacuum is applied?

Yes >> Test complete.

No >> Refer to the Service Information and replace the Turbocharger assembly.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*CHECKING THE ENGINE COOLANT TEMPERATURE SENSOR CALIBRATION

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
ECT SENSOR - COLD
ECT SENSOR - HOT

Diagnostic Test

1. ECT SENSOR - COLD

NOTE: The thermostat must be operating correctly for this test to be valid.

With the scan tool in Sensors, read and note the engine coolant temperature.

Using a temperature probe, measure the engine block temperature near the ECT Sensor.

NOTE: The engine temperature should be below 50°C (120°F).

Are the readings within 7°C (13°F) of each other?

Yes >> Go To 2

No >> Check the wiring and connectors associated with the ECT Sensor for corrosion, damage or other problems. Repair as necessary. If wiring and connectors are o.k., replace the Engine Coolant Temperature Sensor.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. ECT SENSOR - HOT

NOTE: The thermostat must be operating correctly for this test to be valid.

Start the engine and bring the engine to operating temperature (thermostat open).

Turn the engine off and wait 10 minutes to allow the engine temperature to stabilize.

Using a temperature probe, measure the engine block temperature near the ECT Sensor.

With the scan tool, select Engine, then Sensors and read the engine coolant temperature.

Are the readings within 7°C (13°F) of each other?

Yes >> Test Complete.

No >> Check the wiring and connectors associated with the ECT Sensor for corrosion, damage or other problems. Repair as necessary. If wiring and connectors are o.k., replace the Engine Coolant Temperature Sensor.

Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*CHECKING THE EGR SYSTEM

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
VACUUM HOSES/TUBES
VACUUM SUPPLY SYSTEM
EGR VALVE
VALVE BLOCK ASSEMBLY

1. CHECKING VACUUM AT EGR VALVE

NOTE: Ensure there are no EGR hardwire/circuit related DTC's before continuing. Existing EGR circuit related faults will cause misdiagnosis during this test.

Turn the ignition off.

Disconnect the EGR Valve vacuum supply hose.

Connect a vacuum gauge to the disconnected EGR Valve vacuum supply hose.

While observing the vacuum gauge, start and idle the engine

NOTE: The vacuum reading should be above 16 inches for 2 minutes after engine start then drop to below 2 inches.

Does the vacuum read above 16 inches for 2 minutes then drop to below 2 inches?

Yes >> Go to 2

No >> Go to 3
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. EGR VALVE

INCHES OF VACUUM APPLIED TO EGR VALVE	MAF PER CYLINDER MG/HU
10	435 — 475
15	255 — 295
20	165 — 215

NOTE: The engine temperature must be above 160°F for this test to be valid.

Turn the ignition off.

Disconnect the vacuum supply hose from the EGR Valve.

Connect a vacuum pump to the EGR Valve vacuum port.

Start the engine.

NOTE: Engine must be idling in park.

Apply 10 inches, 15 inches and 20 inches of vacuum to the EGR Valve and note the MAF readings at each of the applied vacuum steps.

NOTE: An engine tone change should also be heard when 15 inches or more vacuum is applied to the EGR Valve.

Refer to the chart and compare each of the MAF readings for each of the applied vacuum steps

Are the MAF Per Cyl mg/hu within the chart specifications for applied vacuum step?

Yes >> EGR system functioning properly. Test complete.

No >> Replace the EGR Valve.

3. CHECKING VACUUM AT VALVE BLOCK ASSEMBLY

Turn the ignition off.

Disconnect the Valve Block vacuum hose connector.

Connect a vacuum gauge to the vacuum supply port of the disconnected Valve Block vacuum hose connector. Vacuum supply is provided via the Blue colored vacuum tube at the valve Block vacuum hose connector.

While observing the vacuum gauge, start and idle the engine

NOTE: The vacuum reading should be above 22 inches with the engine idling.

Does the vacuum read above 22 inches with the engine idling?

Yes >> Go To 4

No >> Repair vacuum supply system for insufficient vacuum.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. CHECKING THE AIR CLEANER VENT HOSE

Turn the ignition off.

Disconnect the Valve Block vacuum hose connector.

Check the Black colored vacuum hose between the Valve Block hose connector and the air cleaner for kinks, debris or other restrictions.

NOTE: Problems with this hose will cause incorrect vacuum to the EGR Valve resulting in driveability problems.

Were any problems found?

Yes >> Repair or replace as necessary.

No >> Go to 5
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

5. CHECKING THE EGR VACUUM SUPPLY HOSE

Turn the ignition off.

Disconnect the Valve Block vacuum hose connector.

Check the Tan colored vacuum hose between the Valve Block hose connector and the EGR Valve for kinks, debris or other restrictions.

NOTE: Problems with this hose will cause incorrect vacuum to the EGR Valve resulting in driveability problems.

Were any problems found?

Yes >> Repair or replace as necessary.

No >> Replace the Valve Block Assembly.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

*CHECKING THE ENGINE MECHANICAL SYSTEMS

For a complete wiring diagram **Refer to Section 8W**

Possible Causes
CHECKING ENGINE MECHANICAL SYSTEMS

Diagnostic Test

1. CHECKING ENGINE MECHANICAL

NOTE: The following items should be checked as a possible cause of a Driveability or No-Start problem.

WARNING: Do not attempt to remove or separate high pressure fuel line. Attempting to do so could result in severe bodily injury or death.

Engine Valve Timing - must be within specification

Engine Compression - must be within specifications

Camshaft Lobes - check for abnormal wear

Camshaft Position Sensor - check the camshaft position sensor tooth for debris and deterioration

Crankshaft Position Sensor - check the crankshaft tone wheel for debris and deterioration

Engine Exhaust System - must be free of any restriction

Engine Drive Chains and Sprockets - must be properly positioned

Vacuum System - must operate properly and be free of any vacuum leaks

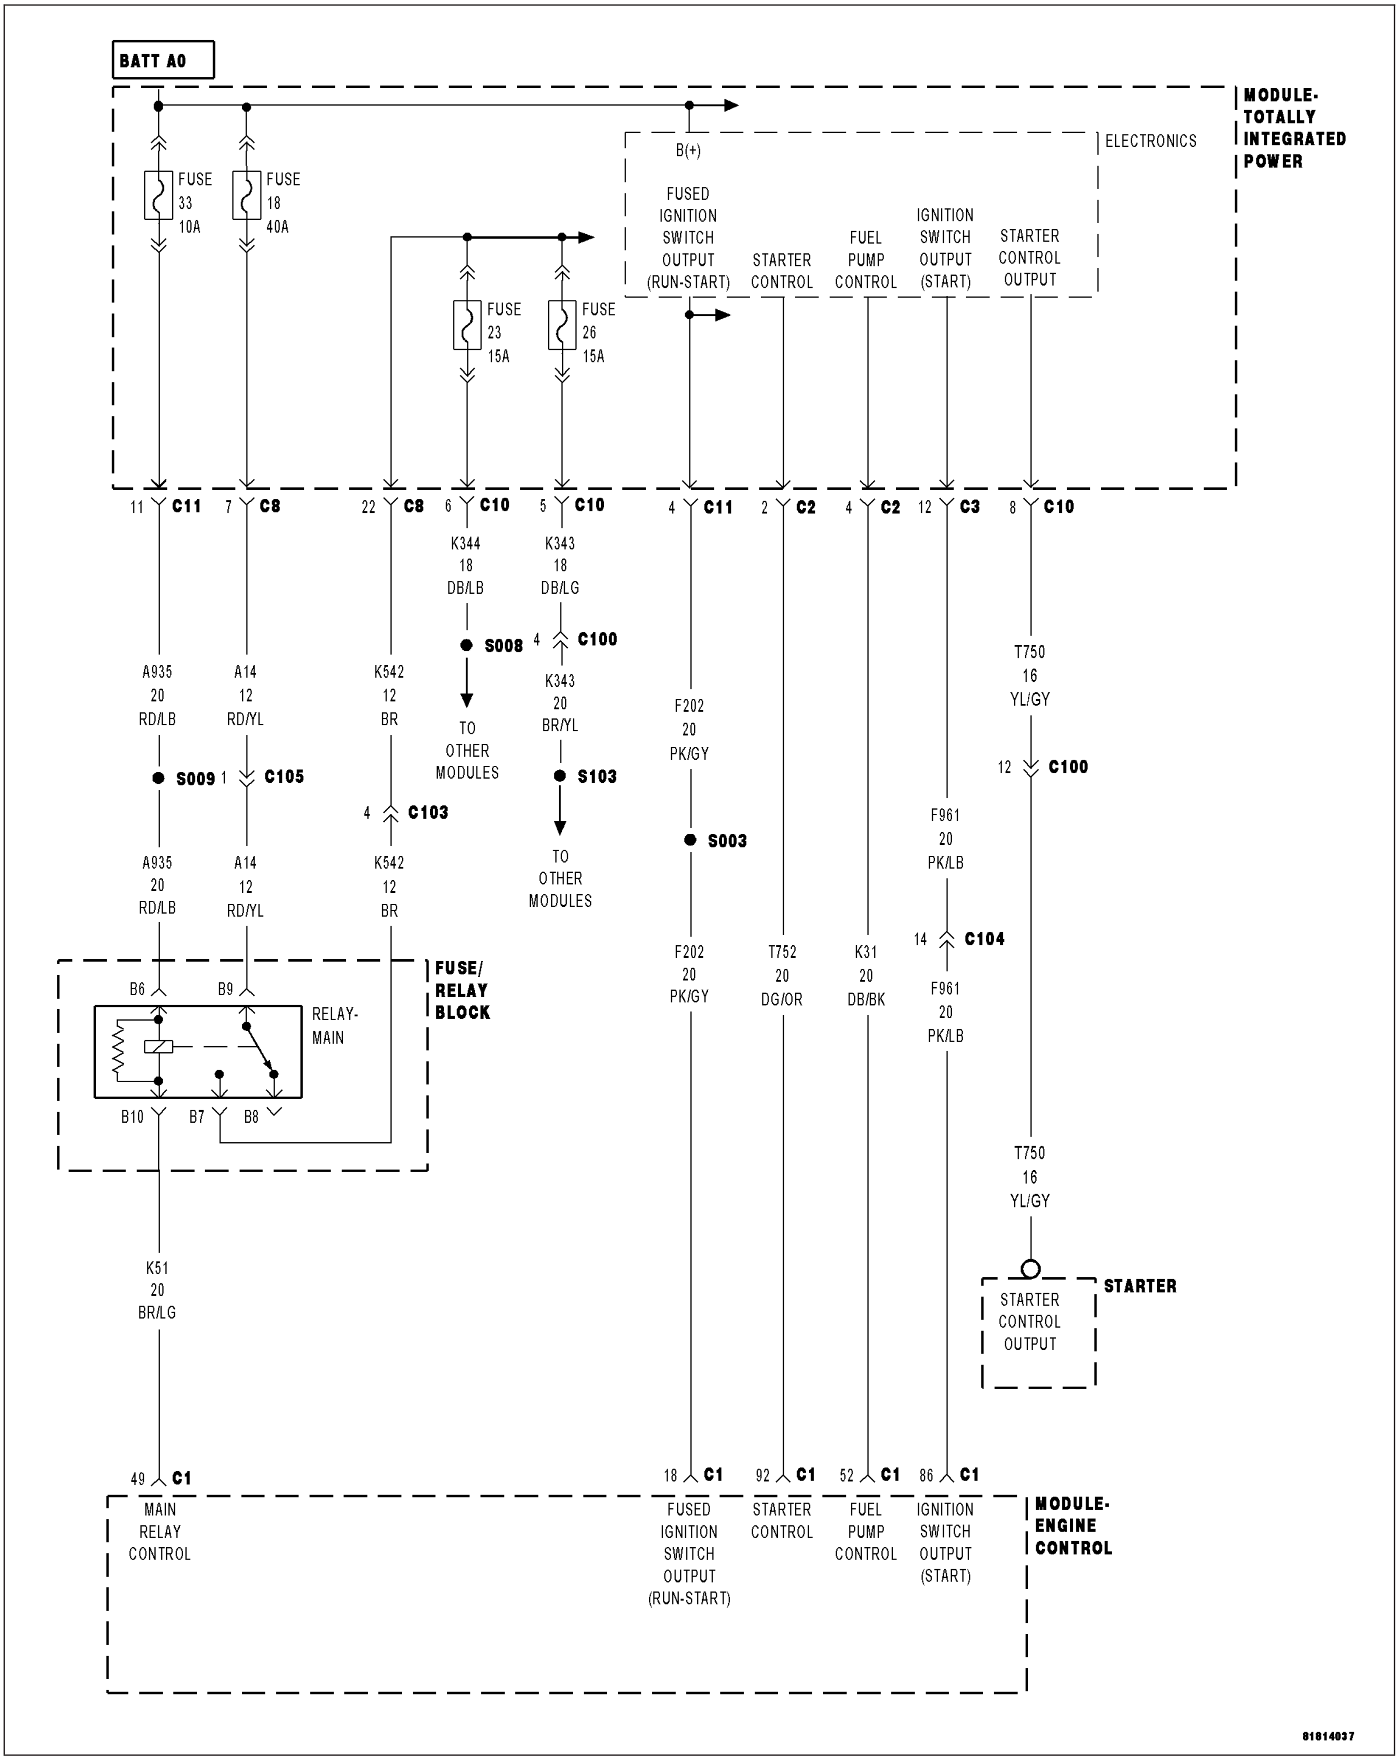
Fuel - must have adequate supply and must be free of contamination (ie. debris, water and gasoline)

Fuel Injectors - must not be plugged or restricted

Fuel Lift Pump - must operate properly (where applicable)

Fuel Injection Pump - must be producing the correct output volume and pressure

Inspect the Fuel Lines, Fuel Filter and Fuel Pressure Relief Valve for signs of restriction and leaks



NOTE: Check for any Technical Service Bulletins that may relate to the problem.

Are there any problems evident?

Yes >> Repair as necessary.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

*CHECKING THE ECM POWER AND GROUND CIRCUITS

Possible Causes
MAIN RELAY CONTROL CIRCUIT OPEN
MAIN RELAY OUTPUT CIRCUIT(S) OPEN
CHECKING THE MAIN RELAY SYSTEM
ECM GROUND CIRCUIT(S) OPEN
FUSED MAIN RELAY BATTERY SUPPLY CIRCUIT OPEN
FUSED IGNITION SWITCH (START) OUTPUT CIRCUIT OPEN
FUSED IGNITION SWITCH (START/RUN) OUTPUT CIRCUIT OPEN
SUBSTITUTE MAIN RELAY
MAIN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Diagnostic Test

1. ECM GROUND CIRCUIT(S) OPEN

NOTE: Before checking the ECM Power and Grounds, check the Totally Integrated Power Module (TTIPM) for DTC's. Repair all TTIPM ignition switch or power supply related DTC's before continuing with this test.

Turn the ignition off.

Disconnect the ECM harness connectors.

Using a 12-volt test light connected to 12-volts, check each of the ECM ground circuits in ECM harness connector C1 cavities 1, 2 and 4.

Did the test light illuminate for each cavity?

Yes >> Go To 2

No >> Repair the ECM Ground circuit(s) for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

2. FUSED IGNITION SWITCH START OUTPUT CIRCUIT OPEN

Turn the ignition to the Start position.

Using a 12-volt test light connected to ground, check the Fused Ignition Switch Start Output circuit in ECM harness connector C1 cavity 86.

Is the test light on?

Yes >> Go To 3

No >> Repair the Fused Ignition Switch Start Output circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

3. FUSED IGNITION SWITCH START/RUN OUTPUT CIRCUIT OPEN

Turn the ignition to the Start position.

Using a 12-volt test light connected to ground, check the Fused Ignition Switch Start/Run Output circuit in ECM harness connector C1 cavity 18.

Turn the ignition to the Run position.

Using a 12-volt test light connected to ground, check the Fused Ignition Switch Start/Run Output circuit in ECM harness connector C1 cavity 18.

Is the test light on for both ignition switch positions?

Yes >> Go To 4

No >> Repair the Fused Ignition Switch Start/Run Output circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

4. CHECKING THE MAIN RELAY SYSTEM

Turn the ignition off.

Connect a jumper wire between ground and the Main Relay Control circuit in ECM C1 harness connector cavity 49.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Fused Main Relay Output circuits at the ECM C1 harness connector cavities 3, 5 and 6.

Does the test light illuminate brightly for each circuit?

Yes >> Test Complete.

No >> Go To 5

5. FUSED MAIN RELAY BATTERY SUPPLY CIRCUIT OPEN

Turn the ignition off.

Remove the Main Relay.

Using a 12-volt test light connected to ground, check both Fused Main Relay Battery Supply circuits in Main Relay connector.

Is the test light on?

Yes >> Go To 6

No >> Repair the Fused Main Relay Battery Supply circuit(s) for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

6. MAIN RELAY OUTPUT CIRCUIT OPEN

Connect a jumper wire between cavity B7 and cavity B9 in the Main Relay connector.

Using a 12-volt test light connected to ground, check the Main Relay Output circuit in ECM harness connector C1 cavities 3, 5 and 6.

Did the test light illuminate for each circuit?

Yes >> Go To 7

No >> Repair the Main Relay Output circuit(s) for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

7. MAIN RELAY

Turn the ignition off.

Install a known good relay in place of the Main Relay.

Connect a jumper wire between ground and the Main Relay Control circuit in ECM C1 harness connector cavity 49.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the Fused Main Relay Output circuits at the ECM C1 harness connector cavities 3, 5 and 6.

Did the test light illuminate brightly for each circuit?

Yes >> Replace the Main Relay.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Go To 8

8. MAIN RELAY CONTROL CIRCUIT OPEN

Turn the ignition off.

Remove the Main Relay.

Measure the resistance of the Main Relay Control circuit between the Main Relay connector and the ECM harness connector.

Is the resistance below 10.0 ohms?

Yes >> Go To 9

No >> Repair the Main Relay Control circuit for an open.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

9. MAIN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE

Connect a jumper wire between cavity B7 and cavity B9 of the Main Relay connector.

Turn the ignition on.

Measure the voltage on the Main Relay Control circuit.

Is the voltage above 1.0 volt?

Yes >> Repair the Main Relay Control circuit for a short to voltage.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

*INTERMITTENT DTC

For a complete wiring diagram **Refer to Section 8W**

Diagnostic Test

1. INTERMITTENT DTC

WARNING: When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

The conditions necessary to set this DTC are not present at this time.

Review the scan tool environmental data. If possible, try to duplicate the conditions under which the DTC set.

If applicable, actuate the component with the scan tool.

Monitor the scan tool data relative to this circuit and wiggle test the wiring and connectors.

Look for the data to change, the actuation to be interrupted, or for the DTC to reset during the wiggle test.

Refer to any Technical Service Bulletins (TSBs) that may apply.

Turn the ignition off.

Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.

Perform a voltage drop test on the related circuits between the suspected component and the ECM.

Inspect and clean all ECM, engine, and chassis grounds that are related to the most current DTC.

If numerous trouble codes were set, use a schematic and inspect any common ground or supply circuits.

For intermittent Misfire DTCs check for restrictions in the Intake and Exhaust system, proper installation of Sensors, vacuum leaks, and binding components that are run by the accessory drive belt.

Use the scan tool to perform a System Test if one applies to the component.

A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

Were any problems found during the above inspections?

Yes >> Perform the necessary repairs.
Perform the ECM Verification Test Ver. 1. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

No >> Test Complete.

PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. NO RESPONSE

NOTE: For vehicle communication problems, use the scan tool to refer to the Network Review Screen. The screen depicts a high level view of the vehicle network. Fault and problem areas appear in red.

Does the scan tool display a Vehicle Network problem or NO RESPONSE condition?

Yes >> Refer to the appropriate BUS Communication test in Section 8 ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS.

No >> Go To 2

2. NO START

Does the vehicle have a NO START condition?

Yes >> Check the vehicle for any DTC(s), including Vehicle Theft Security related DTC(s), that may cause a no-start condition.

If no DTC(s) are present that relate to a no-start condition, refer to the Non DTC Diagnostic Procedures that relate to Fuel and Starting.

No >> Go To 3

3. VEHICLE REPAIR HISTORY AND TSB(s)

Check the vehicle repair history for repairs that may relate to the current condition.

Inspect the vehicle for aftermarket accessories that may have been installed incorrectly.

Check for any TSB(s) related to the condition or DTC(s).

If a TSB applies, follow the procedure outlined in the TSB.

Select the appropriate response for the condition that applies:

Performing a TSB procedure repaired the condition.
Test Complete.

Perform the ECM Verification Test Ver. 1.

A DTC is present, no TSB applies, or the TSB didn't repair the condition.
Go To 4

No DTC(s) or conditions are present.
Refer to the INTERMITTENT CONDITION Diagnostic Procedure.

4. VEHICLE INSPECTION

WARNING: WHEN THE ENGINE IS OPERATING, DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

Based on the diagnostic condition that applies, review the following list and perform any tests that relate to the condition:

If multiple DTCs are set in the ECM, review the wiring schematics for problems in any shared supply or ground circuits. Refer to the diagnostic procedure for Checking the ECM Power and Ground Circuits.

Inspect the air intake system and turbocharger related tubes for damage, restriction, or poor connection.

Inspect the exhaust system and related tubes for damage, restriction, or poor connection.

Remove and inspect the Air Filter for soiling or excessive dirt and debris which may cause an air flow restriction.

If the ECM detects and stores a DTC, the ECM also stores the environmental conditions under which the DTC was set.

Before erasing stored DTCs, record these conditions. Attempting to duplicate these conditions may assist when checking for an active DTC.

With the scan tool, Clear the stored DTC(s).

Attempt to duplicate the environmental conditions under which the DTC was set.

Review the DTC When Monitored and Set Conditions. If possible, try to duplicate the vehicle conditions under which the DTC conditions will be monitored. Operate the vehicle under those conditions.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors between the component and the module.

If the DTC(s) are fuel or air related, check the fuel level and quality.

Were any repairs made that corrected the DTC or condition?

Yes >> Test complete.
Perform the ECM Verification Test Ver. 1.

No >> Refer to the diagnostic test procedure related to the DTC.

STANDARD PROCEDURE

ECM VERIFICATION TEST

For a complete wiring diagram **Refer to Section 8W**.

Diagnostic Test

1. SELECT THE PROPER VERIFICATION TEST

Select the verification test for the repair that has been completed:

Speed Control repair
Go To 2

Charging System repair
Go To 3

No Start repair
Go To 4

DTC and all other repairs
Go To 5

2. SPEED CONTROL VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.

2. With the scan tool, erase all diagnostic trouble codes (DTCs).

3. Road test the vehicle at a speed above 60 km/h (35 MPH).

4. Turn the speed control ON/OFF switch on.

5. Depress and release the SET switch. If the speed control does not engage, the repair is not complete, continue with step 12.

6. Quickly depress and release the RESUME/ACCEL switch. If the vehicle speed does not increase by 3 km/h (2 MPH), the repair is not complete, continue with step 12.

7. Using caution, depress and release the brake pedal. If the speed control does not disengage, the repair is not complete, continue with step 12.

8. With the vehicle speed at least 60 km/h (35 MPH), depress the RESUME/ACCEL switch. If the speed control does not resume at the previously set speed, the repair is not complete, continue with step 12.

9. Hold down the COAST switch. If the vehicle does not decelerate, the repair is not complete, continue with step 12.

10. While still holding down the COAST switch, ensure the vehicle speed is at least 60 km/h (35 MPH) and release the COAST switch. If the vehicle does not adjust and set a new vehicle speed, the repair is not complete, continue with step 12.

11. With the speed control engaged, depress the ON/OFF switch. If the speed control does not disengage, the repair is not complete, continue with step 12.

12. If the vehicle did not successfully perform all of the previous steps, check for Technical Service Bulletins (TSBs) that pertain to this speed control problem and then, if necessary, return to the Symptom List.

13. If the vehicle successfully performed all of the previous steps, the speed control system is now functioning as designed. The repair is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.

3. CHARGING SYSTEM VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. With the scan tool, erase all diagnostic trouble codes (DTCs).
3. Start the engine.
4. Raise the engine speed to 2000 RPM for at least 30 seconds.
5. Allow the engine to idle.
6. Turn the ignition off for 20 seconds.
7. Turn the ignition on.
8. With the scan tool, read ECM DTCs.
9. If this DTC has set again, or another DTC has set, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
10. If the charging system is functioning correctly and there are no DTCs, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.

4. NO START VERIFICATION TEST

NOTE: IMPORTANT! If the Engine Control Module or Sentry Key Immobilizer Module has been replaced, ensure the programming procedure for the module has been performed in accordance with the Service Information.

2. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
3. Inspect the engine oil for contamination. If it is contaminated, change the oil and filter.
4. With the scan tool, erase all diagnostic trouble codes (DTCs).
5. Turn the ignition off for at least 10 seconds.
6. Attempt to start the engine.
7. If the engine is unable to start, look for any Technical Service Bulletins (TSBs) that may relate to this condition. Return to the Symptom List if necessary.
8. If the engine starts and continues to run, the repair is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.

5. ROAD TEST VERIFICATION TEST

1. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.
2. If this verification procedure is being performed after a non-DTC test, perform steps 3 and 4. If not, proceed to step 5.
3. Check to see if the initial symptom still exists. If there are no trouble codes and the symptom no longer exists, the repair was successful and testing is now complete.
4. If the initial or another symptom exists, the repair is not complete. Check all pertinent Technical Service Bulletins (TSBs) and return to the Symptom List if necessary.
5. For previously read DTCs that have not been dealt with, return to the Symptom List and follow the diagnostic path for that DTC; otherwise, continue.
6. If the Engine Control Module (ECM) has been replaced, continue with step 9.
7. With the scan tool, erase all diagnostic trouble codes (DTCs), then disconnect the scan tool.
8. Turn the ignition off for at least 10 seconds.
9. If equipped with a Transfer Case Position Switch, perform step 10, otherwise, continue with step 11.
10. With the ignition switch on, place the Transfer Case Shift Lever in each gear position, stopping for 15 seconds in each position.
11. Road test the vehicle. For some of the road test, go at least 64 km/h (40 MPH). If this test is for an A/C Relay Control Circuit, drive the vehicle for at least 5 minutes with the A/C on.
12. At some point, stop the vehicle and turn the engine off for at least 10 seconds, then restart the engine and continue.
13. Upon completion of the road test, turn the engine off and check for DTCs with the scan tool.
14. If the repaired DTC has set again, the repair is not complete. Check for any pertinent Technical Service Bulletins (TSBs) and return to the Symptom List. If there are no DTCs, the repair was successful and is now complete.

Are any DTCs or symptoms remaining?

Yes >> Repair is not complete, refer to the appropriate diagnostic procedure.

No >> Repair is complete.

ENGINE 1.8L WORLD

TABLE OF CONTENTS

ENGINE 1.8L WORLD

DESCRIPTION

The 1.8 Liter (110 cu. in.) in-line four cylinder engine is a double over head camshaft with mechanical lash buckets and four valves per cylinder design. This engine is NOT free-wheeling; meaning that the pistons will contact the valves in the event of a timing chain failure.

The cylinders are numbered from front of the engine to the rear. The firing order is 1–3–4–2.

The engine identification number is located on the rear of the cylinder block.

DIAGNOSIS AND TESTING

INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Lash Adjuster Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing chain.
ENGINE STALLS OR IDLES ROUGH	1. Incorrect fuel mixture.	1. (Refer to Appropriate Diagnostic Information)
	2. Intake manifold leakage.	2. Inspect intake manifold, manifold gasket, and vacuum hoses.
	3. Faulty ignition coil(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

ENGINE MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
VALVETRAIN NOISE	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil level.
	5. Dirt in lash adjusters.	5. Replace rocker arm/hydraulic lash adjuster assembly.
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms.
	7. Worn lash adjusters.	7. Install new rocker arm/hydraulic lash adjuster assembly.
	8. Worn valve guides.	8. Replace cylinder head.
	9. Excessive runout of valve seats on valve faces.	9. Grind valves, replace cylinder head.
	10. Missing adjuster pivot.	10. Replace rocker arm/hydraulic lash adjuster assembly.

CONDITION	POSSIBLE CAUSES	CORRECTION
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.
	7. Misaligned connecting rods.	7. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.
	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure switch.	2. Install new oil pressure switch.
	3. Low oil pressure.	3. Check sending unit and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Replace cylinder head.
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Check engine oil level and add oil if necessary.
2. Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.
3. Remove engine cover.
4. Disconnect coil electrical connectors and remove coils.
5. Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
6. Disconnect injector electrical connectors.
7. Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
8. Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.
9. Repeat the previous step for all remaining cylinders.
10. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
11. If one or more cylinders have abnormally low compression pressures, repeat the compression test.
12. If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders, between a cylinder and the adjacent water jacket or from an oil passage to the exterior of the engine.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.
5. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:
   - Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
   - Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
   - Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

   - Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
   - If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
6. If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.

3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.
    a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
    b. Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.
4. If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.
7. After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

1. Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
2. Remove negative battery cable.
3. Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.
4. With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
5. Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).
6. Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
7. Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

8. Install new spark plugs.
9. Drain engine oil and remove oil filter.
10. Install a new oil filter.
11. Fill engine with specified amount of approved oil.
12. Connect negative battery cable.

13. Start engine and check for any leaks.

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

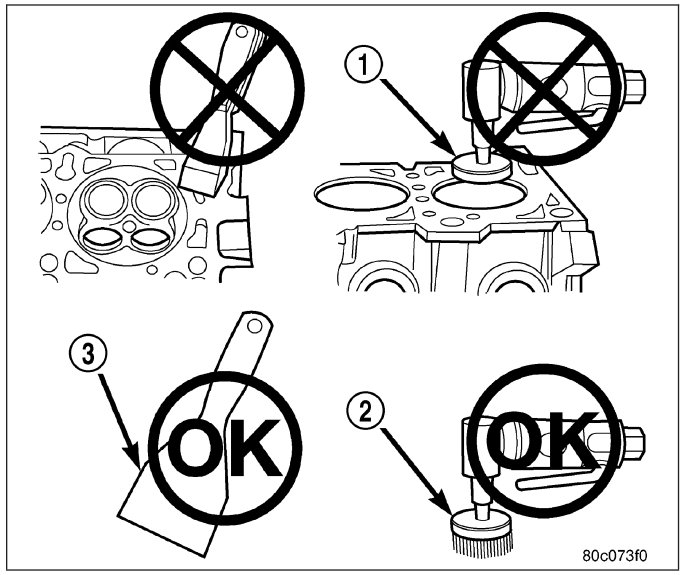
MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces.



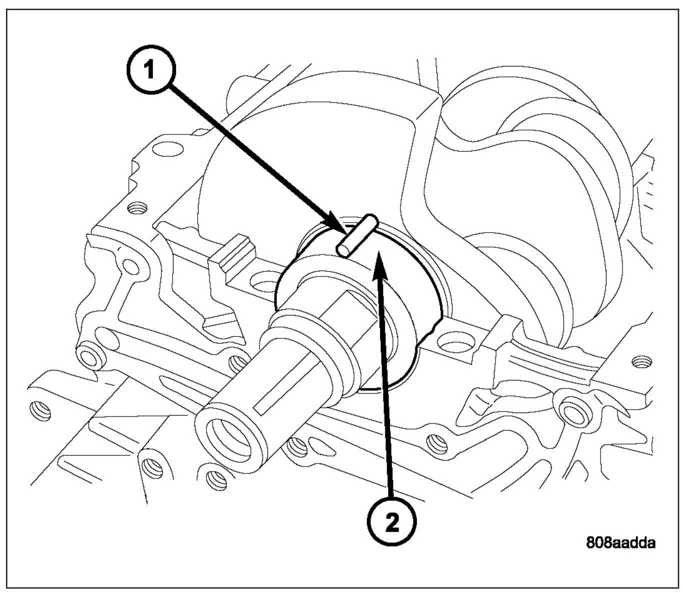
ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.



Only use the following for cleaning gasket surfaces:

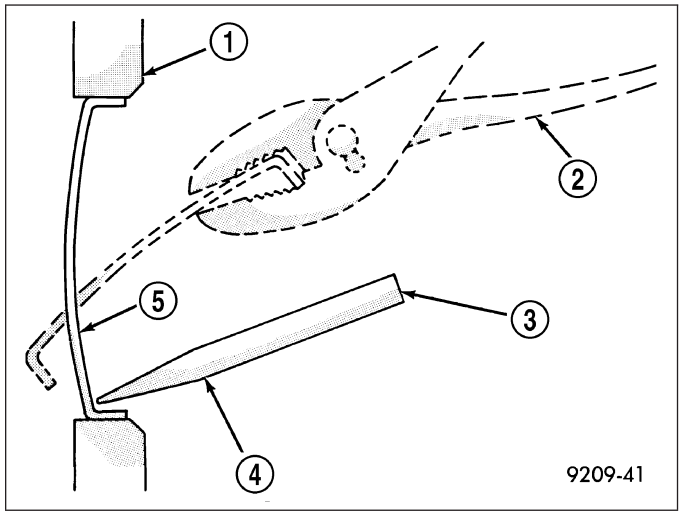
- Solvent or a commercially available gasket remover
- Plastic or wood scraper
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes. (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap/bed plate bolts of the bearing being checked to the proper specifications.
3. Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**



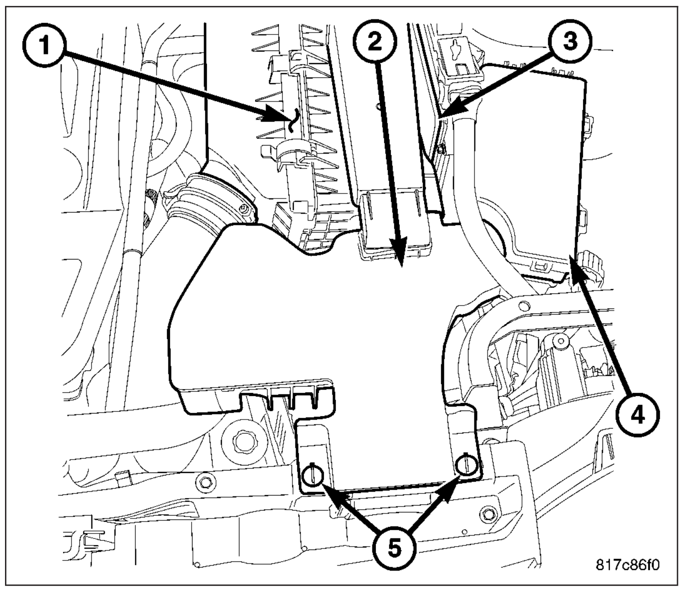
NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

4. Install the proper crankshaft bearings to achieve the specified bearing clearances.

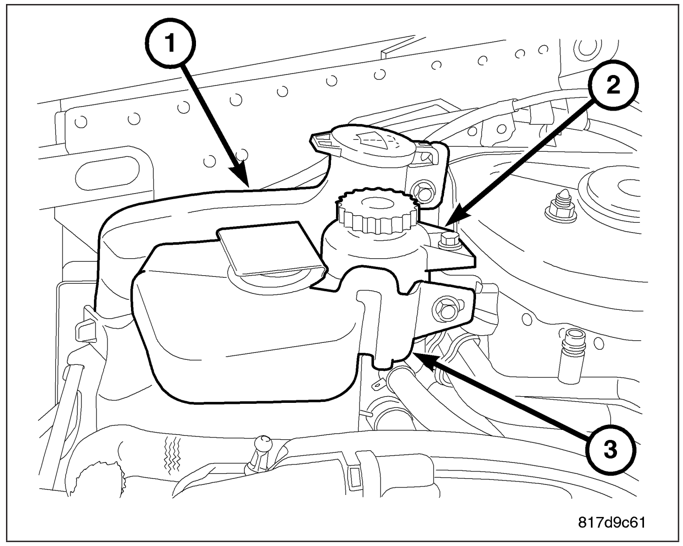
CYLINDER HEAD CORE PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug.

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

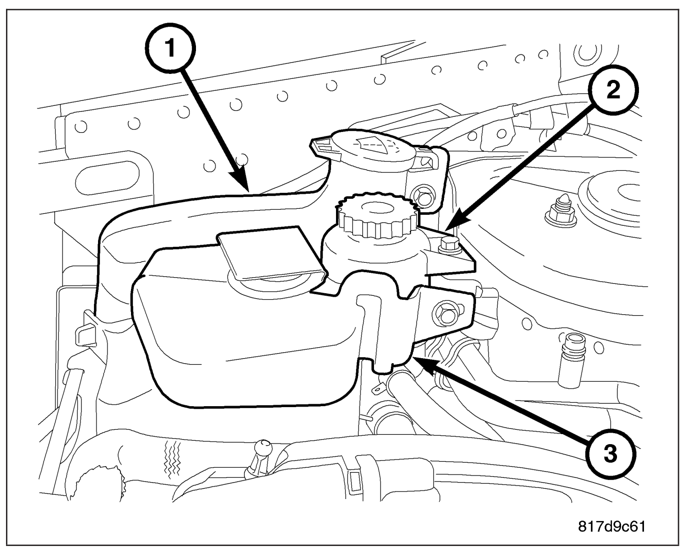


Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.



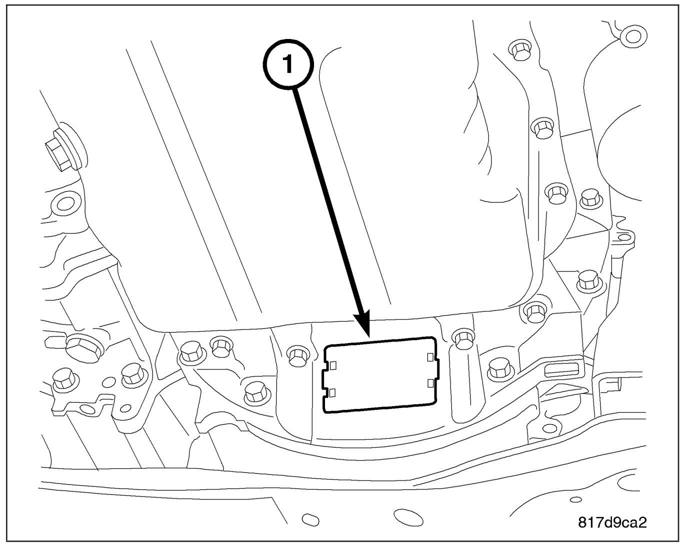
It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

REMOVAL - ENGINE ASSEMBLY

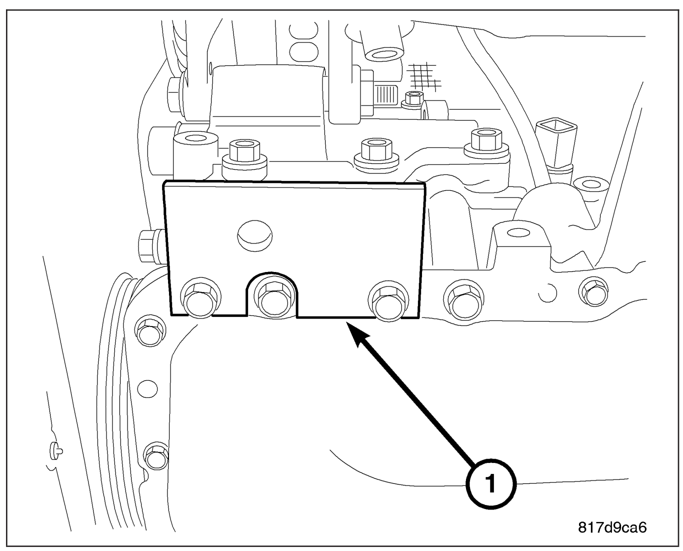


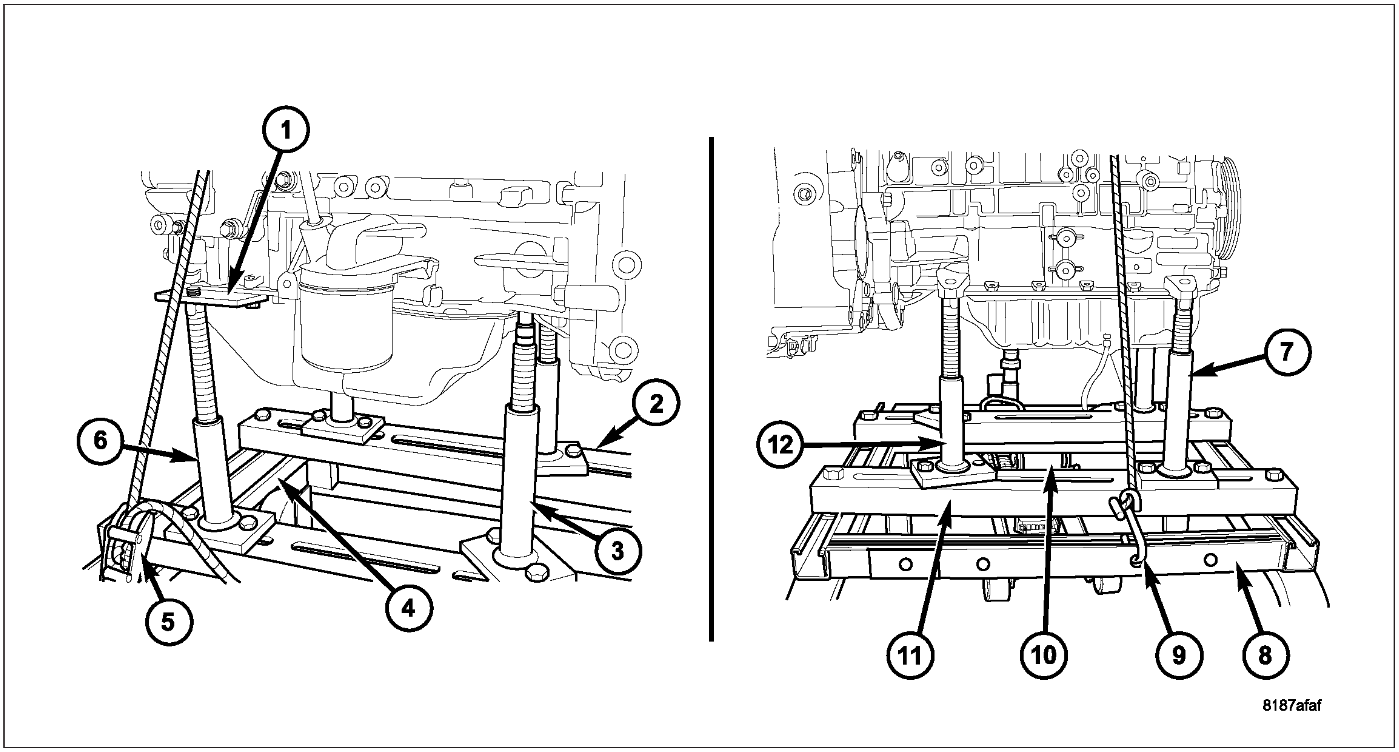
1. Perform fuel pressure release procedure, then disconnect and remove fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Remove air cleaner housing assembly (1) and clean air hose (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect both cables from battery.
4. Remove battery and battery tray.
5. Discharge air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).
6. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

7. Remove coolant reservoir (3).
8. Remove grill trim panel.
9. Remove upper radiator hose from radiator and coolant manifold.
10. Remove upper radiator hose support.
11. Remove lower radiator hose at coolant manifold.
12. Remove coolant hose from coolant manifold.
13. Disconnect the following electrical connectors, Variable Valve Timing Solenoids, oil temperature sensor, injectors, map, coils, cam position sensors, coolant temperature sensors, capacitor, oxygen sensor, intake air temperature sensor.
14. Remove air intake tube from throttle body.
15. Remove vacuum lines from throttle body.
16. Unclip harness from intake.



17. Disconnect electronic throttle control and manifold flow control valve electrical connectors.
18. Remove PCV hose from valve cover.
19. Remove dipstick.
20. Remove throttle body support bracket.
21. Remove intake bolts and remove intake.
22. Disconnect coolant temperature sensor at block, Knock sensor, oil pressure sensor, generator, starter, block heater, A/C compressor, and block ground.
23. Remove accessory drive belt.
24. Remove power steering reservoir (2).
25. Remove power steering line support.
26. Remove power steering pump and set aside.
27. Remove upper idler pulley.
28. Remove transaxle filler tube.
29. Disconnect transmission linkage and electrical connectors.
30. Remove transmission vent hose.
31. Remove ground strap near right tower.
32. Remove rear heat shield.
33. Remove maniverter heat shields.
34. Raise vehicle.
35. Remove wheels.
36. Remove right front splash shield.
37. Remove axle nuts.

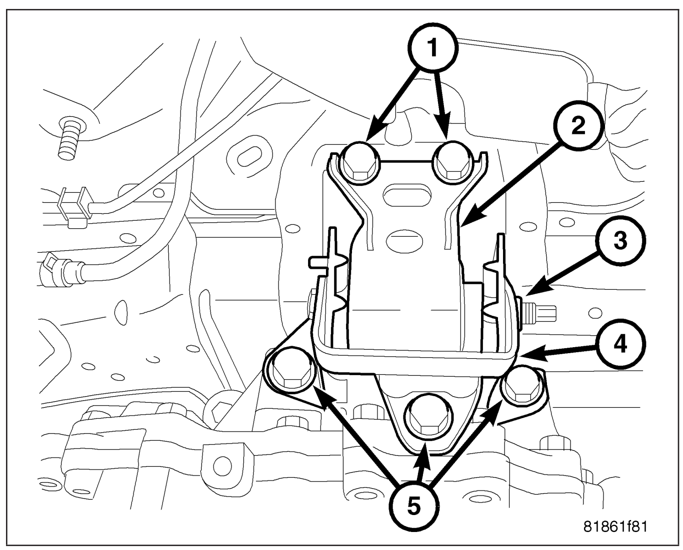


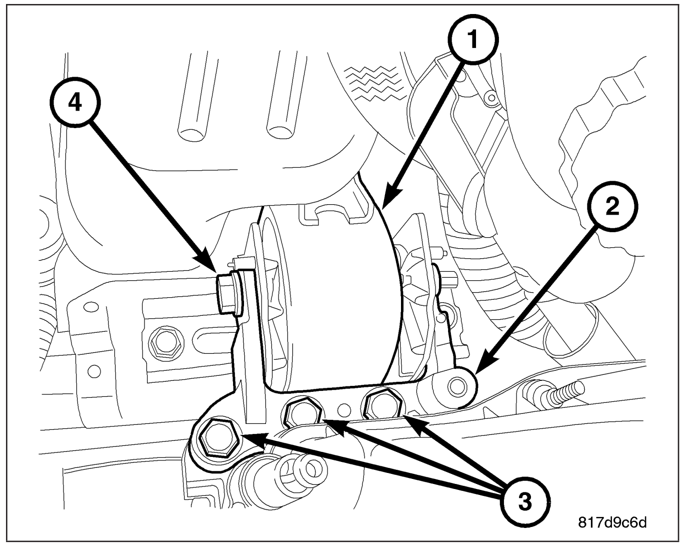


38. Remove ball joint pinch bolts and separate steering knuckle from ball joint.
39. Remove axles.
40. Drain oil.
41. Mark drive shaft and flange.
42. Remove carrier bearing and heat shield.
43. Remove driveshaft.
44. Remove exhaust pipe to maniverter bolts.
45. Remove maniverter support bracket.
46. Lower vehicle.
47. Remove coolant manifold.
48. Remove maniverter bolts.

49. Remove maniverter to left of engine.
50. Hoist up.
51. Remove front mount through bolt.
52. Remove crossmember.
53. Remove front mount bracket.
54. Remove rear mount through bolt.
55. Remove rear mount.
56. Remove rear mount bracket.
57. Pull engine forward and support.
58. Remove PTU assembly (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).
59. Remove inspection cover and mark torque converter to flywheel.
60. Remove torque converter bolts.
61. Remove lower bell housing bolts.
62. Remove A/C lines from compressor and remove A/C compressor.
63. Remove A/C mounting bracket.

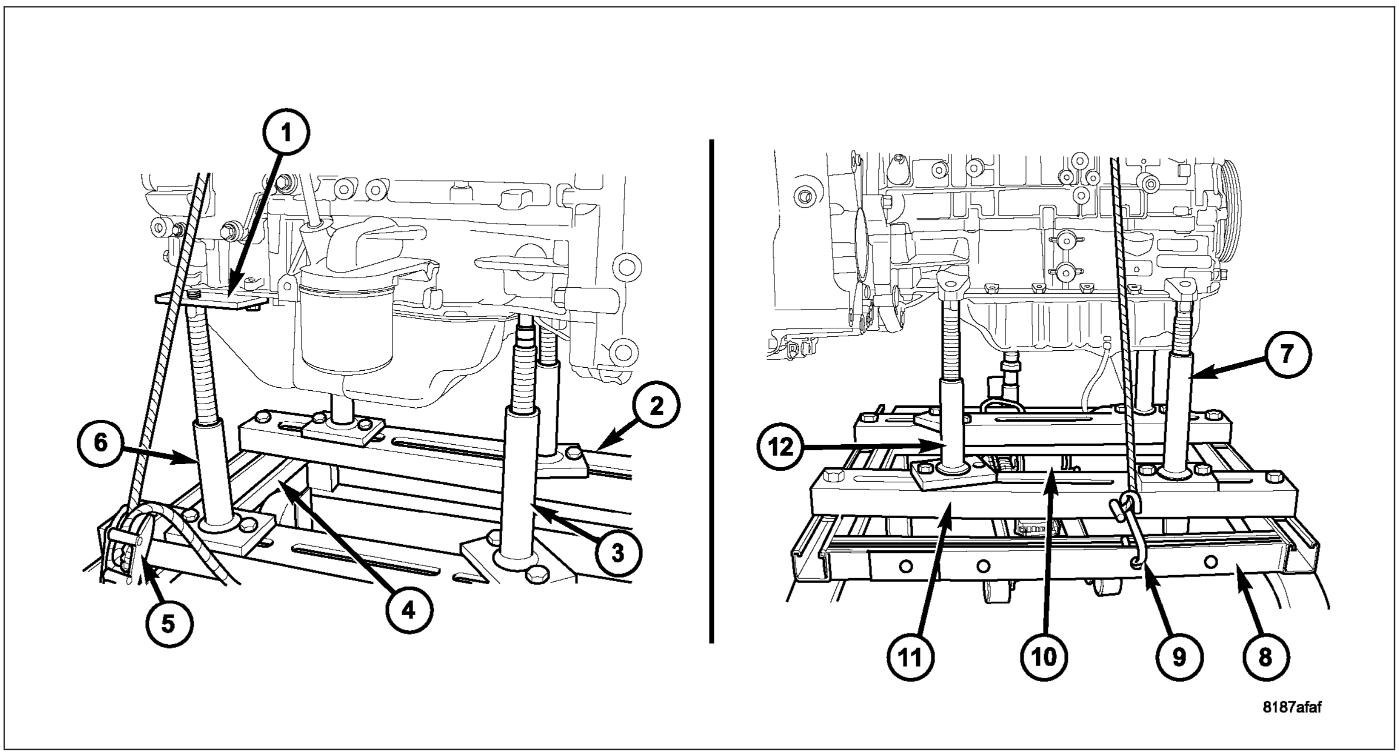
64. Install Adapter 9704.
65. Remove generator and lower idler pulley.
66. Disconnect transmission electrical connector.
67. Disconnect CKP electrical connector.
68. Remove coolant hoses at transaxle cooler.
69. Remove transaxle cooler lines from cooler.





70. Position dolly under engine and lower vehicle.

WARNING: Safety straps MUST be used.



71. Install safety straps.
72. Remove PCM bracket and set aside.
73. Remove left engine mount through bolt (3).

74. Remove right engine mount through bolt (4).
75. Raise vehicle away from engine and transaxle.
76. Separate engine from transaxle.

INSTALLATION - ENGINE ASSEMBLY

1. Position engine and transmission assembly under vehicle and slowly lower the vehicle over the engine/transaxle assembly.
2. Continue lowering vehicle until engine/transaxle aligns to mounting locations.
3. Install mounting bolts at the right and left engine/transaxle mount bolts and Tighten bolts to 118 N·m (87 ft. lbs.).
4. Install mounting bolts at the right and left engine/transaxle mount bolts and Tighten bolts to 118 N·m (87 ft. lbs.).
5. Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.
6. Remove Adapter 9704.
7. Install pcm bracket.
8. Install maniverter assembly and upper lower heat shields.
9. Install oxygen sensor and connect electrical connector.
10. Install coolant manifold assembly.

11. Install transaxle linkage and adjust as necessary.
12. Install transaxle vent hose.
13. Connect transaxle range sensor electrical connector.
14. Connect TIS and TOS electrical connectors.
15. Install Ground strap near right strut tower.
16. Raise vehicle.
17. Pull engine forward and restrain engine.

NOTE: Be sure to install O-ring prior to installing PTU assembly.

18. Install PTU.
19. Remove engine restraint.
20. Install front mount bracket and tighten bolts.
21. Install frame cross member.
22. Install front engine mount.
23. Install rear mount bracket.
24. Install rear mount and tighten bolts.
25. Connect CKP electrical connector.
26. Install maniverter to exhaust pipe bolts and tighten.
27. Align driveshaft marks and install and heat shield.
28. Install generator
29. Install A/C bracket.
30. Install A/C lines on compressor and install compressor.
31. Install lower bell housing bolts and tighten.
32. Align torque converter and flex plate mark and install torque converter bolts and tighten.
33. Install inspection cover.
34. Install transaxle connector.
35. Connect trans cooler lines.
36. Install coolant hoses at transmission cooler.
37. Install axles.
38. Install ball joint pinch bolts and tighten.
39. Install axle nuts and tighten.
40. Install splash shields.
41. Install wheels.
42. Install new oil filter.
43. Lower vehicle.
44. Install transaxle filler tube.
45. Install upper idler pulley.
46. Install power steering pump.
47. Install power steering line support bracket.
48. Install power steering pump.
49. Install accessory drive belt.
50. Connect electrical connectors at block ground, starter, A/C compressor, knock sensor, Oil pressure sensor, generator, Coolant temperature sensor at block, and block heater.
51. Install intake manifold. Install intake manifold retaining bolts and tighten.
52. Install throttle body support bracket.
53. Install engine oil dip stick.
54. Install PCV hose to valve cover.

55. Connect manifold flow control valve and electronic throttle control electrical connectors and fasten harness to intake.
56. Install vacuum lines at throttle body.
57. Install intake air tube on throttle body.
58. Connect variable valve timing solenoids, oil temperature sensor, coolant temperature sensor, intake air temperature sensor, injectors, coils, manifold absolute pressure sensor, cam position sensors, oxygen sensor, and capacitor electrical connectors.
59. Install upper radiator support bracket.
60. Install coolant hoses at coolant manifold.
61. Install grill trim panel.
62. Install coolant reservoir and connect hose.
63. Connect fuel line to fuel rail.
64. Install battery tray and battery.
65. Connect battery cables.
66. Install air cleaner housing and connect inlet air hose.
67. Install fresh air inlet.
68. Fill with coolant.
69. Fill with oil.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

70. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
71. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
72. Start engine and check for leaks.

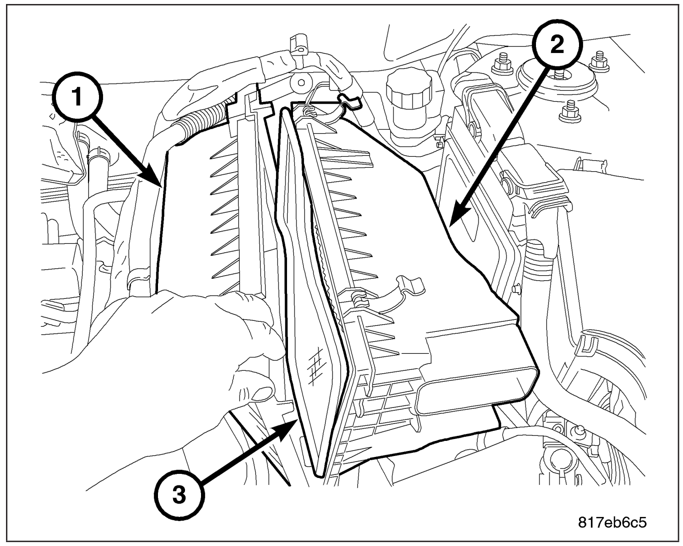
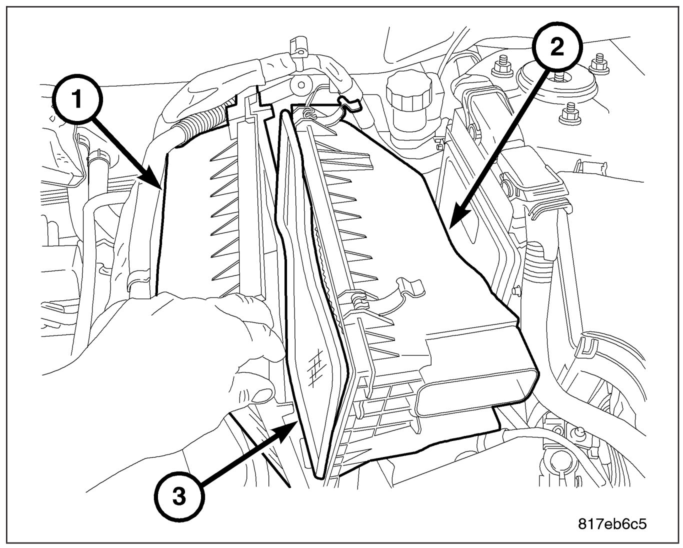
ELEMENT-AIR CLEANER

REMOVAL

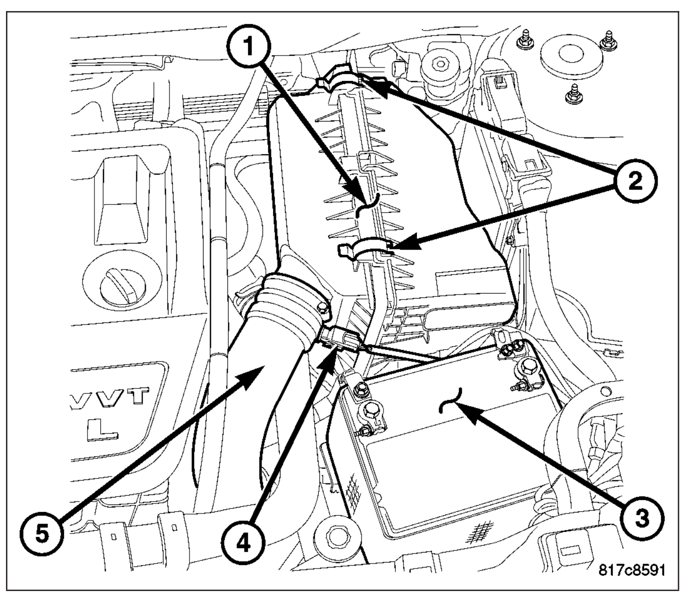


1. Turn Lock Retainers (5) and remove fresh air inlet (2) from air cleaner housing (1).

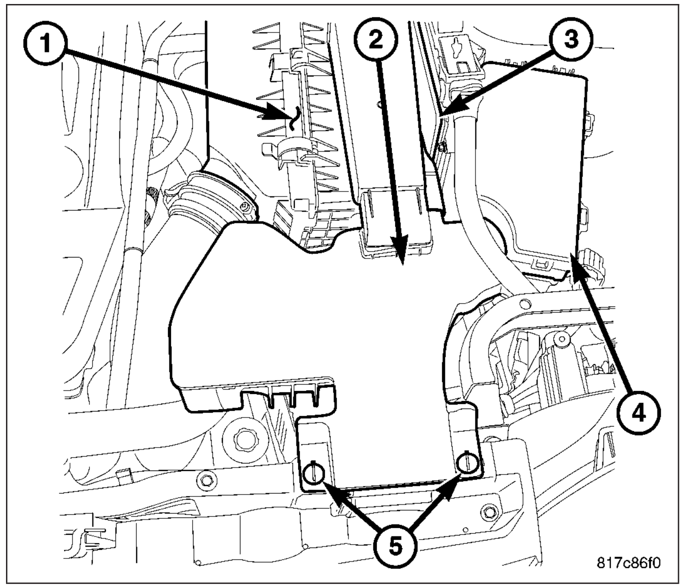
2. Disconnect intake air temperature sensor connector (4).
3. Remove Air inlet tube (5) from air cleaner housing (1).
4. Unfasten clasps (2) on sides of air cleaner housing cover (1).



5. Pull air cleaner cover (1) aside.
6. Remove filter element (3).
7. If necessary, clean the inside of the air cleaner housing (2).

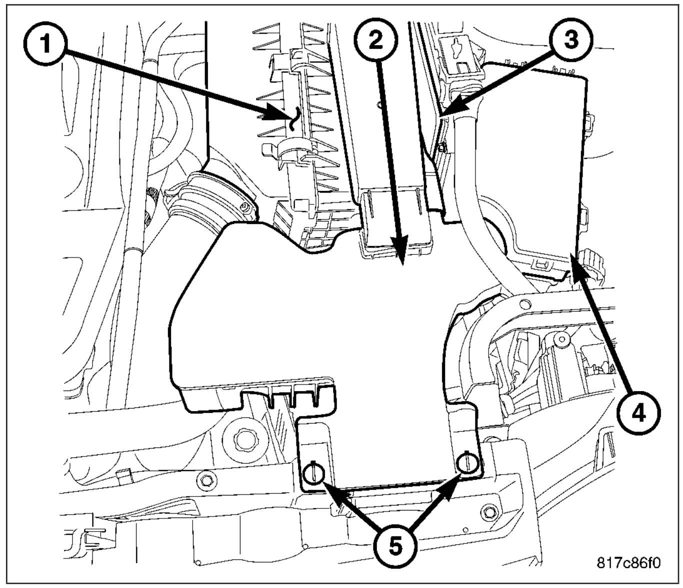


INSTALLATION

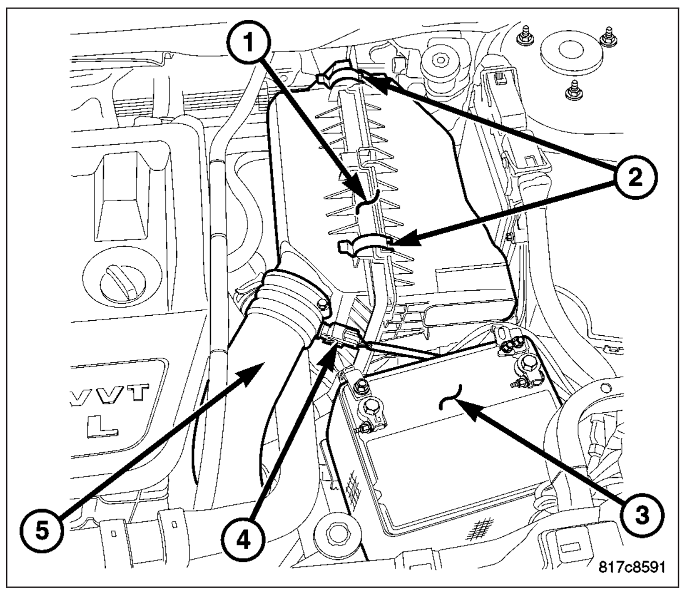


1. Install new filter element.

2. Place cover over air cleaner housing. Snap clasps (2) in place.
3. Install air inlet tube (5).
4. Connect intake air temperature sensor connector (4).



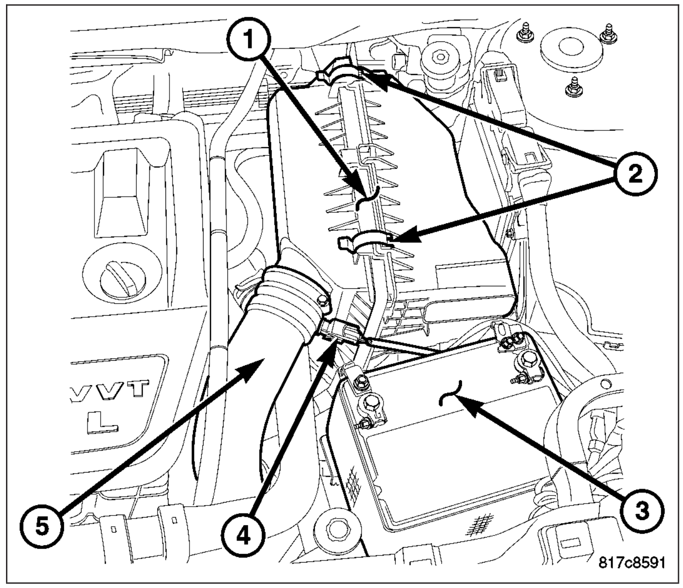
5. Install fresh air inlet (2) on air cleaner housing (1) and lock retainers (5).



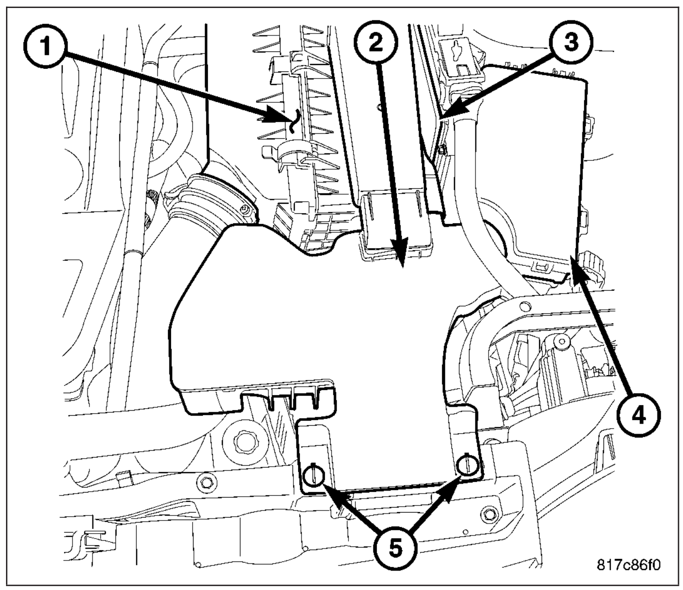
HOUSING-AIR CLEANER

REMOVAL

1. Remove fresh air inlet (2) from air cleaner housing (1).



2. Remove intake air temperature sensor electrical connector (4).
3. Remove air inlet tube (5) from housing (1).
4. Pull housing (1) upward to remove.



INSTALLATION

1. Make sure the rubber grommets, for the air cleaner housing lower pins, are in place when reinstalling the air cleaner housing. The rubber grommets mount to the PDC bracket.
2. Push air cleaner housing (1) down while aligning pins into the grommets.
3. Connect the throttle body air inlet hose (5) to the air cleaner housing (1).
4. Connect intake air temperature sensor connector (4).

5. Install fresh air inlet (2) and lock retainers (5).

CYLINDER HEAD

DESCRIPTION

The cross flow designed, aluminum cylinder head contains dual over-head camshafts with four valves per cylinder. The valves are arranged in two in-line banks. The intake valves face toward the front of the vehicle. The exhaust valves face the dash panel. The cylinder head incorporates powdered metal valve guides and seats. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts.

Integral oil galleries provide lubrication passages to the variable camshaft timing phasers, camshafts, and valve mechanisms.

NOTE: Replacement cylinder heads will come complete with valves, seals, springs, retainers, keepers, lash buckets, and camshafts.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders, between a cylinder and the adjacent water jacket or from an oil passage to the exterior of the engine.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

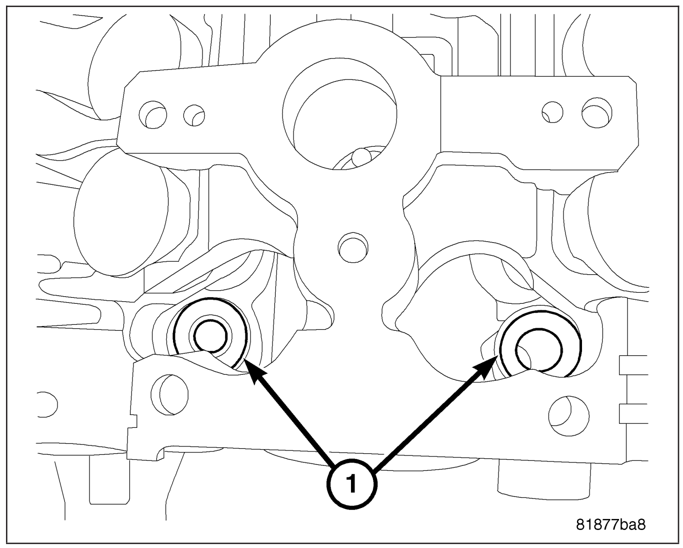
If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD



Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

1. Perform fuel system pressure release procedure **before attempting any repairs**
2. Remove clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect negative cable from battery.
4. Drain cooling system.
5. Remove engine cover.
6. Remove coolant recovery bottle.
7. Remove power steering pump and reposition.
8. Remove windshield washer bottle.
9. Disconnect breather hose.
10. Disconnect PCV hose.
11. Disconnect ignition coil electrical connectors.
12. Remove valve cover.
13. Raise vehicle.
14. Remove right splash shield.
15. Set engine to TDC.
16. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
17. Remove lower A/C compressor bolts if equiped.
18. Remove lower A/C compressor mount.
19. Remove accessory drive belt lower idler pulley.
20. Remove crankshaft and water pump pulleys.
21. Remove right side engine mount bracket lower bolt.
22. Remove timing chain cover lower bolts.
23. Disconnect oxygen sensor electrical connectors.
24. Remove exhaust pipe at manaverter (AWD).
25. Remove manaverter support bracket retaining bolts (AWD).
26. Lower vehicle.
27. Remove power steering pump and set aside.
28. Support engine with suitable jack.
29. Remove right engine mount.
30. Remove accessory drive upper idler pulley.
31. Remove right upper engine mount bracket.
32. Remove accessory drive belt tensioner.
33. Remove upper timing chain cover retaining bolts.
34. Remove timing chain cover.
35. Remove timing chain tensioner.
36. Remove timing chain.
37. Remove timing chain guides.
38. Disconnect fuel line at the fuel rail.
39. Disconnect fuel injector electrical connectors.
40. Disconnect top engine electrical connectors and reposition harness.
41. Remove fuel rail.
42. Remove lower intake manifold support bracket retaining bolt.

43. Disconnect electronic throttle control electrical connector.
44. Disconnect map sensor electrical connector.
45. Disconnect vacuum lines at intake.
46. Remove intake manifold retaining bolts.
47. Remove upper radiator hose retaining bolts.
48. Remove intake manifold.
49. Remove coolant outlet manifold and set aside.
50. Remove ground strap at right rear of cylinder head.
51. Remove oxygen sensor from maniverter (AWD).
52. Remove maniverter heat shields (AWD).
53. Remove maniverter retaining bolts (AWD).
54. Remove maniverter from cylinder head and reposition out of the way (AWD).
55. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

NOTE: All of the cylinder head bolts have captured washersEXCEPTthe front two (1).

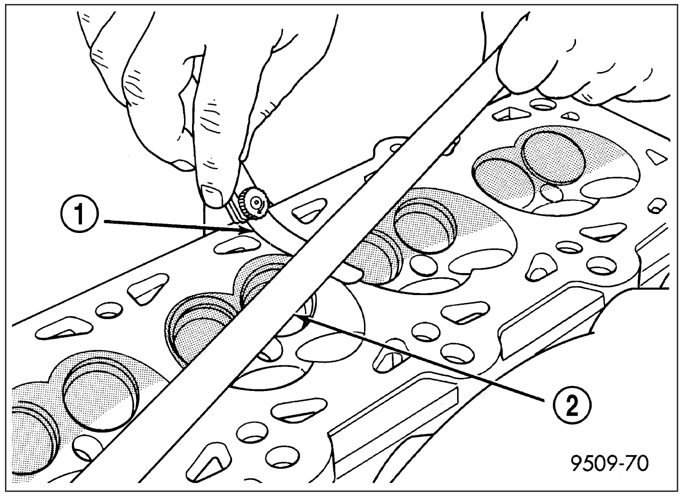
56. Remove cylinder head bolts.
57. Remove cylinder head from engine block.
58. Inspect and clean cylinder head and block sealing surfaces. Refer to Cleaning and Inspection in this section for procedures.

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.

CLEANING

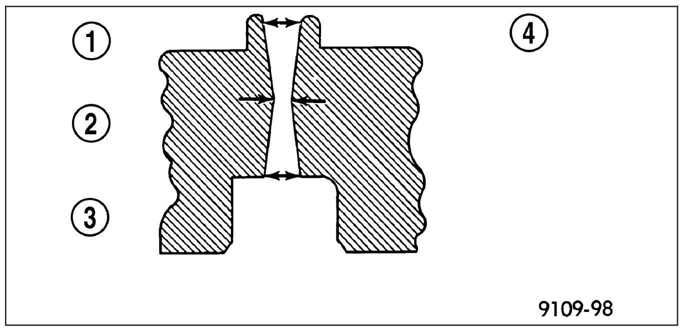
To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.



Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

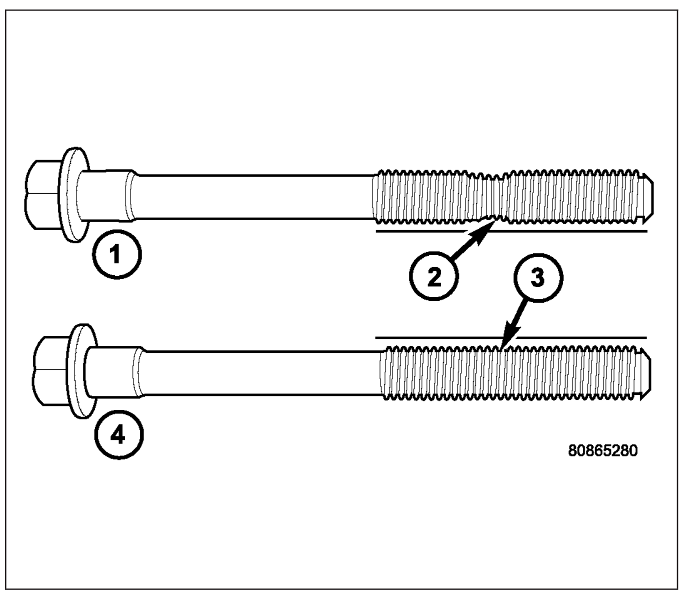


INSPECTION

NOTE: Replacement cylinder heads will come complete with valves, seals, springs, retainers, keepers, lash buckets, and camshafts.

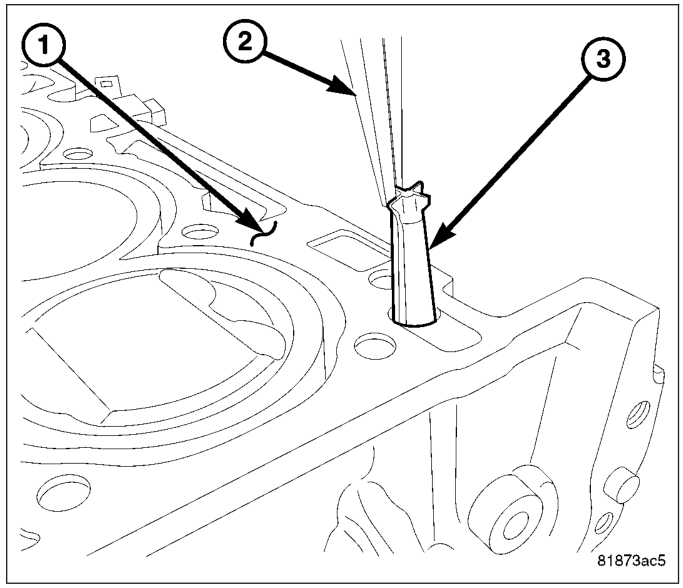
1. Cylinder head must be flat within 0.1 mm (0.004 in.).

2. Inspect camshaft bearing journals for scoring.
3. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
4. Using a small hole gauge and a micrometer, measure valve guides in 3 places top (1), middle (2), and bottom (3). (Refer to 9 - ENGINE - SPECIFICATIONS) Replace guides if they are not within specification.
5. Check valve guide height.
6. Prior to installing cylinder head, the cylinder block should be checked for flatness (Refer to 9 - ENGINE/ENGINE BLOCK - INSPECTION).



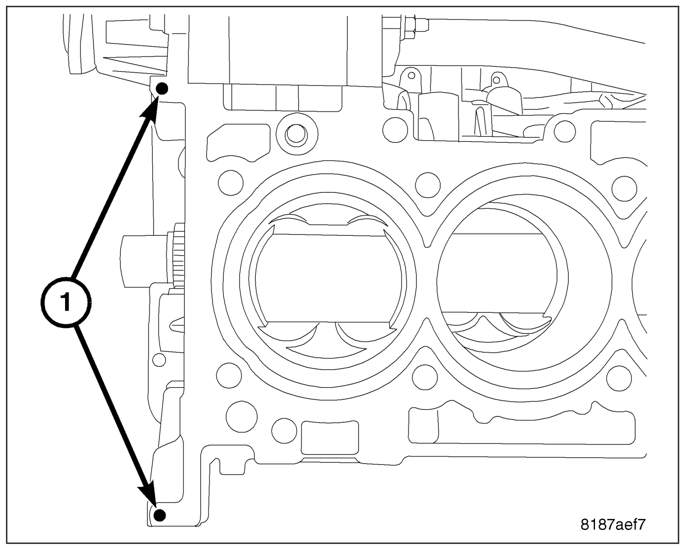
INSTALLATION - CYLINDER HEAD

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.



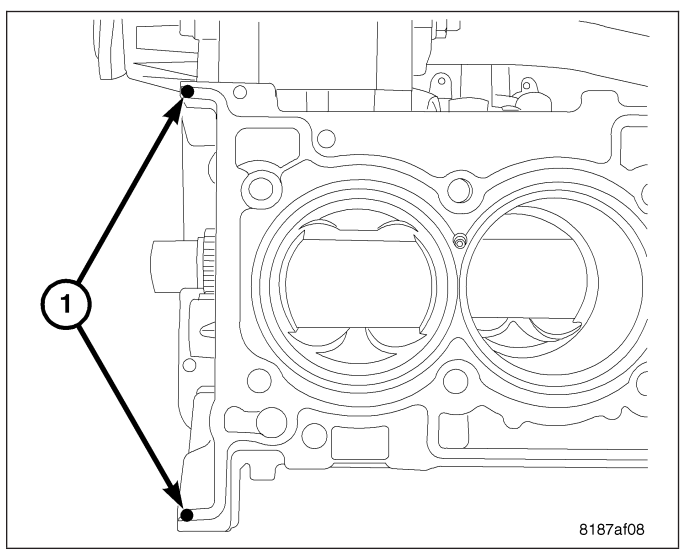
NOTE: The Cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts should be replaced.

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2), the bolt should be replaced.

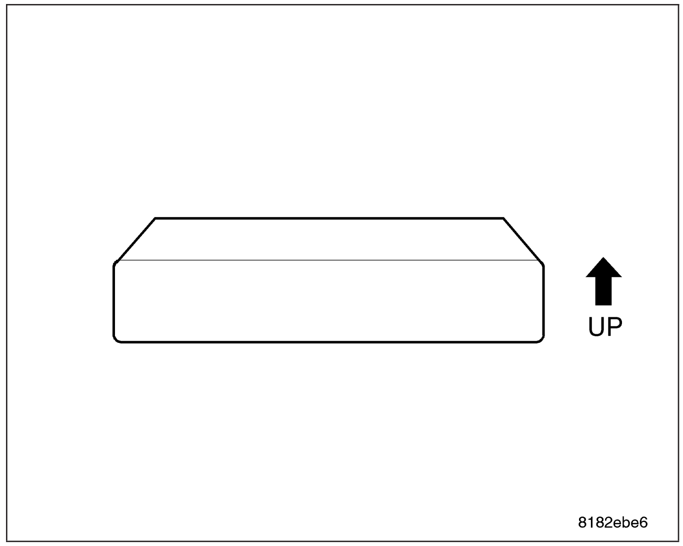


CAUTION: Always replace the variable valve timing filter screen (3) when servicing the head gasket or engine damage could result.

1. Replace the variable valve timing filter screen (3).

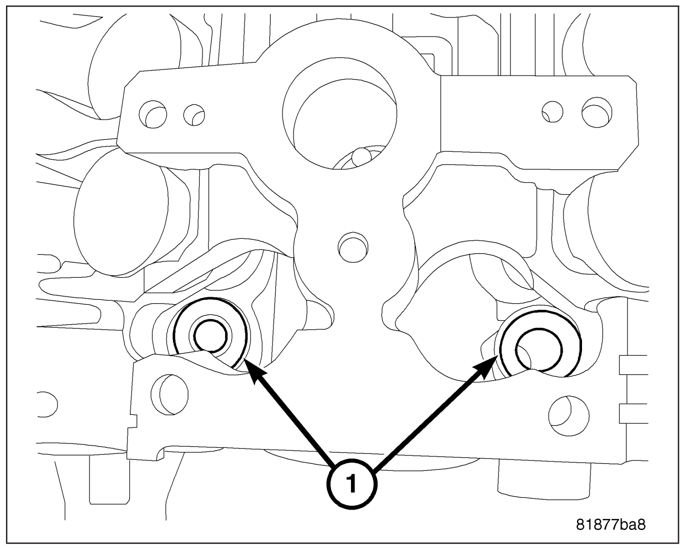


2. Place two pea size dots of RTV (1) on cylinder block as shown.



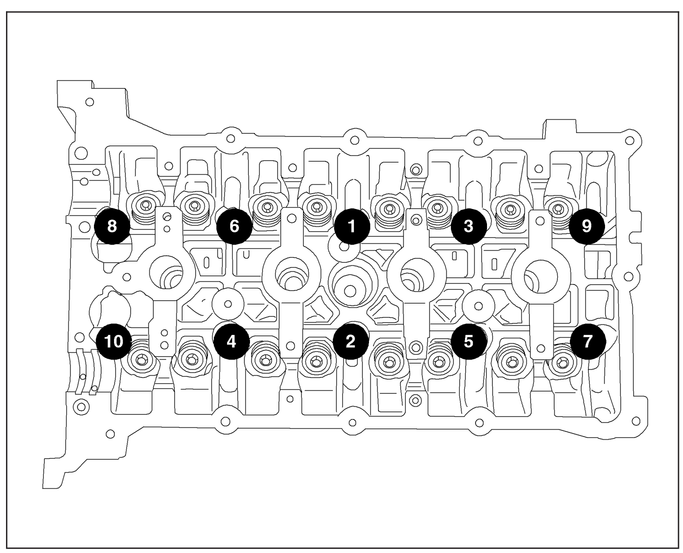
3. Position the new cylinder head gasket on engine block with the part number facing up. Ensure gasket is seated over the locating dowels in block.
4. Place two pea size dots of RTV (1) on cylinder head gasket as shown.

NOTE: The head must be installed within 15 minutes before the RTV skins.



5. Position cylinder head onto engine block.

NOTE: The front two cylinder head bolts do not have captured washers. The washers must be installed with the bevel up towards the bolt head.



6. Install washers (1) for the front two cylinder head bolts.

7. Before installing the bolts, the threads should be lightly coated with engine oil.
8. Install the cylinder head bolts and torque in the sequence shown above.
   - First: All to 30 N·m (25 ft. lbs.)
   - Second: All to 61 N·m (50 ft. lbs.)
   - Third: All to 61 N·m (45 ft. lbs.)
   - Fourth: All an additional 90°

CAUTION: Do not use a torque wrench for the Fourth step.

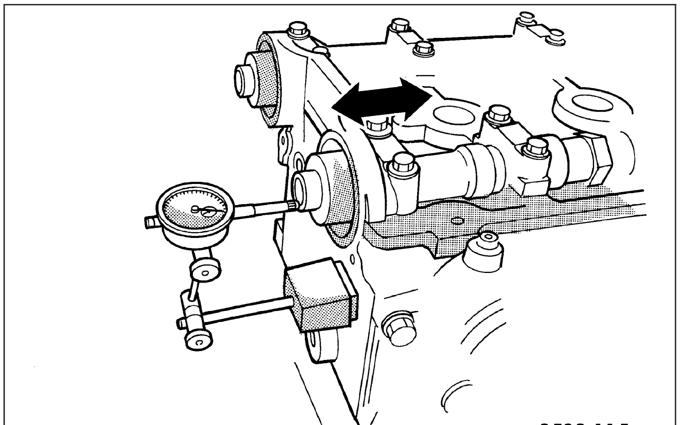
9. Install camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
10. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).
11. Install maniverter/exhaust manifold to cylinder head. Torque fasteners to 34 N·m (25 ft.lbs.).
12. Install heat shields.Torque fasteners to 9 N·m ( ).
13. Install oxygen sensor in maniverter.
14. Install ground strap at right rear of cylinder head.

15. Install coolant manifold.
16. Install intake manifold.
17. Install intake manifold bolts and torque to 24 N·m (18 ft.lbs.).
18. Install upper radiator hose retaining bracket.
19. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
20. Install timing chain cover, torque m6 bolts to 12 N·m (105 in.lbs.) and m8 bolts to 23 N·m (17 ft.lbs.).
21. Connect cam sensor wiring connector.
22. Install spark plugs and torque to 27 N·m (20 ft.lbs.).
23. Install ignition coils and torque to 8 N·m (70 in.lbs.).
24. Install power steering pump reservoir/bracket to cylinder head.
25. Install exhaust pipe to manifold. Torque fasteners to 28 N·m (20 ft. lbs.).
26. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
27. Connect engine coolant temperature sensor connector.
28. Connect upper radiator hose. Connect heater hoses to thermostat housing.
29. Install heater tube support bracket to cylinder head.
30. Install fastener attaching dipstick tube to lower intake manifold
31. Connect fuel supply line quick-connect at the fuel rail assembly (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
32. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
33. Connect negative cable to battery.
34. Install clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

CAMSHAFT(S)

DESCRIPTION

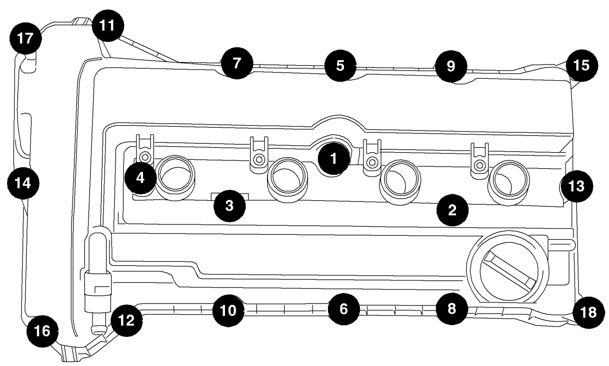
Both camshafts have six bearing journal surfaces and two cam lobes per cylinder. Flanges on the third journal control camshaft end play. Cam position sensors are located on the intake and exhaust camshafts on the rear of the cylinder head.



OPERATION

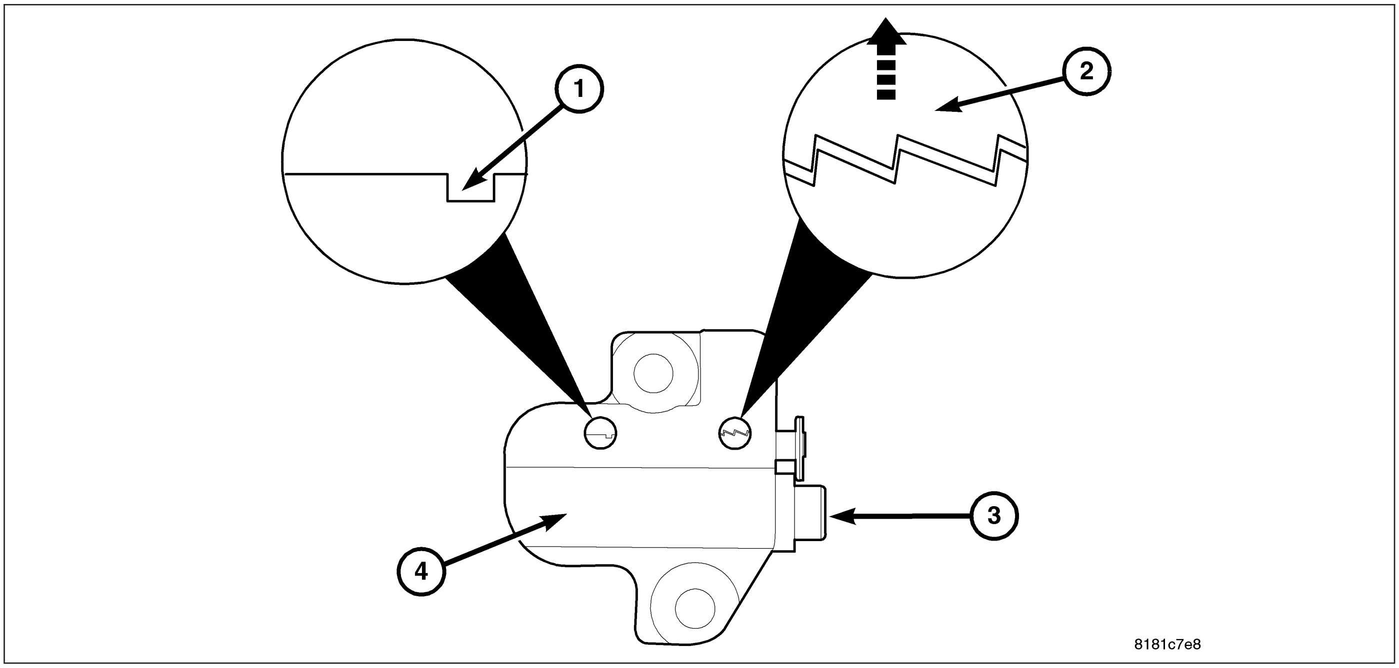
The camshaft is driven by the crankshaft via drive sprockets and a chain. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE



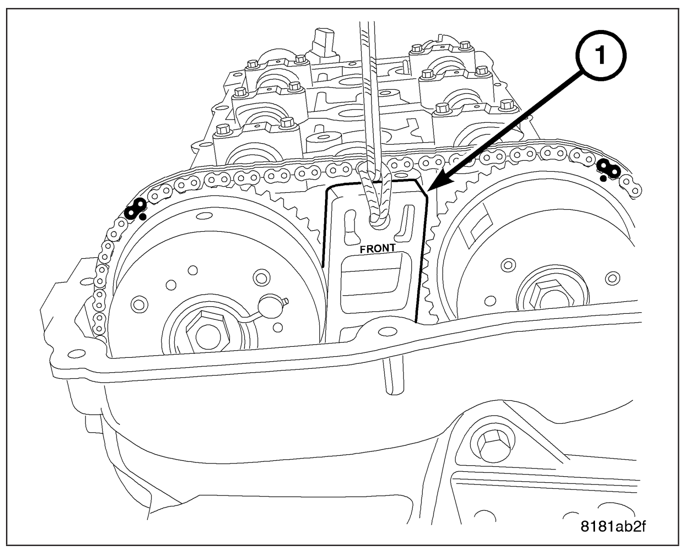
MEASURING CAMSHAFT END PLAY

1. Using a suitable tool, move camshaft as far rearward as it will go.
2. Zero dial indicator.
3. Move camshaft as far forward as it will go.
4. Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).
5. If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

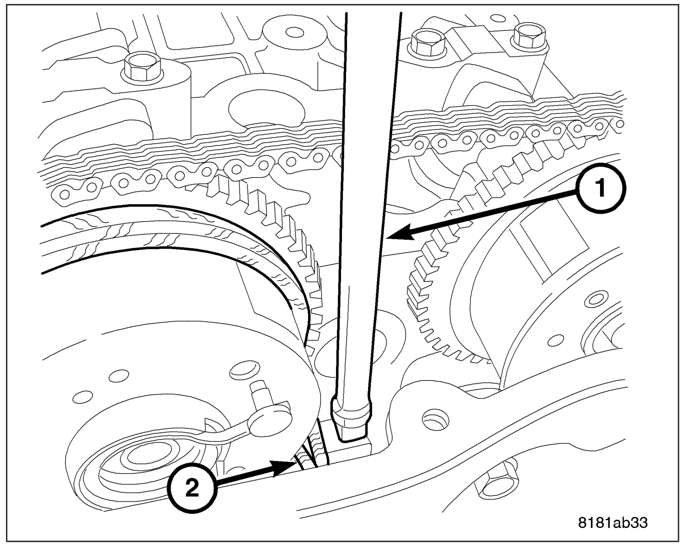


9509-115

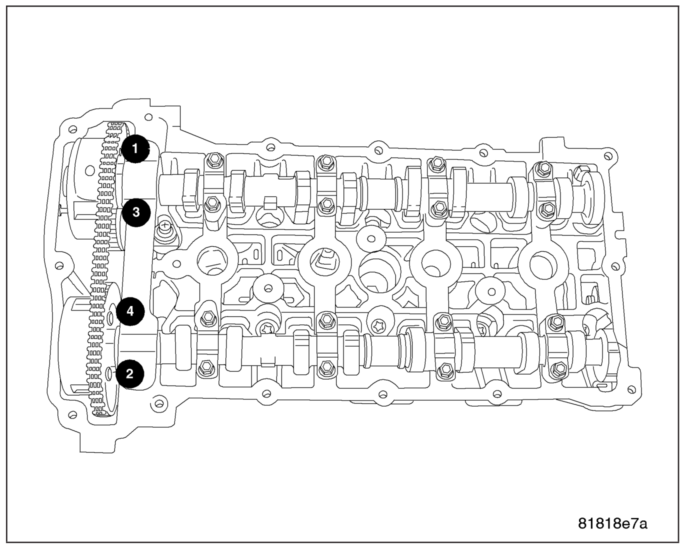
REMOVAL



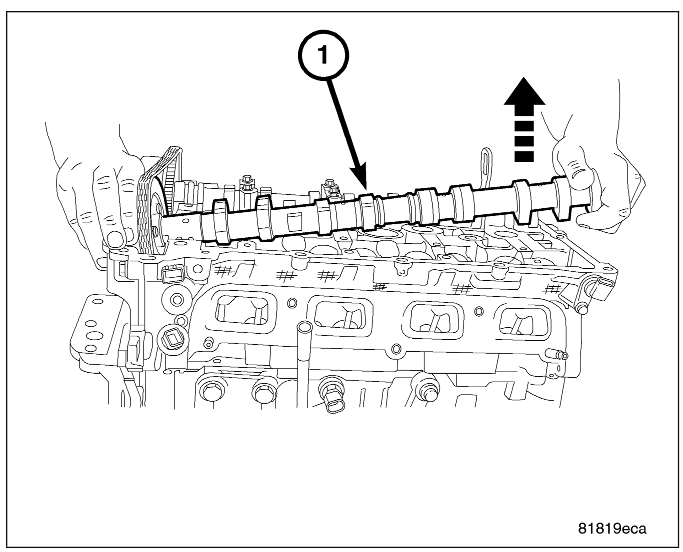
1. Remove engine cover by pulling upward.
2. Disconnect negative battery cable.
3. Remove cylinder head cover (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
4. Raise vehicle.
5. Remove right splash shield.



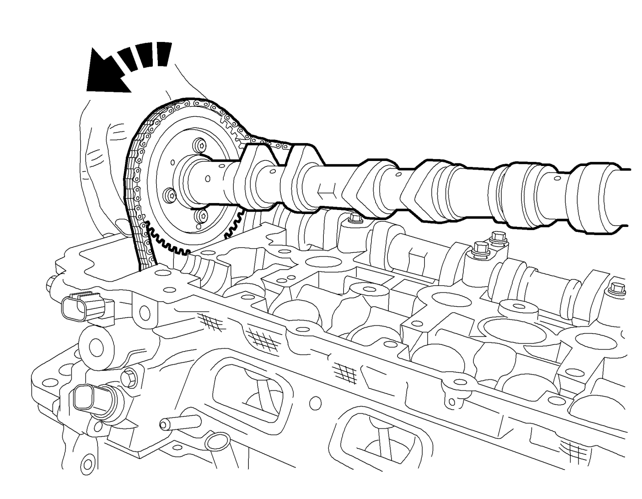
8182e337



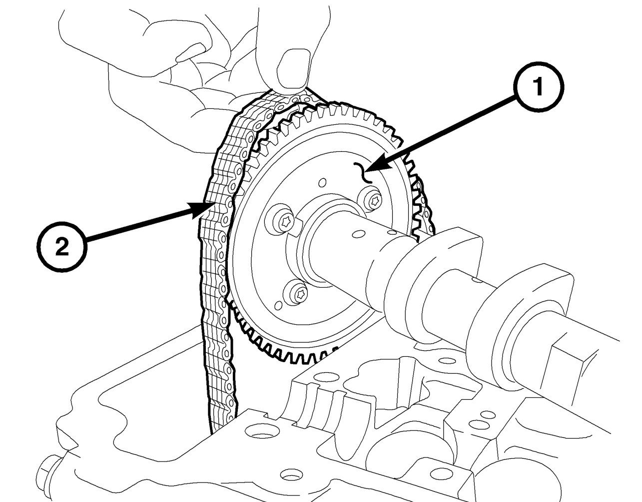
6. Remove timing tensioner plug from front cover.
7. Insert small allen wrench and lift ratchet (2) upward to release the tensioner. Leave the allen wrench installed during the remainder of this procedure.
8. Insert wedge 9701 (1).



9. Lightly tap Wedge 9701(2) into place.



10. Remove the front camshaft bearing cap.
11. Slowly remove the remaining camshaft bearing bolts one turn at a time following the above sequence.



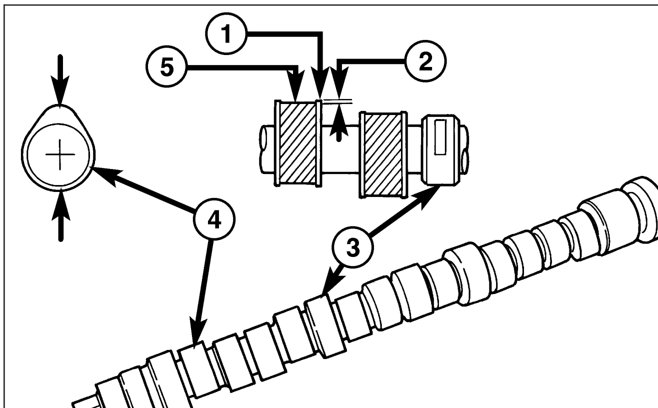
12. Remove intake camshaft (1) by lifting the rear of the camshaft upward.

13. Rotate the camshaft while lifting out of the front bearing cradle.

81819f0f

14. Lift the timing chain (2) off the sprocket (1).
15. Remove exhaust camshaft.

81819faa

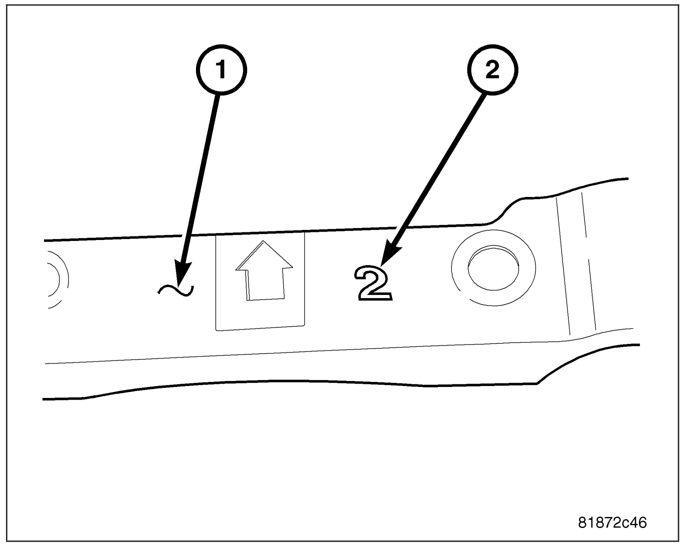


CLEANING

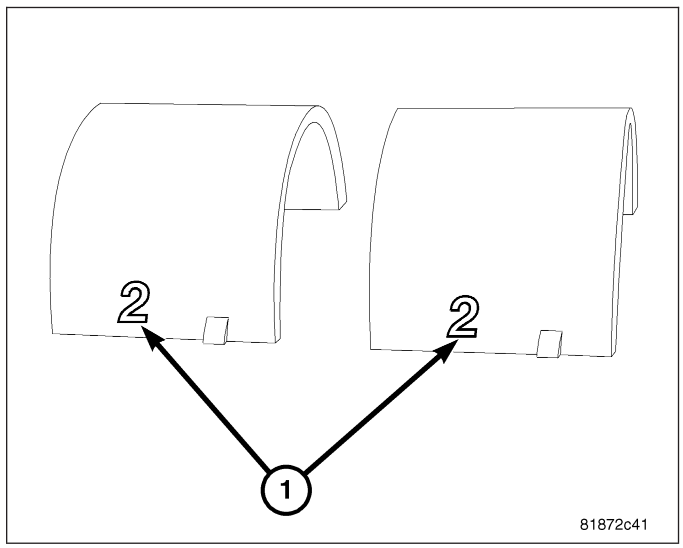
Clean camshafts with a suitable solvent.

INSPECTION

1. Inspect camshaft bearing journals for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

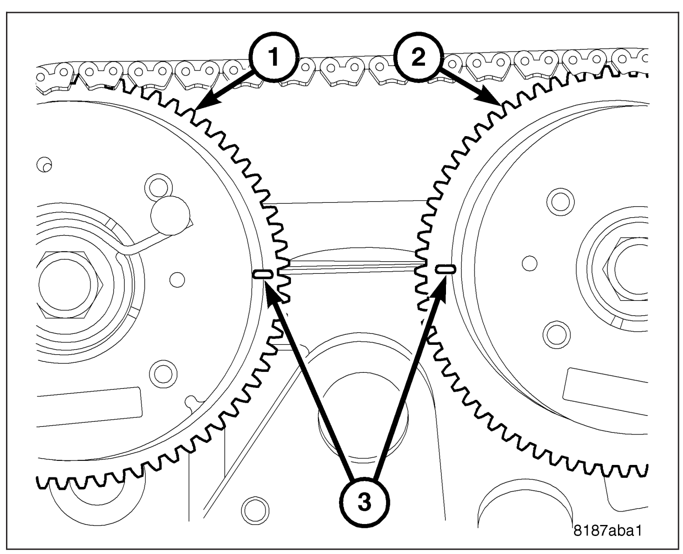


NOTE: If camshaft is replaced due to lobe wear or damage, always replace the lash buckets.

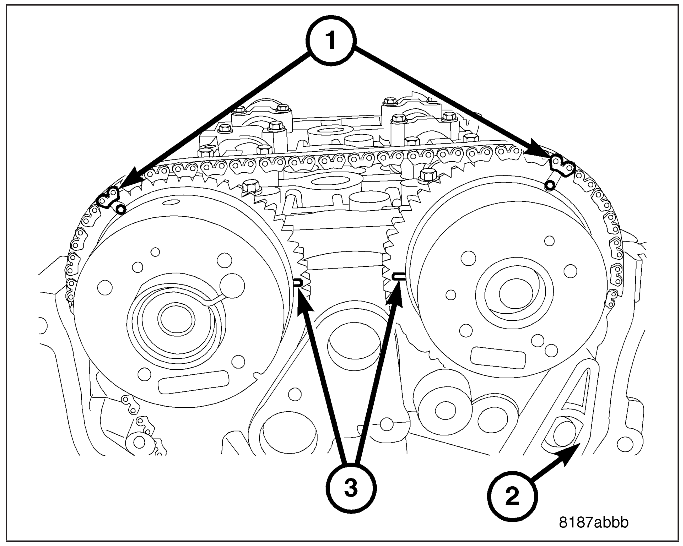


80a544b5

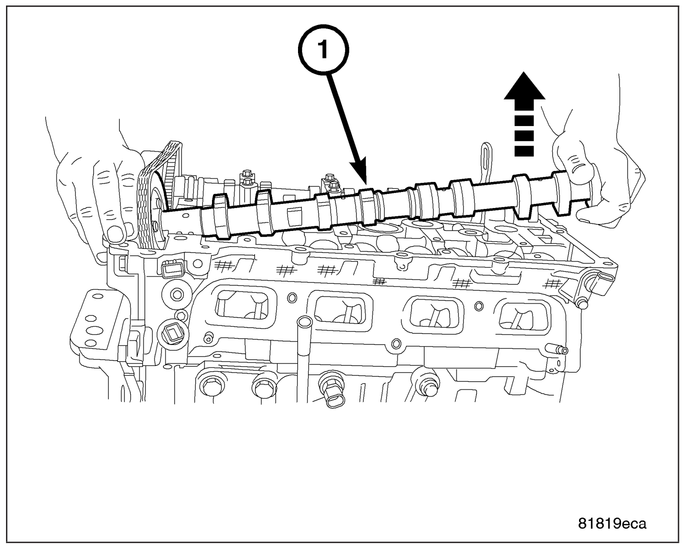
INSTALLATION



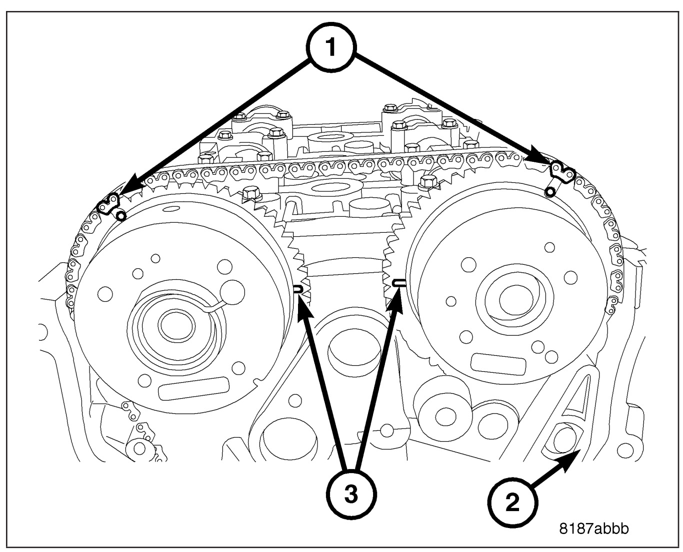
1. Identify which front cam cap (1) is installed on the engine you are working on.
2. The cam cap (1) is numbered (2) either one, two, or three, this corresponds to the select fit bearing to use.



3. Install the corresponding select fit bearing that will also be numbered (1) one, two, or three.
4. Oil all of the camshaft journals with clean engine oil.
5. Install exhaust camshaft and position on bearing journals in the cylinder head.

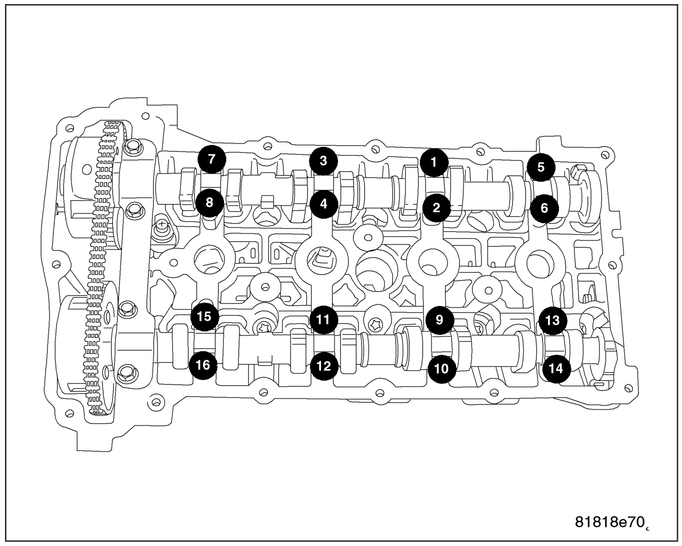


6. Align exhaust cam timing mark so it is parallel to the cylinder head as shown.

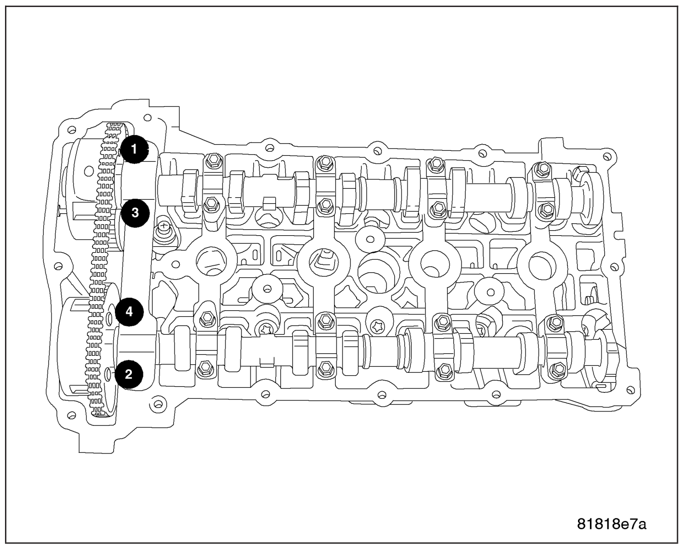


7. Install timing chain onto exhaust cam sprocket making sure that the timing marks (1) on the sprocket and chain are aligned.

8. Install intake camshaft by raising the rear of the camshaft upward and roll the sprocket into the chain.



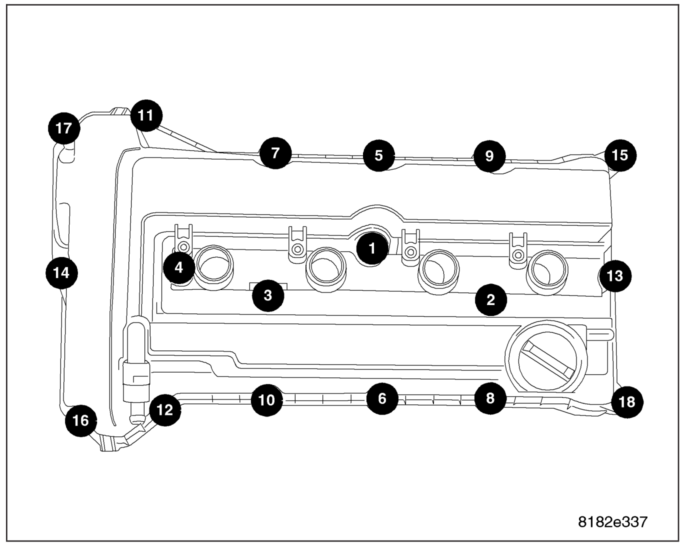
9. Align the timing marks (1) on the intake cam sprocket with the mark in the chain.
10. Position the intake camshaft into the bearing journals in the cylinder head.
11. Verify that the timing marks (1) are aligned on both camshafts and that the timing marks (3) are parallel with the cylinder head.



CAUTION: Install the front intake and exhaust camshaft bearing cap last. Ensure that the dowels are seated and follow torque sequence or damage to engine could result.

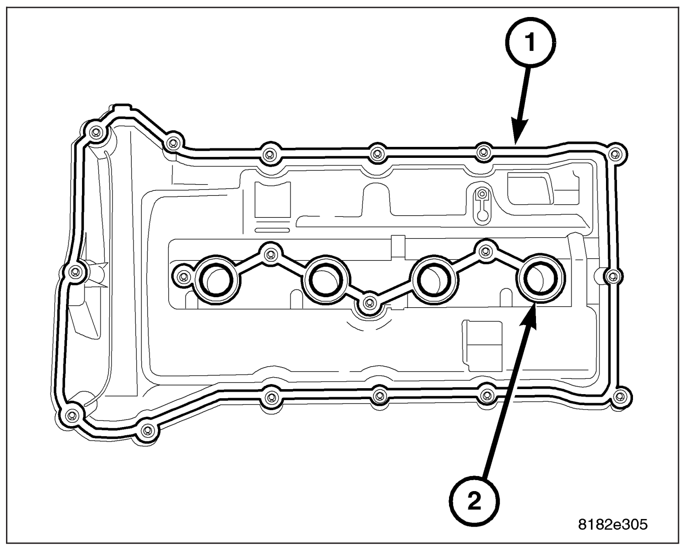
NOTE: If the front camshaft bearing cap is broken, the cylinder head MUST be replaced.

12. Install intake and exhaust camshaft bearing caps slowly torque bolts in the sequence shown.



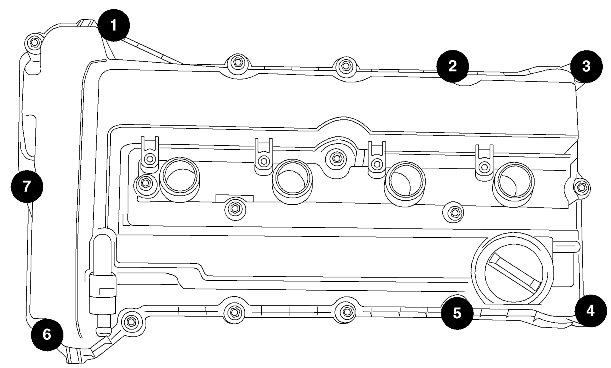
13. Install the front intake and exhaust bearing cap and torque bolts in the sequence shown.
14. Verify that all timing marks are aligned.
15. Remove allen wrench from timing chain tensioner.
16. Remove locking wedge 9701.
17. Apply MOPAR® thread sealant to timing tensioner plug and Install.
18. Install right splash shield.
19. Install cylinder head cover (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
20. Install engine cover.
21. Connect negative battery cable.
22. Fill cooling system.
23. Fill with oil.
24. Start engine and check for leaks.

COVER-CYLINDER HEAD



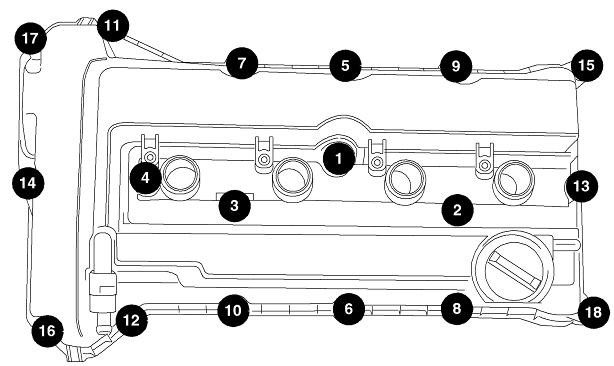
REMOVAL

1. Remove engine cover.
2. Disconnect ignition coil electrical connectors.
3. Disconnect PCV and make-up air hoses from cylinder head cover.
4. Use compressed air to blow dirt and debris off the cylinder head cover prior to removal.
5. Remove cylinder head cover bolts.
6. Remove cylinder head cover from cylinder head.



INSTALLATION

1. Install new cylinder head cover gaskets (1,2).

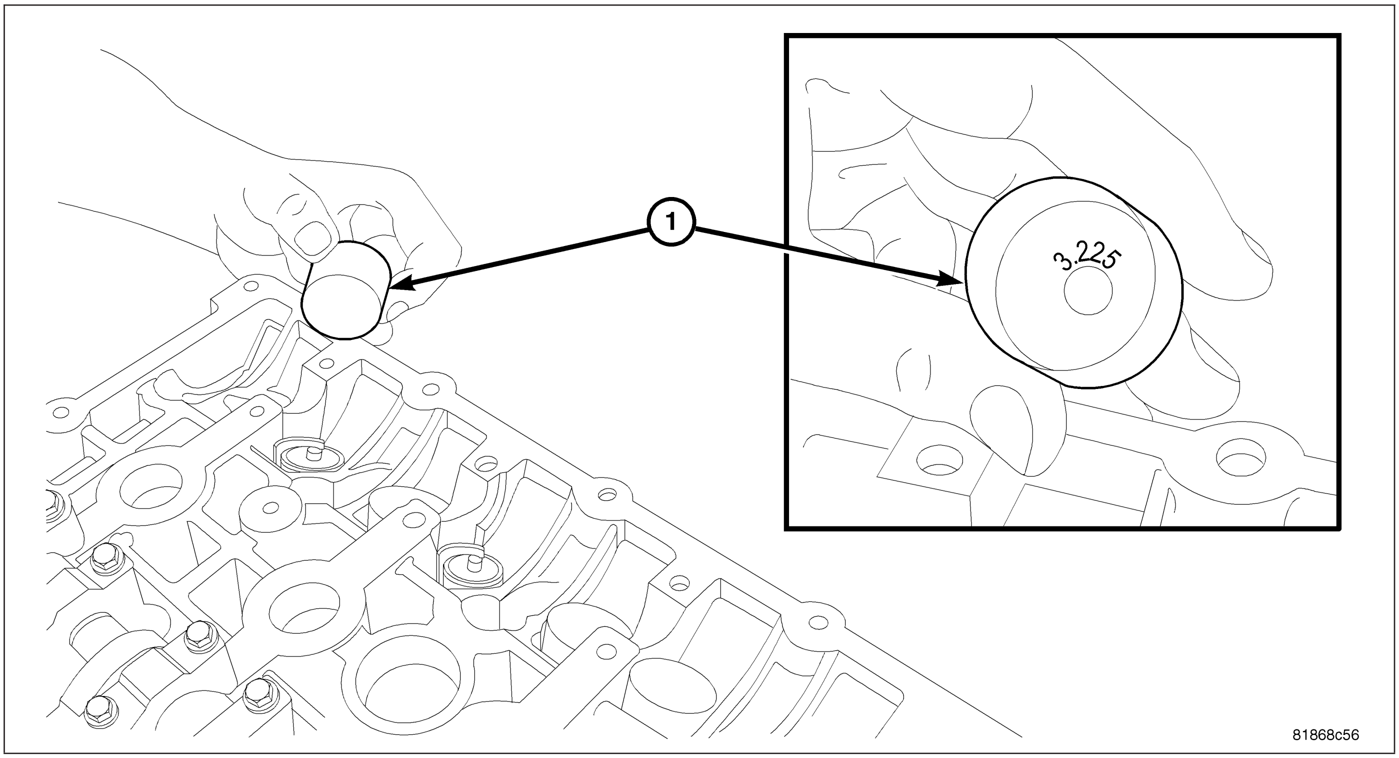


2. Install studs in cover as shown.

8182e312

3. Clean all RTV from cylinder head.
4. Apply RTV to cylinder head/front cover joint.
5. Install cylinder head cover assembly to cylinder head and install all bolts, ensuring the studs are located as shown.
6. Tighten bolts in sequence shown in Using a 2 step torque method as follows:
   a. Tighten all bolts to 4.5 N·m (40 in. lbs.)
   b. Tighten all bolts to 10 N·m (90 in. lbs.).
7. Install ignition coils. Tighten fasteners to 8 N·m (70 in. lbs.).
8. If the PCV valve was removed, tighten PCV valve to 4.5 N·m (40 in. lbs.).
9. Connect PCV and make-up air hoses to cylinder head cover.
10. Install engine cover.

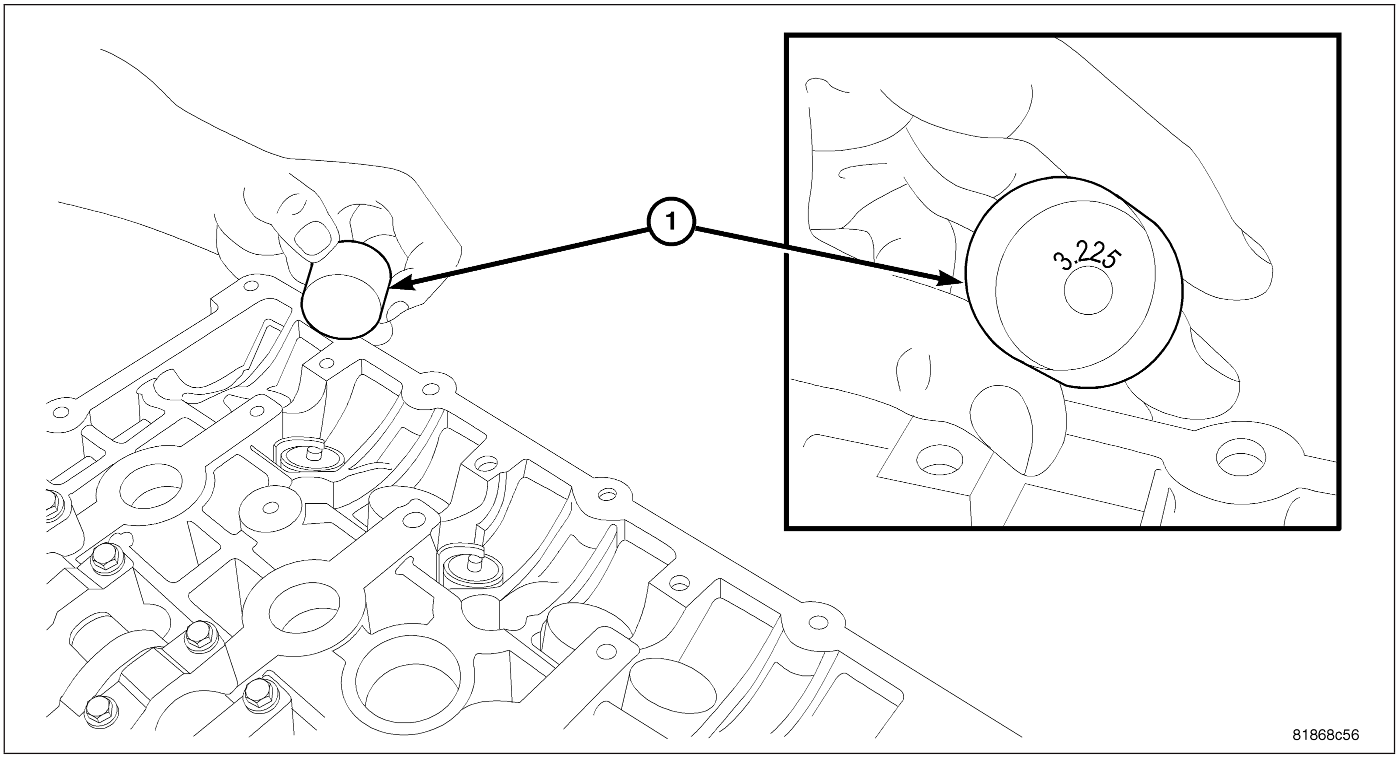
8182e337



TAPPETS-VALVE

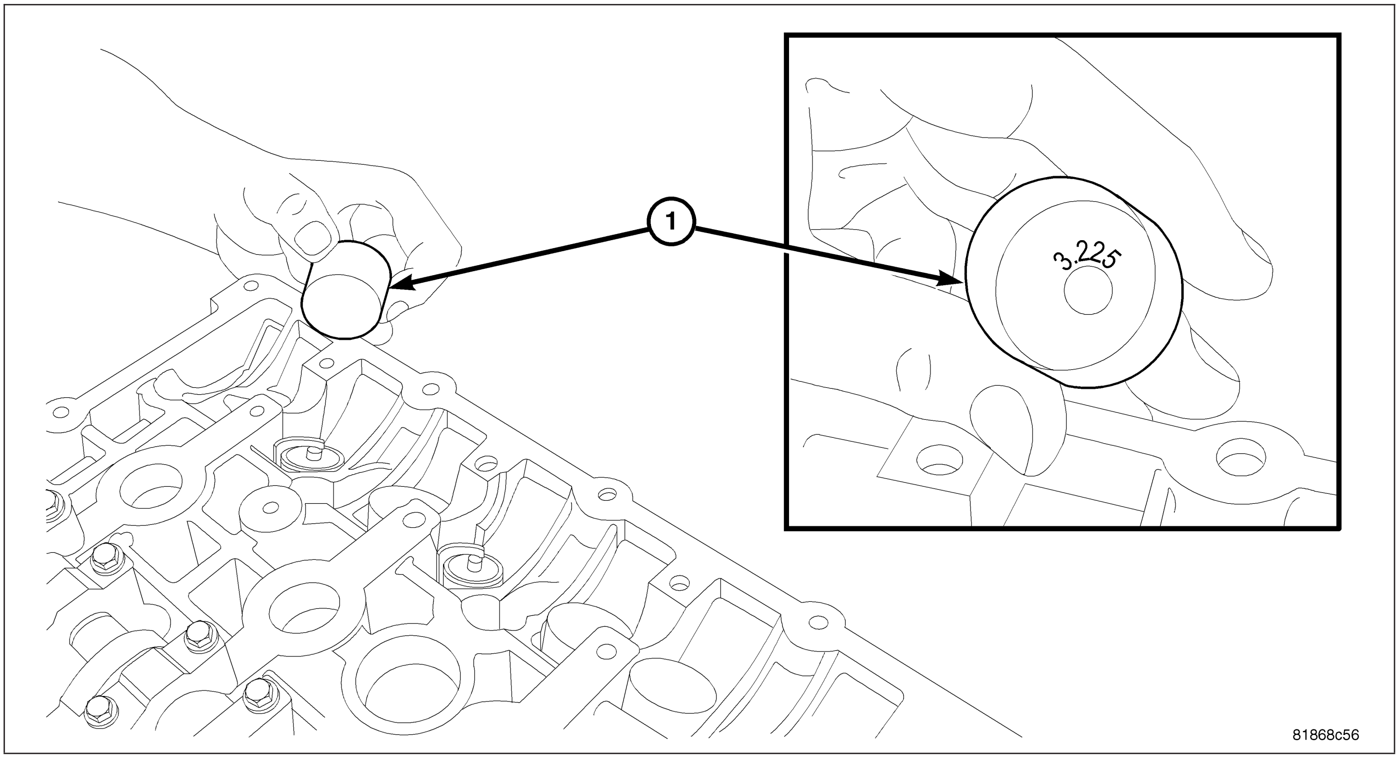
DIAGNOSIS AND TESTING

MECHANICAL VALVE TAPPET NOISE DIAGNOSIS



A tappet-like noise may be produced from several items. Check the following items.

STANDARD PROCEDURE - MEASURING VALVE LASH



1. Remove engine cover.
2. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
3. Rotate camshaft so lobes are vertical.
4. Check clearance using feeler gauges.
5. Repeat for all tappets.
6. If clearance was too small Clearance too Small .
7. If clearance was too large Clearance too Large .

Clearance too Small

1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. spec – measured = delta
3. Decrease bucket thickness by delta.
4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Verify that valve lash is correct.

Clearance too Large

1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. Measured – spec = delta
3. Increase bucket thickness by delta.
4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Verify that valve lash is correct.

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

NOTE: Camshaft buckets must be replaced if cylinder head or camshafts are replaced.

1. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
3. Remove camshaft buckets.
4. Repeat removal procedure for each camshaft bucket.
5. If reusing, mark each camshaft bucket for reassembly in original position.

INSTALLATION

NOTE: If reinstalling original buckets they must go back in their original location or engine damage could result.

1. Apply a light coat of clean engine oil to camshafts buckets prior to assembly.
2. Install camshaft bucket into cylinder head.
3. Repeat installation procedure for each camshaft bucket.

NOTE: If installing new buckets, the valve lash procedure must be performed.

4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

VALVES & SEATS-INTAKE/EXHAUST

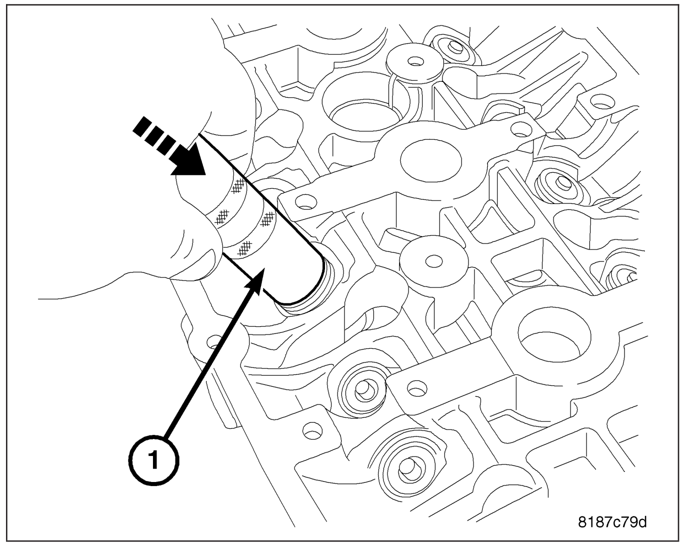
DESCRIPTION

The valves are made of heat resistant steel. They have nitrided stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. The valves have a single bead lock keepers to retain the springs.

OPERATION

The four valves per cylinder (two intake and two exhaust) are opened by using direct acting buckets which are actuated by the camshaft.

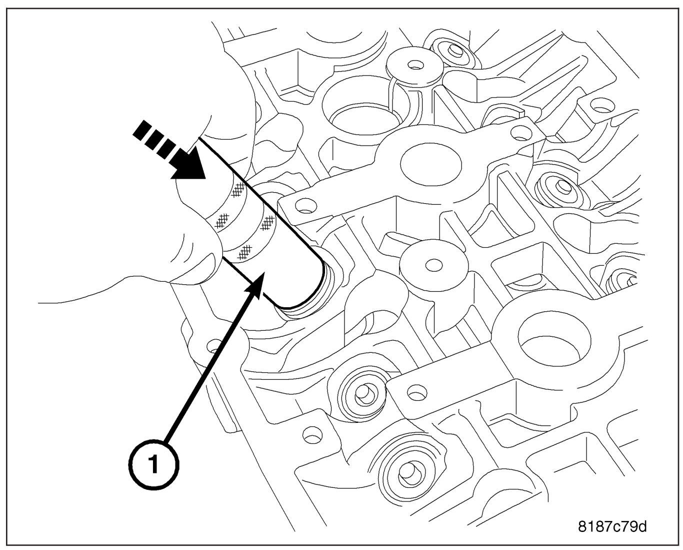
CLEANING



1. Clean all valves thoroughly and discard burned, warped and cracked valves.

SPRINGS & SEALS-VALVE

REMOVAL

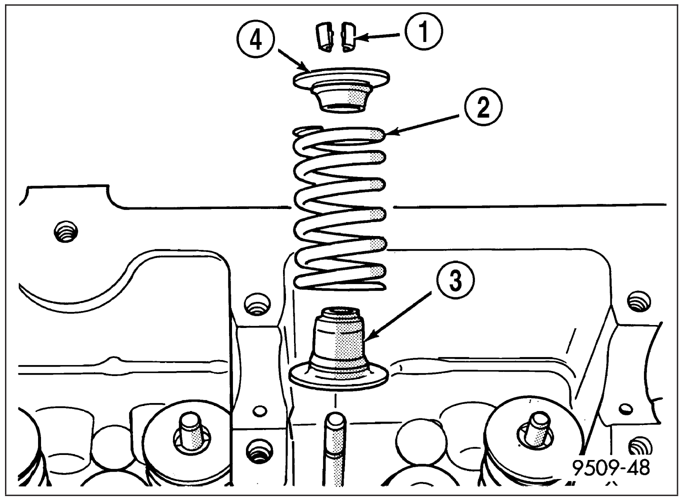


CYLINDER HEAD ON

1. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
3. Rotate crankshaft until piston is at TDC on compression.
4. With air hose attached to adapter tool installed in spark plug hole, apply 90-120 psi air pressure.
5. Using metric valve keeper remover (1), and remove valve spring keepers and retainer.
6. Remove valve spring(s).
7. Remove valve stem seal(s) by a using valve stem seal tool.

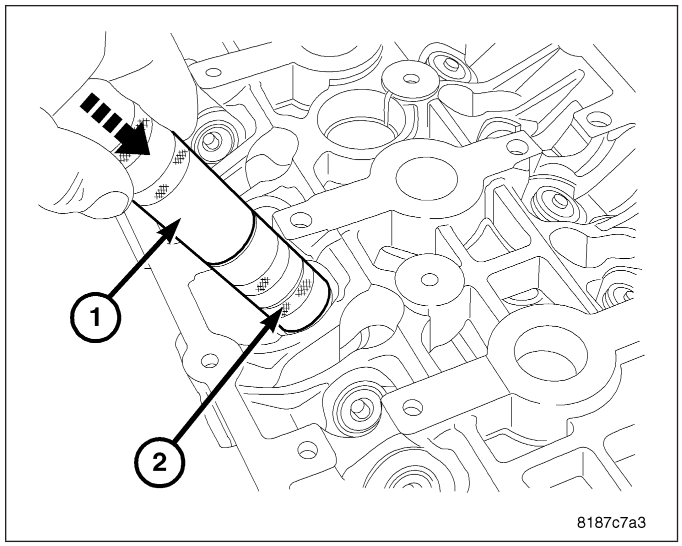
CYLINDER HEAD OFF

1. With cylinder head removed from cylinder block, place a ball of rags in the combustion chamber.
2. Using Snap On metric valve keeper remover (1) or equivalent, remove valve keepers with a downward push.
3. Remove retainer and springs.
4. Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves, locks and retainers to insure installation in original location.
5. Inspect the valves. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSPECTION).



INSPECTION

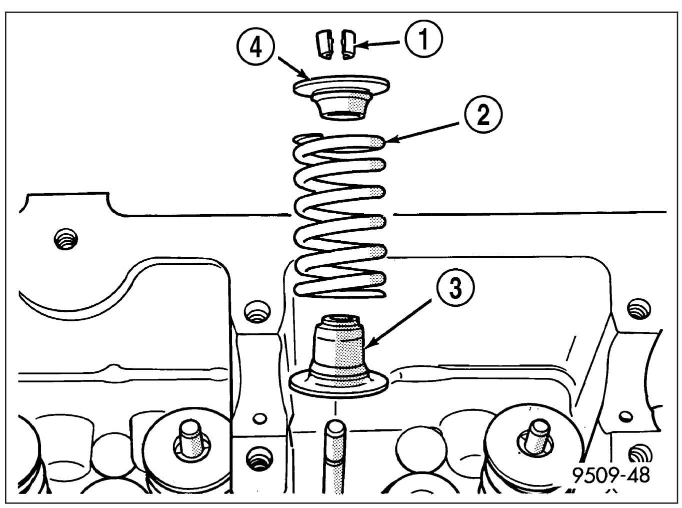
1. Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested for correct tension. Discard the springs that do not meet specifications. The following specifications apply to both intake and exhaust valves springs:
   - Valve Closed Nominal Tension—75 lbs. @ 38.0 mm (1.50 in.)
   - Valve Open Nominal Tension—134 lbs. @ 29.75 mm (1.17 in.)
2. Inspect each valve spring for squareness with a steel square and surface plate, test springs from both ends. If the spring is more than 1.5 mm (1/16 inch) out of square, install a new spring.



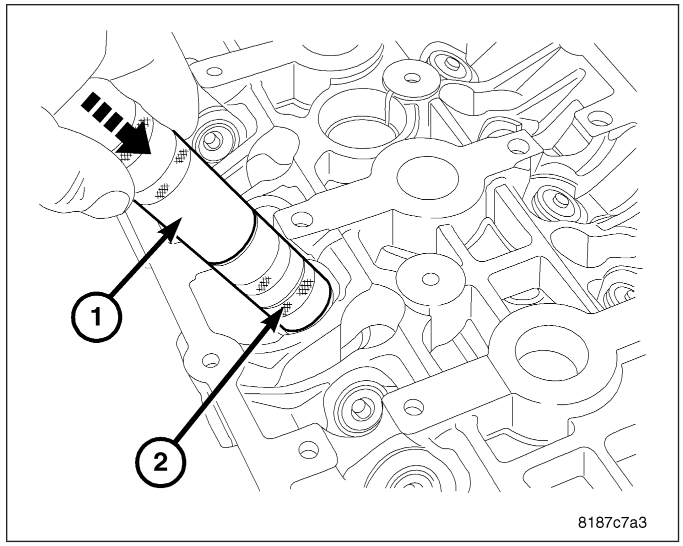
INSTALLATION

CYLINDER HEAD ON

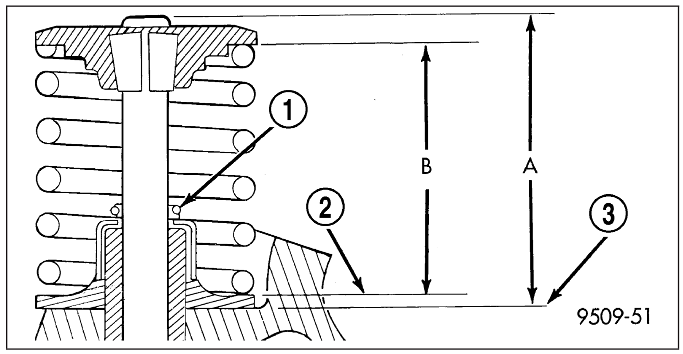
1. Install valve seal/valve spring seat (3) assembly. Push the assembly down with appropriate size socket to seat it onto the valve guide.
2. Install valve spring (2) and retainer (4) with keepers (1).



3. Place the valve keepers in the retainer. Using Snap On metric valve keeper installer (2) and remover (1) as a handle, install valve keepers with a downward push.
4. Remove air hose and install spark plugs.
5. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
6. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

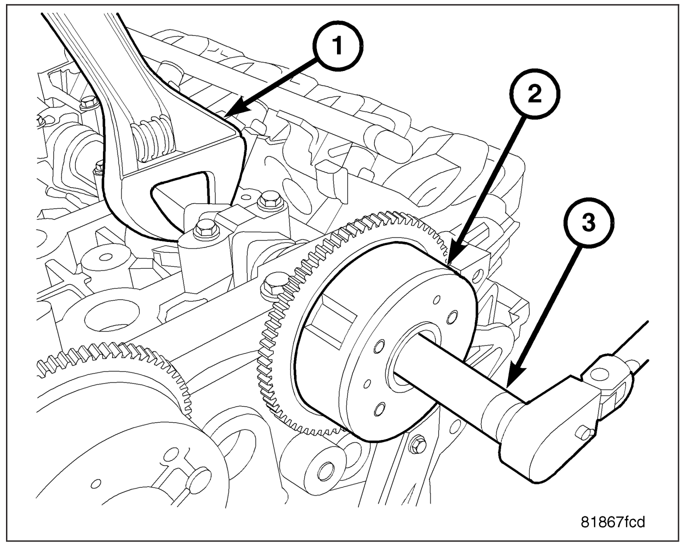


CYLINDER HEAD OFF



1. Coat valve stems with clean engine oil and insert in cylinder head.
2. Install new valve stem seals (3) on all valves using an appropriate sized socket to seat the seal/spring seat. The valve stem seals should be pushed firmly and squarely over valve guide.
3. Install valve springs (2), retainers (4), and keepers (1) in place.

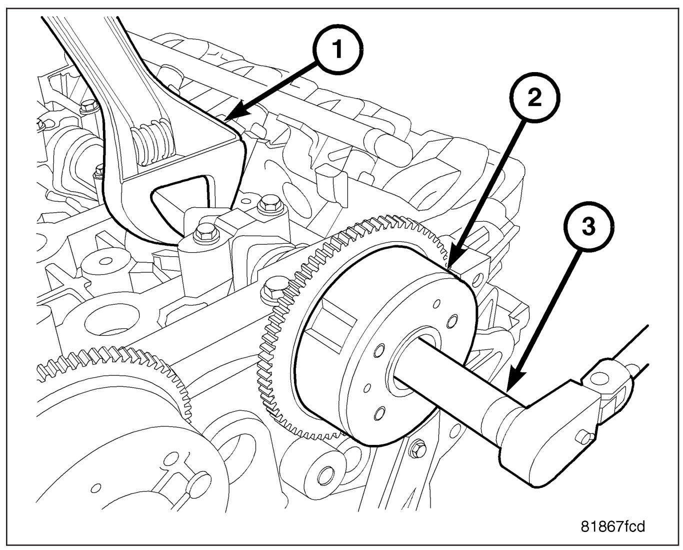
4. Using Snap-on metric valve keeper installer (2) and remover (1) as a handle, push downward to install keepers.



5. Check the valve spring installed height B after refacing the valve and seat. Make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.525 in.), install a 0.762 mm (0.030 in.) spacer under the valve spring seat to bring spring height back within specification.

PHASERS-CAMSHAFT

REMOVAL

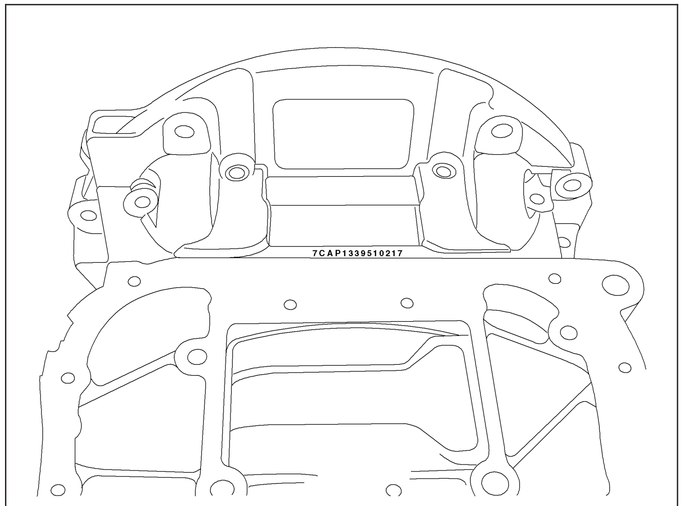


1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. Remove camshaft phaser (2) retaining bolt while holding the camshaft in place with a wrench (1).
3. Remove phaser (2) assembly from camshaft.

INSTALLATION

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin and camshaft phaser may occur.

1. Install phaser (2) assembly on camshaft.
2. Install phaser retaining bolt and torque while holding camshaft in place with a wrench (1).
3. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

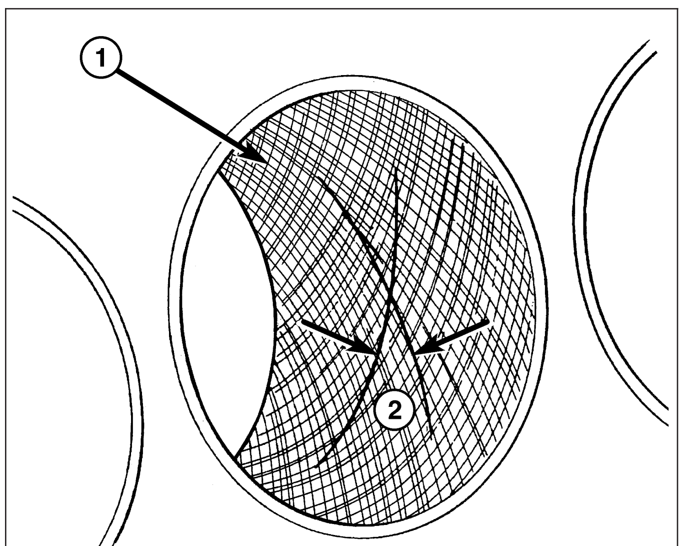


ENGINE BLOCK

DESCRIPTION

The die cast aluminum cylinder block is a two-piece assembly, consisting of the cylinder block and ladder frame. The block is an open deck design with cast in place cast iron cylinder liners. The cast iron cylinder liners are recessed below the aluminum deck surface. The ladder frame bolts to the cylinder block and does not incorporate the main bearing caps. This design offers a much stronger lower end and increased cylinder block and transaxle rigidity. The rear oil seal retainer is integral with the block and ladder frame. The ladder frame and block are serviced as an assembly.

The engine build date is located on the bottom of the ladder frame just behind the oil pan. The date can be seen with the oil pan in place.



81877211

STANDARD PROCEDURE

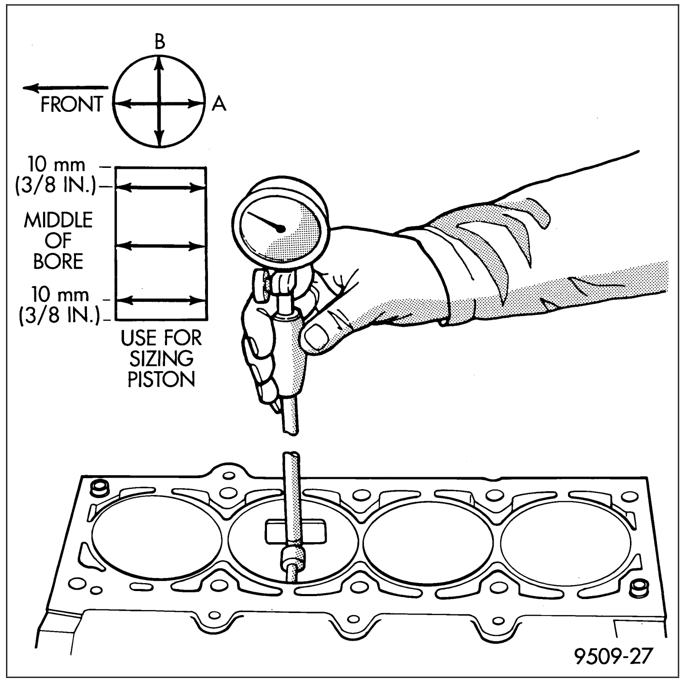
CYLINDER BORE HONING

1. Used carefully, a quality commercially available cylinder bore resizing hone equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.
2. Deglazing of the cylinder walls may be done using a quality commercially available cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.
3. Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 30-50 degrees, the cross hatch angle is most satisfactory for proper seating of rings.

808a6311

4. A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.
5. After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.



CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

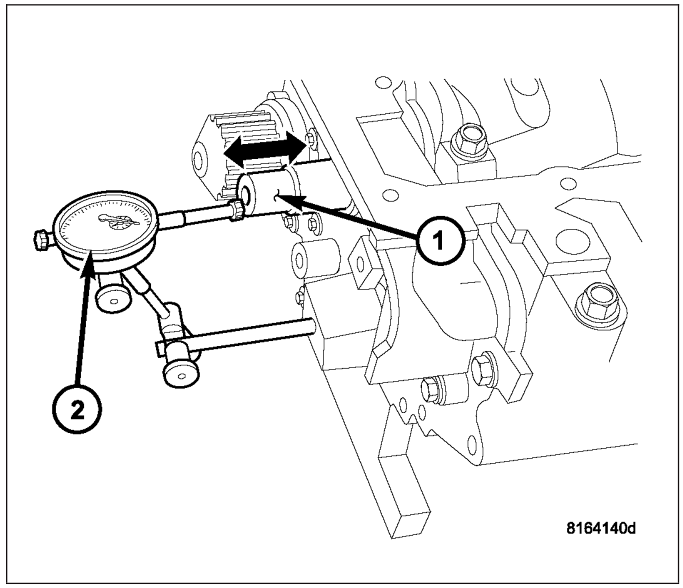
ENGINE BLOCK

1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.
2. If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).
3. Examine block and cylinder bores for cracks or fractures.
4. Check block deck surfaces for flatness. Deck surface must be within service limit of 0.050 mm (0.002 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.



Measure the cylinder bore at three levels in directions A and B. Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT

STANDARD PROCEDURE

MEASURING CRANKSHAFT END PLAY

1. Mount a dial indicator (2) to front of engine with the locating probe on nose of crankshaft (1).
2. Move crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

REMOVAL - CRANKSHAFT

NOTE: Crankshaft can not be removed when engine is in vehicle.

1. Remove engine assembly from vehicle (Refer to 9 - ENGINE - REMOVAL).
2. Separate transaxle from engine.
3. Remove drive plate/flex plate.
4. Remove crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).
5. Mount engine on a suitable repair stand.
6. Drain engine oil and remove oil filter.
7. Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
8. Remove engine mount support bracket.
9. Remove timing chain cover.
10. Remove the timing chain
11. Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
12. Remove balance shaft module.
13. Remove the crankshaft sprocket.
14. Remove crankshaft position sensor.
15. Remove all ladder frame bolts from the engine block.
16. Using a pry bar gently pry the ladder frame loose from the engine block dowel pins using the pry points cast into the block and ladder frame.
17. Ladder frame should be removed evenly from the cylinder block dowel pins to prevent damage to the dowel pins.

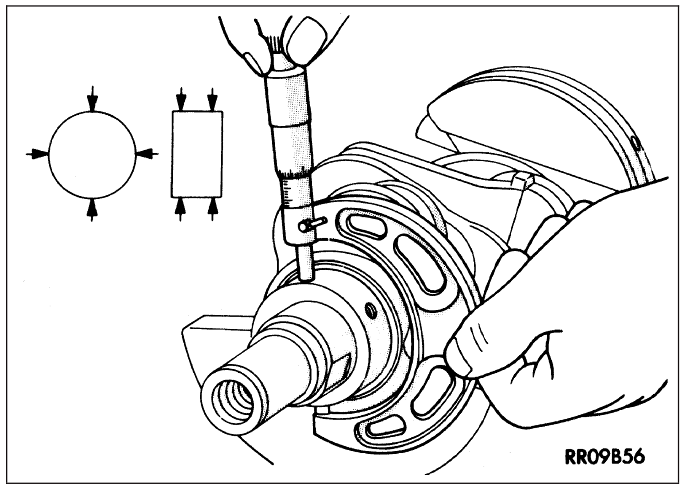
NOTE: If piston/connecting rod replacement is necessary, remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

18. Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

19. Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.



20. Remove main bearing caps.

CAUTION: Use extreme care when handling crankshaft. Tone wheel damage can occur if crankshaft is mishandled.

21. Lift out crankshaft from cylinder block. Do not damage the main bearings or journals when removing the crankshaft.

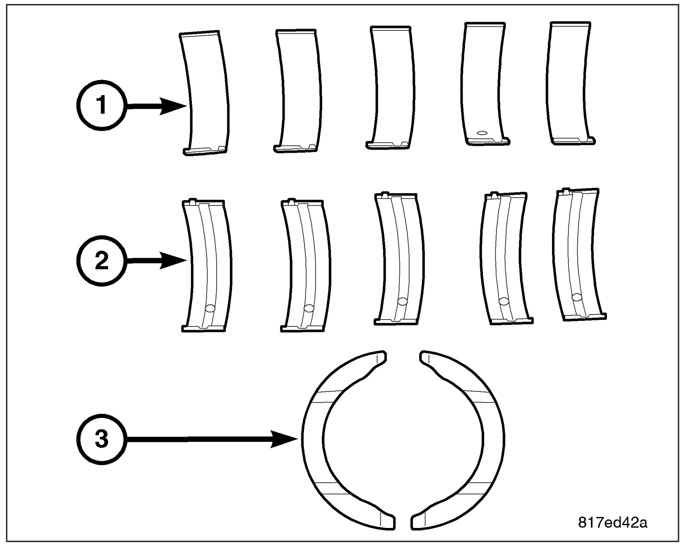
INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring. Limits of taper or out of round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

INSTALLATION - CRANKSHAFT

The crankshaft is supported in five main bearings. All upper bearing shells in the crankcase have oil grooves and holes. All lower bearing shells are smooth. Crankshaft end play is controlled by a two piece thrust bearing on the number three main bearing journal.

1. Install the main bearing upper shells with the lubrication groove and oil hole in the engine block.
2. Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.



NOTE: If the crankshaft is sent out for machine work, it must be balanced as an assembly with the target ring installed.

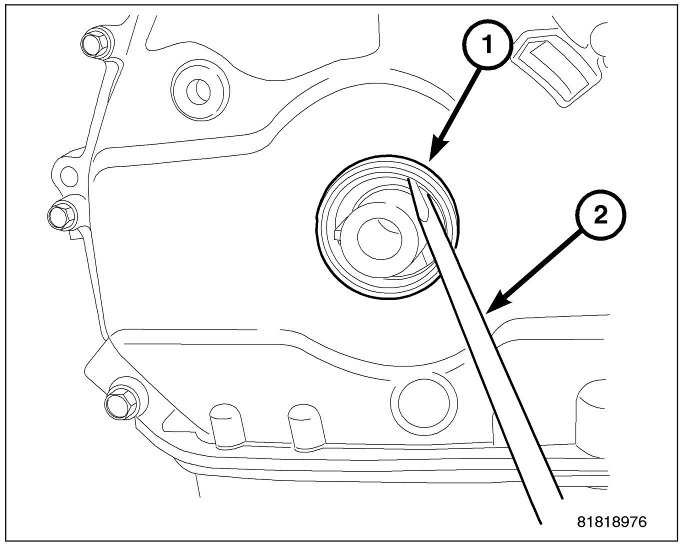
3. Clean crankshaft and target ring with MOPAR® Brake Parts cleaner and dry with compressed air to ensure that the crankshaft mating surface and target ring mounting holes are free from oil and lock patch debris.

NOTE: Always use NEW mounting screws whether installing original or new target ring.

4. Install **NEW**mounting screws finger tight starting with the #1 location. Make sure engagement occurs with the shoulder of the screws and mounting hole before starting all other screws.
5. Torque all mounting screws with T30 torx bit to 13 Nm (110 in-lbs) following the torque sequence.

NOTE: Lightly apply trans gel to thrust bearings to hold bearings in block.

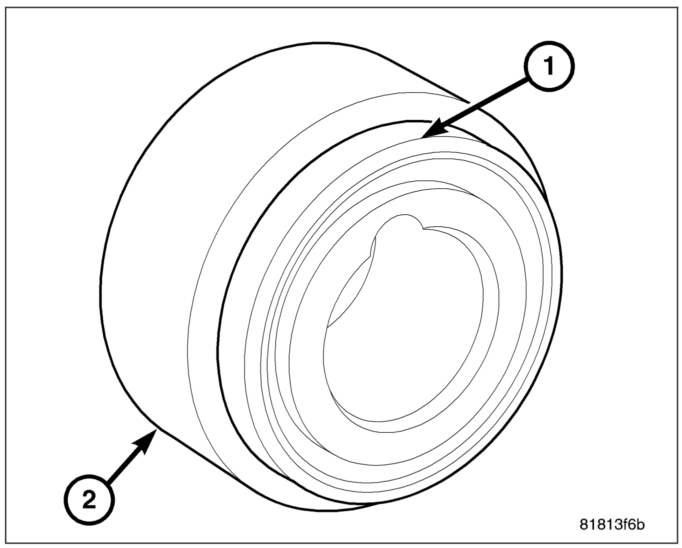
6. Install thrust bearings (3) in block.



CAUTION: Do not get oil on the ladder frame mating surface. It will affect the ability of the RTV to seal the ladder frame to cylinder block.

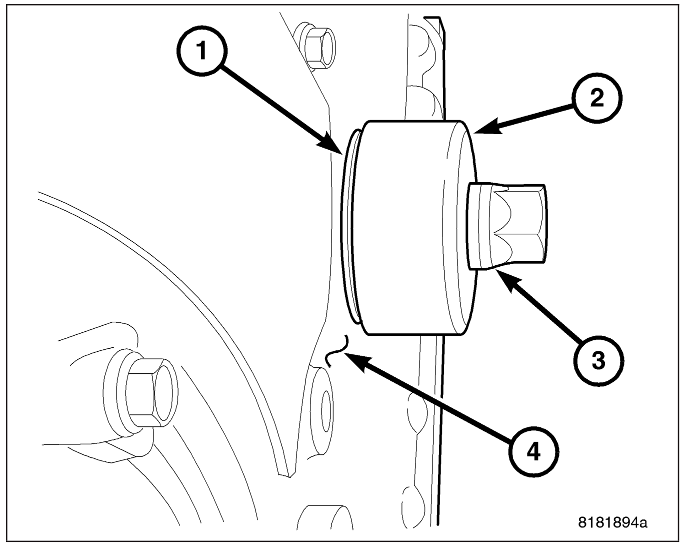
7. Oil the bearings and journals. Install crankshaft in engine block.
8. Install lower main bearings (1) into main bearing cap. Make certain the bearing tabs are seated into the bearing cap slots.
9. Before installing the bolts the threads should be clean and dry.
10. Install main bearing caps to engine block, install bolts finger tight.
11. To ensure correct thrust bearing alignment, perform the following steps:
    - Step 1: Rotate crankshaft until number 4 piston is at TDC.
    - Step 2: Move crankshaft rearward to limits of travel.
    - Step 3: Then, move crankshaft forward to limits of travel.
    - Step 4: Wedge an appropriate tool between the rear of the cylinder block and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.
12. Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown.
13. Remove wedge tool used to hold crankshaft.
14. Check the crankshaft turning torque, it should not exceed 5.6 N·m (50 in. lbs.).
15. Check crankshaft end play (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).
16. Install connecting rod bearings and caps. **Do Not Reuse Connecting Rod Bolts.** Torque connecting rod bolts to 27 N·m (20 ft. lbs.) plus 1/4 turn.
17. Install the ladder frame assembly (Refer to 9 - ENGINE/ENGINE BLOCK/LADDER FRAME - INSTALLATION).
18. Install the balance shaft module (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
19. Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
20. Install crankshaft position sensor.
21. Install cylinder head if it was removed (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
22. Install front crankshaft sprocket.
23. Install the timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
24. Install the timing chain front cover.
25. Install front crankshaft oil seal.
26. Install engine mount support bracket.
27. Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
28. Remove engine from repair stand and position on Special Tools 6135 and 6710 Engine Dolly and Cradle. Install safety straps around the engine to cradle and tighten and lock them into position.
29. Install crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).
30. Install drive plate/flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten to 95 N·m (70 ft. lbs.).
31. Attach transaxle to engine. Tighten attaching bolts to 101 N·m (75 ft. lbs.).
32. Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).
33. Install new oil filter and fill with oil.
34. Start engine and check for leaks.

SEAL-CRANKSHAFT OIL FRONT

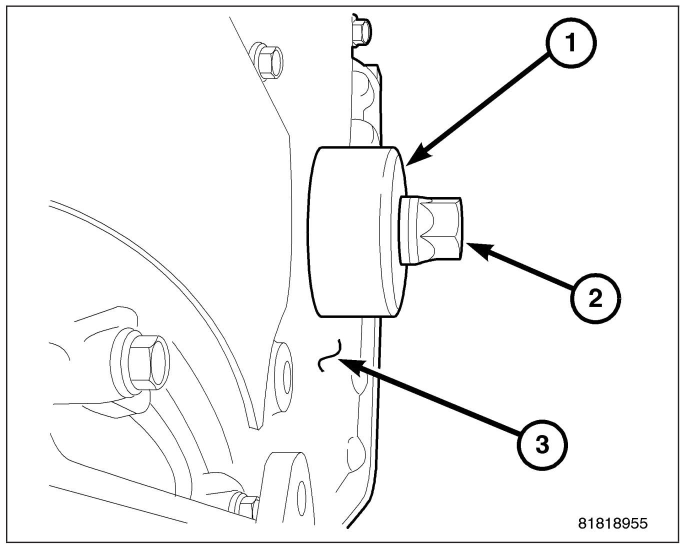


REMOVAL

1. Remove the crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
2. Remove front crankshaft oil seal (1) by prying out with a screw driver (2). Be careful not to damage the cover seal surface.

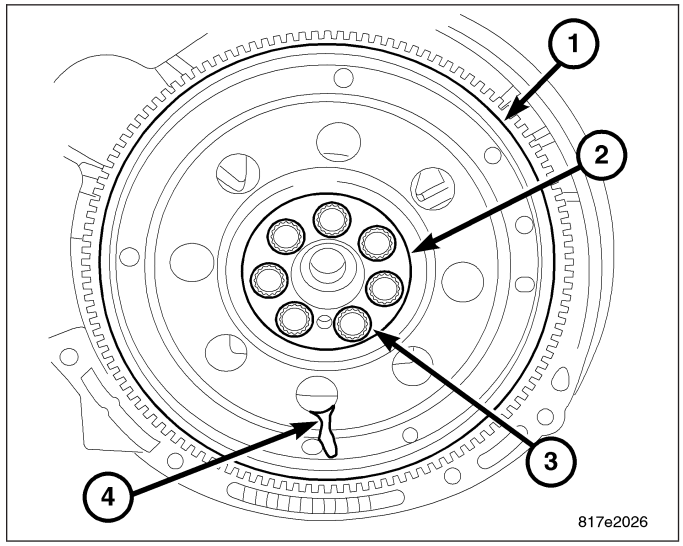


INSTALLATION

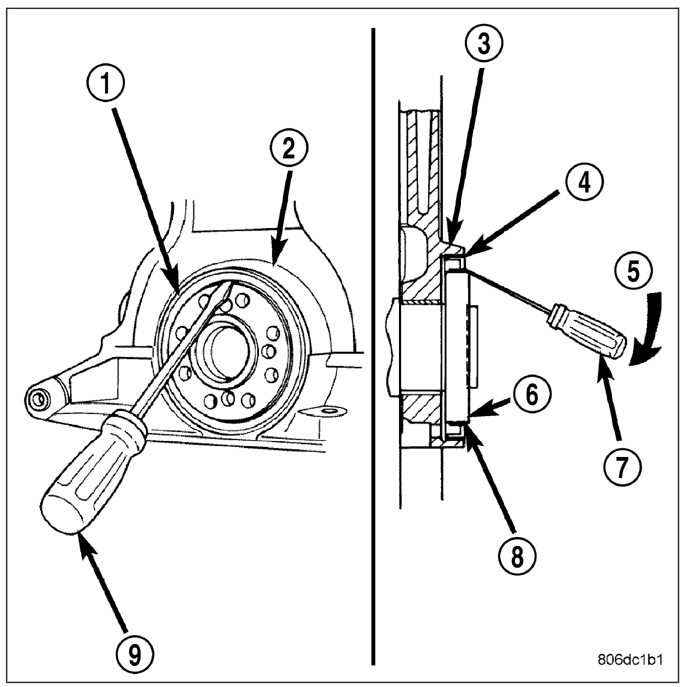


1. Place seal (1) onto Seal installer 9506 (2) with seal spring towards the inside of engine.

2. Install new seal (1) by using Seal installer 9506 (2) and crankshaft damper bolt (3).



3. Press seal into front cover until Seal Installer 9506 (1) seats against timing chain cover (3).
4. Remove seal installer 9506 (1).
5. Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION.

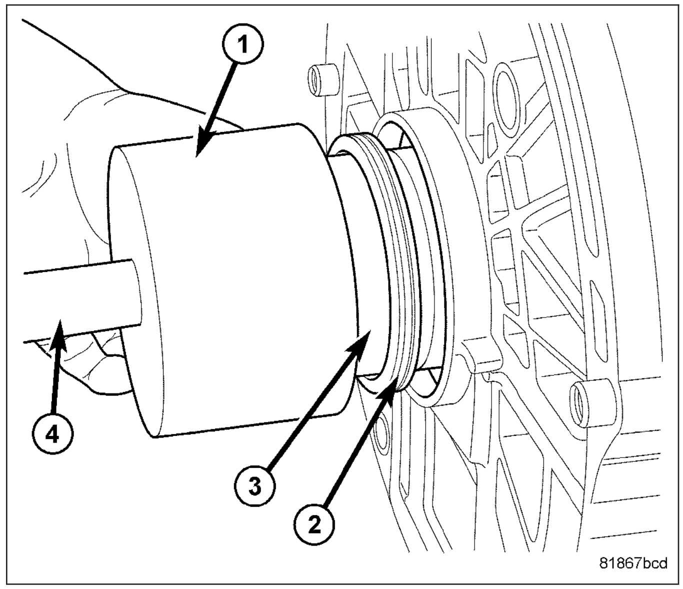


SEAL-CRANKSHAFT OIL REAR

REMOVAL

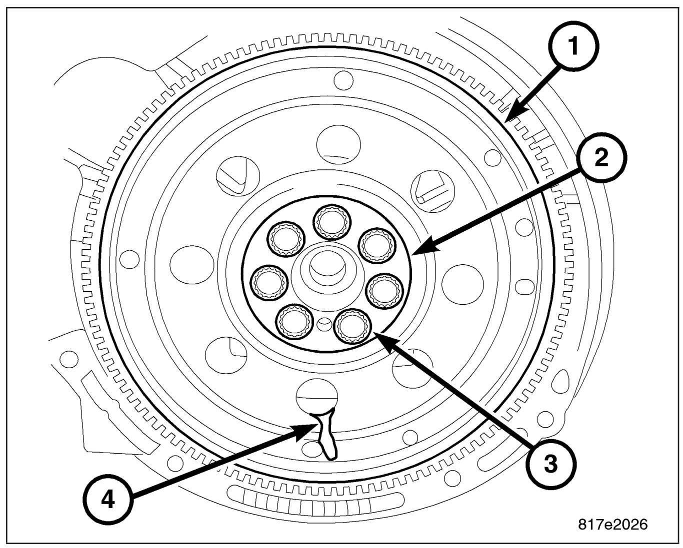
1. Remove transaxle
2. Remove flex plate bolts and discard.
3. Remove flex plate (1).

4. Insert a 3/16 flat bladed screwdriver (7) between the dust lip (8) and the metal case (4) of the crankshaft seal (1). Angle the screwdriver through the dust lip against metal case of the seal. Pry out seal.



CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.

INSTALLATION



CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

NOTE: When installing seal, no lube on seal is needed.

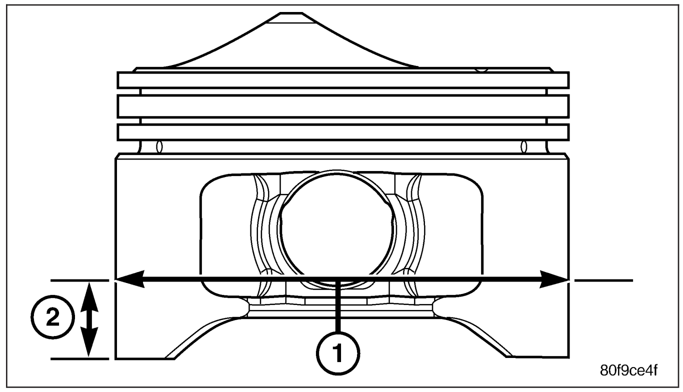
1. Place Special Tool 9509 (3) Seal Guide on crankshaft.
2. Position seal (2) over guide tool. Guide tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.
3. Drive the seal into the block using Special Tool 9706 (1) and handle C-4171 (4) until the tool bottoms out against the block.

4. Install flex plate (1). Install new flex plate bolts and torque to 95 N·m (70 ft. lbs.).
5. Install transaxle. Refer to TRANSMISSION/TRANSAXLE - INSTALLATION for procedure.

ROD-PISTON & CONNECTING

DESCRIPTION

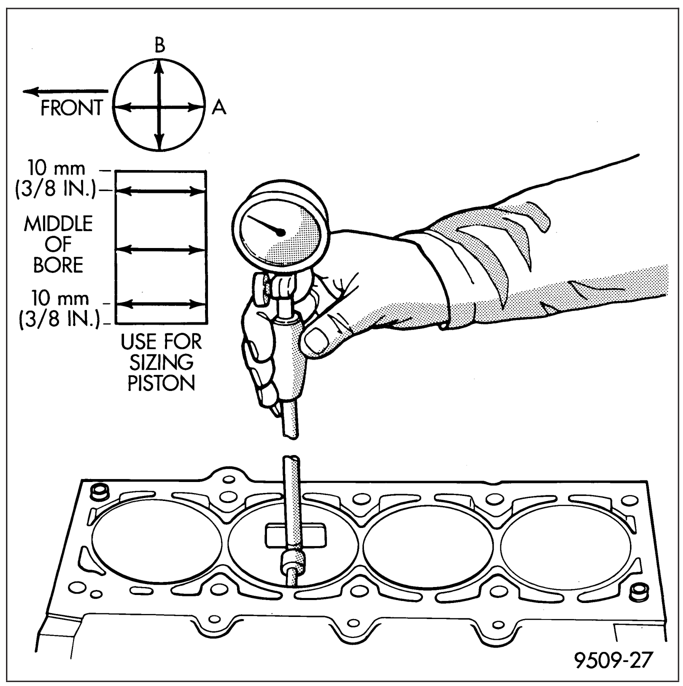
The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged connecting rods. The pistons pin is offset 0.8 mm (0.0314 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. The pistons with rings and connecting rods are serviced as an assembly.



STANDARD PROCEDURE

PISTON TO CYLINDER BORE FITTING

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).



Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin (1).

1. Measurement should be taken approximately 16 mm (0.629 in.) from the bottom of the skirt (2) as shown in.

NOTE: Correct piston to bore clearance must be established in order to assure quiet and economical operation.

2. Cylinder bores should be measured halfway down the cylinder bore and transverse (measurement location B) to the engine crankshaft center line shown in. Refer to for Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL

NOTE: Pistons, rings, and rods are serviced as an assembly.

CAUTION: All four piston/rod assemblies must be replaced as a set or engine damage may result.

1. Remove engine (Refer to 9 - ENGINE - REMOVAL).
2. Separate engine from transaxle.
3. Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

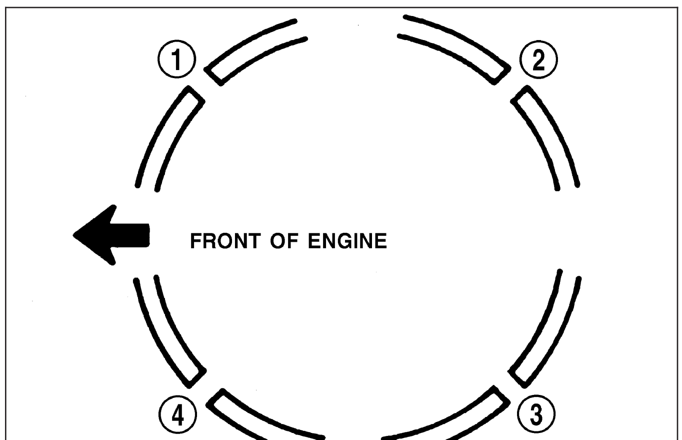
4. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
5. Remove balance shaft assembly.

NOTE: Remove any carbon build up prior to piston removal.

6. Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**.
7. Rotate crankshaft so that each connecting rod is centered in cylinder bore.
8. Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods, as damage to connecting rod could occur.

CAUTION: Care must be taken not to damage the fractured rod and cap joint surfaces, as engine damage many occur.



9. Remove connecting rod bolts and cap.

NOTE: Do not reuse connecting rod bolts.

10. Carefully push each piston and rod assembly out of cylinder bore. Re-install bearing cap on the mating rod.
11. Repeat procedure for each piston and connecting rod assembly.

INSTALLATION

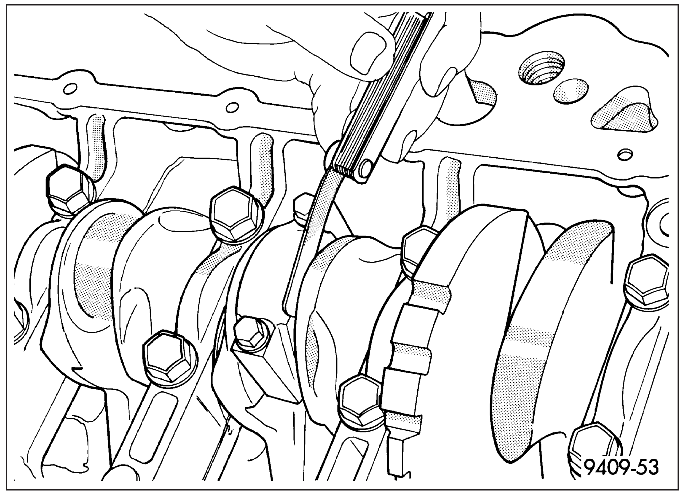
1. Install piston rings on piston (Refer to 9 - ENGINE/ ENGINE BLOCK/PISTON RINGS - INSTALLATION).
2. Before installing pistons and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.
3. Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown above. As viewed from the top of the piston.
4. Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston. **Be sure position of rings does not change during this operation**.

9509-46

5. The directional arrow stamped on the piston should face toward the front of the engine.
6. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Lubricate connecting rod journal with clean engine oil.

NOTE: There are three different size rod bearings, perform rod bearing selection procedure.

7. The rod bearing sizes are indicated on the nose of the crankshaft.
8. Install connecting rod upper bearing half into connecting rod.
9. Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.



NOTE: The connecting rod cap bolts should NOT be reused.

10. Before installing the **NEW** bolts, the threads should be coated with clean engine oil.
11. Install connecting rod lower bearing half into connecting rod cap. Install connecting rod cap.
12. Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.
13. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

1. Tighten the bolts to 27 N·m (20 ft. lbs.).
2. Tighten the connecting rod bolts an additional **1/4 TURN.**

14. Using a feeler gauge, check connecting rod side clearance. (Refer to 9 - ENGINE - SPECIFICATIONS) for connecting rod side clearance.
15. Install the ladder frame.
16. Install oil pump/Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - INSTALLATION).
17. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
18. Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

BEARINGS-CRANKSHAFT MAIN

STANDARD PROCEDURE - MAIN BEARING SELECTION

NOTE: There are three different possibilities for the upper main bearings and five different lower main bearings. The upper and lower bearing shells are not interchangeable.

The lower main bearing identification is stamped in the nose of the crankshaft (1). There are 5 different bearing sizes available 0 through 4.

CRANKSHAFT IDENTIFICATION		LOWER CRANKSHAFT BEARING SELECTION	
JOURNAL DIAMETER GRADE	DIMENSION	LOWER MAIN BEARING SIZE CLASSIFICATION	LOWER MAIN BEARING DIMENSION
0	52 mm	0 (Pink or Red)	2 mm
1	52 mm	1 (Black)	2 mm
2	52 mm	2 (No Color)	2 mm
3	52 mm	3 (Green)	2 mm
4	52 mm	4 (Blue)	2 mm

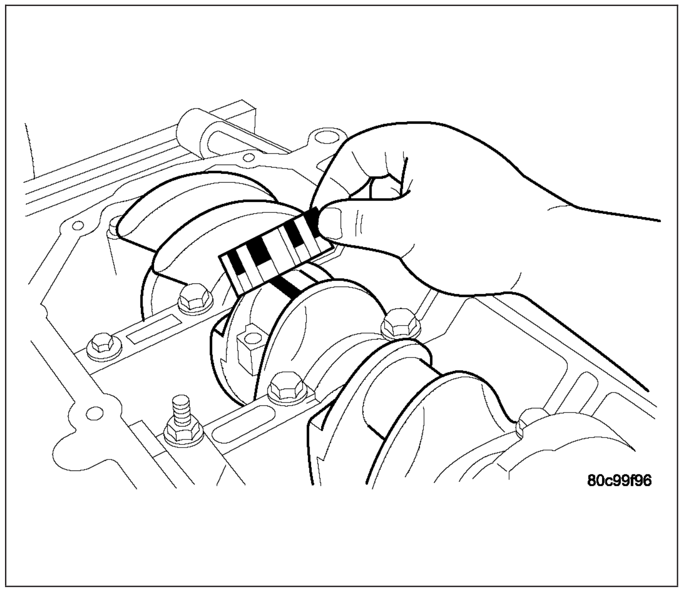
The upper main bearing shell identification is located in the middle of cylinder block on the right side of the engine when viewing from the flywheel. There are three different size bearings available.

UPPER MAIN BEARING SELECTION

CYLINDER BLOCK IDENTIFICATION		UPPER CRANKSHAFT BEARING SELECTION	
MAIN BEARING GRADE	DIMENSION	UPPER MAIN BEARING SIZE CLASSIFICATION	UPPER MAIN BEARING DIMENSION
1	56 mm	1 (Black)	2 mm
2	56 mm	2 (No Color)	2 mm
3	56 mm	3 (Green)	2 mm

BEARINGS-CONNECTING ROD

STANDARD PROCEDURE



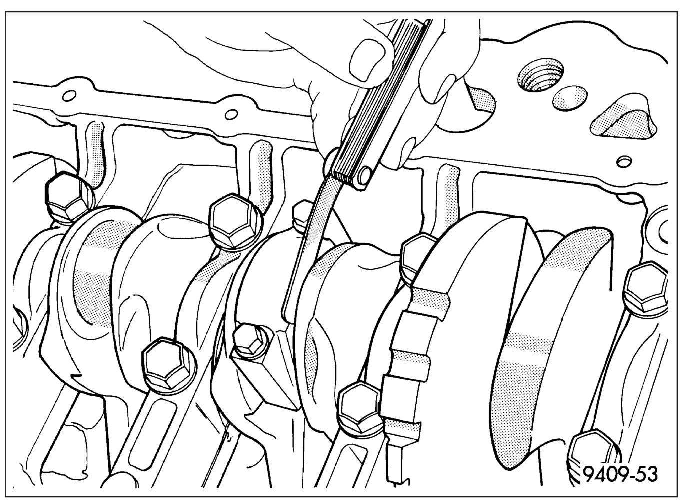
CONNECTING ROD - FITTING

There are three different sizes of rod bearings available. Connecting rod bearing identification can be found on the nose of the crankshaft. Use the table below for proper bearing selection.

CONNECTING ROD BEARING SELECTION

CRANKSHAFT PIN DIAMETER GRADE	DIMENSION	CONNECTING ROD BEARING CLASSIFICATION	CONNECTING ROD BEARING DIMENSION
1	48 mm	1 (Black)	1.5 mm
2	48 mm	2 (No Color)	1.5 mm
3	48 mm	3 (Green)	1.5 mm

1. For measuring connecting rod bearing clearance procedure and use of Plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE) For bearing clearance refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS).

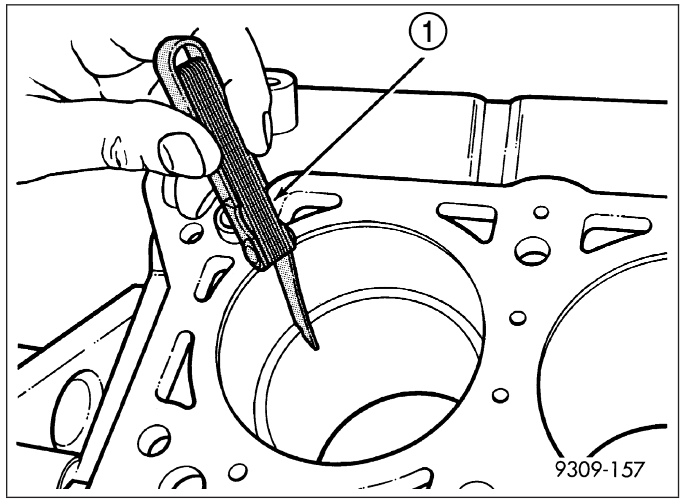


NOTE: The rod bolts should not be reused.

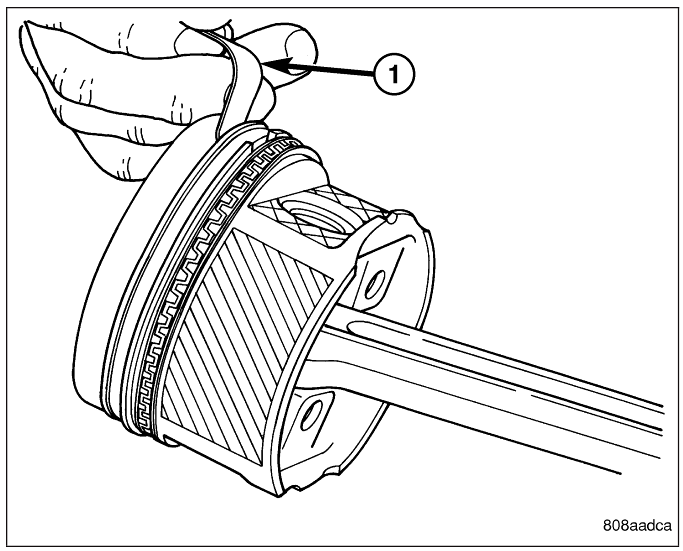
2. Before installing the **NEW** rod bolts the threads and under the bolt head should be oiled with clean engine oil.
3. Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.
4. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

   1. Tighten the bolts to 27 N·m (20 ft. lbs.).
   2. Tighten the connecting rod bolts an additional 90°.
5. Using a feeler gauge, check connecting rod side clearance. Refer to clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).



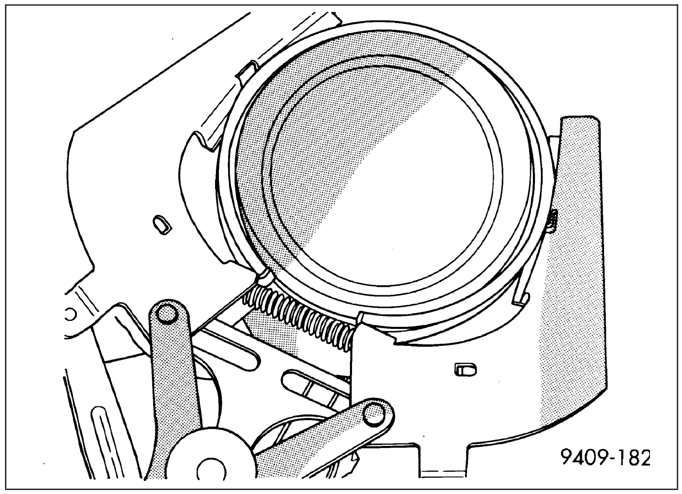
RINGS-PISTON



STANDARD PROCEDURE

PISTON RING - FITTING

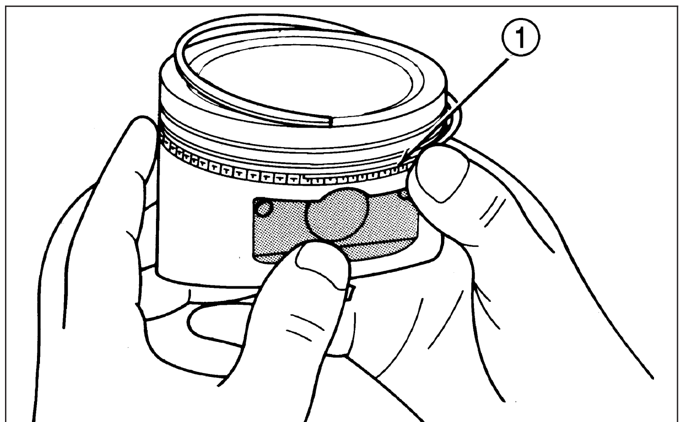
1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch) from bottom of cylinder bore. Check gap with feeler gauge. Refer to Engine Specifications.



2. Check piston ring to groove side clearance. Refer to Engine Specifications.

REMOVAL

1. Using a suitable ring expander, remove upper and intermediate piston rings.
2. Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.
3. Clean ring grooves of any carbon deposits.



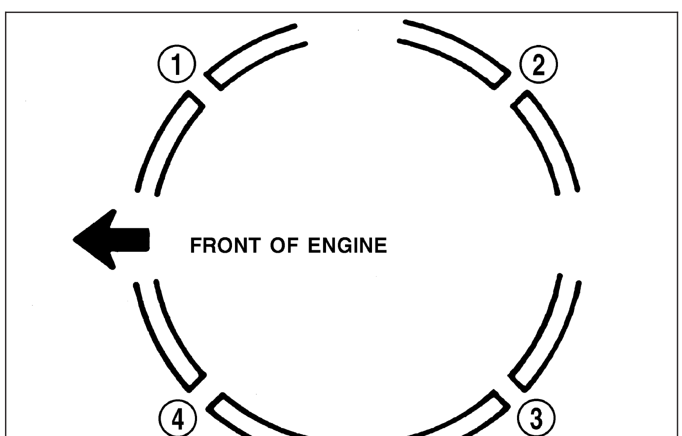
9409-182

INSTALLATION

NOTE: The identification mark on face of upper and intermediate piston rings must point toward top of piston.

CAUTION: Install piston rings in the following order:

1. Oil ring expander.
2. Upper oil ring side rail.
3. Lower oil ring side rail.
4. No. 2 Intermediate piston ring.
5. No. 1 Upper piston ring.

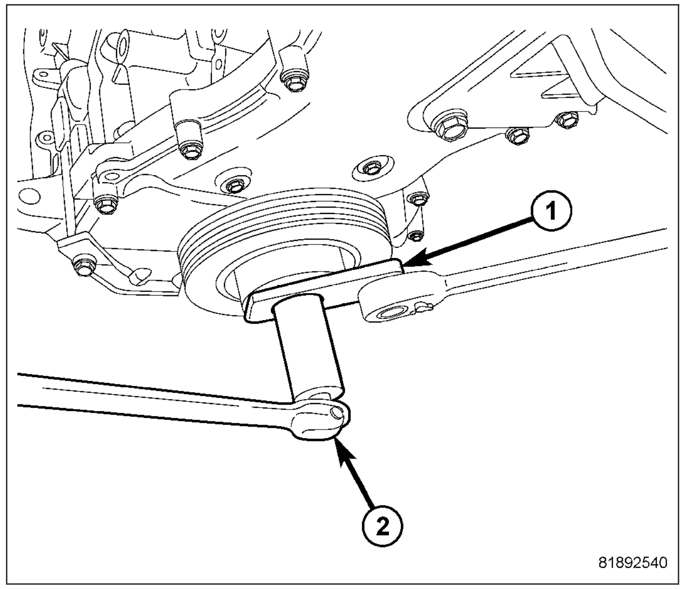


9409-184

1. Install oil ring expander.
2. Install upper side rail first and then the lower side rail. Install the side rails by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander.**

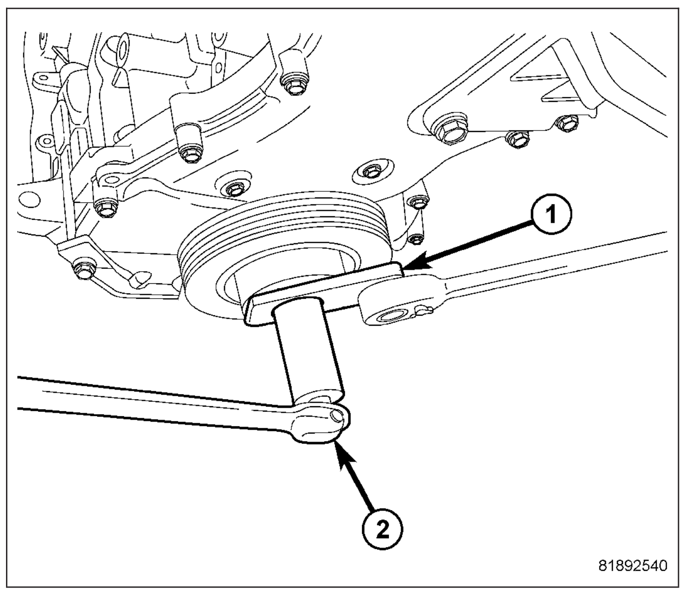
NOTE: The compression rings are marked Y1 for the upper compression ring and Y2 for the second compression ring. These markings must face upward.

3. Install No. 2 piston ring and then No. 1 piston ring.
4. Position piston ring end gaps as shown in.
5. Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.



9509-46

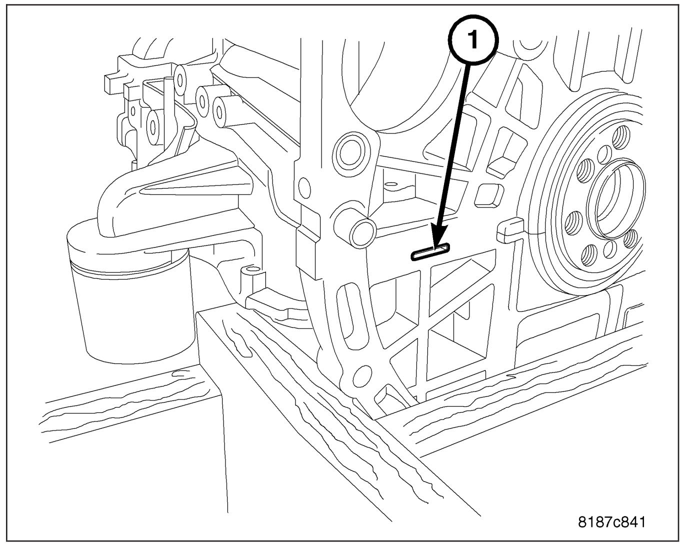
DAMPER-VIBRATION



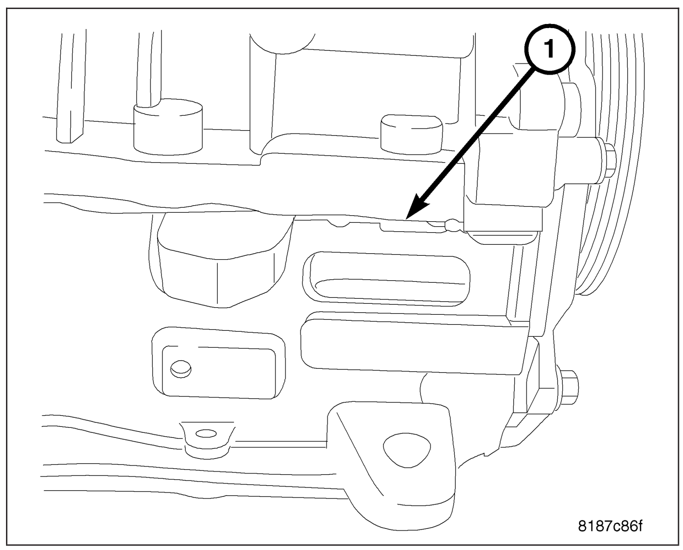
REMOVAL

1. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Install Damper holder 9707 (1).
3. Remove crankshaft damper bolt.
4. Pull damper off crankshaft.

INSTALLATION



1. Install crankshaft damper.
2. Apply clean engine oil crankshaft damper bolt threads and between bolt head and washer. Torque bolt to 210 N·m (155 ft. lbs.).
3. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

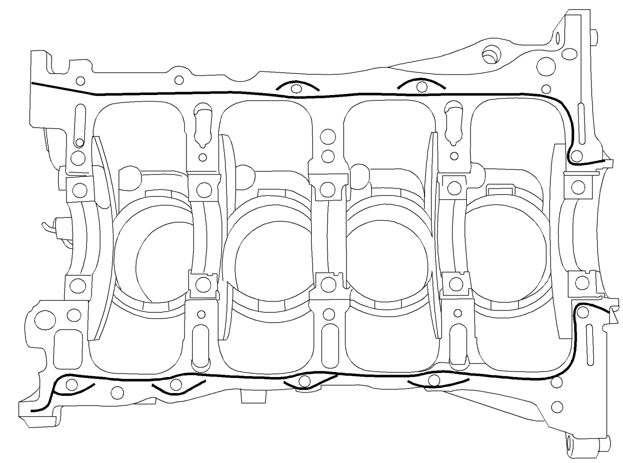


FRAME-LADDER

REMOVAL

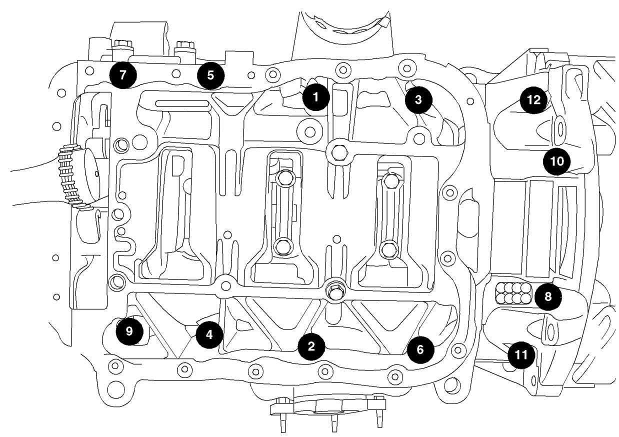
1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Remove oil pump/balance shaft assembly (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
3. Remove ladder frame retaining bolts.
4. Remove ladder frame using pry points cast in the rear of the block (1).

5. To assist in removing the ladder frame another (1) pry points cast in the left side of the block.



CLEANING

Clean ladder frame with a plastic or wooden scraper and a suitable solvent.

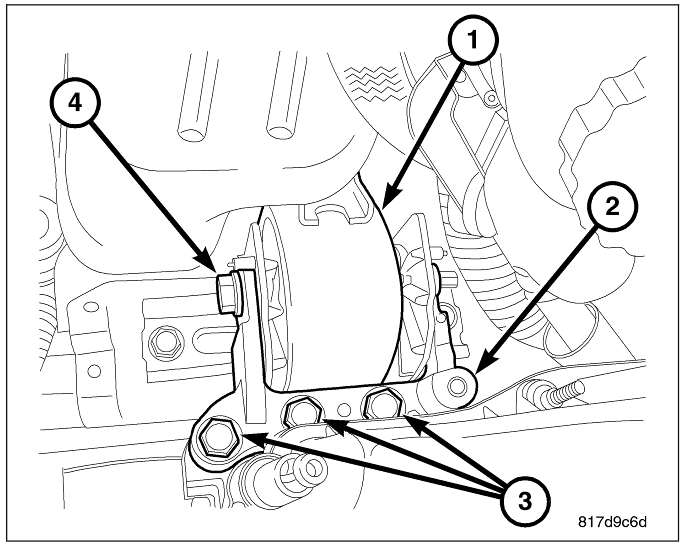


INSTALLATION

1. Apply a 2 mm bead of sealant as shown.

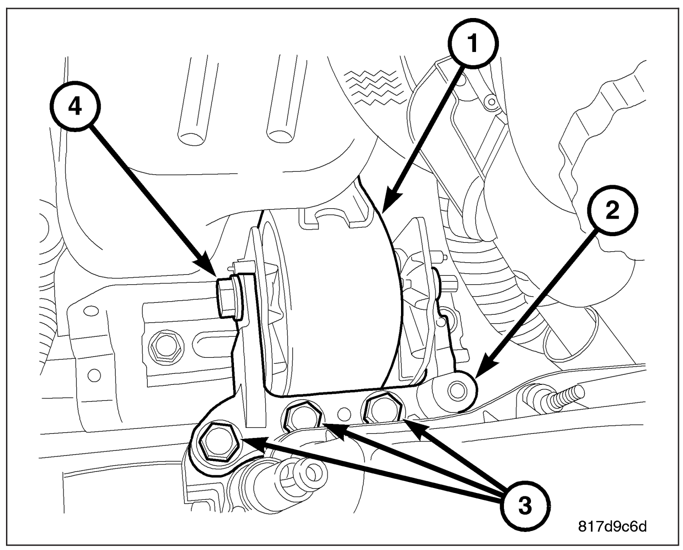
8186540e

2. Install bolts and torque shown following a three step method.
   - First: All to 20 N·m (15 ft. lbs.)
   - Second: All to 49 N·m (36 ft. lbs.)
   - Third: All to 49 N·m (36 ft. lbs.)
3. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/ OIL PAN - INSTALLATION).



818670ab

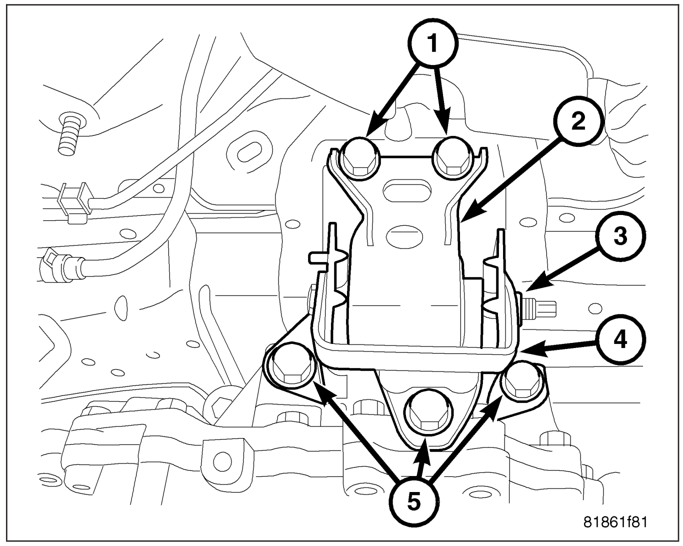
MOUNT-RIGHT



REMOVAL

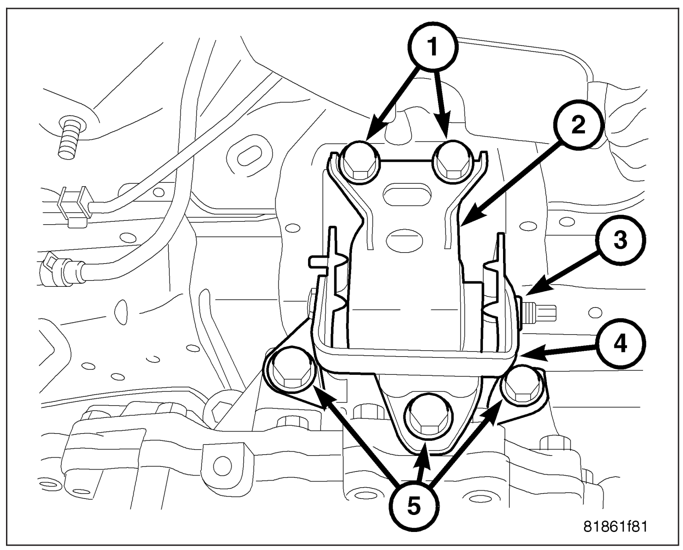
1. Remove coolant reservoir and set aside.
2. Remove power steering reservoir and set aside.
3. Remove windshield washer bottle.
4. Remove power steering line support bracket from engine mount.
5. Support transaxle with a block of wood and a suitable jack.
6. Remove engine mount through bolt (4).
7. Remove engine mount bracket bolts (3).
8. Remove engine mount retaining bolts.
9. Remove engine mount.

INSTALLATION



1. Install engine mount.
2. Install engine mount retaining bolts and torque to 28 N·m (250 in. lbs.).
3. Install engine mount bracket and torque bolts (3) to 68 N·m (50 ft. lbs.).
4. Install engine mount through bolt (4) and torque to 115 N·m (85 ft. lbs.).
5. Remove jack.
6. Install power steering line support bracket at engine mount.
7. Install windshield washer bottle.
8. Install power steering reservoir.
9. Install coolant reservoir.

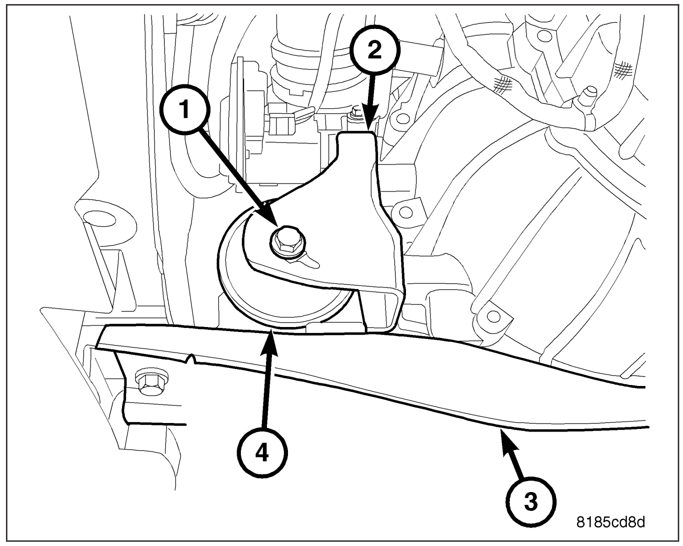
MOUNT-LEFT



REMOVAL

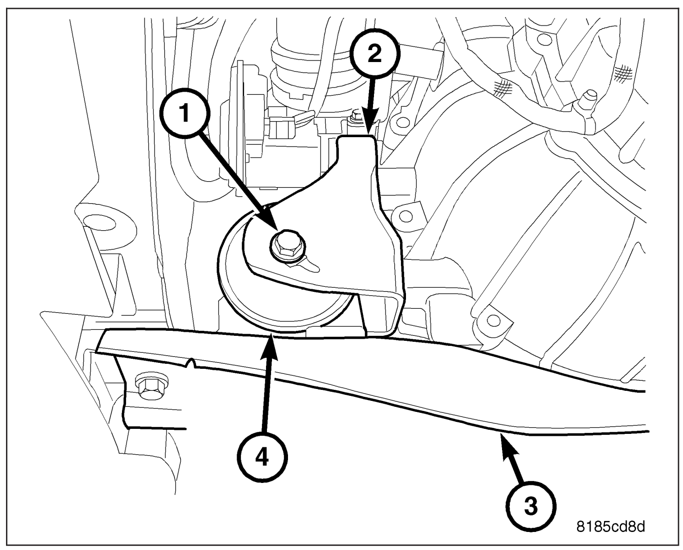
1. Remove air cleaner assembly.
2. Disconnect negative cable from battery.
3. Remove PCM.
4. Remove PCM mounting bracket.
5. Support transaxle with a suitable jack.
6. Remove left mount through bolt (3).
7. Remove mount to transaxle bolts (5).
8. Remove left mount bracket (4).
9. Remove left mount bracket to body frame rail fasteners.
10. Remove mount.

INSTALLATION



1. Install mount.
2. Install left mount to frame rail bolts and torque to 28N·m (250 in. lbs.).
3. Install left mount bracket (4).
4. Install mount to transaxle bolts (5) and torque to 68 N·m (50 ft.lbs.).
5. Install mount through bolt (3) and torque to 115 N·m (85 ft.lbs.).
6. Remove jack.
7. Install PCM mounting bracket.
8. Install PCM.
9. Connect negative battery cable.
10. Install air cleaner assembly.

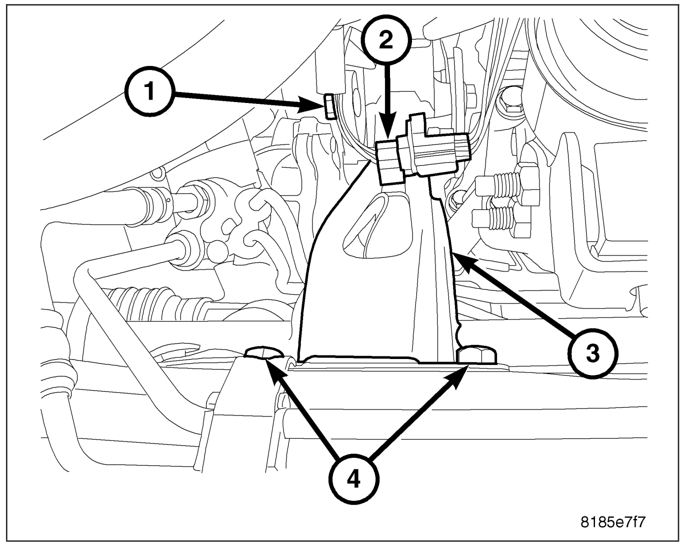
MOUNT-FRONT



REMOVAL

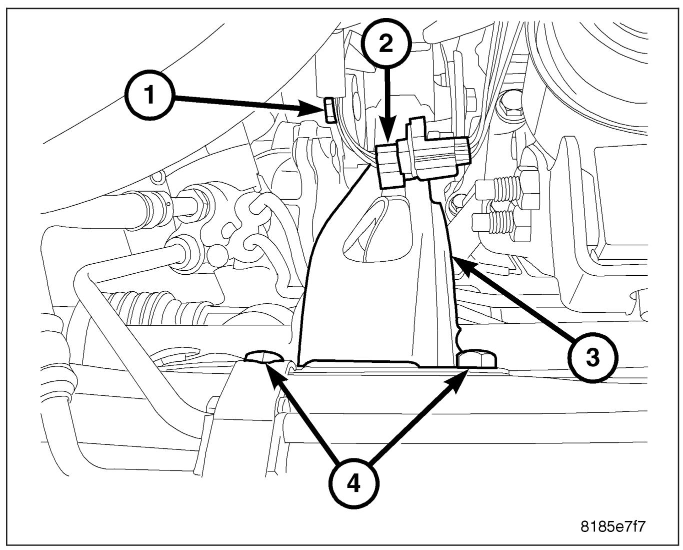
1. Raise vehicle.
2. Remove fore aft member (3) to mount (4) bolts.
3. Remove mount through bolt (1).
4. Remove fore aft member (3) mounting bolts and remove.
5. Remove front mount (4).

INSTALLATION



1. Install mount (4) and tighten bolts.
2. Install fore aft member (3) and tighten bolts.
3. Install mount through bolt (1) and tighten.
4. Lower vehicle.

MOUNT-REAR



REMOVAL

1. Remove rear mount retaining bolts (4).
2. Remove rear mount through bolt (1).
3. Remove oxygen sensor connector (2) from mount.
4. Remove rear mount (3).

INSTALLATION

1. Install rear mount (3).
2. Install rear mount retaining bolts (4) and tighten.
3. Install rear mount through bolt (1) and tighten.
4. Install oxygen sensor connector (2) retainer to mount (3).

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump is chain driven by the crankshaft. Oil pressure is controlled by a relief valve mounted inside the oil pump housing.

OPERATION

Engine oil is drawn up through the pickup tube and is pressurized by the oil pump and routed through the oil filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from the main bearing journals to the connecting rod journals. The main oil gallery also feeds oil pressure to the timing chain tensioner. A vertical hole at the number three main bearing area routes pressurized oil through a restrictor up into the cylinder head. The restrictor that is integral to the cylinder head gasket, provides increased oil flow to the main gallery. Upper engine lubrication is provided by one main feed to the number three camshaft bearing cap. Oil is then routed through the rocker shafts to the remaining camshaft bearing caps and rocker arms/hydraulic lash adjusters. Oil returning to the oil pan from the pressurized components supplies lubrication to the valve stems. The cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collar.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

Check oil pressure using a gauge at oil pressure switch location.

1. If equipped with A/C remove accessory drive belt and A/C compressor.
2. Remove pressure sending unit.
3. Install oil pressure test gauge, Special Tool C-3292 with Adapter 8406.

CAUTION: If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM.

4. Warm engine to normal operating temperature.
5. Monitor gauge readings at idle and 3000 rpm. For specifications (Refer to 9 - ENGINE - SPECIFICATIONS).
6. If oil pressure is low (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSPECTION).

FILTER-OIL

REMOVAL

1. Turn oil filter cap counterclockwise 2 ½ turns and wait one minute.

NOTE: A drain back valve incorporated into the oil filter cartridge housing allows oil to drain back into the crankcase as the oil filter cartridge is removed.

2. Continue turning the oil filter cap counterclockwise. Remove cap slowly to avoid spill of oil.
3. Remove oil filter cartridge from the cap.

NOTE: If the center tube separates from the cap and stays inside the filter cartridge, you must remove the center tube from the filter element and snap it back onto the cap with the spring.

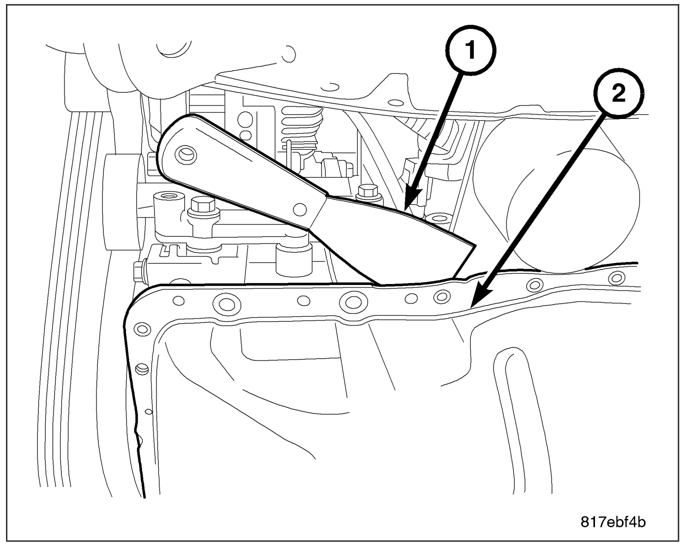
4. Remove and discard o-ring from cap.

INSTALLATION

1. Install new o-ring on cap.
2. Install new oil filter cartridge over center tube of cap.

NOTE: Before installation, make sure no grommet is left on the center post of the oil filter housing from the previous filter.

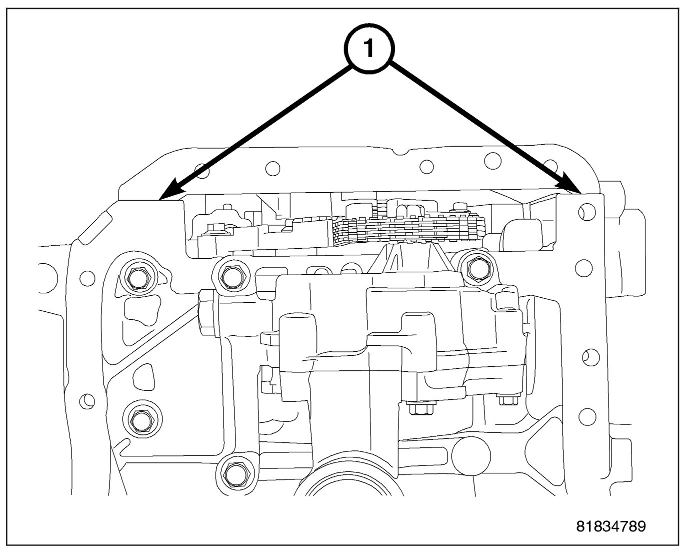
3. Align the grommet hole of the oil filter cartridge with the center post of the filter housing.
4. Press in and turn oil filter cap clockwise. Tighten cap to 25 N·m (18 ft. lbs). Cap flange should sit tightly on the housing flange.
5. Fill oil to proper level.
6. Start engine. Check for leaks.



PAN-OIL

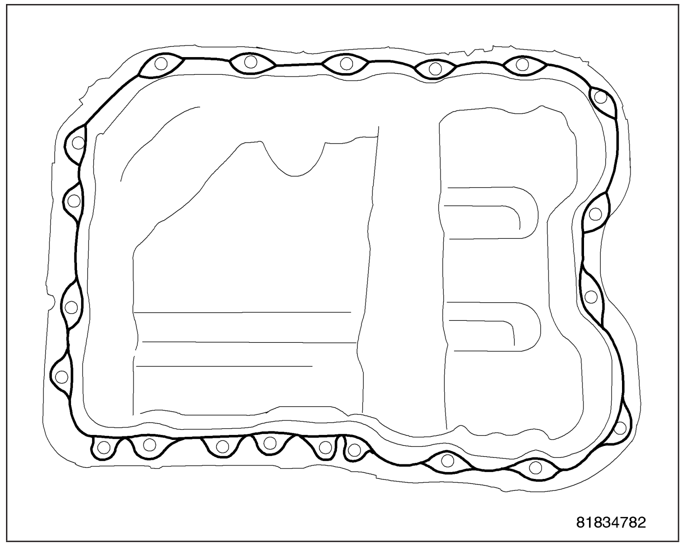
REMOVAL

1. Raise vehicle on hoist.
2. Drain engine oil.
3. Remove accessory drive belt splash shield.
4. Remove lower A/C compressor mounting bolt (if equipped).
5. Remove A/C mounting bracket.



NOTE: Do not use pry points in block to remove oil pan.

6. Remove oil pan retaining bolts.
7. Using a putty knife (1), loosen seal around oil pan (2).
8. Remove oil pan (2).

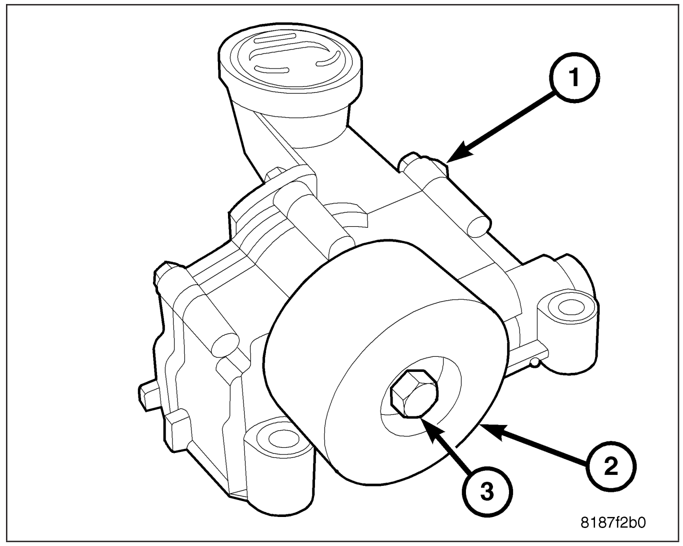


INSTALLATION

1. Apply Mopar® Engine RTV GEN II at the front cover to engine block parting lines (1).

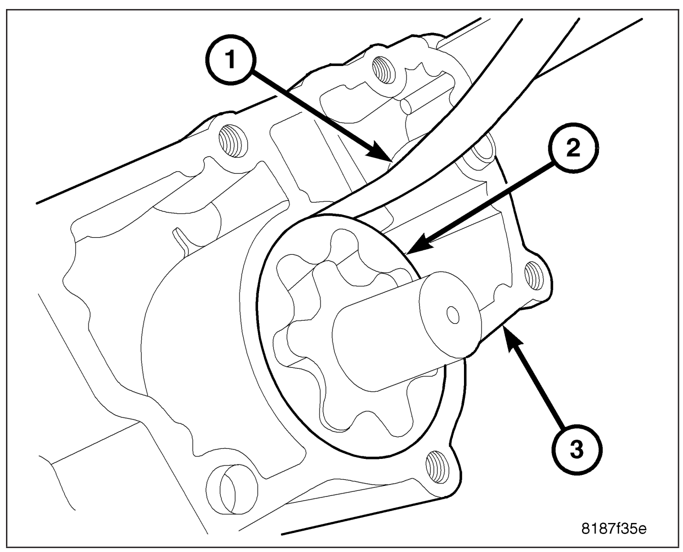
2. Apply a 2 mm bead of Mopar® Engine RTV GEN II around the oil pan as shown.

3. Tighten screws to 12 N·m (105 in. lbs.).
4. Install oil drain plug.
5. Lower vehicle and fill engine crankcase with proper oil to correct level.
6. Start engine and check for leaks.



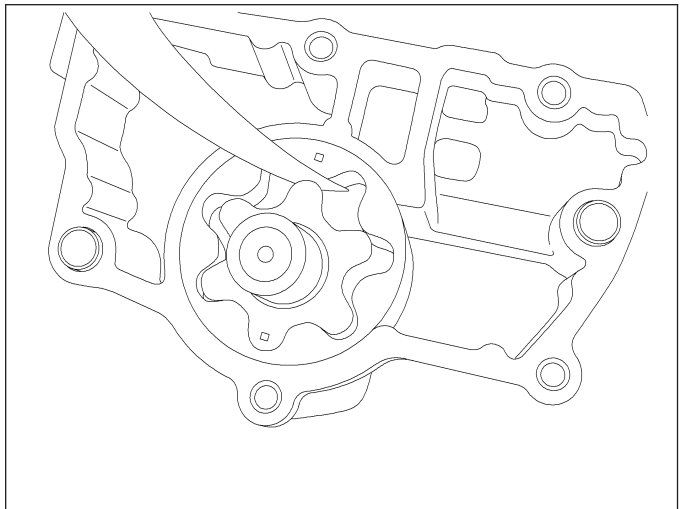
PUMP-OIL

REMOVAL



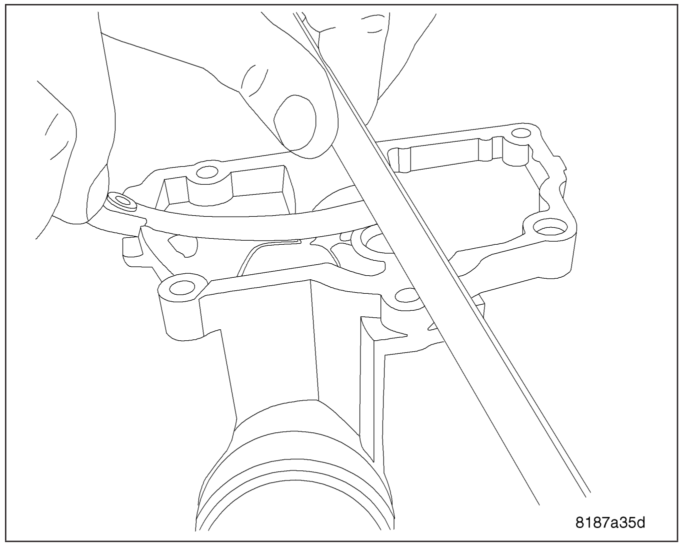
1. Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).

INSPECTION

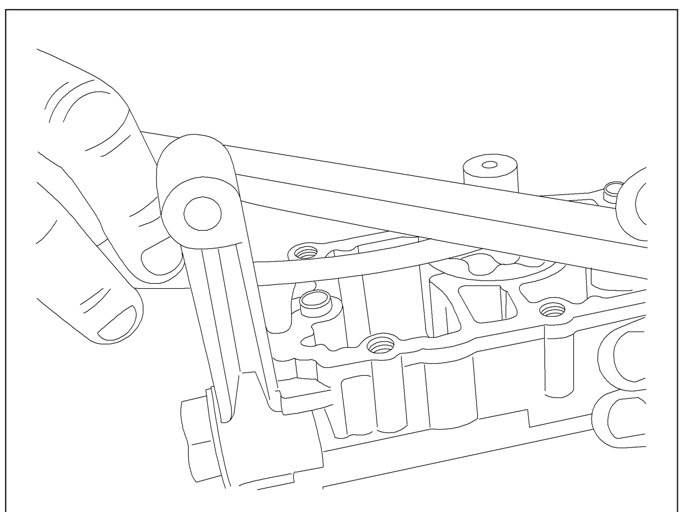


1. Remove pressure relief valve.
2. Inspect pressure relief valve for scoring or damage. If scored or damaged, replace valve.
3. Inspect oil pump housing bore for damage or scoring, if found replace pump.
4. Remove oil pump drive sprocket using holder 9711 (2).
5. Remove oil pump housing retaining bolts.
6. Remove oil pump housing.

7. Measure outer rotor (2) to housing (3) clearance with feeler gauge (1).

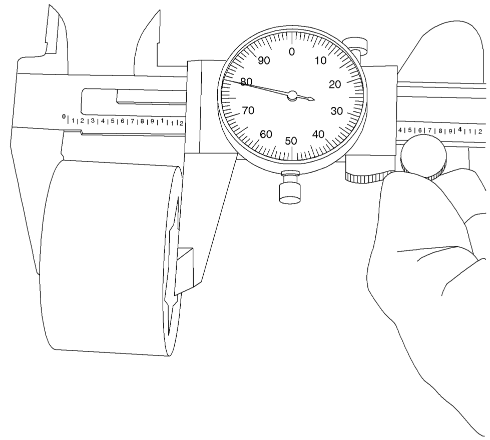


8. Measure tip clearance between outer and inner rotor.



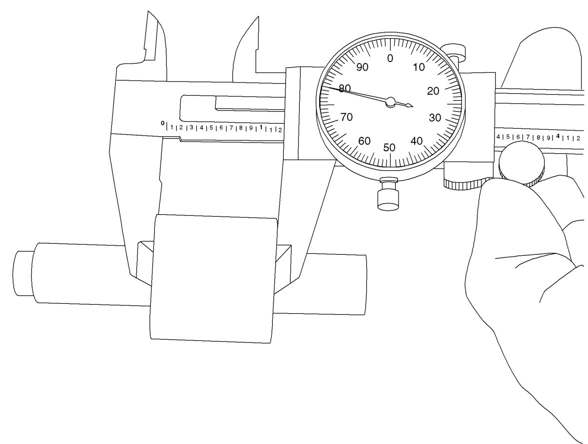
8187a349

9. Measure pump cover flatness with a straight edge and feeler gauge.



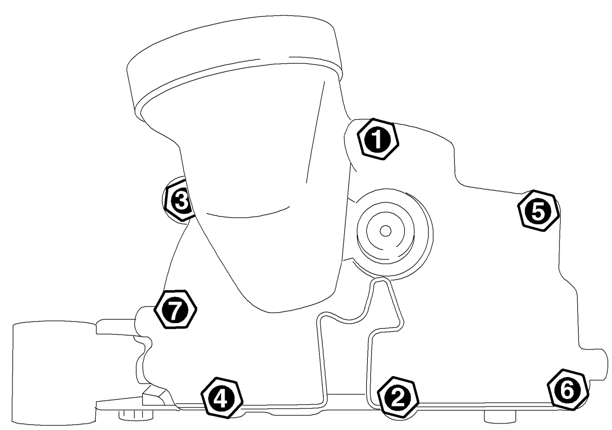
8187a35d

10. Measure clearance over rotors with a straight edge and feeler gauge.



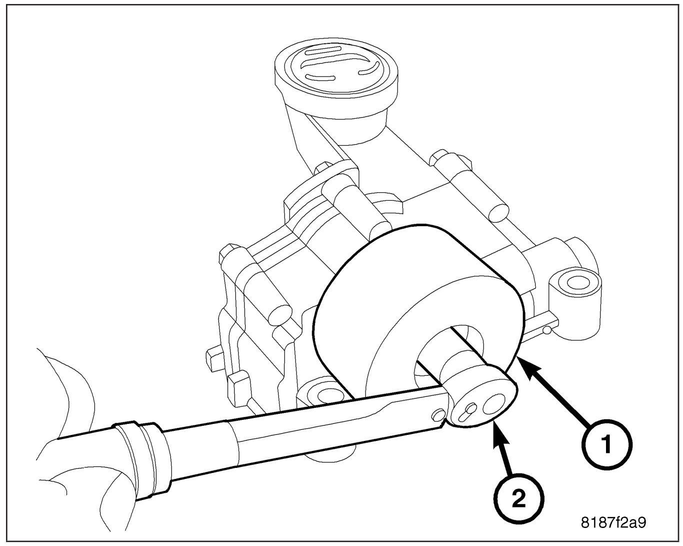
8188d716

11. Measure outer rotor thickness.



8187a3ad

12. Measure inner rotor thickness.



8188d71d

13. Inspect pump housing for scoring, replace as needed.
14. If pump passes inspections, install pump cover.
15. Install retaining bolts and tighten.

817ecfd1

16. Install pump drive sprocket using holder 9711 (1) and tighten.

INSTALLATION

1. Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - INSTALLATION).

SENSOR/SWITCH-ENGINE OIL PSI

DESCRIPTION

The oil pressure switch is located on the left front side of the engine block. The oil pressure switch is a pressure sensitive switch that is activated by the engine's oil pressure (in the main oil gallery). The switch is a two terminal device (one terminal is provided to the wiring harness and the other terminal is the switch's metal housing that screws into the engine block).

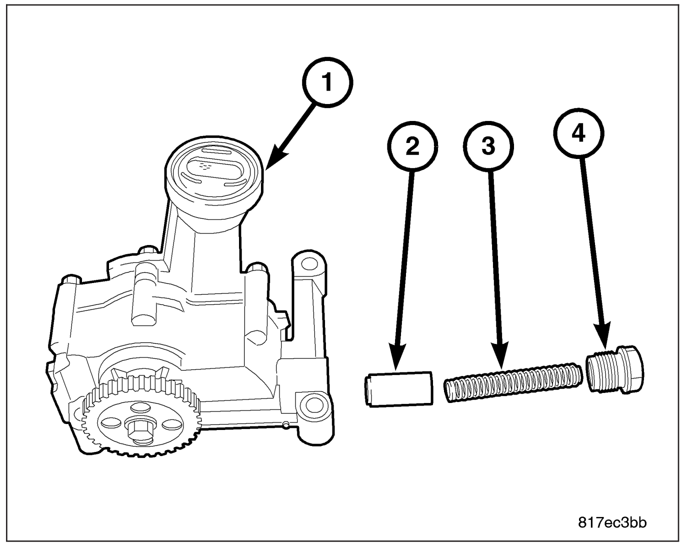
OPERATION

The oil pressure switch is normally "Closed." The switch changes from a ″Closed″ circuit to an ″Open″ circuit, on increasing pressure of 7 psig. The oil pressure switch changes from an ″Open″ circuit to a ″Closed″ circuit, on decreasing pressure, between 2 psig and 4 psig.

REMOVAL

1. Raise vehicle.
2. Disconnect electrical connector.
3. Remove oil pressure sending unit using oil pressure socket C-4597.

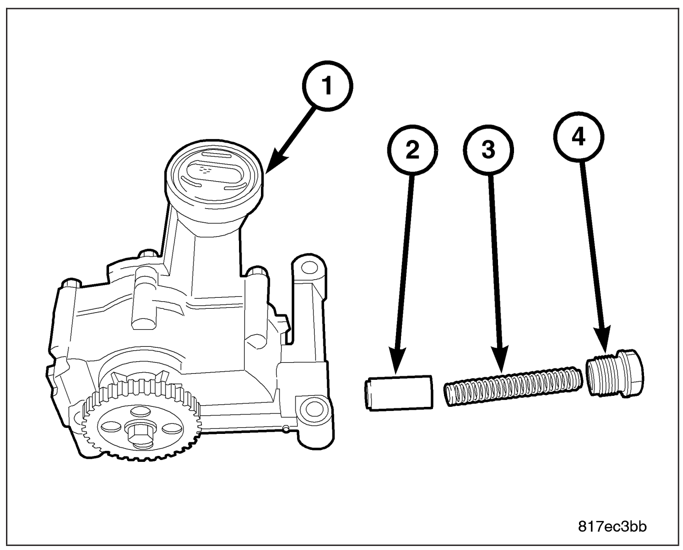
INSTALLATION



1. Install oil pressure sending unit using oil pressure socket C-4597.
2. Connect electrical connector.

VALVE-OIL PRESSURE RELIEF

REMOVAL



NOTE: Oil pressure relief valve can be serviced without removing oil pump from the engine.

1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Remove cap (4).
3. Remove spring (3) and valve (2).
4. Inspect valve (2) and pump (1) bore seizure or scoring. Replace as needed.

INSTALLATION

1. Lubricate valve (2) and pump (1) bore with clean engine oil.
2. Install valve (2) and spring (3).
3. Install cap (4) and tighten.
4. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

MANIFOLD-INTAKE

DIAGNOSIS AND TESTING

INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

1. Start the engine.
2. Spray a small stream of water (Spray Bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

LOWER INTAKE MANIFOLD

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

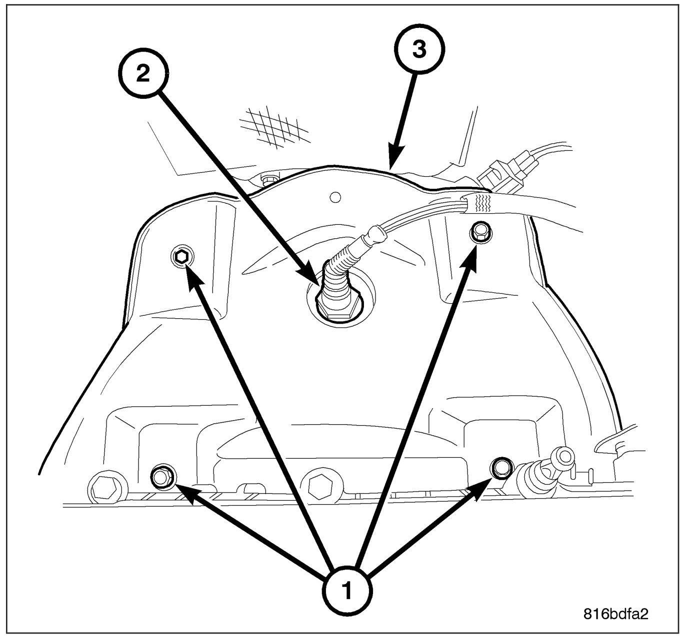
1. Remove engine cover.
2. Perform fuel system pressure release procedure **before attempting any repairs (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY - STANDARD PROCEDURE).**
3. Remove air cleaner housing.
4. Disconnect negative battery cable.
5. Disconnect fuel line at rail.
6. Remove fuel injector electrical connectors.
7. Remove fuel rail retaining bolts and remove fuel rail.
8. Disconnect oil temperature sensor.
9. Disconnect variable valve timing solenoid electrical connector.
10. Disconnect intake camshaft position sensor electrical connector.
11. Position harness out of the way.
12. Remove throttle body support bracket.
13. Disconnect electronic throttle control electrical connector.
14. Remove wiring harness retainer from the intake manifold.
15. Disconnect MAP sensor electrical connector.
16. Disconnect vacuum lines at intake.
17. Remove upper radiator hose retaining bracket.
18. Remove intake manifold retaining bolts.
19. Remove intake manifold.

CLEANING

1. Discard gasket(s).
2. Clean all sealing surfaces.

INSPECTION

1. Inspect manifold for cracks, distortion, or mounting surface warpage. Replace manifold if necessary.
2. Inspect manifold gasket for surface damage or excessive swelling. Replace gaskets as necessary.



INSTALLATION

LOWER INTAKE MANIFOLD

1. Clean all gasket surfaces.
2. Replace intake manifold gasket.
3. Install intake manifold, torque bolts to 25 N·m (220 in. lbs.).
4. Install the fuel rail assembly to intake manifold. Tighten screws to 23 N·m (200 in. lbs.).
5. Connect fuel injector electrical connectors.
6. Inspect quick connect fittings for damage, replace if necessary (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE). Connect fuel supply hose to fuel rail assembly. Check connection by pulling on connector to insure it locked into position.
7. Connect negative cable to battery.
8. Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

MANIFOLD-EXHAUST

REMOVAL

1. Remove engine cover.
2. Remove clean air hose and air cleaner housing.
3. Disconnect negative cable from battery.
4. Disconnect throttle and speed control cables from the throttle lever and bracket.
5. Disconnect MAP sensor electrical connector.
6. Remove fasteners securing power steering fluid reservoir to cylinder head.
7. Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).
8. Remove bolts attaching upper heat shield.
9. Remove upper heat shield.
10. Raise vehicle.
11. Disconnect exhaust pipe from manifold.
12. Remove engine wiring heat shield.
13. Remove manifold support bracket.
14. Remove lower exhaust manifold heat shield.
15. Disconnect oxygen sensor electrical connector.
16. Remove exhaust manifold lower retaining fasteners.
17. Lower vehicle and remove the upper exhaust manifold retaining fasteners.
18. Remove exhaust manifold from above/between the engine and cowl panel.
19. Remove and discard manifold gasket.
20. Mark prop shaft and differential for proper installation (if equipped).
21. Remove the rear prop shaft (if equipped) (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).
22. Remove the two exhaust to maniverter (exhaust manifold with catalytic converter) bolts.
23. Unplug the down - stream O2 sensor connector.
24. Remove the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL).
25. Lower the vehicle on the hoist.
26. Unplug the up - stream O2 sensor connector.
27. Remove up - stream O2 sensor from the maniverter (exhaust manifold with catalytic converter) using o2 sensor socket 8439 (2).
28. Remove the four maniverter heat shield bolts (1).
29. Remove the two retaining bolts and one nut from the maniverter side heat shield (3).
30. Remove the seven maniverter to head retaining bolts.
31. Slide the maniverter up and to the right, The support the maniverter (1) with the help of a bungie cord.
32. Raise the vehicle on the hoist.
33. Remove the four (1) engine to maniverter bracket bolts.
34. Remove the rear engine mount through bolt (2).
35. Remove the three front engine mount to frame bolts and the mount through bolt.
36. Remove the PTU mounting bolts.
37. Install a screw jack (2)on front engine mount bracket (1).
38. Raise the front of the engine until the rear mount has dropped (1,2).
39. Separate the PTU from the transaxle.

40. Remove and discard old O-ring between Transmission and PTU
41. Roll the PTU (1) forward and down to remove.

CLEANING

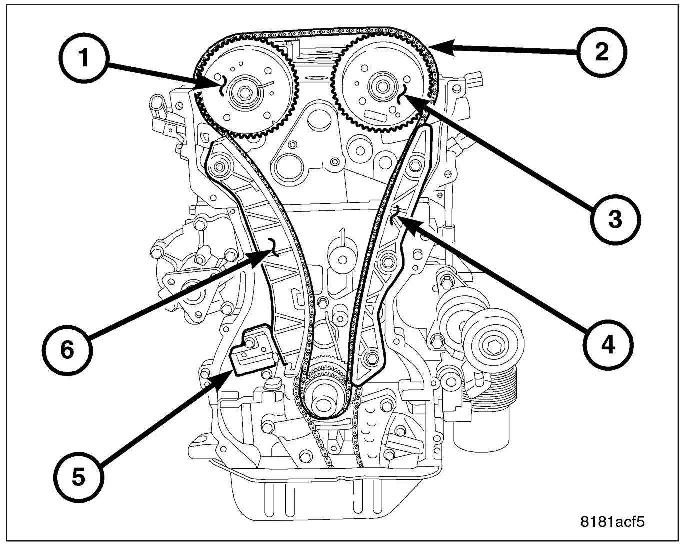
1. Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

1. Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.
2. Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

1. Install a new exhaust manifold gasket. **DO NOT APPLY SEALER**.
2. Position exhaust manifold in place. Tighten fasteners, starting at center and progressing outward in both directions to 23 N·m (200 in. lbs.). Raise and lower vehicle for fastener access as necessary. Repeat tightening procedure until all fasteners are at specified torque.
3. Install exhaust manifold heat shields. Tighten bolts to 12 N·m (105 in. lbs.).
4. Install exhaust manifold support bracket.
5. Install engine wiring heat shield.
6. Connect oxygen sensor electrical connector.
7. Install exhaust pipe to manifold. Tighten fasteners to 28 N·m (250 in. lbs.).
8. Install coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).
9. Install fasteners securing power steering fluid reservoir to cylinder head.
10. Connect MAP sensor electrical connector.
11. Connect throttle and speed control cables to the throttle lever and bracket.
12. Connect negative cable to battery.
13. Install clean air hose and air cleaner housing.
14. Roll the PTU in moving from front to back.
15. Rest the PTU on the frame while the engine and transaxle are raised back into position.
16. Lower screw jack until rear mount through bolt can be installed.
17. Install rear mount through bolt and torque bolt to 75 Nm (55 ft. lbs.).
18. Install the transmission crossmember and bolts, torque to 75 Nm (55 ft. lbs.).
19. Install the through bolt at the front transmission mount and torque to 75 Nm (55 ft. lbs.)
20. Insure that the O-ring between the PTU and transaxle is in place.
21. Slide the PTU into place.
22. Install and torque PTU mounting bolts to 58 N-m (43 lbf-ft).
23. Lower the hoist.
24. Place the maniverter back into place and install the seven bolts.
25. Torque the maniverter bolts.
26. Install the maniverter side heat shield into place.
27. Install the two retaining bolts and one retaining nut.
28. Install the maniverter heat shield and the four retaining bolts.
29. Torque the maniverter heat shield bolts.
30. Using tool 8439 install the O2 sensor.
31. Install the air box.
32. Install engine trim cover.
33. Raise the vehicle on the hoist.
34. Install the maniverter to block bracket and four mounting bolts.



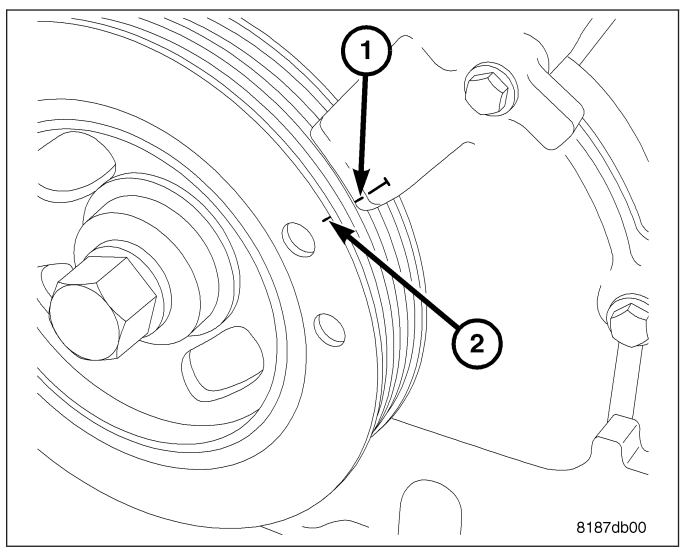
35. Torque maniverter to block bracket mounting bolts.
36. Install the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).
37. Install the Prop shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
38. install the right axle shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
39. Install the right front tire.
40. Fill PTU. (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - STANDARD PROCEDURE).
41. lower hoist
42. Connect battery cables.
43. Top off the fluids.

VALVE TIMING

DESCRIPTION

The timing drive system consists of the following:

- Timing Chain (2)
- Camshaft Sprockets (1,3)
- Crankshaft Sprocket
- Right Timing Chain Guide (Moveable) (6)
- Left Timing Chain Guide (Fixed) (4)
- Timing Chain Tensioner (5)



The camshaft sprockets are attached to the cam phasers which are attached to the front of the camshafts and is used with the timing chain and crankshaft sprocket to turn the camshafts. The camshaft position sensors target is part of the camshafts and is used with the camshaft position sensors to provide the PCM with valvetrain position information.

The timing chain tensioner is installed in the right side of the engine block. Using engine oil pressure, the tensioner applies constant pressure to the right side (movable) timing chain guide, which in turn applies pressure to the timing chain. Also as the tensioner extends, it rachet locks in position to provide constant timing chain tension.

STANDARD PROCEDURE

VALVE TIMING VERIFICATION

1. Remove engine cover.
2. Remove cylinder head cover (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER - REMOVAL).
3. Set engine to TDC.
4. Using a dial indicator, set number one cylinder to TDC on the compression stroke.
5. The mark on the camshaft sprocket should be in line with the cylinder head cover sealing surface.
6. Using a suitable light, look down into the timing chain cavity at the crankshaft sprocket. A paint mark on the crankshaft sprocket should align with the edge of the engine block boss indicated in.
7. Install cylinder head cover (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

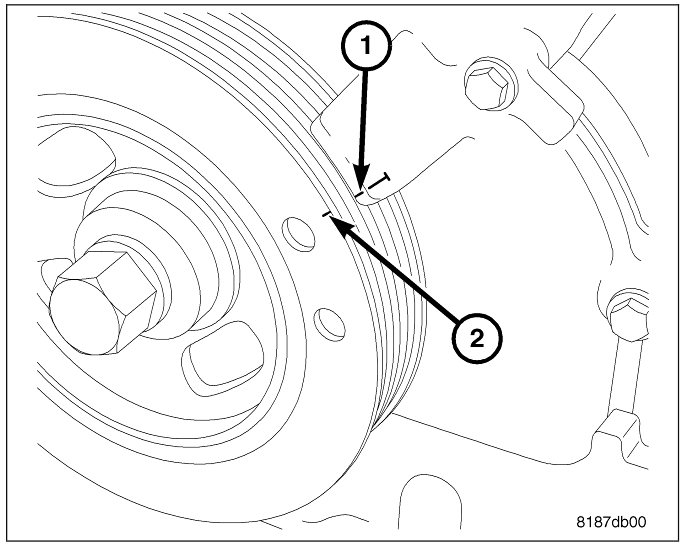
COVER-TIMING CHAIN

REMOVAL

1. Remove engine cover.
2. Perform fuel pressure bleed procedure.
3. Remove air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Disconnect negative battery cable.
5. Drain cooling system
6. Remove coolant recovery bottle.
7. Remove windshield washer bottle.
8. Remove power steering reservoir and set aside.
9. Remove make up air hose.
10. Remove PCV hose.
11. Disconnect ignition coil electrical connectors.
12. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
13. Raise vehicle.
14. Remove right lower splash shield.
15. Set engine to TDC.
16. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
17. Remove lower A/C compressor retaining bolts.
18. Remove A/C compressor lower bracket.
19. Remove accessory drive belt lower idler pulley.
20. Remove crankshaft pulley.
21. Remove water pump pulley.
22. Remove timing chain cover lower bolts.
23. Lower vehicle.
24. Remove power steering pump and set aside.
25. Support engine with a suitable jack.
26. Remove right engine mount.
27. Remove accessory drive belt upper idler pulley.
28. Remove right engine mount bracket.
29. Remove accessory drive belt tensioner.
30. Remove timing chain cover upper retaining bolts.
31. Remove timing chain cover.

INSTALLATION

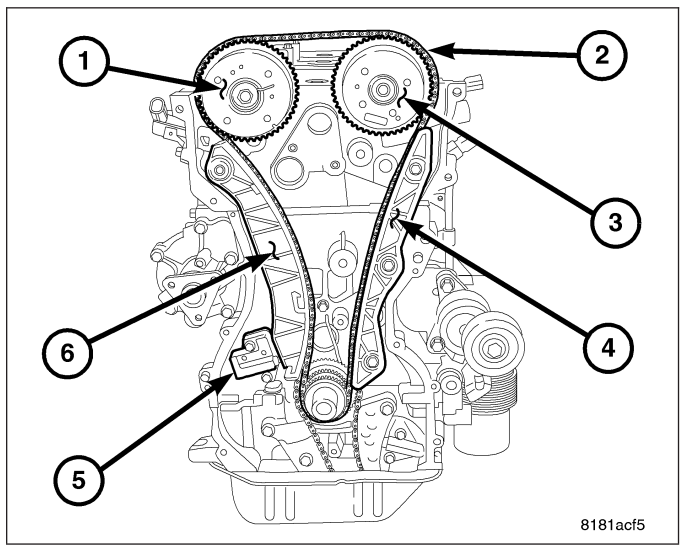
1. Clean all sealing surfaces.
2. Apply RTV as shown at the cylinder head to block parting line.
3. Apply RTV as shown in the corner of the oil pan and block.
4. Apply 2mm bead of RTV as shown.
5. Install timing chain cover.
6. Install timing chain cover upper retaining bolts and torque bolts.
7. Install accessory drive belt tensioner.
8. Install right engine mount bracket and torque.
9. Install accessory drive belt upper idler pulley.
10. Install right engine mount and torque bolts.



11. Remove jack from under engine.
12. Install power steering pump.
13. Raise vehicle.
14. Install timing chain cover lower retaining bolts and torque bolts.
15. Install oil pan to timing chain cover lower retaining bolts and torque bolts.
16. Install water pump pulley.
17. Install crankshaft pulley and torque bolt.
18. Install accessory drive belt lower idler pulley.
19. Install lower A/C compressor mounting bracket.
20. Install A/C compressor.
21. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
22. Install right lower splash shield.
23. Lower vehicle.
24. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)
25. Connect coil electrical connector,
26. Connect PCV hose to PCV valve.
27. Connect make up air hose.
28. Install power steering reservoir.
29. Install windshield washer bottle.
30. Install coolant recovery bottle.
31. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
32. Connect negative battery cable.
33. Install air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
34. Install engine cover.

CHAIN AND SPROCKETS-TIMING

REMOVAL

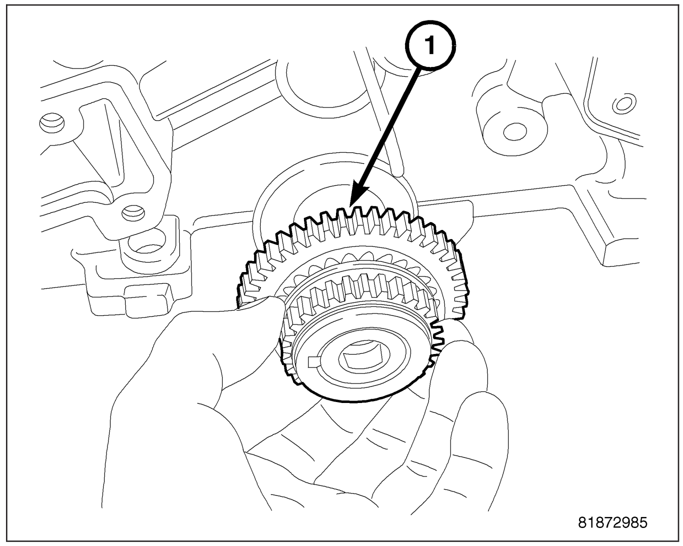


TIMING CHAIN

1. Perform fuel pressure bleed procedure.
2. Remove air cleaner housing.
3. Set engine to TDC.
4. Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

NOTE: If the timing chain plated links can no longer be seen, the timing chain links corresponding the timing marks must be marked prior to removal if the chain is to be reused.

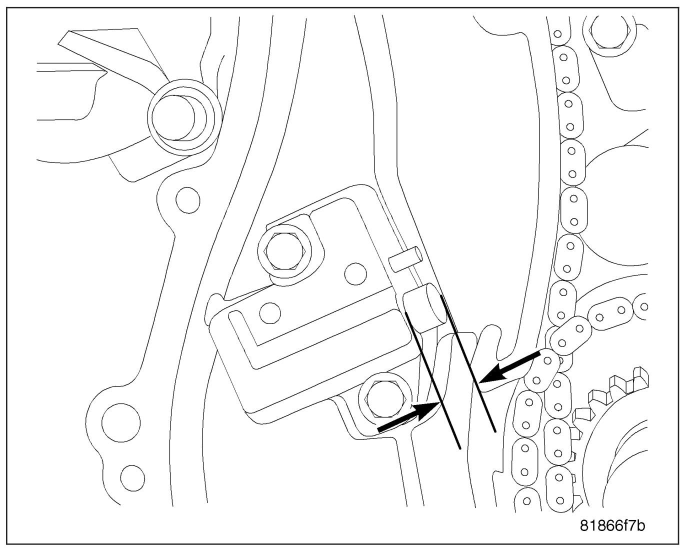
5. Remove timing chain tensioner (5) (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL).
6. Remove timing chain (2).



CAMSHAFT SPROCKET(S)

Refer to camshaft phasor removal (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

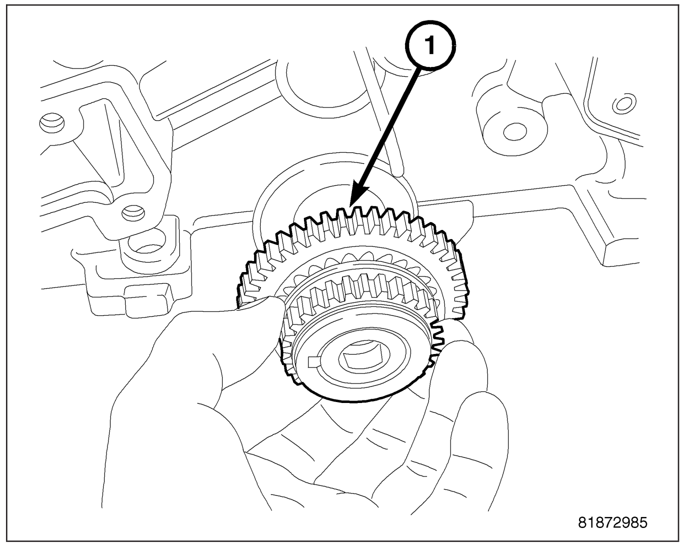
CRANKSHAFT SPROCKET



1. Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
2. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
3. Remove oil pump drive chain tensioner.
4. Remove oil pump drive chain.
5. Remove crankshaft sprocket (1).

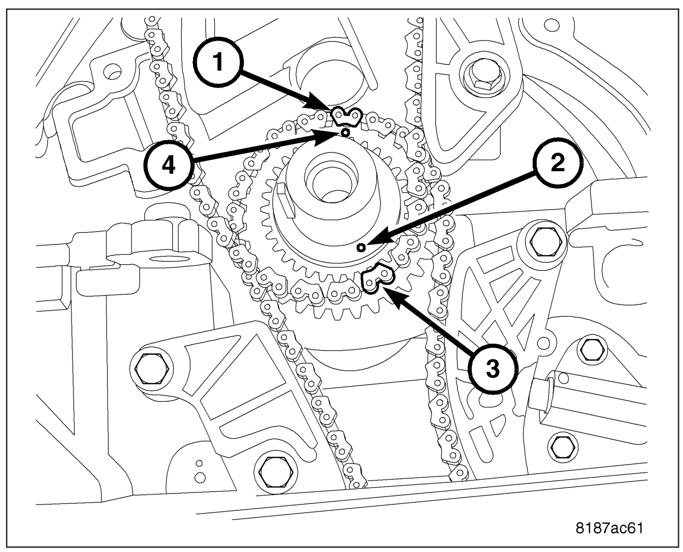
INSPECTION

Inspect timing chain for stretching prior to removal.



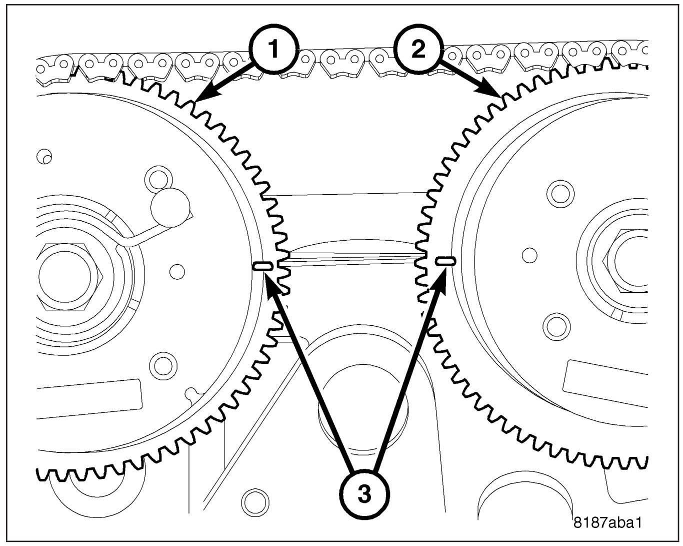
1. Rotate engine while watching timing chain tensioner plunger. When the plunger reaches its maximum travel stop rotating engine.
2. Measure the distance from the tensioner body and the edge of the chain guide as shown.
3. If the distance is greater than 20.5 mm (0.81 in.) inspect guide shoes for excessive wear.
4. If guides are okay, replace timing chain.

INSTALLATION

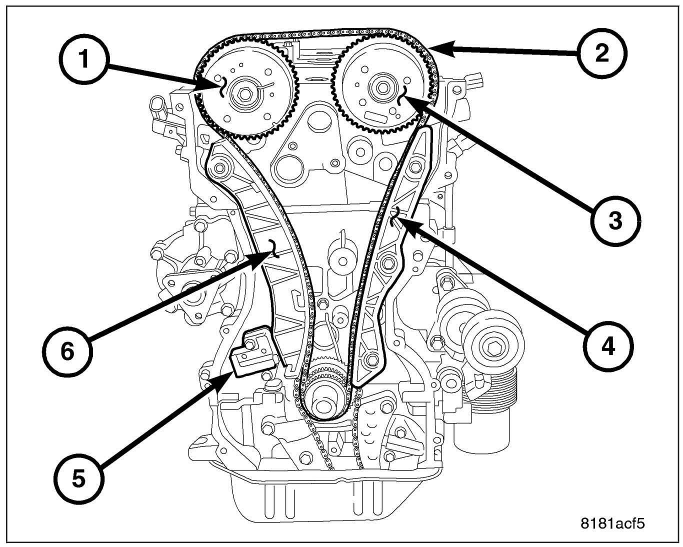


CRANKSHAFT SPROCKET

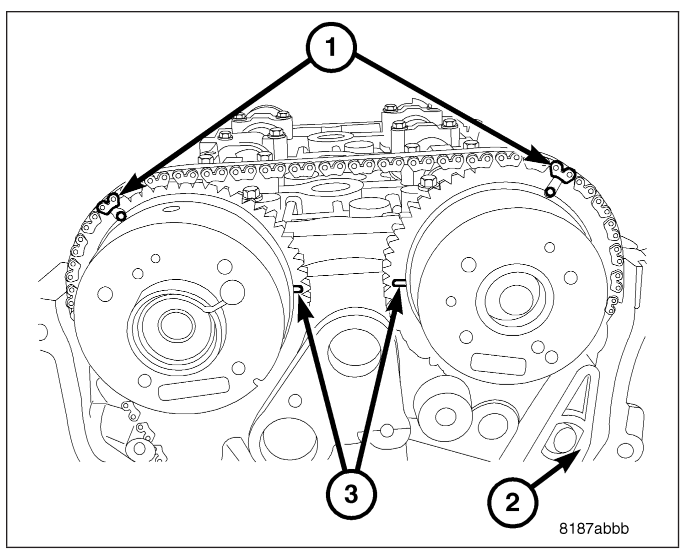
1. Install crankshaft sprocket (1) onto crankshaft.
2. Install oil pump drive chain. Verify that Oil pump is correctly timed.
3. Reset oil pump drive chain tensioner by pushing plunger inward and install Tensioner Pin 8514.
4. Install oil pump drive chain tensioner and remove Tensioner Pin 8514.
5. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
6. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/ OIL PAN - INSTALLATION).
7. Fill engine with oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).
8. Start engine and check for leaks.



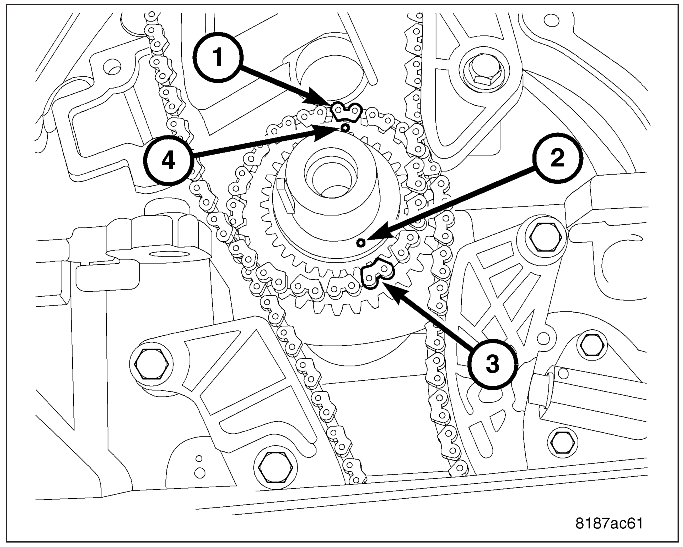
TIMING CHAIN



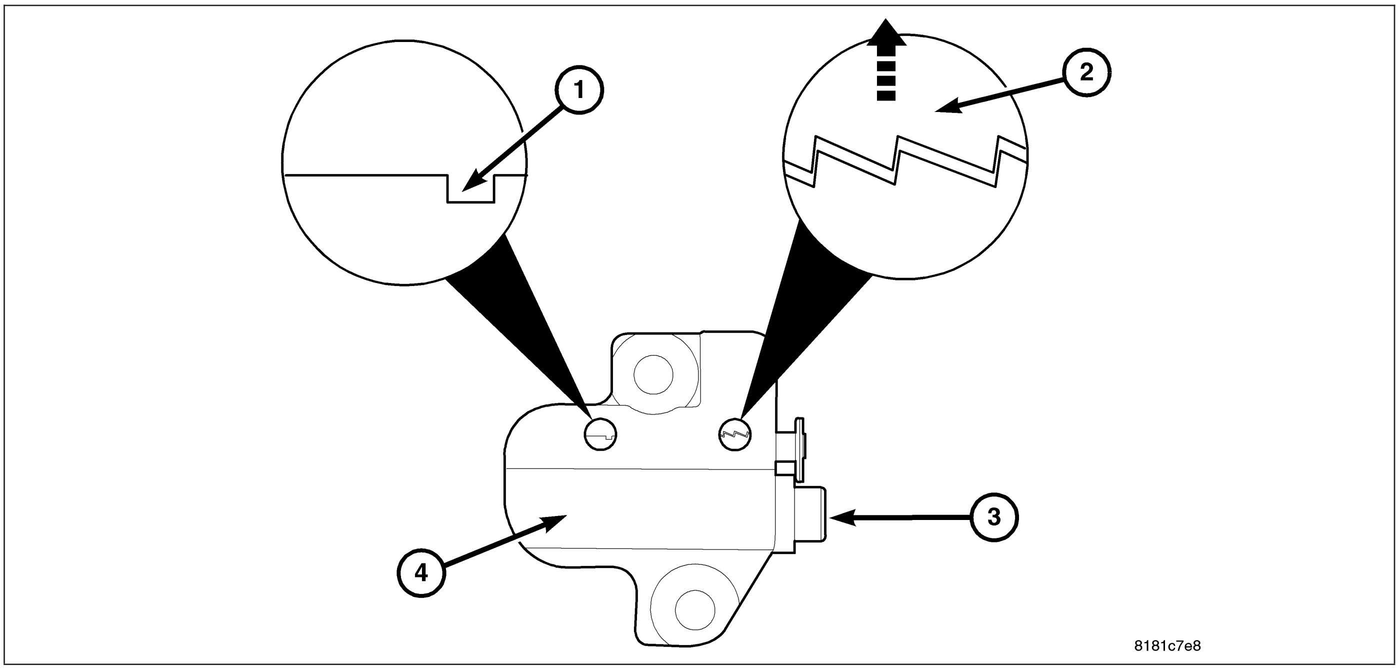
1. Verify that the crankshaft sprocket keyway is at the 9 o'clock position.



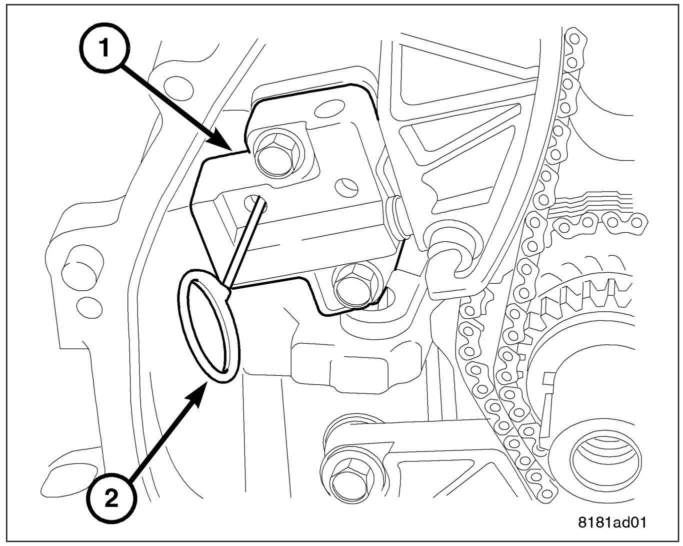
2. Align camshaft timing marks (3) so they are parallel to the cylinder head as shown.



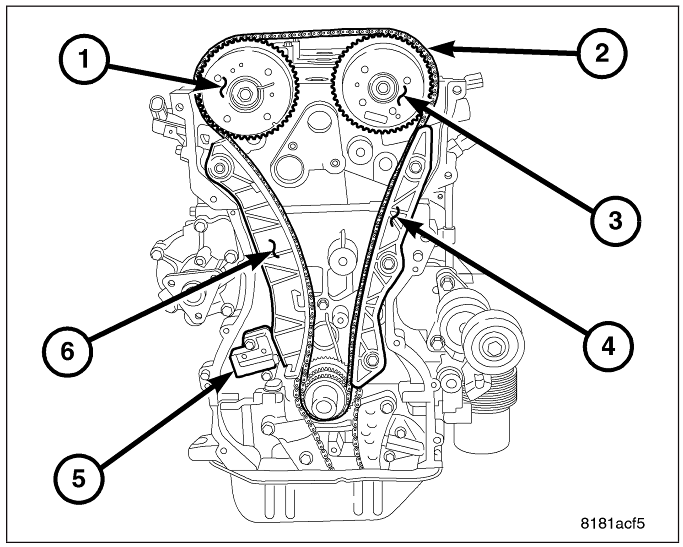
3. Install timing chain guide (4) and torque bolts.



4. Install timing chain so plated links on chain align with timing marks on camshaft sprockets (1).

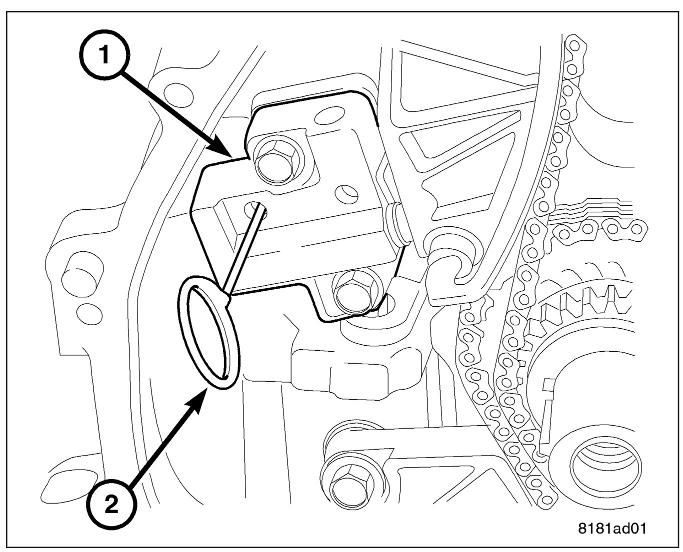


5. Align timing mark on the crankshaft sprocket (2) with the plated link (3) on the timing chain. Position chain so slack will be on the tensioner side.



6. Reset timing chain tensioner (4) by lifting up on ratchet (2) and pushing plunger (3) inward towards the tensioner body (4). Insert tensioner pin 8514 into slot (1) to hold tensioner plunger in the retracted position.

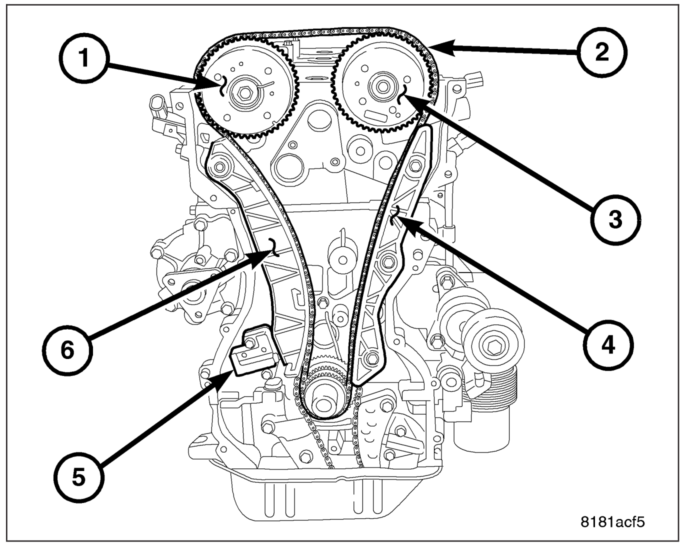
7. Install timing chain tensioner (1) and torque bolts to 12 N·m (105 in. lbs.).



NOTE: Keep the slack in the timing chain on the tensioner side.

8. Install the moveable timing chain pivot guide (6) and torque bolt to 12 N·m (105 in. lbs.).

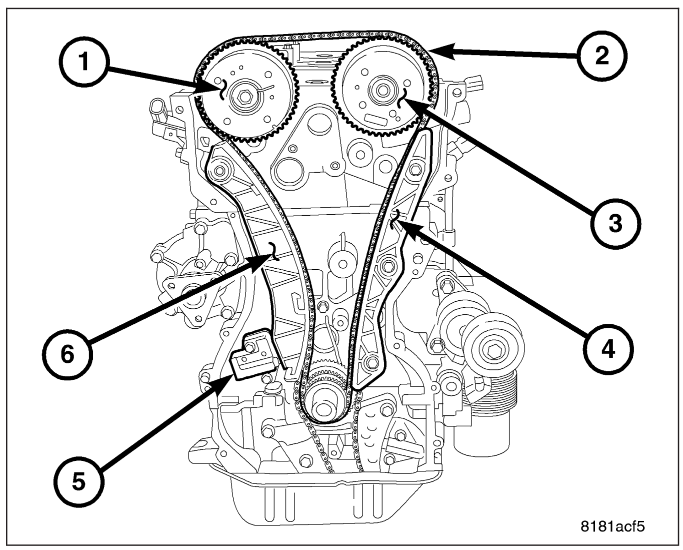
9. Remove timing tensioner pin 8514 (2).
10. Rotate the crankshaft CLOCKWISE two complete revolutions until the crankshaft is repositioned at the TDC position. Verify that the camshaft and crankshaft timing marks are in proper position.
11. Install front timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
12. Connect negative battery cable.
13. Fill with oil, start engine and check for leaks.



TIMING-CHAIN TENSIONER

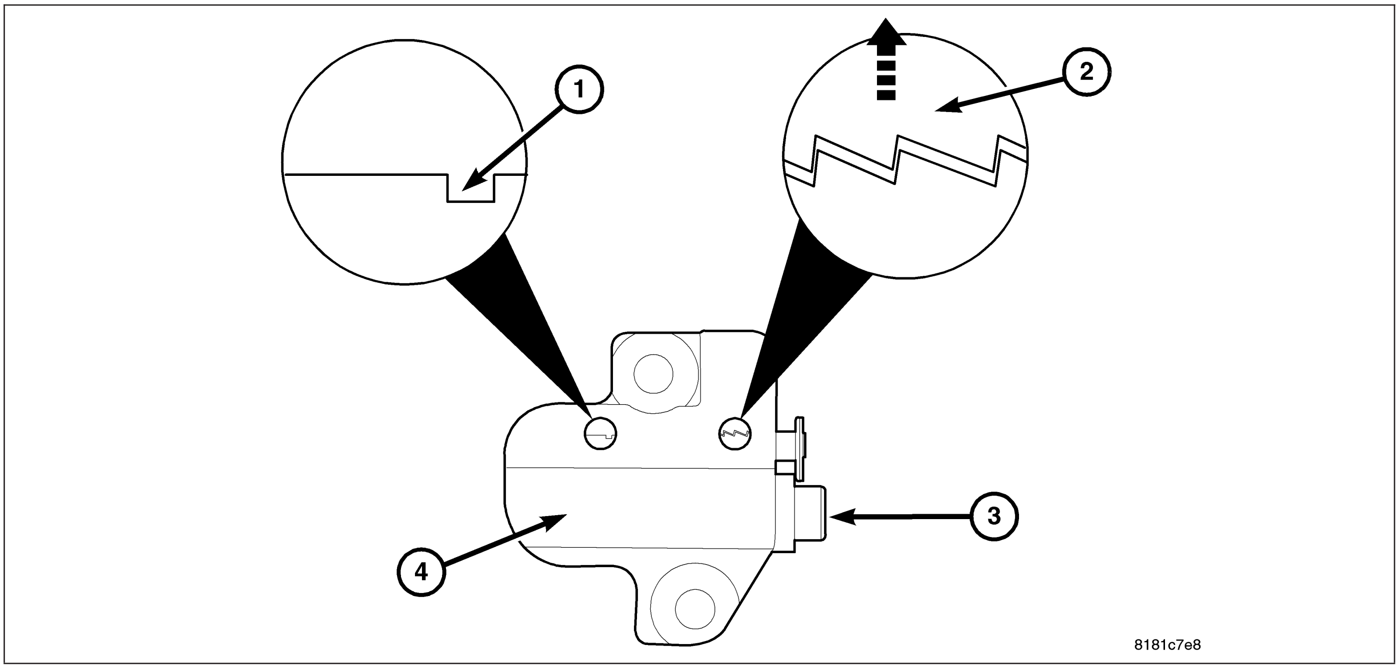
REMOVAL

1. Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).



NOTE: Tensioner will not come apart during removal.

2. Remove timing chain tensioner retaining bolts and remove tensioner.



INSTALLATION

1. Reset tensioner.
2. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

ADJUSTMENTS

ADJUSTMENT

1. Raise ratchet (2) with small screw driver.
2. Push plunger (3) towards tensioner body (4).
3. Insert tensioner pin 8514 into slot (1). This will hold the tensioner in the retracted position.

ENGINE 2.0L WORLD

TABLE OF CONTENTS

ENGINE 2.0L WORLD

DESCRIPTION

The 2.0 Liter (122 cu. in.) in-line four cylinder engine is a double over head camshaft with mechanical lash buckets and four valves per cylinder design. This engine is NOT free-wheeling; meaning that the pistons will contact the valves in the event of a timing chain failure.

The cylinders are numbered from front of the engine to the rear. The firing order is 1–3–4–2.

The engine identification number is located on the rear of the cylinder block.

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Mechanical Valve Tappet Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing belt/chain.
ENGINE STALLS OR IDLES ROUGH	1. Idle speed too low.	1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)
	2. Incorrect fuel mixture.	2. (Refer to Appropriate Diagnostic Information)
	3. Intake manifold leakage.	3. Inspect intake manifold, manifold gasket, and vacuum hoses.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
VALVETRAIN NOISE	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil level.
	5. Worn cam lobe.	5. Install new camshaft.
	6. Worn tappet bucket.	6. Install new select fit tappet bucket.
	7. Worn valve guides.	7. Ream guides and install new valves with oversize stems.
	8. Excessive runout of valve seats on valve faces.	8. Grind valve seats and valves.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.
	7. Connecting rod out-of-round.	7. Replace connecting rod.
	8. Misaligned connecting rods.	8. Replace bent connecting rods.

CONDITION	POSSIBLE CAUSES	CORRECTION
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.
	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure sending unit.	2. Install new sending unit.
	3. Low oil pressure.	3. Check sending unit and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Ream guide(s) and replace valve(s) with oversize valve(s) and seal(s).
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Check engine oil level and add oil if necessary.
2. Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

3. Remove engine cover.
4. Disconnect coil electrical connectors and remove coils.
5. Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
6. Disconnect injector electrical connectors.
7. Be sure throttle blade is fully open during the compression check.
8. Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
9. Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.
10. Repeat the previous step for all remaining cylinders.
11. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
12. If one or more cylinders have abnormally low compression pressures, repeat the compression test.
13. If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.
5. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:
   - Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
   - Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
   - Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

   - Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
   - If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
6. If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.
    a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
    b. Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.
4. If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.
7. After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

1. Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
2. Remove negative battery cable.
3. Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.
4. With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
5. Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

6. Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
7. Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

8. Install new spark plugs.
9. Drain engine oil and remove oil filter.
10. Install a new oil filter.
11. Fill engine with specified amount of approved oil.
12. Connect negative battery cable.
13. Start engine and check for any leaks.

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

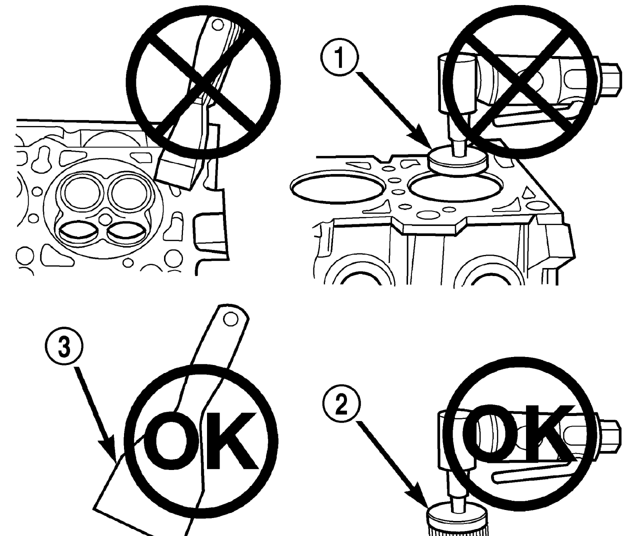
MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces.



ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

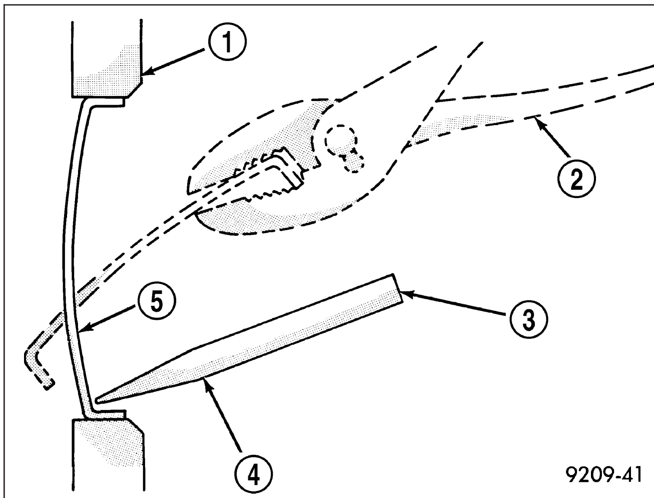
Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

80c073f0

Only use the following for cleaning gasket surfaces:



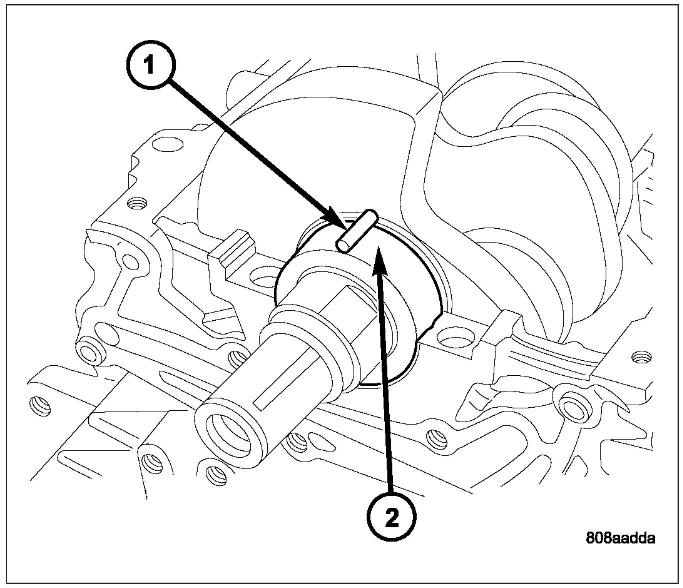
- Solvent or a commercially available gasket remover
- Plastic or wood scraper
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

CYLINDER HEAD CORE PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug.

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.



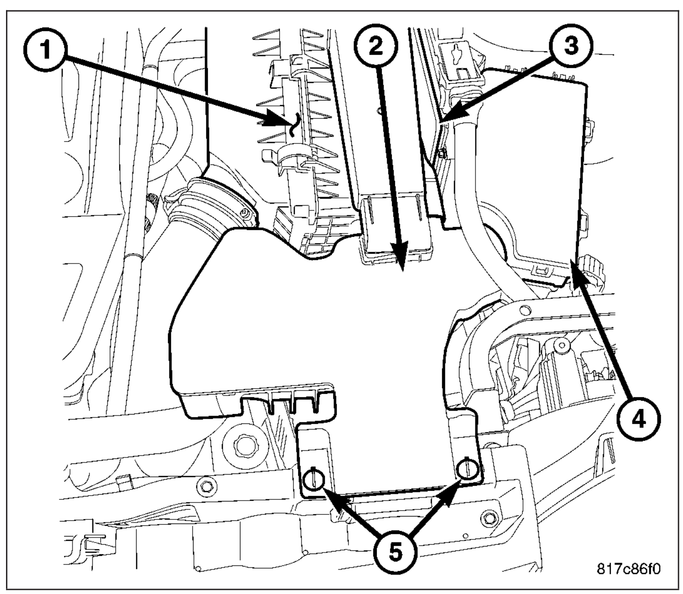
9209-41

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

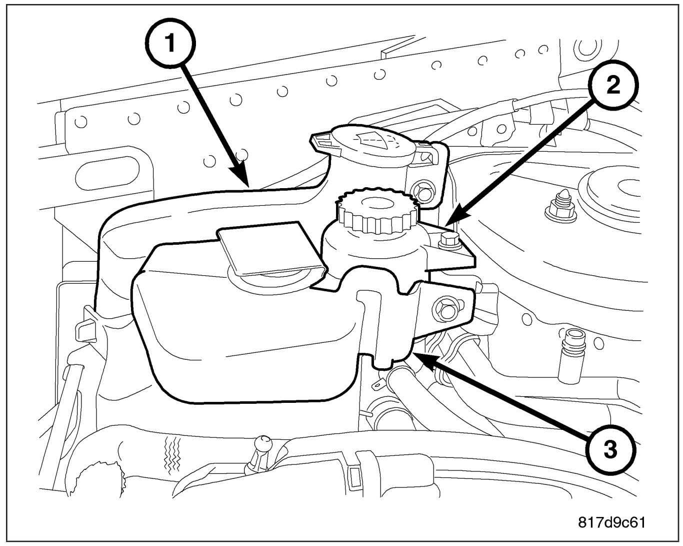
MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:



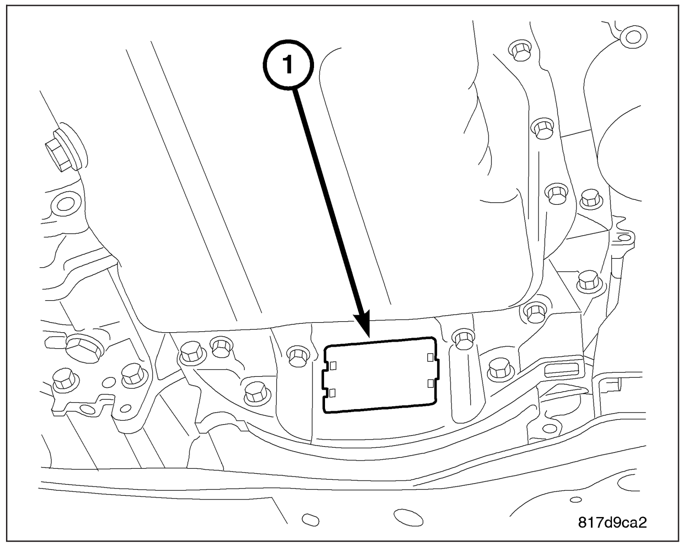
1. Remove oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes. (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap/bed plate bolts of the bearing being checked to the proper specifications.
3. Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.



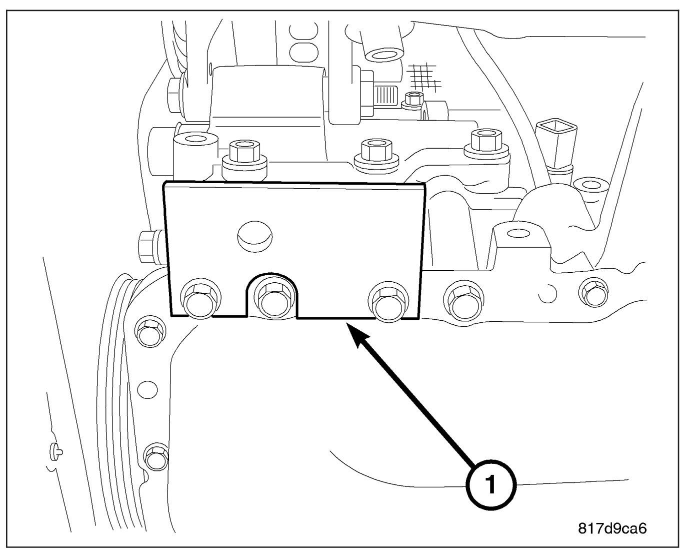
4. Install the proper crankshaft bearings to achieve the specified bearing clearances.

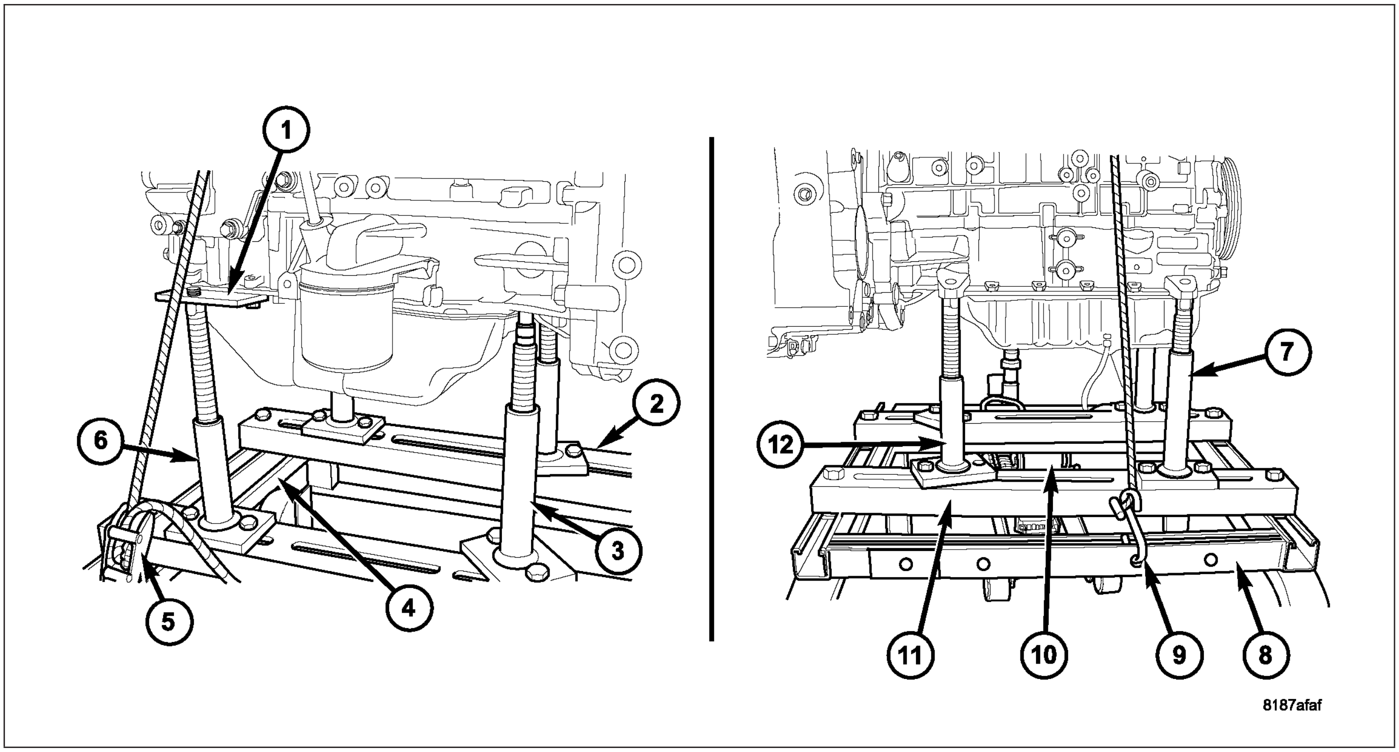
REMOVAL - ENGINE ASSEMBLY



1. Perform fuel pressure release procedure, then disconnect and remove fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Remove air cleaner housing assembly (1) and clean air hose (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect both cables from battery.
4. Remove battery and battery tray.
5. Discharge air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).
6. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

7. Remove coolant reservoir (3).
8. Remove grill trim panel.
9. Remove upper radiator hose from radiator and coolant manifold.
10. Remove upper radiator hose support.
11. Remove lower radiator hose at coolant manifold.
12. Remove coolant hose from coolant manifold.
13. Disconnect the following electrical connectors, variable valve timing solenoids, oil temperature sensor, injectors, map, coils, cmp's, coolant temperature sensors, capacitor, oxygen sensor, intake air temperature sensor.
14. Remove air intake tube from throttle body.
15. Remove vacuum lines from throttle body and intake manifold.

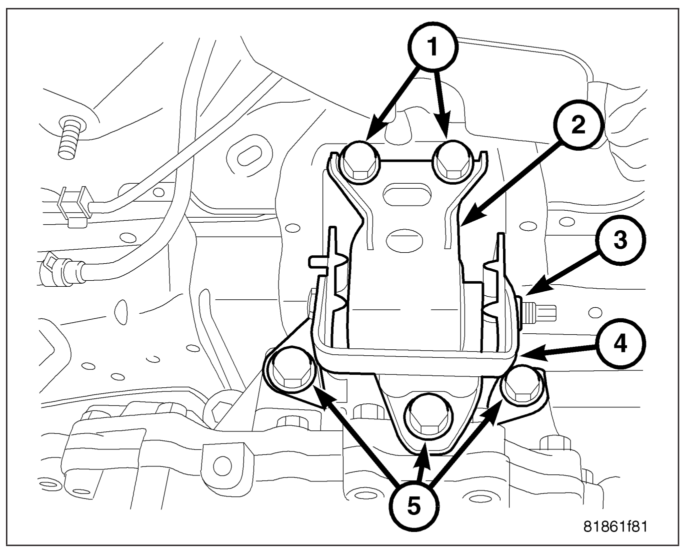


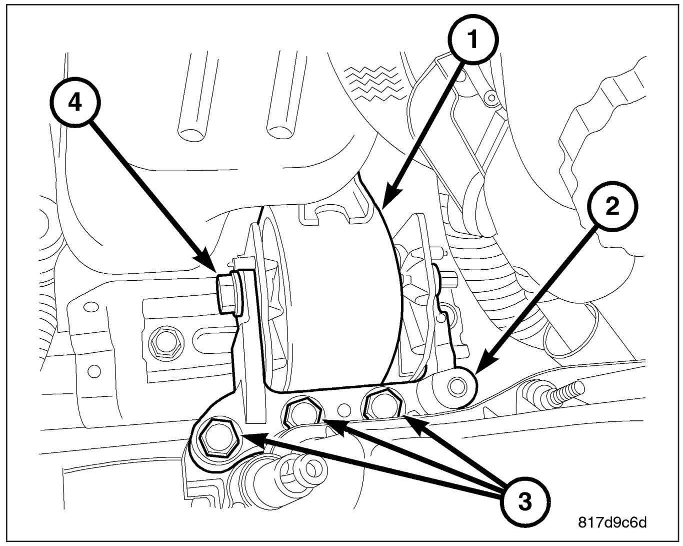


16. Unclip harness from intake.
17. Disconnect electronic throttle control and manifold flow control valve electrical connectors.
18. Remove PCV hose from valve cover.
19. Remove dipstick.
20. Remove throttle body support bracket.
21. Remove intake bolts and remove intake.
22. Disconnect coolant temperature sensor at block, Knock sensor, oil pressure sensor, generator, starter, block heater, A/C compressor, and block ground.
23. Remove accessory drive belt.
24. Remove power steering reservoir.
25. Remove power steering line support.
26. Remove power steering pump and set aside.
27. Remove upper idler pulley.
28. Remove transaxle filler tube.
29. Disconnect transmission linkage.
30. Disconnect transmission range sensor, TIS and TOS.
31. Remove transmission vent hose.
32. Remove ground strap near right tower.
33. Remove rear heat shield.
34. Remove maniverter heat shields.
35. Raise vehicle.
36. Remove wheels.
37. Remove right front splash shield.
38. Remove axle nuts.
39. Remove ball joint pinch bolts and separate steering knuckle from ball joint.
40. Remove axles.
41. Drain oil.
42. Mark drive shaft and flange.
43. Remove carrier bearing and heat shield.
44. Remove driveshaft.
45. Remove exhaust pipe to maniverter/exhaust manifold bolts.
46. Remove maniverter/exhaust manifold support bracket.
47. Lower vehicle.
48. Remove coolant manifold.

49. Remove maniverter/exhaust manifold bolts.
50. Remove maniverter/exhaust manifold to left of engine.
51. Hoist up.
52. Remove front mount through bolt.
53. Remove crossmember.
54. Remove front mount bracket.
55. Remove rear mount through bolt.
56. Remove rear mount.
57. Remove rear mount bracket.
58. Pull engine forward and support.
59. Remove PTU assembly if equiped (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).
60. Remove inspection cover (1) and mark torque converter to flywheel.
61. Remove torque converter bolts.
62. Remove lower bellhousing bolts.
63. Remove A/C lines from compressor and remove A/C compressor.
64. Remove A/C mounting bracket.

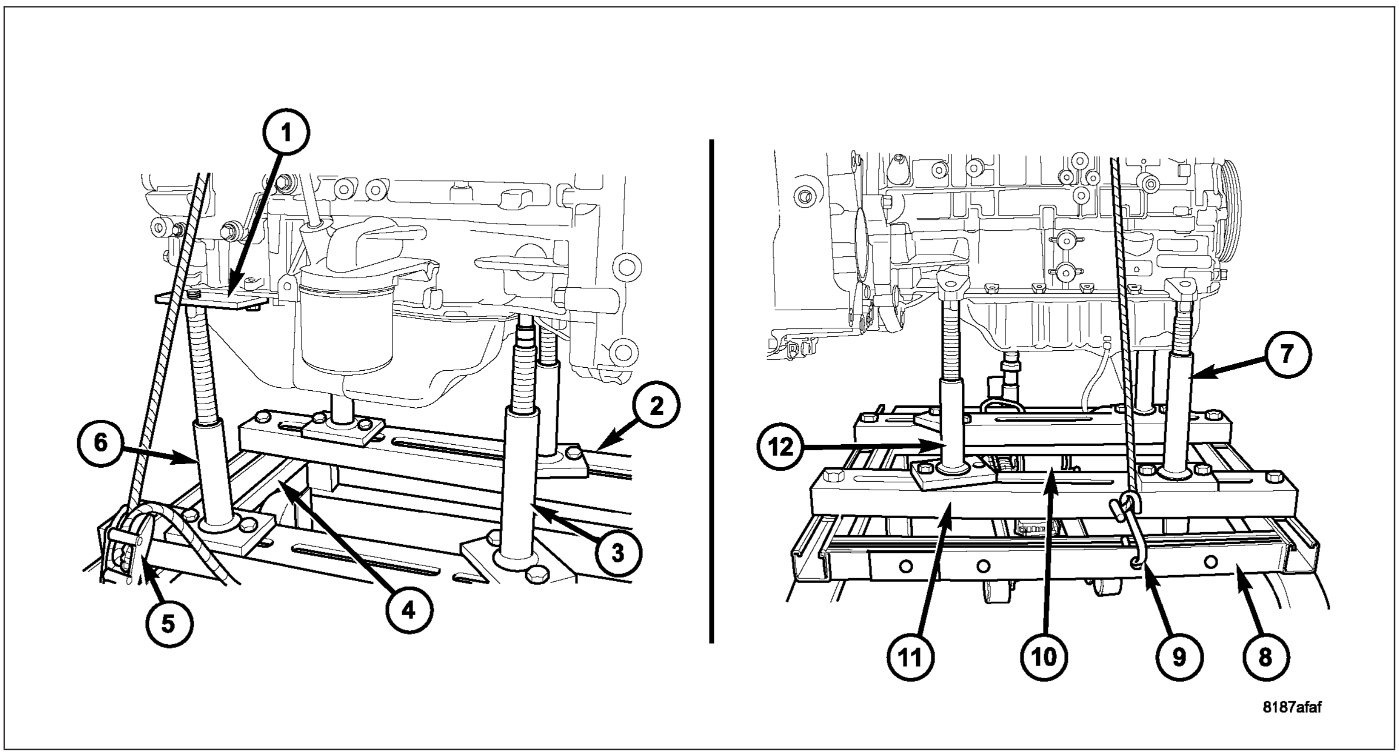
65. Install Adapter 9704 (1).
66. Remove generator and lower idler pulley.
67. Disconnect transmission electrical connector.
68. Disconnect CKP electrical connector.
69. Remove coolant hoses at transaxle cooler.
70. Remove transaxle cooler lines from cooler.





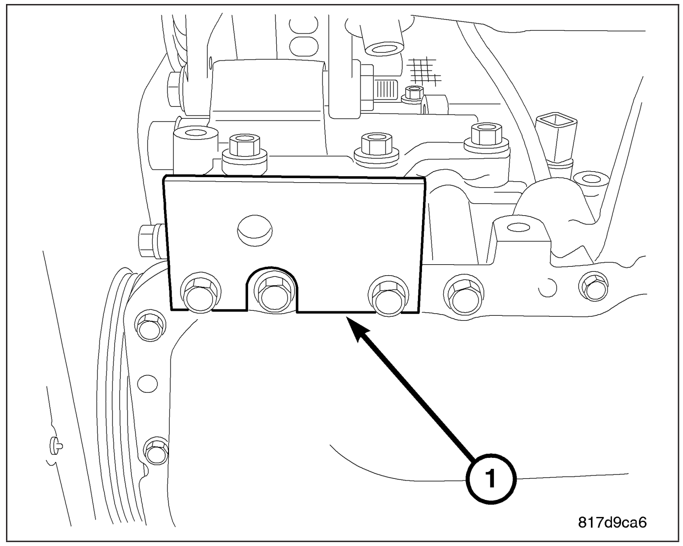
71. Position dolly (4,8) under engine and lower vehicle.

WARNING: Safety straps MUST be used.



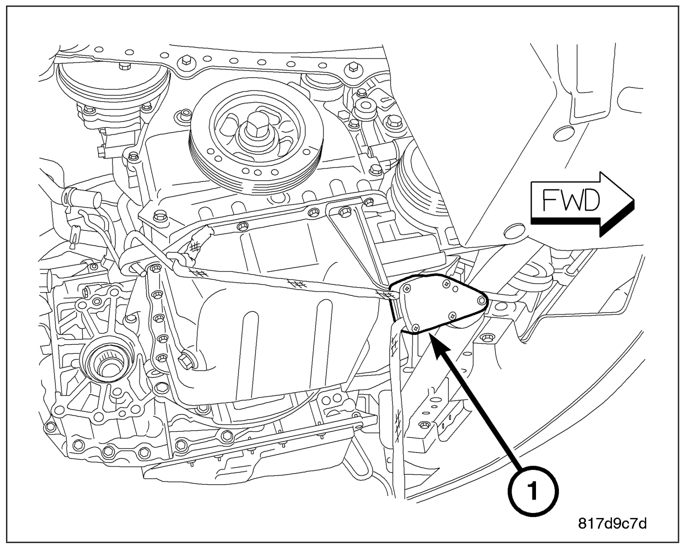
72. Install safety straps (6,9).
73. Remove PCM bracket and set aside.
74. Remove left engine mount through bolt (3).

75. Remove right engine mount through bolt (4).
76. Raise vehicle away from engine and transaxle.
77. Separate engine from transaxle.

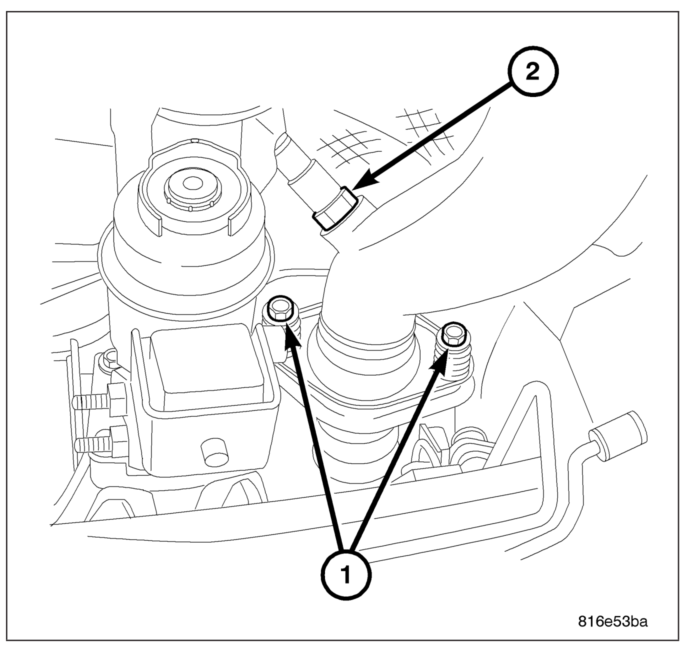


INSTALLATION - ENGINE ASSEMBLY

1. Position engine and transmission assembly under vehicle and slowly lower the vehicle over the engine/transaxle assembly.
2. Continue lowering vehicle until engine/transaxle aligns to mounting locations. Install mounting bolts at the right and left engine/transaxle mount bolts and Tighten bolts to 118 N·m (87 ft. lbs.).
3. Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.

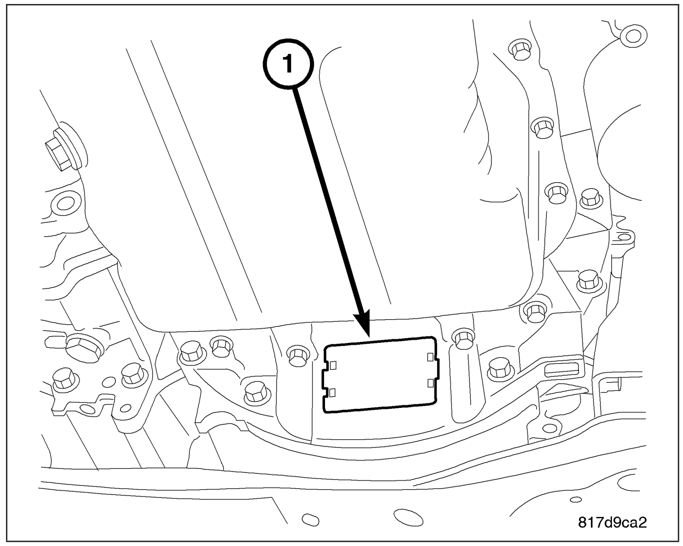


4. Remove Adapter 9704 (1).
5. Install pcm bracket.
6. Install maniverter assembly and upper lower heat shields.
7. Install oxygen sensor and connect electrical connector.
8. Install coolant manifold assembly.
9. Install transaxle linkage and adjust as necessary.
10. Install transaxle vent hose.
11. Connect transaxle electrical connectors.
12. Install Ground strap near right strut tower.
13. Raise vehicle.

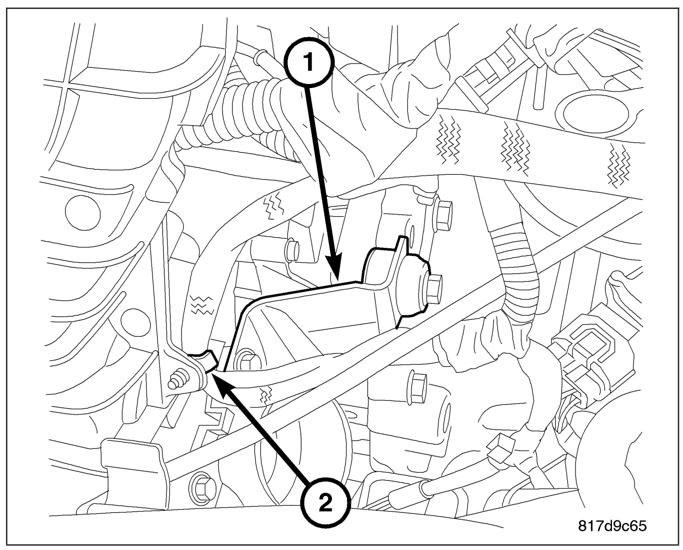


14. Pull engine forward and restrain engine.

NOTE: Be sure to install O-ring prior to installing PTU assembly.



15. Install PTU.
16. Remove engine restraint.
17. Install front mount bracket and tighten bolts.
18. Install frame cross member.
19. Install front engine mount.
20. Install rear mount bracket.
21. Install rear mount and tighten bolts.
22. Connect CKP electrical connector.



23. Install maniverter to exhaust pipe bolts (1) and tighten bolts.
24. Align driveshaft marks and install and heat shield.
25. Install generator
26. Install A/C bracket.
27. Install A/C lines on compressor and install compressor.
28. Install lower bell housing bolts and tighten bolts.
29. Align torque converter and flex plate mark. Install torque converter bolts and tighten.

30. Install inspection cover (1).

31. Install transaxle electrical connectors.
32. Connect trans cooler lines.
33. Install coolant hoses at transmission cooler.
34. Install axles.
35. Install ball joint pinch bolts and tighten.
36. Install axle nuts and tighten.
37. Install splash shields.
38. Install wheels.
39. Install new oil filter.
40. Lower vehicle.
41. Install transaxle filler tube.
42. Install upper idler pulley.
43. Install power steering pump.
44. Install power steering line support bracket.
45. Install power steering pump.
46. Install accessory drive belt.
47. Connect electrical connectors at block ground, starter, A/C compressor, knock sensor, Oil pressure sensor, generator, Coolant temperature sensor at block, and block heater.
48. Install intake manifold and tighten bolts.
49. Install throttle body support bracket (1).

50. Install engine oil dip stick.
51. Install PCV hose to valve cover.
52. Connect manifold flow control valve and electronic throttle control electrical connectors and fasten harness to intake.
53. Install vacuum lines at throttle body and intake manifold.
54. Install intake air tube on throttle body.
55. Connect engine harness electrical connectors.
56. Install upper radiator support bracket.
57. Install coolant hoses at coolant manifold.
58. Install grill trim panel.
59. Install coolant reservoir and connect hose.
60. Connect fuel line to fuel rail.
61. Install battery tray and battery.
62. Connect battery cables.
63. Install air cleaner housing and connect inlet air hose.
64. Install fresh air inlet.
65. Fill with coolant.
66. Fill with oil.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

67. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
68. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
69. Start engine and check for leaks.

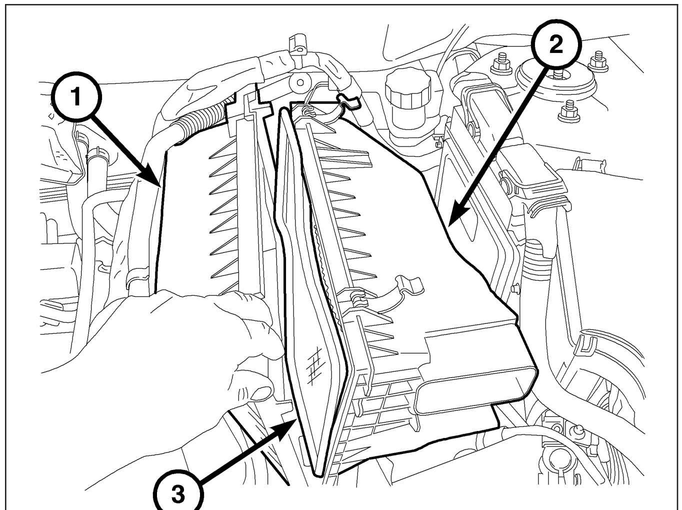
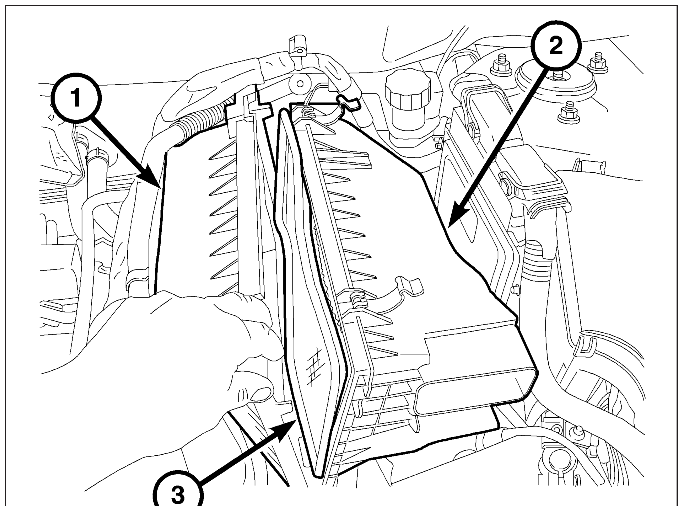
ELEMENT-AIR CLEANER

REMOVAL



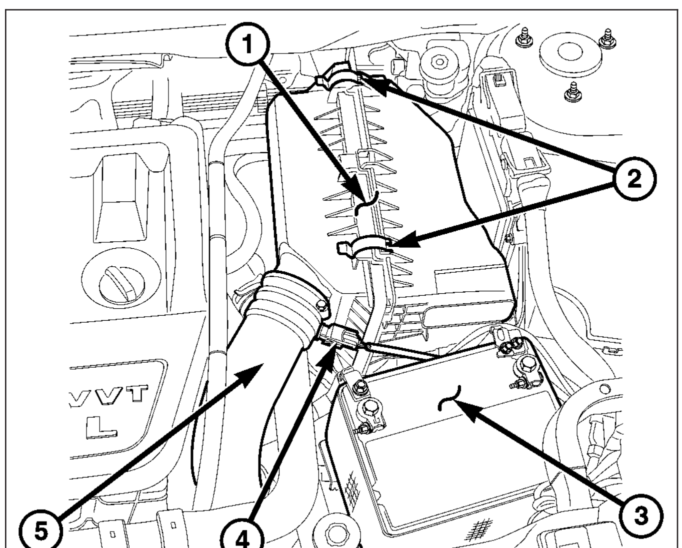
1. Turn Lock Retainers (5) and remove fresh air inlet (2) from air cleaner housing (1).

2. Disconnect intake air temperature sensor connector (4).
3. Remove Air inlet tube (5) from air cleaner housing (1).
4. Unfasten clasps (2) on sides of air cleaner housing cover (1).



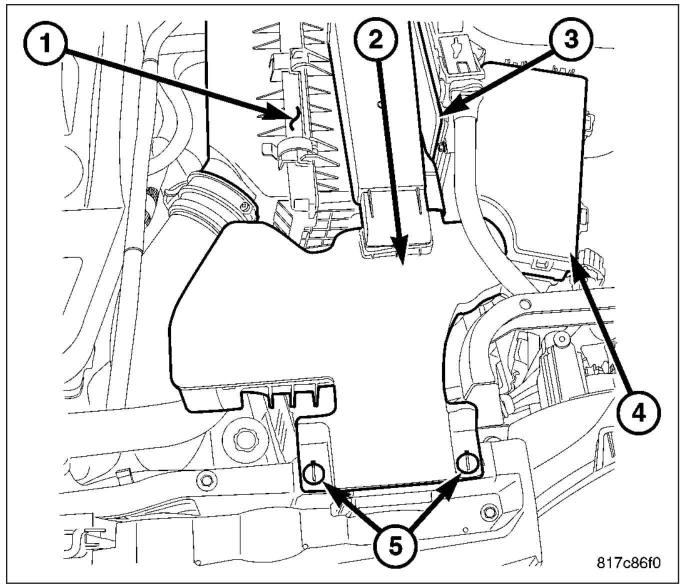
5. Pull air cleaner cover (1) aside.
6. Remove filter element (3).
7. If necessary, clean the inside of the air cleaner housing (2).

817eb6c5



INSTALLATION

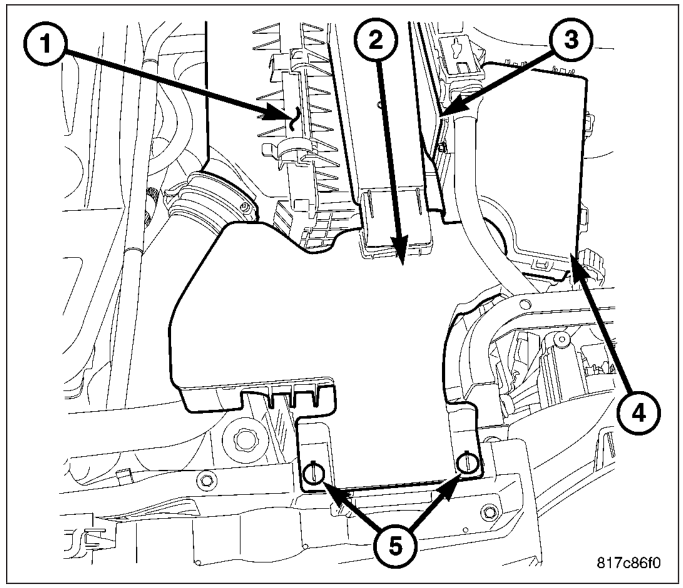
1. Install new filter element.



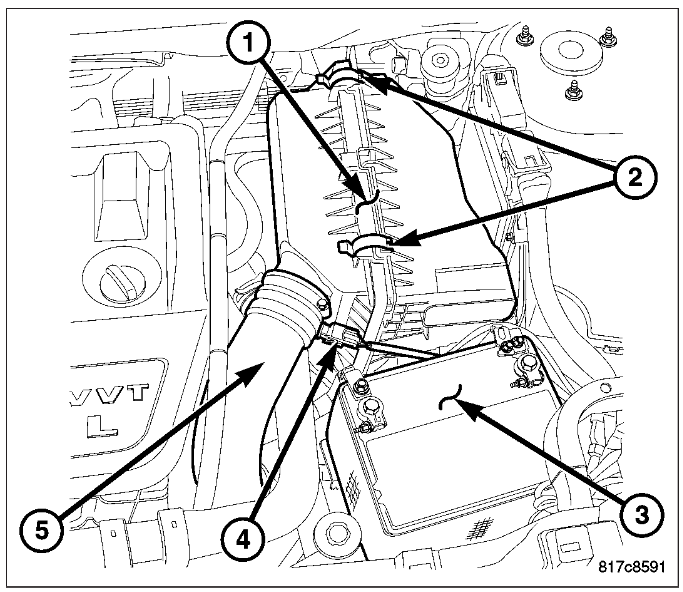
817eb6c5

2. Place cover over air cleaner housing. Snap clasps (2) in place.
3. Install air inlet tube (5).
4. Connect intake air temperature sensor connector (4).

817c8591



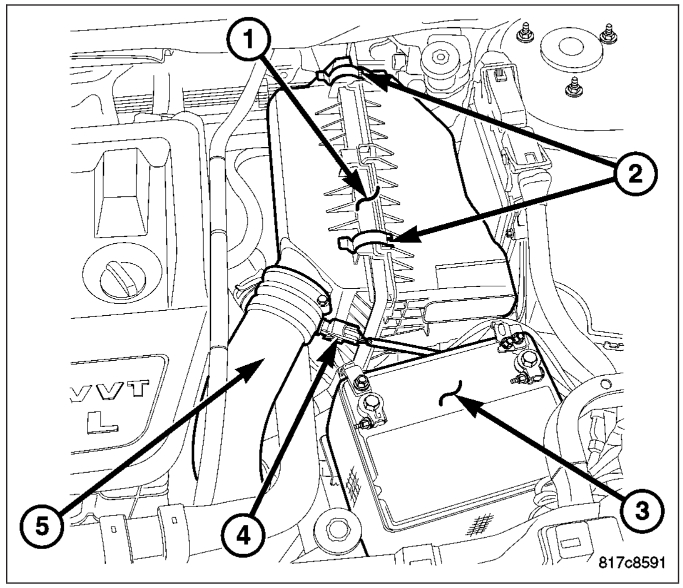
5. Install fresh air inlet (2) on air cleaner housing (1) and lock retainers (5).



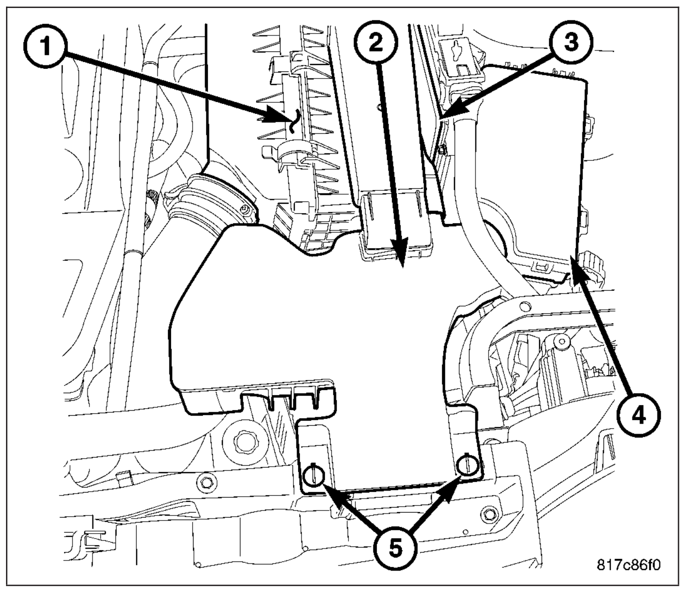
HOUSING-AIR CLEANER

REMOVAL

1. Remove fresh air inlet (2) from air cleaner housing (1).



2. Remove intake air temperature sensor electrical connector (4).
3. Remove air inlet tube (5) from housing (1).
4. Pull housing (1) upward to remove.



INSTALLATION

1. Make sure the rubber grommets, for the air cleaner housing lower pins, are in place when reinstalling the air cleaner housing. The rubber grommets mount to the PDC bracket.
2. Push air cleaner housing (1) down while aligning pins into the grommets.
3. Connect the throttle body air inlet hose (5) to the air cleaner housing (1).
4. Connect intake air temperature sensor connector (4).

5. Install fresh air inlet (2) and lock retainers (5).

CYLINDER HEAD

DESCRIPTION

The cross flow designed, aluminum cylinder head contains dual over-head camshafts with four valves per cylinder. The valves are arranged in two in-line banks. The intake valves face toward the front of the vehicle. The exhaust valves face the dash panel. The cylinder head incorporates powdered metal valve guides and seats. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts.

Integral oil galleries provide lubrication passages to the variable camshaft timing phasers, camshafts, and valve mechanisms.

NOTE: Replacement cylinder heads will come complete with valves, seals, springs, retainers, keepers, lash buckets, and camshafts.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders, between a cylinder and the adjacent water jacket or from an oil passage to the exterior of the engine.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

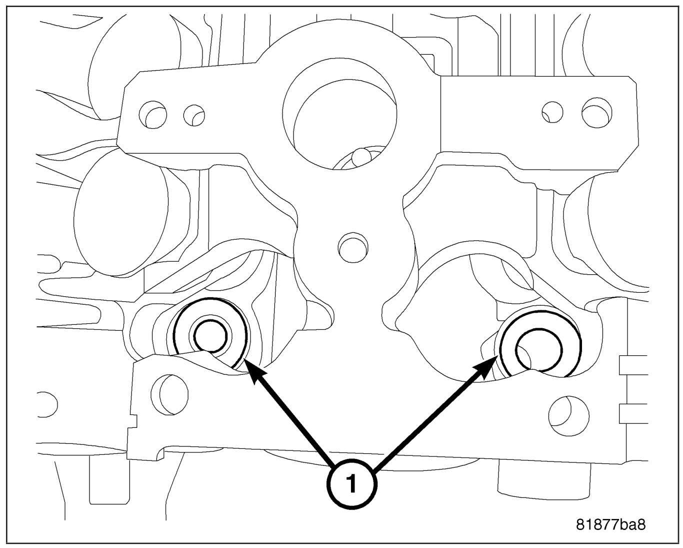
If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD



Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

1. Perform fuel system pressure release procedure **before attempting any repairs**
2. Remove clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect negative cable from battery.
4. Drain cooling system.
5. Remove engine cover.
6. Remove coolant recovery bottle.
7. Remove power steering pump and reposition.
8. Remove windshield washer bottle.
9. Disconnect breather hose.
10. Disconnect PCV hose.
11. Disconnect ignition coil electrical connectors.
12. Remove valve cover.
13. Raise vehicle.
14. Remove right splash shield.
15. Set engine to TDC.
16. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
17. Remove lower A/C compressor bolts if equiped.
18. Remove lower A/C compressor mount.
19. Remove accessory drive belt lower idler pulley.
20. Remove crankshaft and water pump pulleys.
21. Remove right side engine mount bracket lower bolt.
22. Remove timing chain cover lower bolts.
23. Disconnect oxygen sensor electrical connectors.
24. Remove exhaust pipe at manaverter (AWD).
25. Remove manaverter support bracket retaining bolts (AWD).
26. Lower vehicle.
27. Remove power steering pump and set aside.
28. Support engine with suitable jack.
29. Remove right engine mount.
30. Remove accessory drive upper idler pulley.
31. Remove right upper engine mount bracket.
32. Remove accessory drive belt tensioner.
33. Remove upper timing chain cover retaining bolts.
34. Remove timing chain cover.
35. Remove timing chain tensioner.
36. Remove timing chain.
37. Remove timing chain guides.
38. Disconnect fuel line at the fuel rail.
39. Disconnect fuel injector electrical connectors.
40. Disconnect top engine electrical connectors and reposition harness.
41. Remove fuel rail.
42. Remove lower intake manifold support bracket retaining bolt.

43. Disconnect electronic throttle control electrical connector.
44. Disconnect map sensor electrical connector.
45. Disconnect vacuum lines at intake.
46. Remove intake manifold retaining bolts.
47. Remove upper radiator hose retaining bolts.
48. Remove intake manifold.
49. Remove coolant outlet manifold and set aside.
50. Remove ground strap at right rear of cylinder head.
51. Remove oxygen sensor from maniverter (AWD).
52. Remove maniverter heat shields (AWD).
53. Remove maniverter retaining bolts (AWD).
54. Remove maniverter from cylinder head and reposition out of the way (AWD).
55. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

NOTE: All of the cylinder head bolts have captured washersEXCEPTthe front two (1).

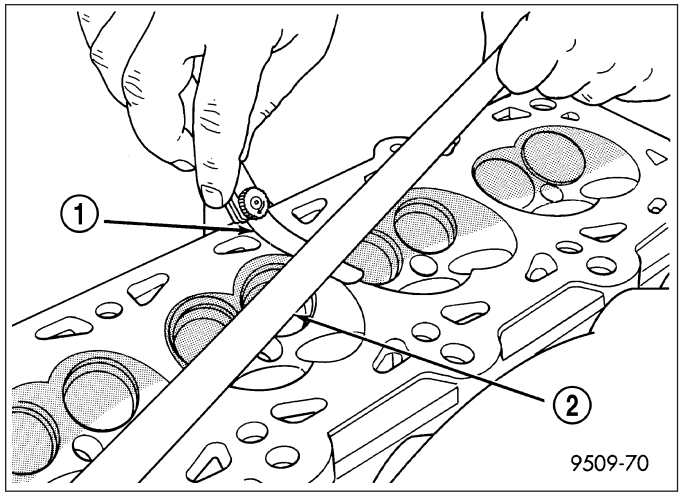
56. Remove cylinder head bolts.
57. Remove cylinder head from engine block.
58. Inspect and clean cylinder head and block sealing surfaces. Refer to Cleaning and Inspection in this section for procedures.

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.

CLEANING

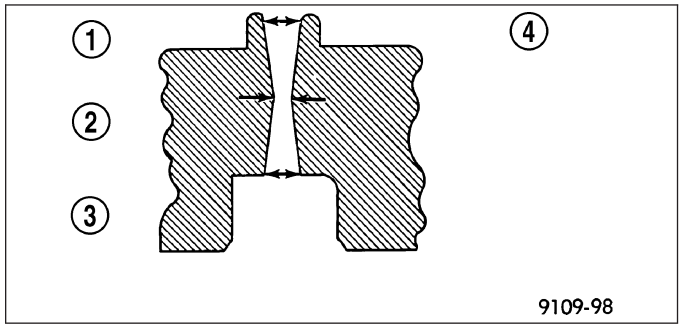
To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.



Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

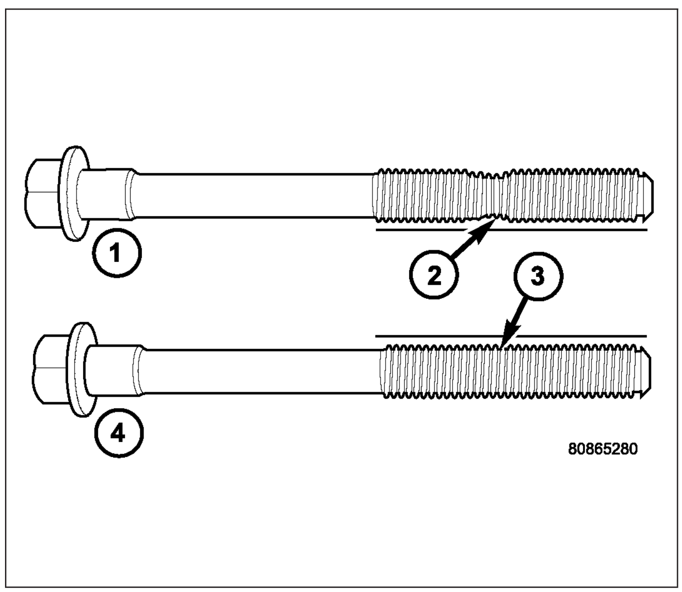


INSPECTION

NOTE: Replacement cylinder heads will come complete with valves, seals, springs, retainers, keepers, lash buckets, and camshafts.

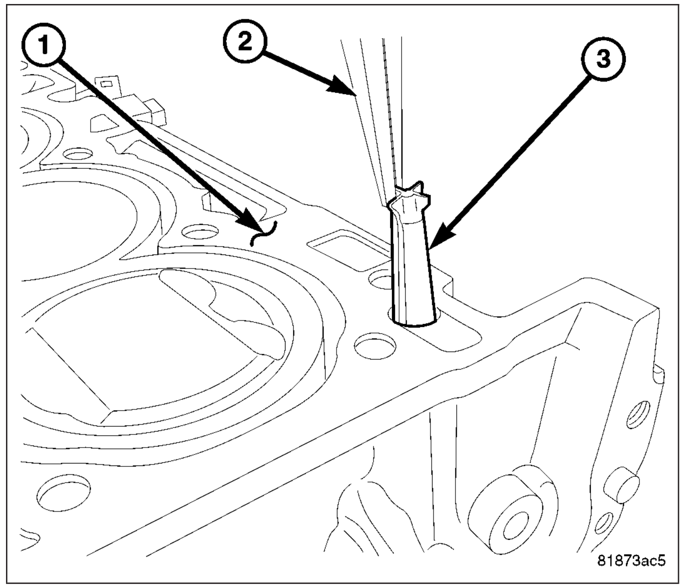
1. Cylinder head must be flat within 0.1 mm (0.004 in.).

2. Inspect camshaft bearing journals for scoring.
3. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
4. Using a small hole gauge and a micrometer, measure valve guides in 3 places top (1), middle (2), and bottom (3). (Refer to 9 - ENGINE - SPECIFICATIONS) Replace guides if they are not within specification.
5. Check valve guide height.
6. Prior to installing cylinder head, the cylinder block should be checked for flatness (Refer to 9 - ENGINE/ENGINE BLOCK - INSPECTION).



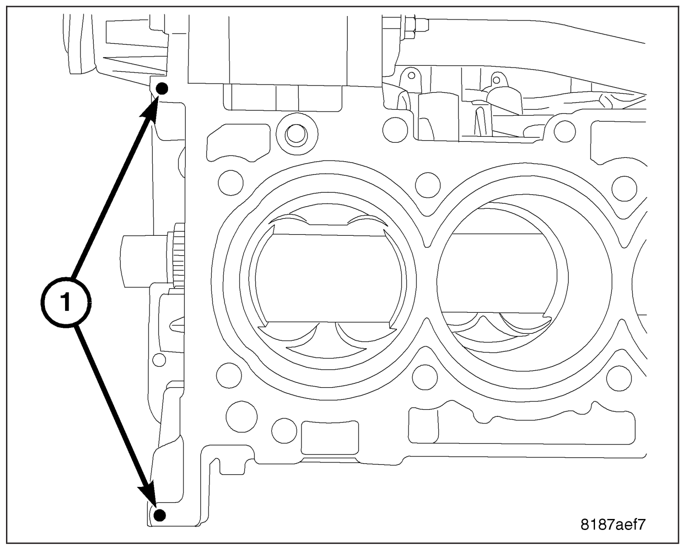
INSTALLATION - CYLINDER HEAD

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.



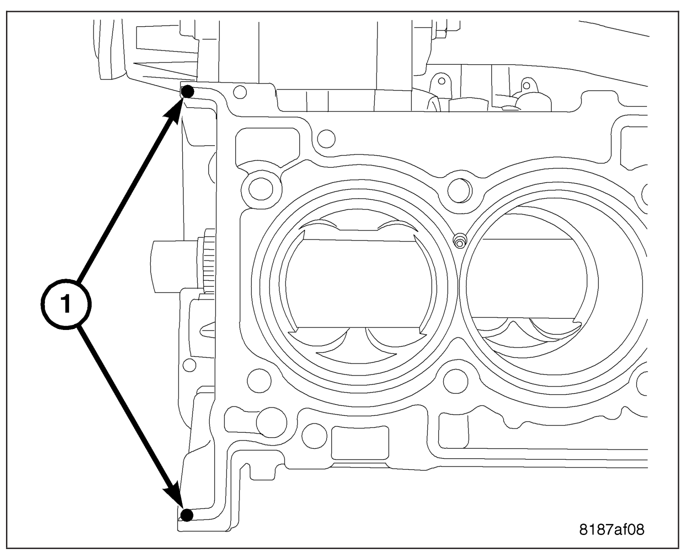
NOTE: The Cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts should be replaced.

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2), the bolt should be replaced.

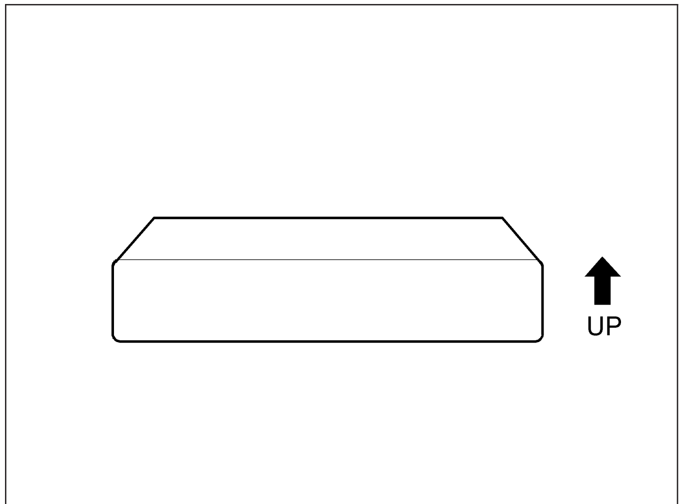


CAUTION: Always replace the variable valve timing filter screen (3) when servicing the head gasket or engine damage could result.

1. Replace the variable valve timing filter screen (3).



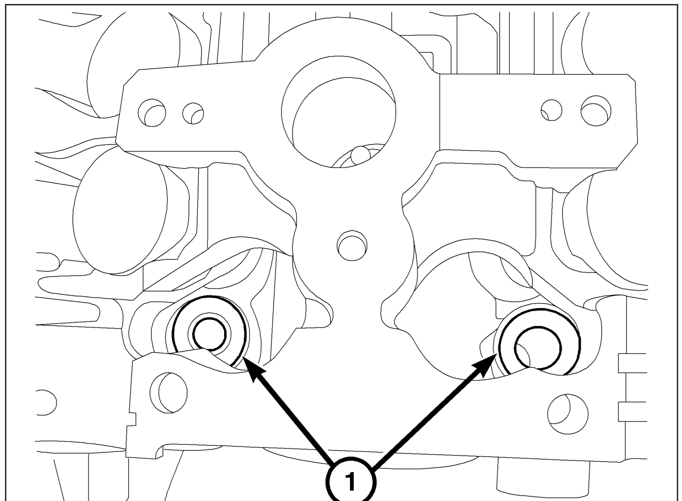
2. Place two pea size dots of RTV (1) on cylinder block as shown.



3. Position the new cylinder head gasket on engine block with the part number facing up. Ensure gasket is seated over the locating dowels in block.
4. Place two pea size dots of RTV (1) on cylinder head gasket as shown.

NOTE: The head must be installed within 15 minutes before the RTV skins.

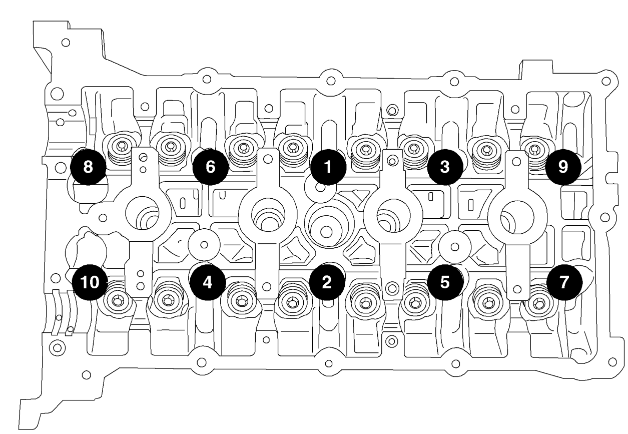
5. Position cylinder head onto engine block.



NOTE: The front two cylinder head bolts do not have captured washers. The washers must be installed with the bevel up towards the bolt head.

8182ebe6

6. Install washers (1) for the front two cylinder head bolts.



81877ba8

7. Before installing the bolts, the threads should be lightly coated with engine oil.
8. Install the cylinder head bolts and torque in the sequence shown above.
   - First: All to 30 N·m (25 ft. lbs.)
   - Second: All to 61 N·m (50 ft. lbs.)
   - Third: All to 61 N·m (45 ft. lbs.)
   - Fourth: All an additional 90°

CAUTION: Do not use a torque wrench for the Fourth step.

9. Install camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

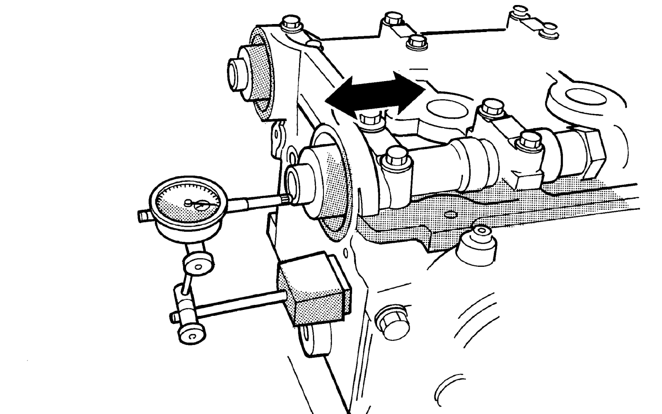
10. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).
11. Install maniverter/exhaust manifold to cylinder head. Torque fasteners to 34 N·m (25 ft.lbs.).
12. Install heat shields.Torque fasteners to 9 N·m ( ).

13. Install oxygen sensor in maniverter.
14. Install ground strap at right rear of cylinder head.
15. Install coolant manifold.
16. Install intake manifold.
17. Install intake manifold bolts and torque to 24 N·m (18 ft.lbs.).
18. Install upper radiator hose retaining bracket.
19. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
20. Install timing chain cover, torque m6 bolts to 12 N·m (105 in.lbs.) and m8 bolts to 23 N·m (17 ft.lbs.).
21. Connect cam sensor wiring connector.
22. Install spark plugs and torque to 27 N·m (20 ft.lbs.).
23. Install ignition coils and torque to 8 N·m (70 in.lbs.).
24. Install power steering pump reservoir/bracket to cylinder head.
25. Install exhaust pipe to manifold. Torque fasteners to 28 N·m (20 ft. lbs.).
26. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
27. Connect engine coolant temperature sensor connector.
28. Connect upper radiator hose. Connect heater hoses to thermostat housing.
29. Install heater tube support bracket to cylinder head.
30. Install fastener attaching dipstick tube to lower intake manifold
31. Connect fuel supply line quick-connect at the fuel rail assembly (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
32. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
33. Connect negative cable to battery.
34. Install clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

CAMSHAFT(S)

DESCRIPTION

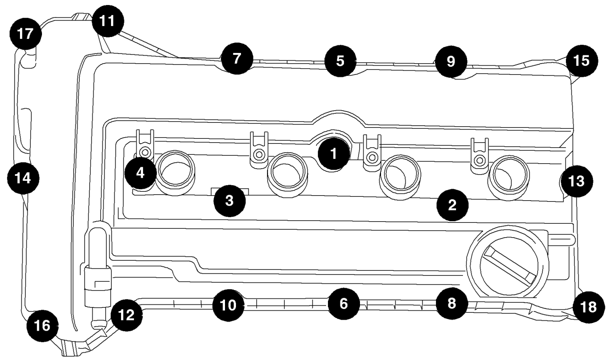
Both camshafts have six bearing journal surfaces and two cam lobes per cylinder. Flanges on the third journal control camshaft end play. Cam position sensors are located on the intake and exhaust camshafts on the rear of the cylinder head.



OPERATION

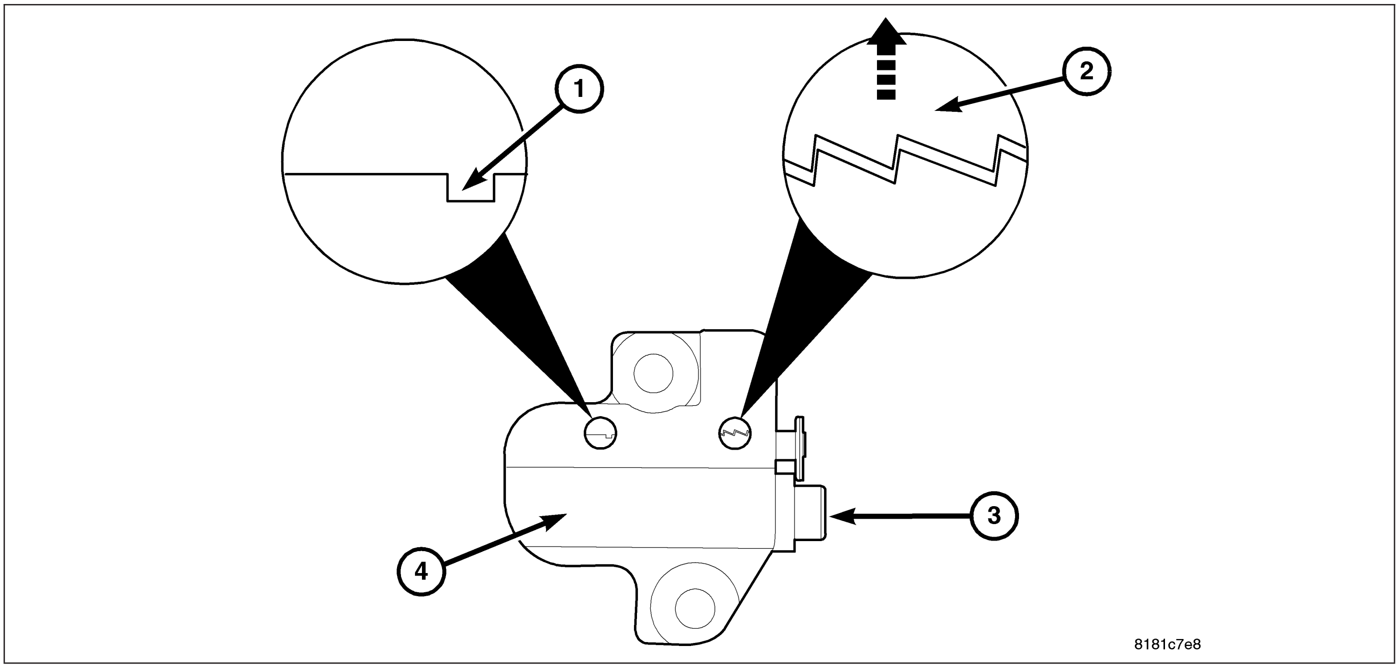
The camshaft is driven by the crankshaft via drive sprockets and a chain. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE



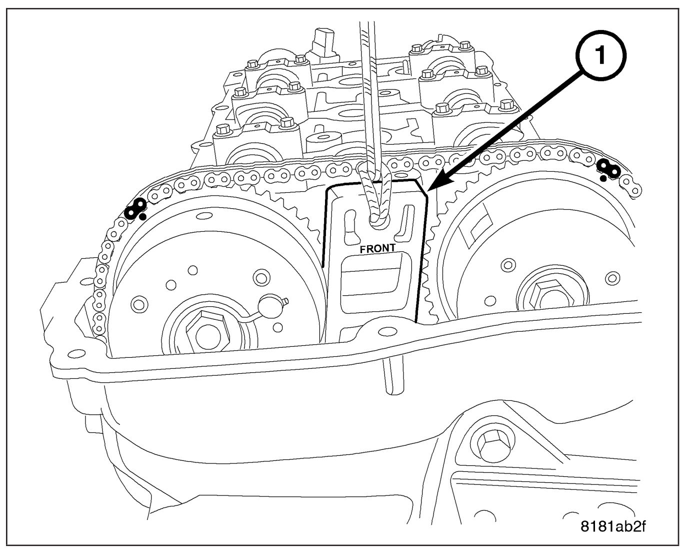
MEASURING CAMSHAFT END PLAY

1. Using a suitable tool, move camshaft as far rearward as it will go.
2. Zero dial indicator.
3. Move camshaft as far forward as it will go.
4. Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).
5. If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

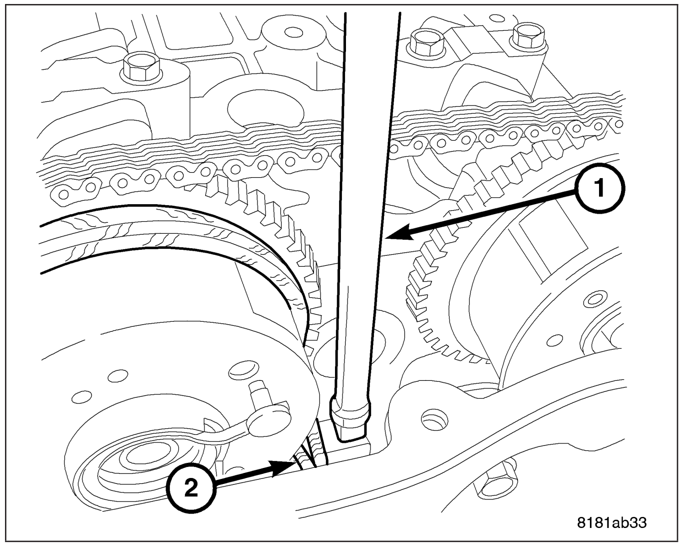


9509-115

REMOVAL

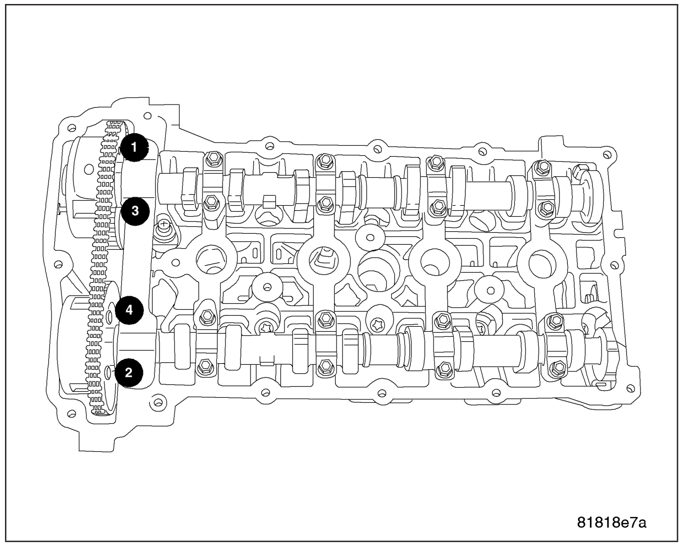


1. Remove engine cover by pulling upward.
2. Disconnect negative battery cable.
3. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
4. Raise vehicle.
5. Remove right splash shield.

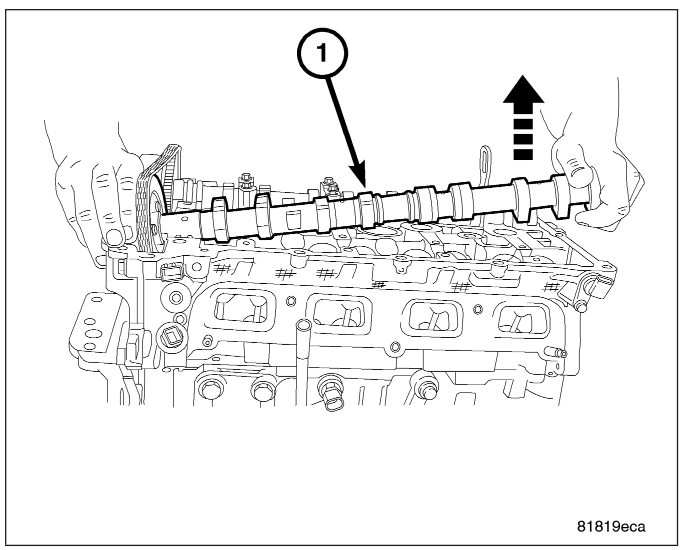


8182e337

6. Remove timing tensioner plug from front cover.
7. Insert small allen wrench and lift ratchet (2) upward to release the tensioner. Leave the allen wrench installed during the remainder of this procedure.
8. Insert wedge 9701 (1).

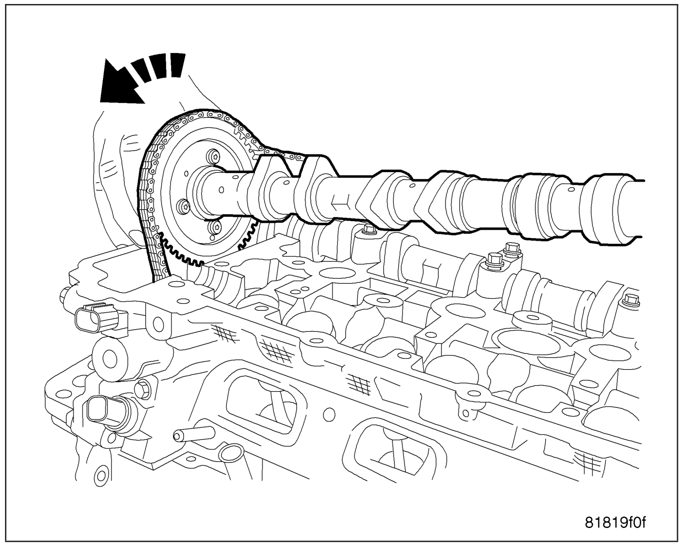


9. Lightly tap Wedge 9701(2) into place.



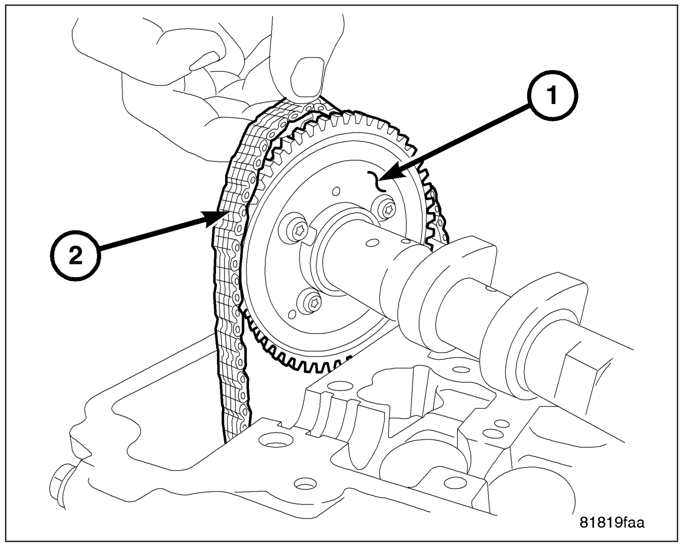
8181ab33

10. Remove the front camshaft bearing cap.
11. Slowly remove the remaining camshaft bearing bolts one turn at a time following the above sequence.



81818e7a

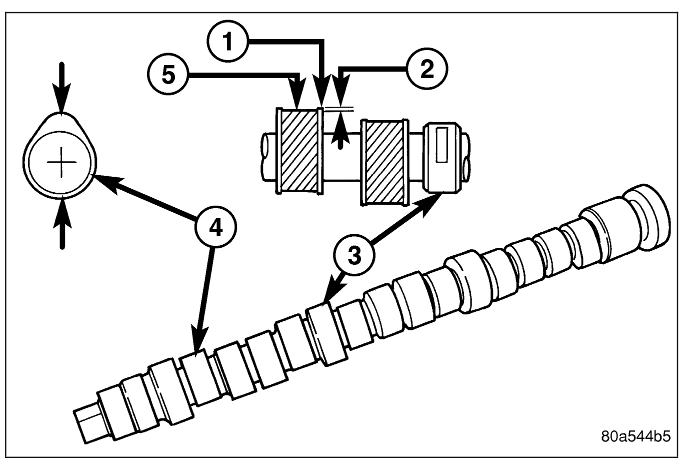
12. Remove intake camshaft (1) by lifting the rear of the camshaft upward.



81819eca

13. Rotate the camshaft while lifting out of the front bearing cradle.

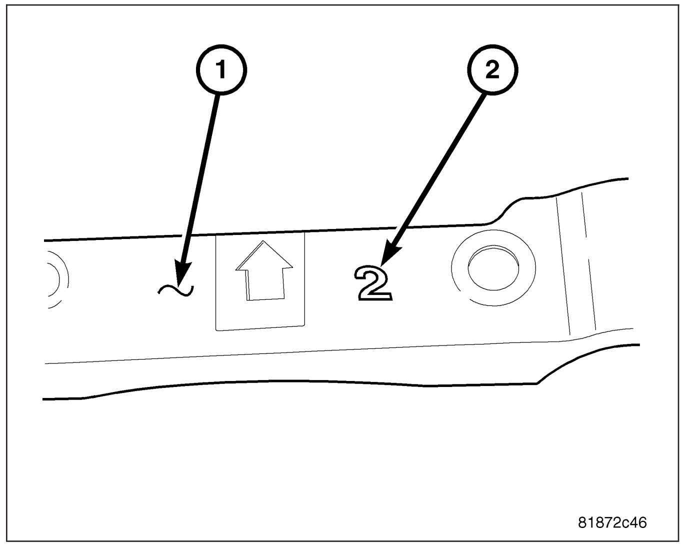
14. Lift the timing chain (2) off the sprocket (1).
15. Remove exhaust camshaft.



CLEANING

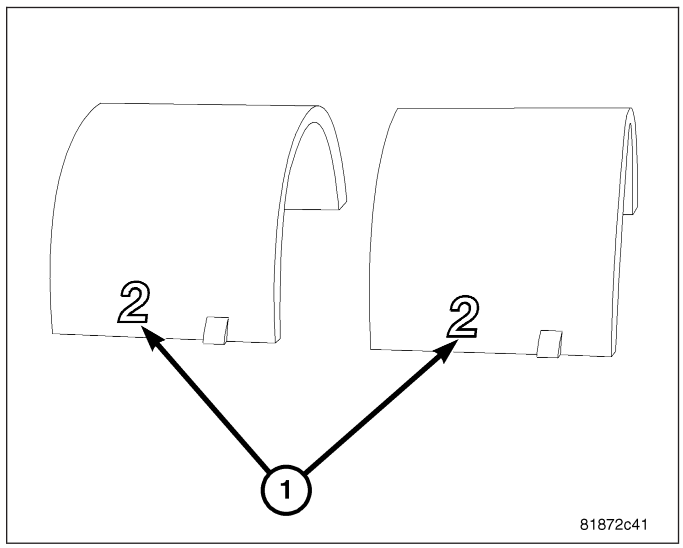
Clean camshafts with a suitable solvent.

INSPECTION

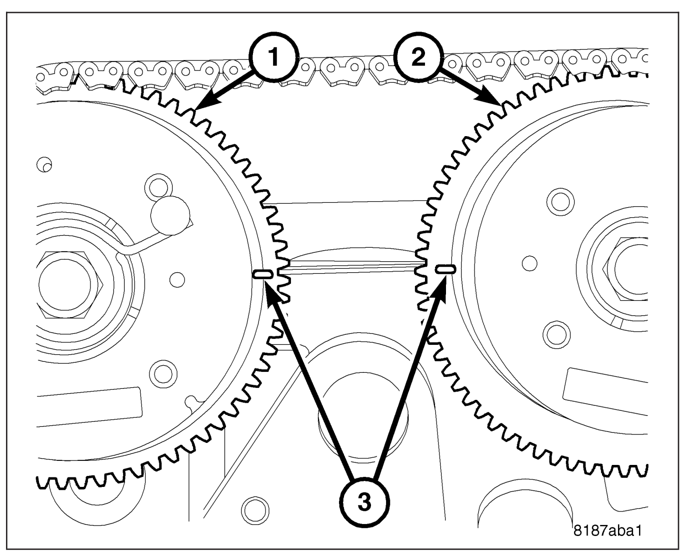


1. Inspect camshaft bearing journals for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

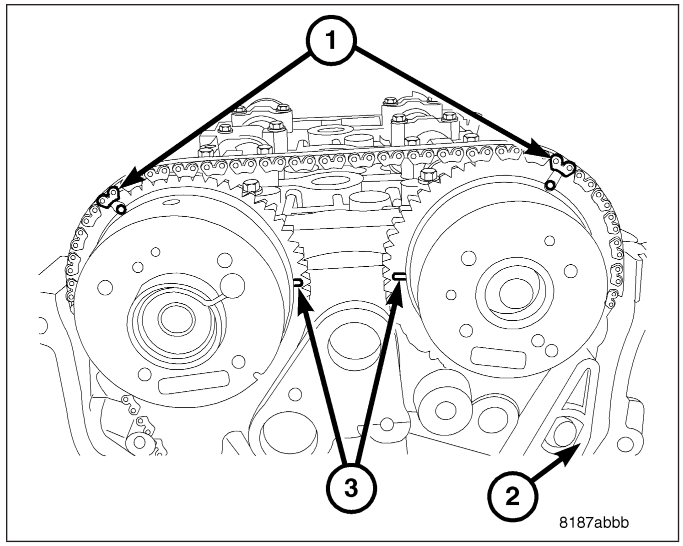
NOTE: If camshaft is replaced due to lobe wear or damage, always replace the lash buckets.



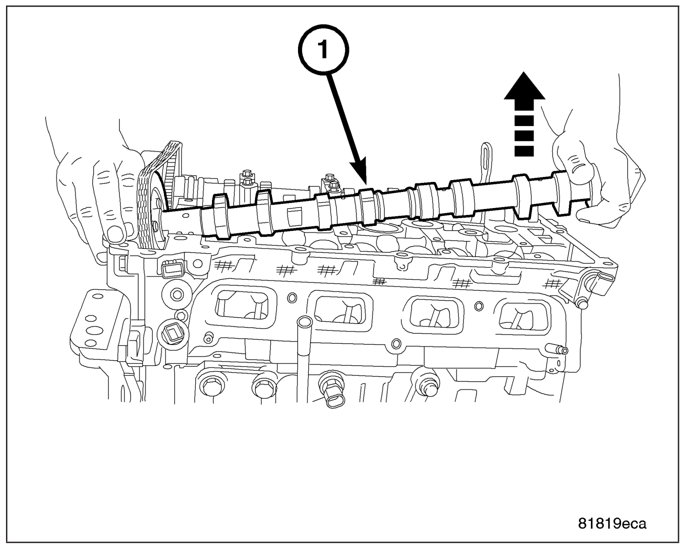
INSTALLATION



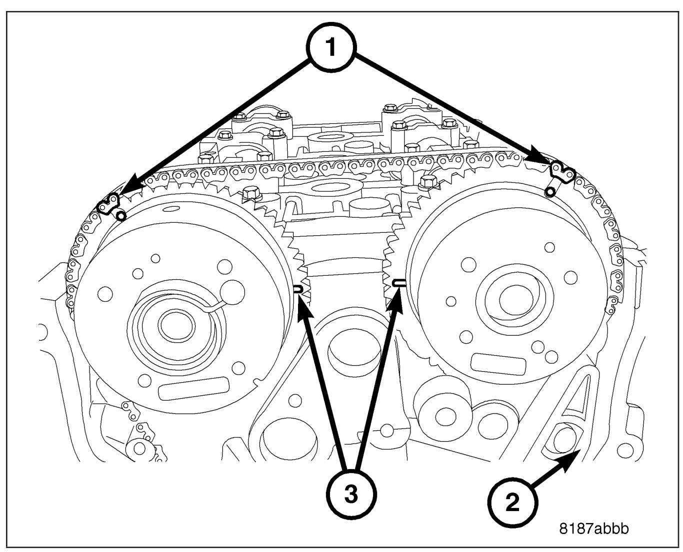
1. Identify which front cam cap (1) is installed on the engine you are working on.
2. The cam cap (1) is numbered (2) either one, two, or three, this corresponds to the select fit bearing to use.



3. Install the corresponding select fit bearing that will also be numbered (1) one, two, or three.
4. Oil all of the camshaft journals with clean engine oil.
5. Install exhaust camshaft and position on bearing journals in the cylinder head.

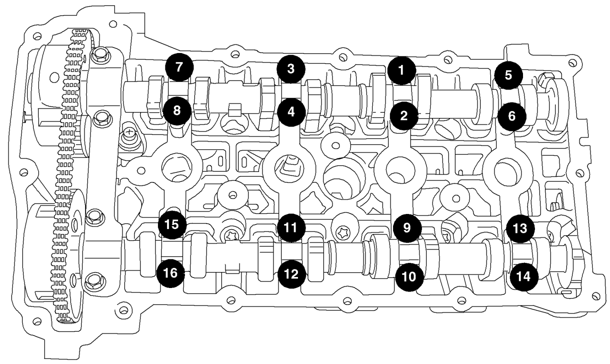


6. Align exhaust cam timing mark so it is parallel to the cylinder head as shown.



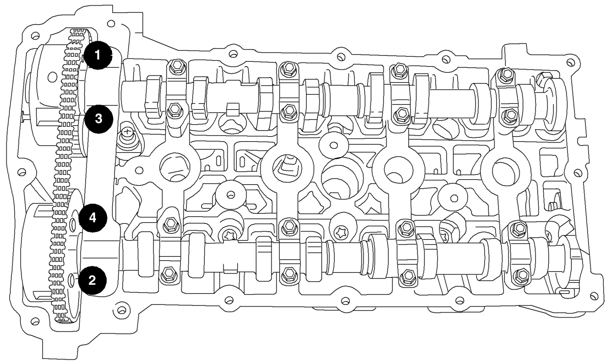
7. Install timing chain onto exhaust cam sprocket making sure that the timing marks (1) on the sprocket and chain are aligned.

8. Install intake camshaft by raising the rear of the camshaft upward and roll the sprocket into the chain.



9. Align the timing marks (1) on the intake cam sprocket with the mark in the chain.
10. Position the intake camshaft into the bearing journals in the cylinder head.
11. Verify that the timing marks (1) are aligned on both camshafts and that the timing marks (3) are parallel with the cylinder head.

CAUTION: Install the front intake and exhaust camshaft bearing cap last. Ensure that the dowels are seated and follow torque sequence or damage to engine could result.

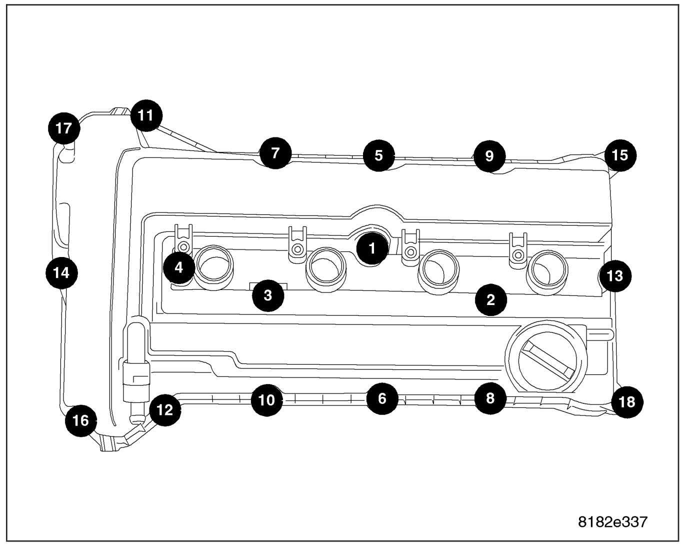


NOTE: If the front camshaft bearing cap is broken, the cylinder head MUST be replaced.

12. Install intake and exhaust camshaft bearing caps slowly torque bolts in the sequence shown.

81818e70

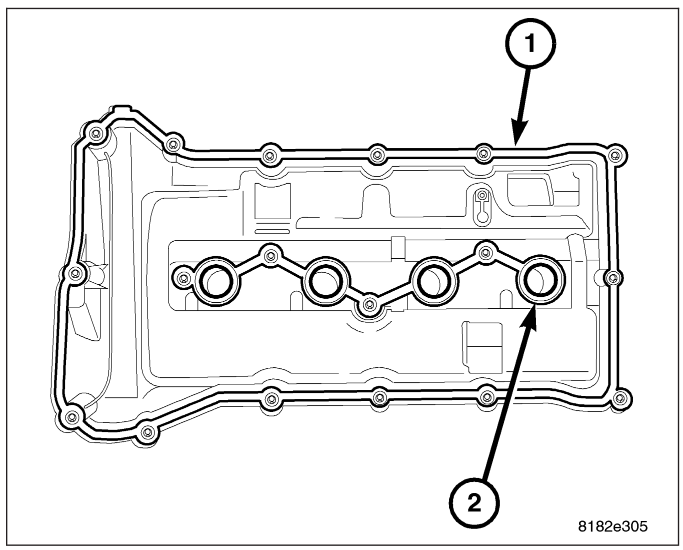
13. Install the front intake and exhaust bearing cap and torque bolts in the sequence shown.



81818e7a

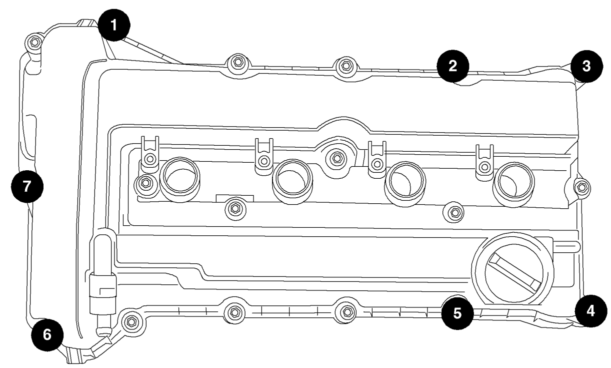
14. Verify that all timing marks are aligned.
15. Remove allen wrench from timing chain tensioner.
16. Remove locking wedge 9701.
17. Apply MOPAR® thread sealant to timing tensioner plug and Install.
18. Install right splash shield.
19. Install cylinder head cover (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
20. Install engine cover.
21. Connect negative battery cable.
22. Fill cooling system.
23. Fill with oil.
24. Start engine and check for leaks.

COVER-CYLINDER HEAD



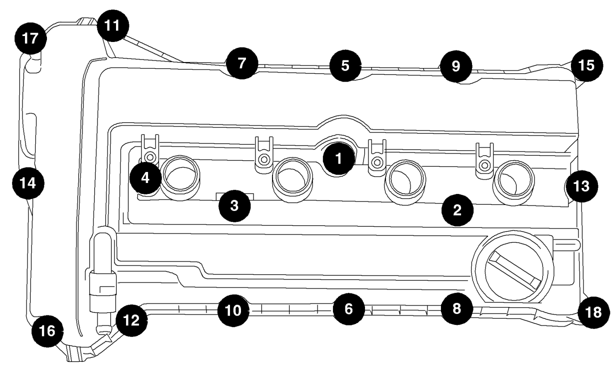
REMOVAL

1. Remove engine cover.
2. Disconnect ignition coil electrical connectors.
3. Disconnect PCV and make-up air hoses from cylinder head cover.
4. Use compressed air to blow dirt and debris off the cylinder head cover prior to removal.
5. Remove cylinder head cover bolts.
6. Remove cylinder head cover from cylinder head.



INSTALLATION

1. Install new cylinder head cover gaskets (1,2).

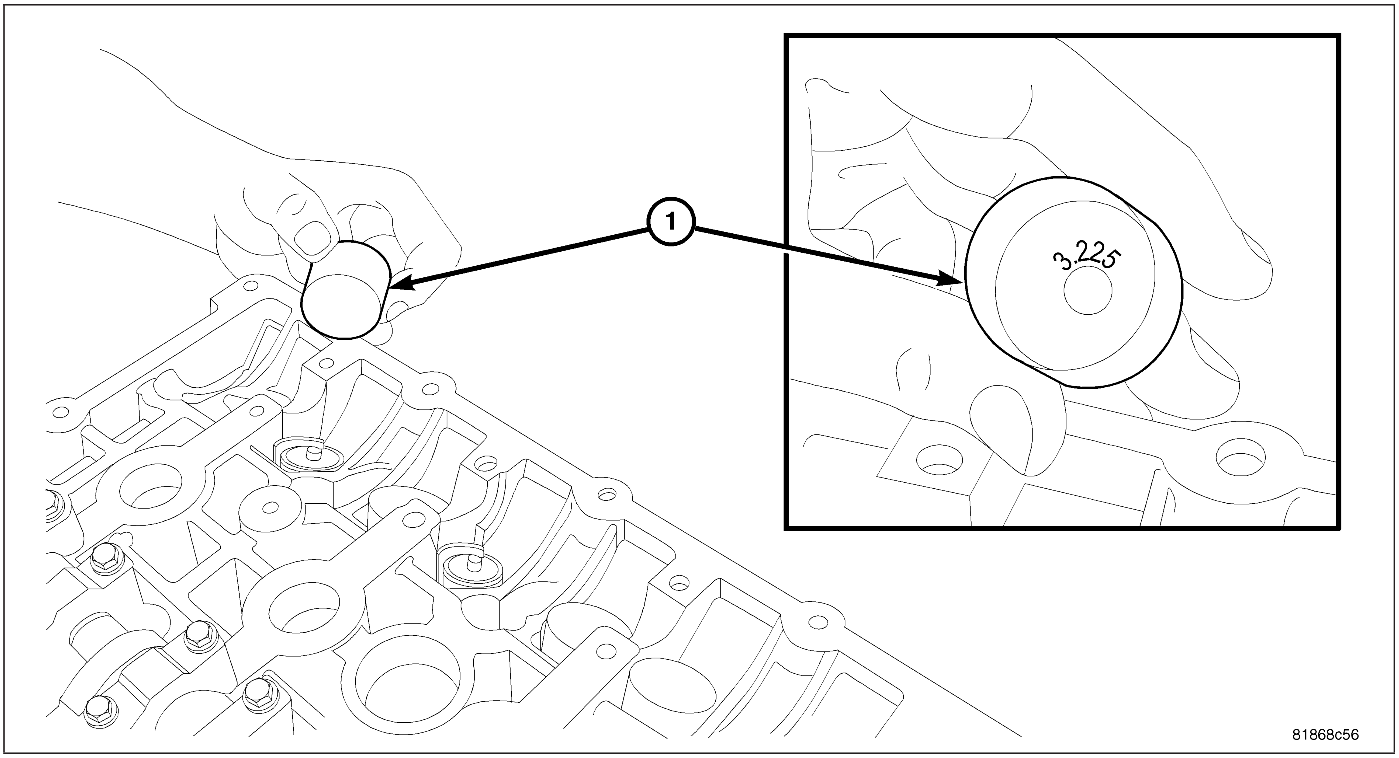


2. Install studs in cover as shown.

8182e312

3. Clean all RTV from cylinder head.
4. Apply RTV to cylinder head/front cover joint.
5. Install cylinder head cover assembly to cylinder head and install all bolts, ensuring the studs are located as shown.
6. Tighten bolts in sequence shown in Using a 2 step torque method as follows:
   a. Tighten all bolts to 4.5 N·m (40 in. lbs.)
   b. Tighten all bolts to 10 N·m (90 in. lbs.).
7. Install ignition coils. Tighten fasteners to 8 N·m (70 in. lbs.).
8. If the PCV valve was removed, tighten PCV valve to 4.5 N·m (40 in. lbs.).
9. Connect PCV and make-up air hoses to cylinder head cover.
10. Install engine cover.

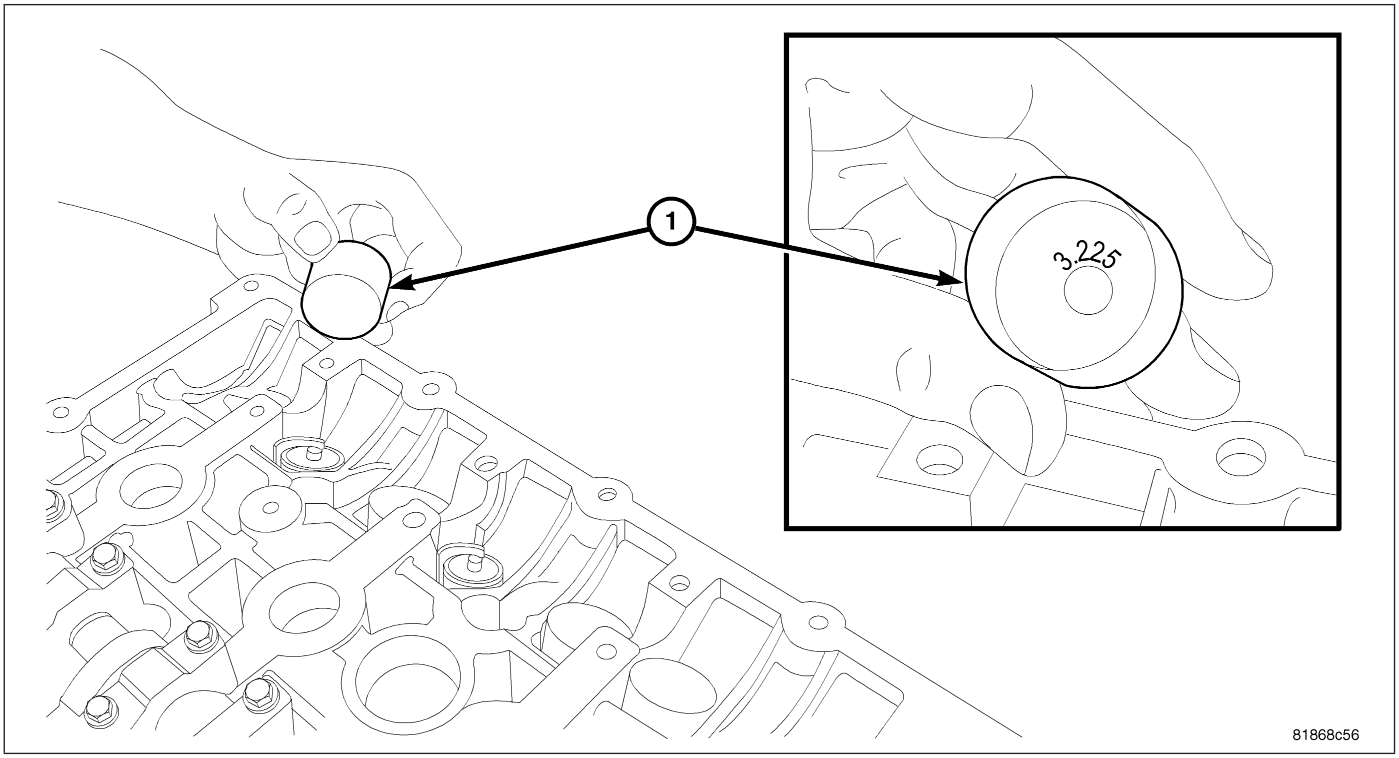
8182e337



TAPPETS-VALVE

DIAGNOSIS AND TESTING

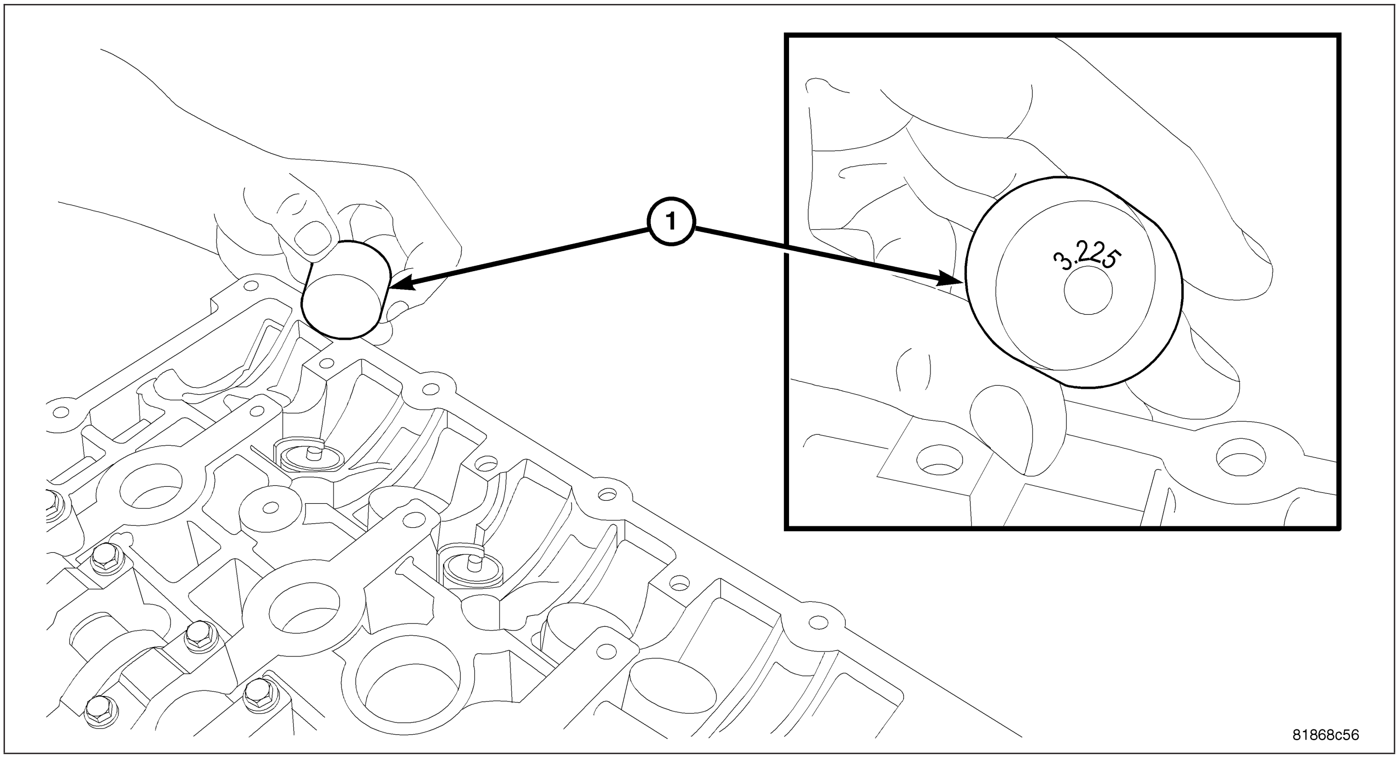
MECHANICAL VALVE TAPPET NOISE DIAGNOSIS



A tappet-like noise may be produced from several items. Check the following items.

STANDARD PROCEDURE - MEASURING VALVE LASH

1. Remove engine cover.
2. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
3. Rotate camshaft so lobes are vertical.
4. Check clearance using feeler gauges.
5. Repeat for all tappets.
6. If clearance was too small Clearance too Small .
7. If clearance was too large Clearance too Large .



Clearance too Small

81868c56

1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. spec – measured = delta
3. Decrease bucket thickness by delta.
4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Verify that valve lash is correct.

Clearance too Large

1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. Measured – spec = delta
3. Increase bucket thickness by delta.
4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Verify that valve lash is correct.

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

NOTE: Camshaft buckets must be replaced if cylinder head or camshafts are replaced.

1. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
3. Remove camshaft buckets.
4. Repeat removal procedure for each camshaft bucket.
5. If reusing, mark each camshaft bucket for reassembly in original position.

INSTALLATION

NOTE: If reinstalling original buckets they must go back in their original location or engine damage could result.

1. Apply a light coat of clean engine oil to camshafts buckets prior to assembly.
2. Install camshaft bucket into cylinder head.
3. Repeat installation procedure for each camshaft bucket.

NOTE: If installing new buckets, the valve lash procedure must be performed.

4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

VALVES & SEATS-INTAKE/EXHAUST

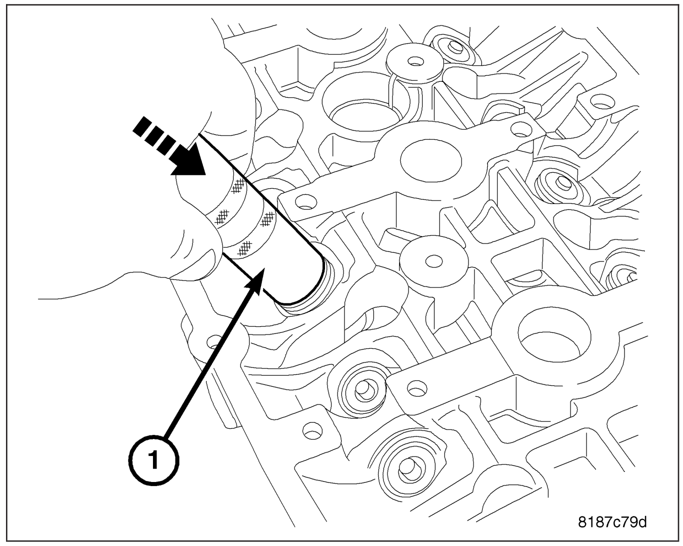
DESCRIPTION

The valves are made of heat resistant steel. They have nitrided stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. The valves have a single bead lock keepers to retain the springs.

OPERATION

The four valves per cylinder (two intake and two exhaust) are opened by using direct acting buckets which are actuated by the camshaft.

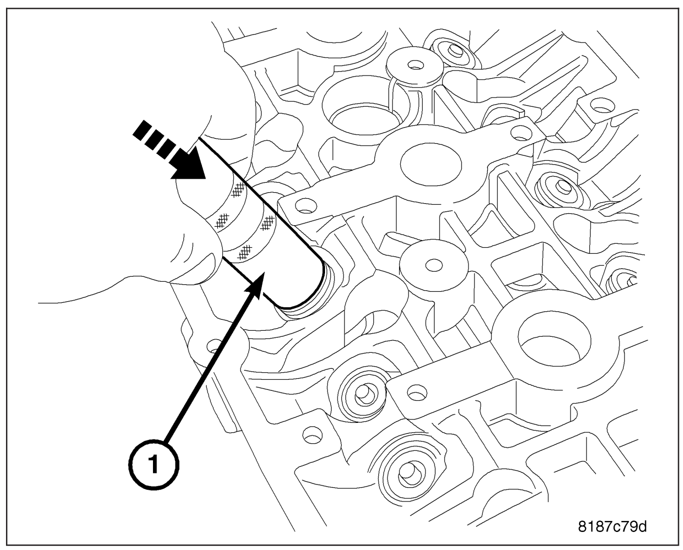
CLEANING



1. Clean all valves thoroughly and discard burned, warped and cracked valves.

SPRINGS & SEALS-VALVE

REMOVAL

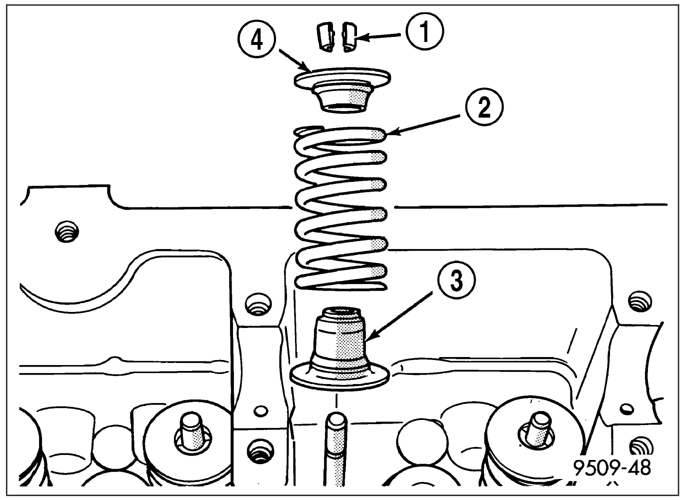


CYLINDER HEAD ON

1. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
3. Rotate crankshaft until piston is at TDC on compression.
4. With air hose attached to adapter tool installed in spark plug hole, apply 90-120 psi air pressure.
5. Using metric valve keeper remover (1), and remove valve spring keepers and retainer.
6. Remove valve spring(s).
7. Remove valve stem seal(s) by a using valve stem seal tool.

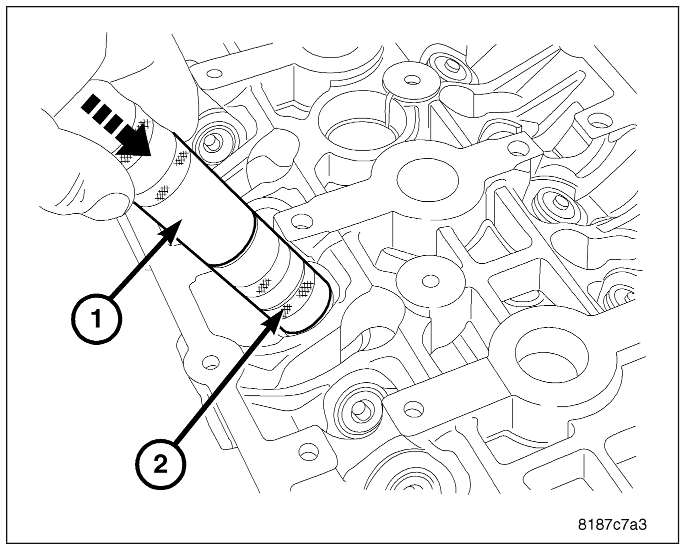
CYLINDER HEAD OFF

1. With cylinder head removed from cylinder block, place a ball of rags in the combustion chamber.
2. Using Snap On metric valve keeper remover (1) or equivalent, remove valve keepers with a downward push.
3. Remove retainer and springs.
4. Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves, locks and retainers to insure installation in original location.
5. Inspect the valves. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSPECTION).



INSPECTION

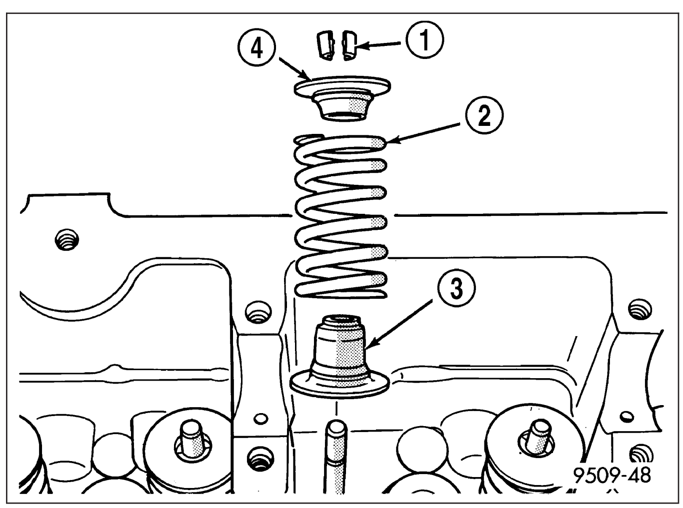
1. Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested for correct tension. Discard the springs that do not meet specifications. The following specifications apply to both intake and exhaust valves springs:
   - Valve Closed Nominal Tension—75 lbs. @ 38.0 mm (1.50 in.)
   - Valve Open Nominal Tension—134 lbs. @ 29.75 mm (1.17 in.)
2. Inspect each valve spring for squareness with a steel square and surface plate, test springs from both ends. If the spring is more than 1.5 mm (1/16 inch) out of square, install a new spring.



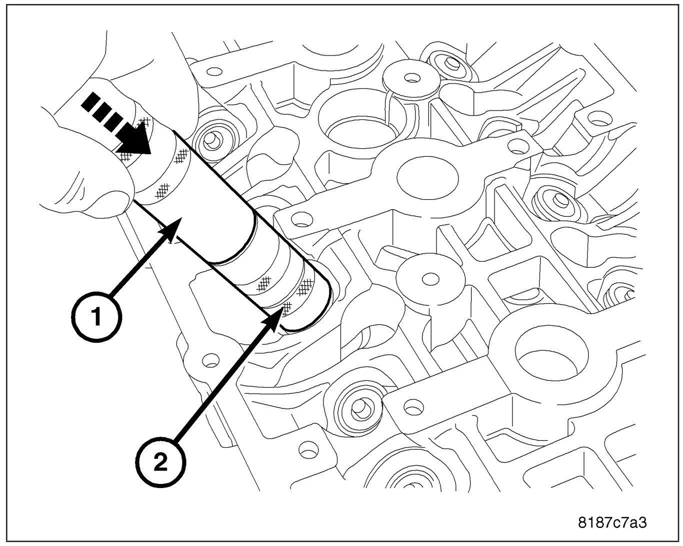
INSTALLATION

CYLINDER HEAD ON

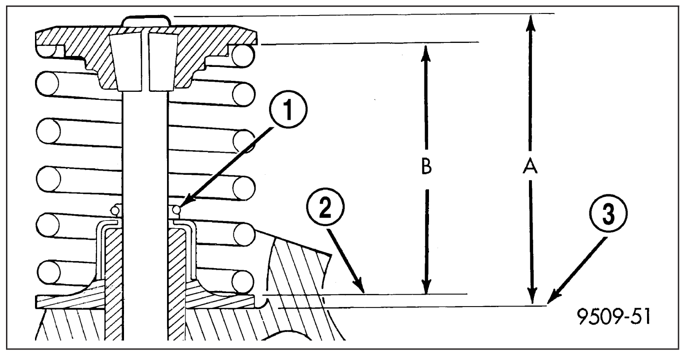
1. Install valve seal/valve spring seat (3) assembly. Push the assembly down with appropriate size socket to seat it onto the valve guide.
2. Install valve spring (2) and retainer (4) with keepers (1).



3. Place the valve keepers in the retainer. Using Snap On metric valve keeper installer (2) and remover (1) as a handle, install valve keepers with a downward push.
4. Remove air hose and install spark plugs.
5. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
6. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

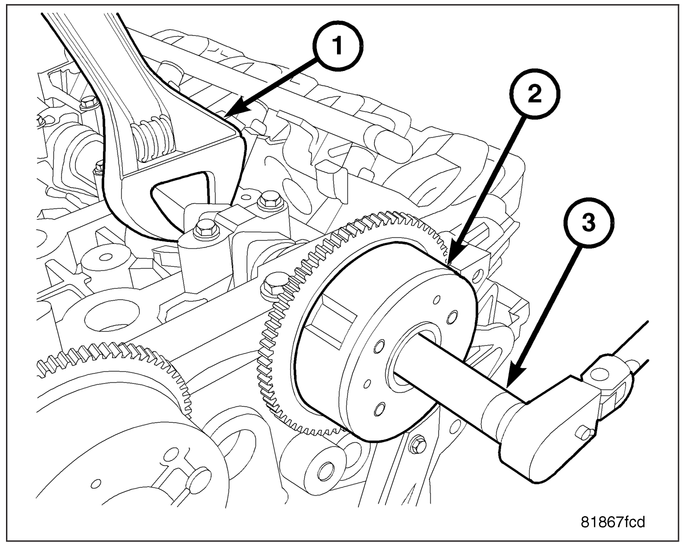


CYLINDER HEAD OFF



1. Coat valve stems with clean engine oil and insert in cylinder head.
2. Install new valve stem seals (3) on all valves using an appropriate sized socket to seat the seal/spring seat. The valve stem seals should be pushed firmly and squarely over valve guide.
3. Install valve springs (2), retainers (4), and keepers (1) in place.

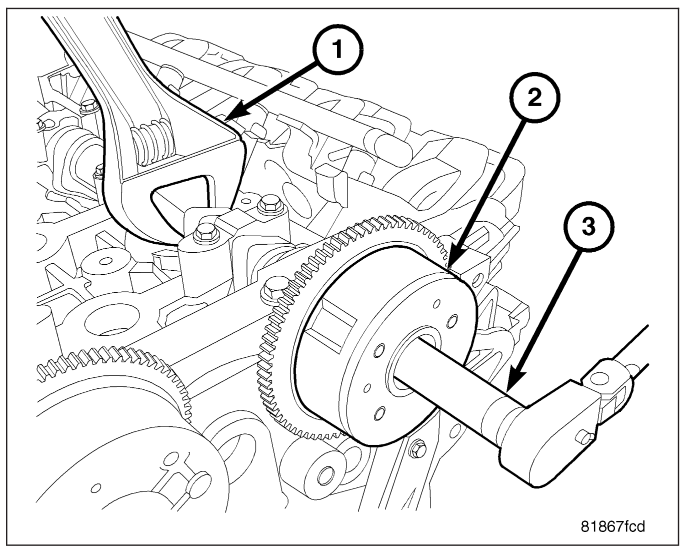
4. Using Snap-on metric valve keeper installer (2) and remover (1) as a handle, push downward to install keepers.



5. Check the valve spring installed height B after refacing the valve and seat. Make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.525 in.), install a 0.762 mm (0.030 in.) spacer under the valve spring seat to bring spring height back within specification.

PHASERS-CAMSHAFT

REMOVAL

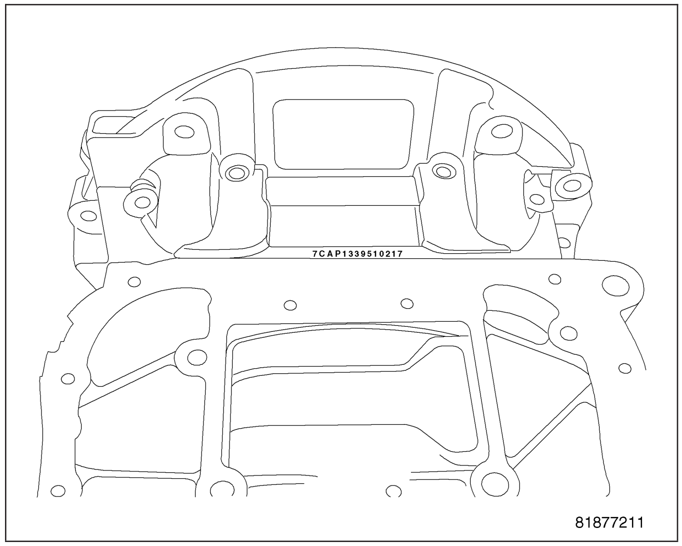


1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. Remove camshaft phaser (2) retaining bolt while holding the camshaft in place with a wrench (1).
3. Remove phaser (2) assembly from camshaft.

INSTALLATION

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin and camshaft phaser may occur.

1. Install phaser (2) assembly on camshaft.
2. Install phaser retaining bolt and torque while holding camshaft in place with a wrench (1).
3. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

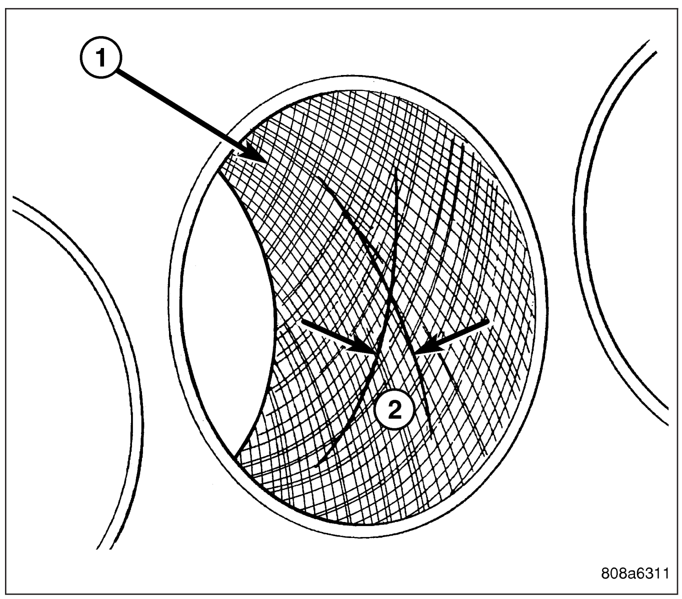


ENGINE BLOCK

DESCRIPTION

The die cast aluminum cylinder block is a two-piece assembly, consisting of the cylinder block and ladder frame. The block is an open deck design with cast in place cast iron cylinder liners. The cast iron cylinder liners are recessed below the aluminum deck surface. The ladder frame bolts to the cylinder block and does not incorporate the main bearing caps. This design offers a much stronger lower end and increased cylinder block and transaxle rigidity. The rear oil seal retainer is integral with the block and ladder frame. The ladder frame and block are serviced as an assembly.

The engine build date is located on the bottom of the ladder frame just behind the oil pan. The date can be seen with the oil pan in place.



81877211

STANDARD PROCEDURE

CYLINDER BORE HONING

1. Used carefully, a quality commercially available cylinder bore resizing hone equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.
2. Deglazing of the cylinder walls may be done using a quality commercially available cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

808a6311

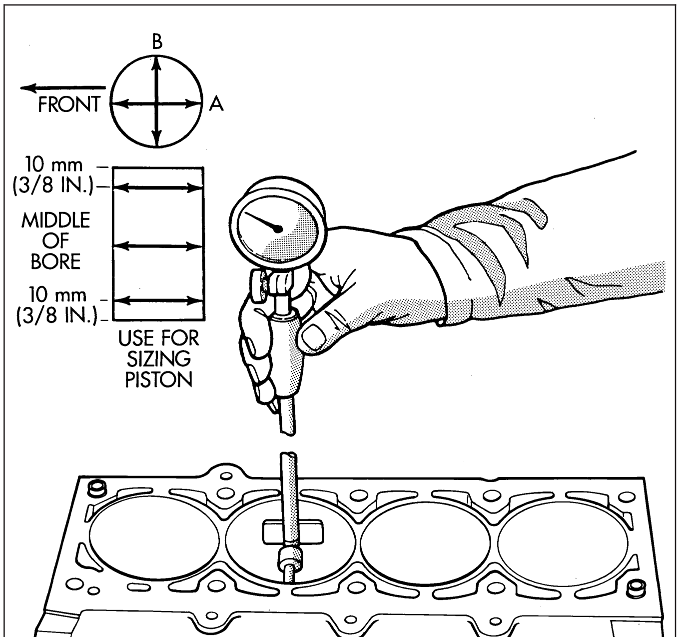
3. Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 30-50 degrees, the cross hatch angle is most satisfactory for proper seating of rings.
4. A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.
5. After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION



ENGINE BLOCK

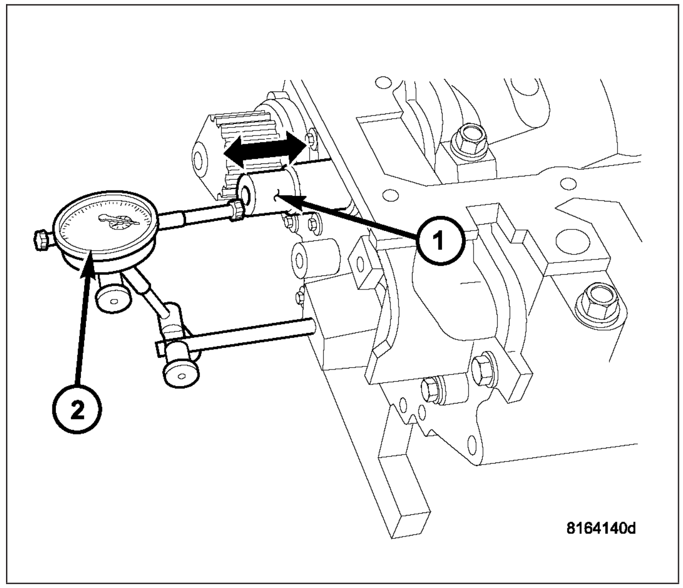
1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.
2. If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).
3. Examine block and cylinder bores for cracks or fractures.
4. Check block deck surfaces for flatness. Deck surface must be within service limit of 0.050 mm (0.002 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

9509-27



Measure the cylinder bore at three levels in directions A and B. Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT

STANDARD PROCEDURE

MEASURING CRANKSHAFT END PLAY

1. Mount a dial indicator (2) to front of engine with the locating probe on nose of crankshaft (1).
2. Move crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

REMOVAL - CRANKSHAFT

NOTE: Crankshaft can not be removed when engine is in vehicle.

1. Remove engine assembly from vehicle (Refer to 9 - ENGINE - REMOVAL).
2. Separate transaxle from engine.
3. Remove drive plate/flex plate.
4. Remove crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).
5. Mount engine on a suitable repair stand.
6. Drain engine oil and remove oil filter.
7. Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
8. Remove engine mount support bracket.
9. Remove timing chain cover.
10. Remove the timing chain
11. Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
12. Remove balance shaft module.
13. Remove the crankshaft sprocket.
14. Remove crankshaft position sensor.
15. Remove all ladder frame bolts from the engine block.
16. Using a pry bar gently pry the ladder frame loose from the engine block dowel pins using the pry points cast into the block and ladder frame.
17. Ladder frame should be removed evenly from the cylinder block dowel pins to prevent damage to the dowel pins.

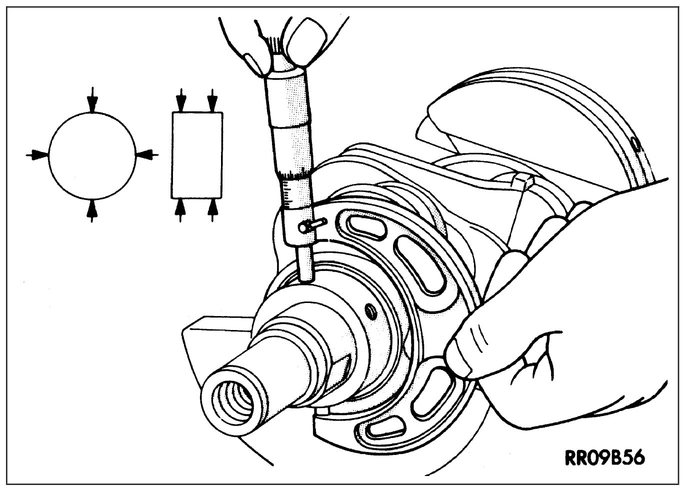
NOTE: If piston/connecting rod replacement is necessary, remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

18. Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

19. Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.



20. Remove main bearing caps.

CAUTION: Use extreme care when handling crankshaft. Tone wheel damage can occur if crankshaft is mishandled.

21. Lift out crankshaft from cylinder block. Do not damage the main bearings or journals when removing the crankshaft.

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring. Limits of taper or out of round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

INSTALLATION - CRANKSHAFT

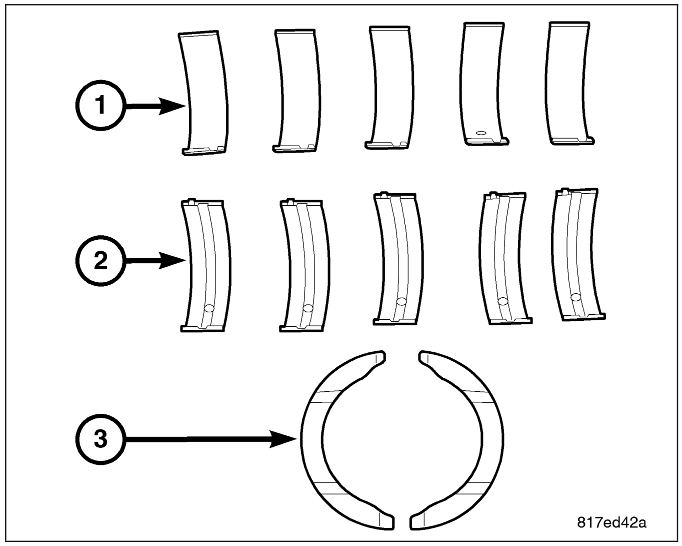
The crankshaft is supported in five main bearings. All upper bearing shells in the crankcase have oil grooves and holes. All lower bearing shells are smooth. Crankshaft end play is controlled by a two piece thrust bearing on the number three main bearing journal.

1. Install the main bearing upper shells with the lubrication groove and oil hole in the engine block.
2. Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.

NOTE: If the crankshaft is sent out for machine work, it must be balanced as an assembly with the target ring installed.

3. Clean crankshaft and target ring with MOPAR® Brake Parts cleaner and dry with compressed air to ensure that the crankshaft mating surface and target ring mounting holes are free from oil and lock patch debris.

NOTE: Always use NEW mounting screws whether installing original or new target ring.



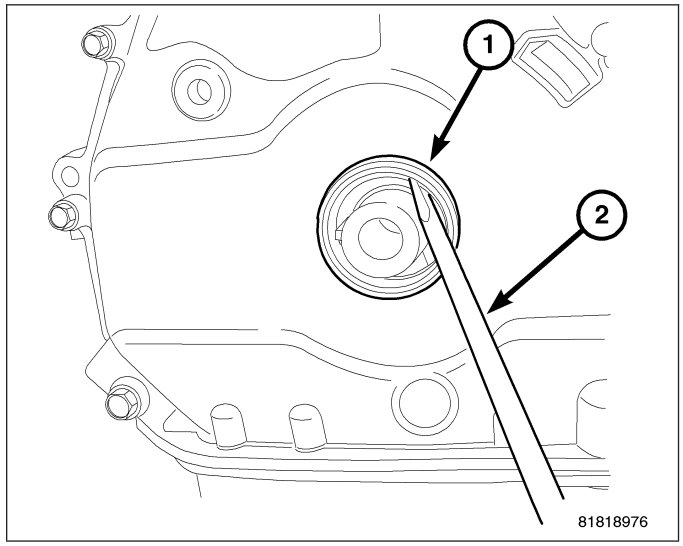
4. Install **NEW**mounting screws finger tight starting with the #1 location. Make sure engagement occurs with the shoulder of the screws and mounting hole before starting all other screws.
5. Torque all mounting screws with T30 torx bit to 13 Nm (110 in-lbs) following the torque sequence.

NOTE: Lightly apply trans gel to thrust bearings to hold bearings in block.

6. Install thrust bearings (3) in block.

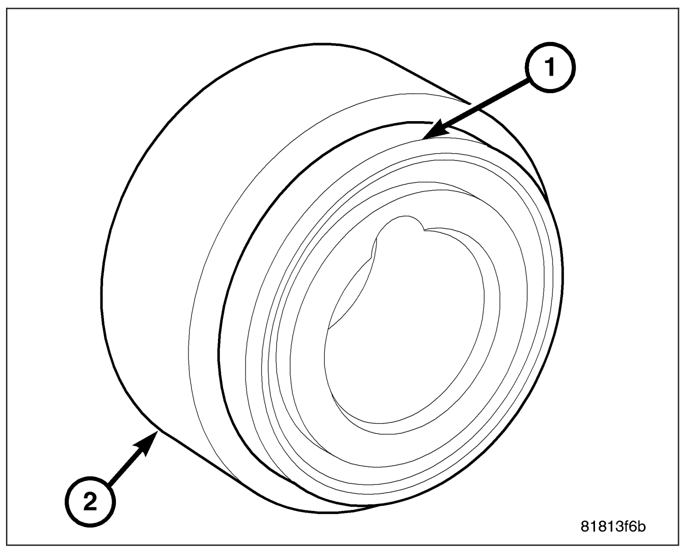
CAUTION: Do not get oil on the ladder frame mating surface. It will affect the ability of the RTV to seal the ladder frame to cylinder block.

7. Oil the bearings and journals. Install crankshaft in engine block.
8. Install lower main bearings (1) into main bearing cap. Make certain the bearing tabs are seated into the bearing cap slots.
9. Before installing the bolts the threads should be clean and dry.
10. Install main bearing caps to engine block, install bolts finger tight.
11. To ensure correct thrust bearing alignment, perform the following steps:
    - Step 1: Rotate crankshaft until number 4 piston is at TDC.
    - Step 2: Move crankshaft rearward to limits of travel.
    - Step 3: Then, move crankshaft forward to limits of travel.
    - Step 4: Wedge an appropriate tool between the rear of the cylinder block and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.



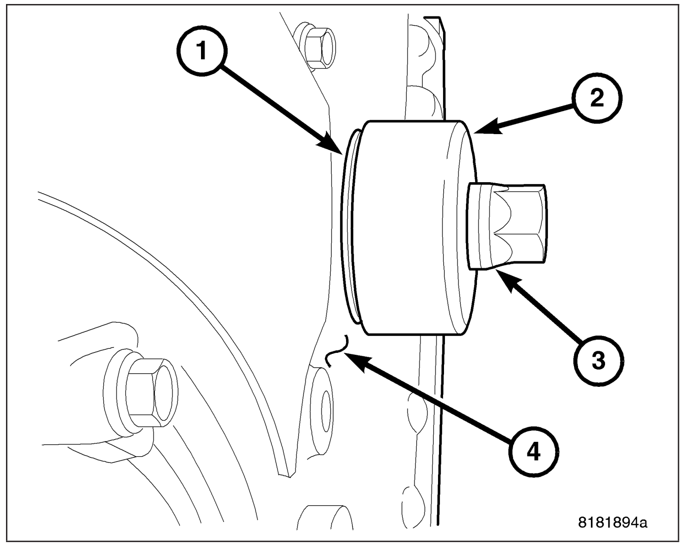
12. Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown.
13. Remove wedge tool used to hold crankshaft.
14. Check the crankshaft turning torque, it should not exceed 5.6 N·m (50 in. lbs.).
15. Check crankshaft end play (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).
16. Install connecting rod bearings and caps. **Do Not Reuse Connecting Rod Bolts.** Torque connecting rod bolts to 27 N·m (20 ft. lbs.) plus 1/4 turn.
17. Install the ladder frame assembly (Refer to 9 - ENGINE/ENGINE BLOCK/LADDER FRAME - INSTALLATION).
18. Install the balance shaft module (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
19. Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
20. Install crankshaft position sensor.
21. Install cylinder head if it was removed (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
22. Install front crankshaft sprocket.
23. Install the timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
24. Install the timing chain front cover.
25. Install front crankshaft oil seal.
26. Install engine mount support bracket.
27. Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
28. Remove engine from repair stand and position on Special Tools 6135 and 6710 Engine Dolly and Cradle. Install safety straps around the engine to cradle and tighten and lock them into position.
29. Install crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).
30. Install drive plate/flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten to 95 N·m (70 ft. lbs.).
31. Attach transaxle to engine. Tighten attaching bolts to 101 N·m (75 ft. lbs.).
32. Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).
33. Install new oil filter and fill with oil.
34. Start engine and check for leaks.

SEAL-CRANKSHAFT OIL FRONT

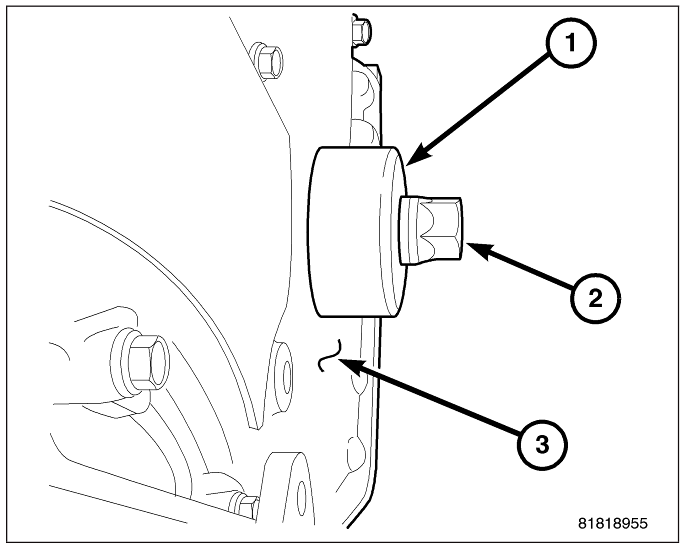


REMOVAL

1. Remove the crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
2. Remove front crankshaft oil seal (1) by prying out with a screw driver (2). Be careful not to damage the cover seal surface.

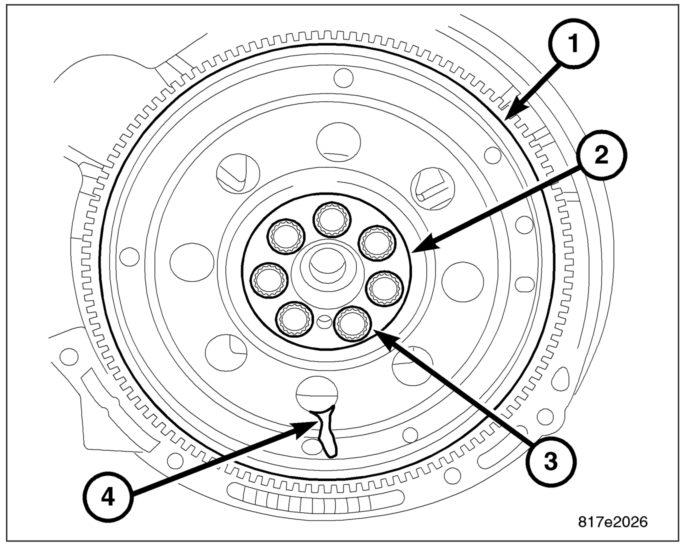


INSTALLATION



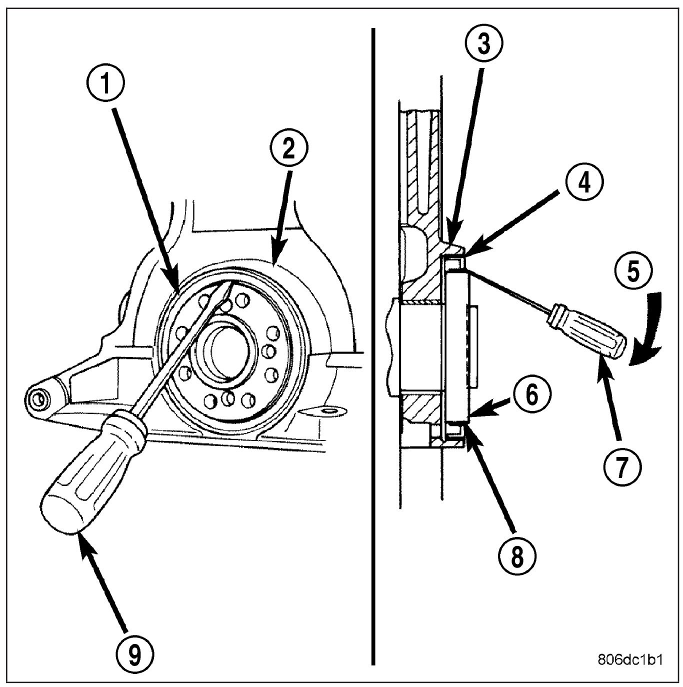
1. Place seal (1) onto Seal installer 9506 (2) with seal spring towards the inside of engine.

2. Install new seal (1) by using Seal installer 9506 (2) and crankshaft damper bolt (3).



3. Press seal into front cover until Seal Installer 9506 (1) seats against timing chain cover (3).
4. Remove seal installer 9506 (1).
5. Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION.

SEAL-CRANKSHAFT OIL REAR

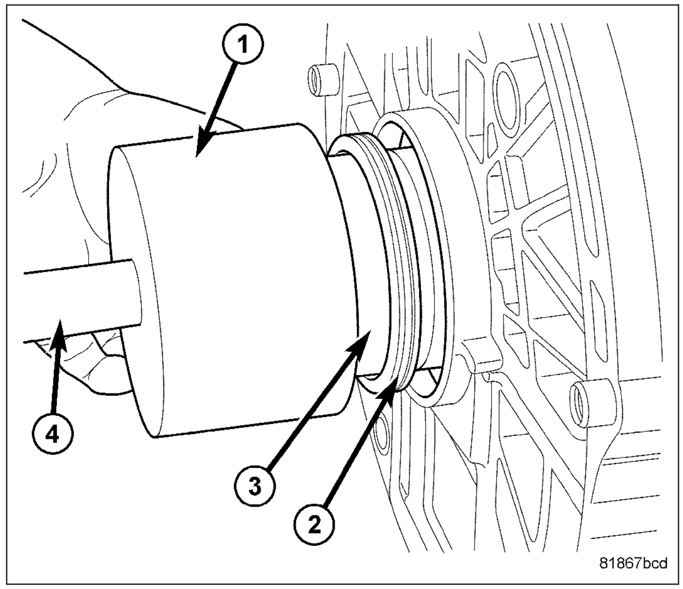


REMOVAL

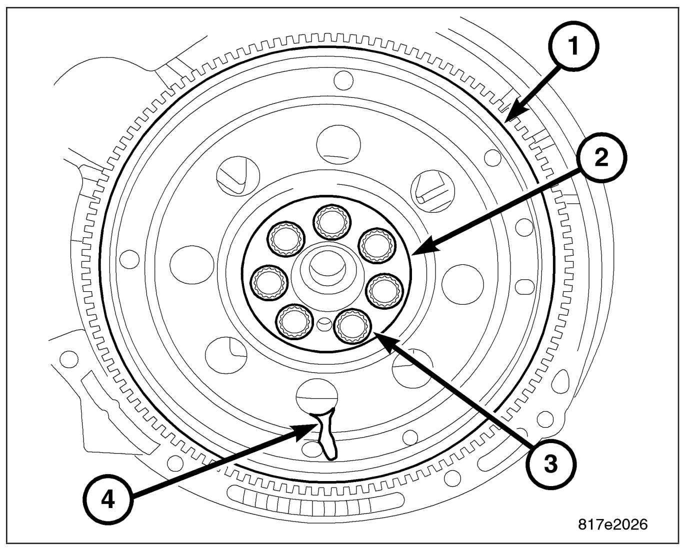
1. Remove transaxle
2. Remove flex plate bolts and discard.
3. Remove flex plate (1).

4. Insert a 3/16 flat bladed screwdriver (7) between the dust lip (8) and the metal case (4) of the crankshaft seal (1). Angle the screwdriver through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.



INSTALLATION



CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

NOTE: When installing seal, no lube on seal is needed.

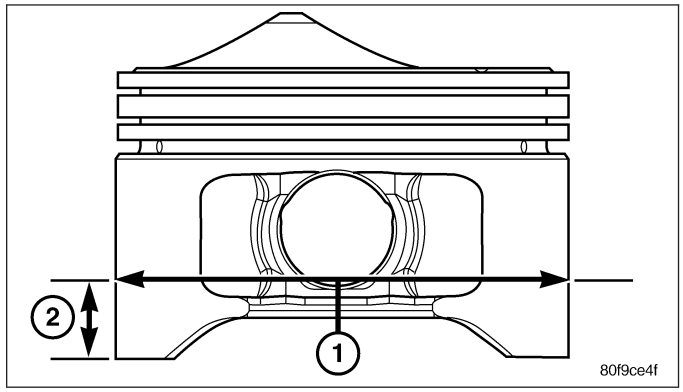
1. Place Special Tool 9509 (3) Seal Guide on crankshaft.
2. Position seal (2) over guide tool. Guide tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.
3. Drive the seal into the block using Special Tool 9706 (1) and handle C-4171 (4) until the tool bottoms out against the block.

4. Install flex plate (1). Install new flex plate bolts and torque to 95 N·m (70 ft. lbs.).
5. Install transaxle. Refer to TRANSMISSION/TRANSAXLE - INSTALLATION for procedure.

PISTON & ROD-CONNECTING

DESCRIPTION

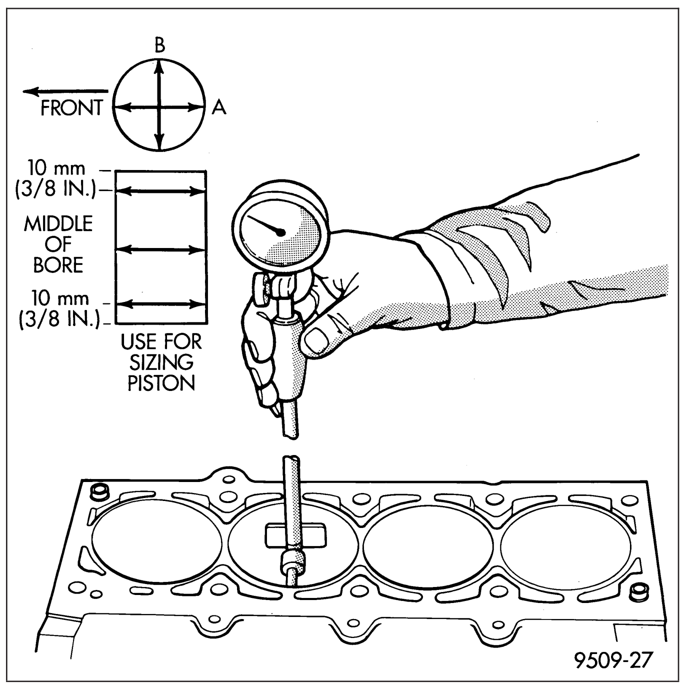
The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged connecting rods. The pistons pin is offset 0.8 mm (0.0314 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. The pistons with rings and connecting rods are serviced as an assembly.



STANDARD PROCEDURE

PISTON TO CYLINDER BORE FITTING

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).



Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin (1).

1. Measurement should be taken approximately 16 mm (0.629 in.) from the bottom of the skirt (2) as shown in.

NOTE: Correct piston to bore clearance must be established in order to assure quiet and economical operation.

2. Cylinder bores should be measured halfway down the cylinder bore and transverse (measurement location B) to the engine crankshaft center line shown in. Refer to for Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL

NOTE: Pistons, rings, and rods are serviced as an assembly.

CAUTION: All four piston/rod assemblies must be replaced as a set or engine damage may result.

1. Remove engine (Refer to 9 - ENGINE - REMOVAL).
2. Separate engine from transaxle.
3. Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

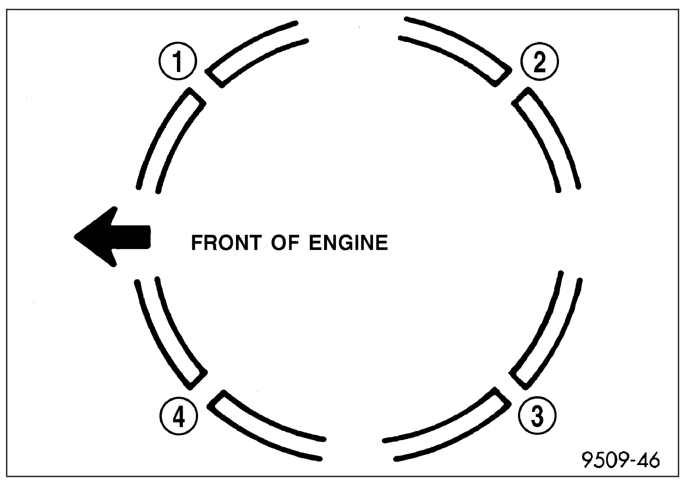
4. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
5. Remove balance shaft assembly.

NOTE: Remove any carbon build up prior to piston removal.

6. Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**.
7. Rotate crankshaft so that each connecting rod is centered in cylinder bore.
8. Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods, as damage to connecting rod could occur.

CAUTION: Care must be taken not to damage the fractured rod and cap joint surfaces, as engine damage many occur.



9. Remove connecting rod bolts and cap.

NOTE: Do not reuse connecting rod bolts.

10. Carefully push each piston and rod assembly out of cylinder bore. Re-install bearing cap on the mating rod.
11. Repeat procedure for each piston and connecting rod assembly.

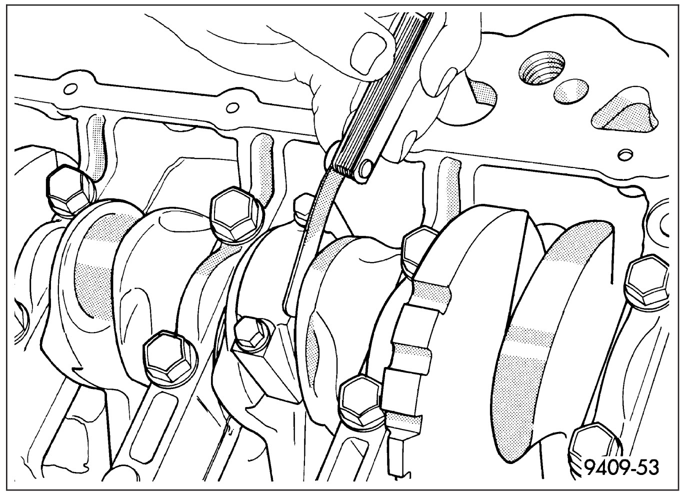
INSTALLATION

1. Install piston rings on piston (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - INSTALLATION).
2. Before installing pistons and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.
3. Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown above. As viewed from the top of the piston.
4. Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston. **Be sure position of rings does not change during this operation**.

5. The directional arrow stamped on the piston should face toward the front of the engine.
6. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Lubricate connecting rod journal with clean engine oil.

NOTE: There are three different size rod bearings, perform rod bearing selection procedure.

7. The rod bearing sizes are indicated on the nose of the crankshaft.
8. Install connecting rod upper bearing half into connecting rod.
9. Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.



NOTE: The connecting rod cap bolts should NOT be reused.

10. Before installing the **NEW** bolts, the threads should be coated with clean engine oil.
11. Install connecting rod lower bearing half into connecting rod cap. Install connecting rod cap.
12. Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.
13. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

1. Tighten the bolts to 27 N·m (20 ft. lbs.).
2. Tighten the connecting rod bolts an additional **1/4 TURN.**

14. Using a feeler gauge, check connecting rod side clearance. (Refer to 9 - ENGINE - SPECIFICATIONS) for connecting rod side clearance.
15. Install the ladder frame.
16. Install oil pump/Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - INSTALLATION).
17. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
18. Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

BEARINGS-MAIN

STANDARD PROCEDURE - MAIN BEARING SELECTION

NOTE: There are three different possibilities for the upper main bearings and five different lower main bearings. The upper and lower bearing shells are not interchangeable.

The lower main bearing identification is stamped in the nose of the crankshaft (1). There are 5 different bearing sizes available 0 through 4.

CRANKSHAFT IDENTIFICATION		LOWER CRANKSHAFT BEARING SELECTION	
JOURNAL DIAMETER GRADE	DIMENSION	LOWER MAIN BEARING SIZE CLASSIFICATION	LOWER MAIN BEARING DIMENSION
0	52 mm	0 (Pink or Red)	2 mm
1	52 mm	1 (Black)	2 mm
2	52 mm	2 (No Color)	2 mm
3	52 mm	3 (Green)	2 mm
4	52 mm	4 (Blue)	2 mm

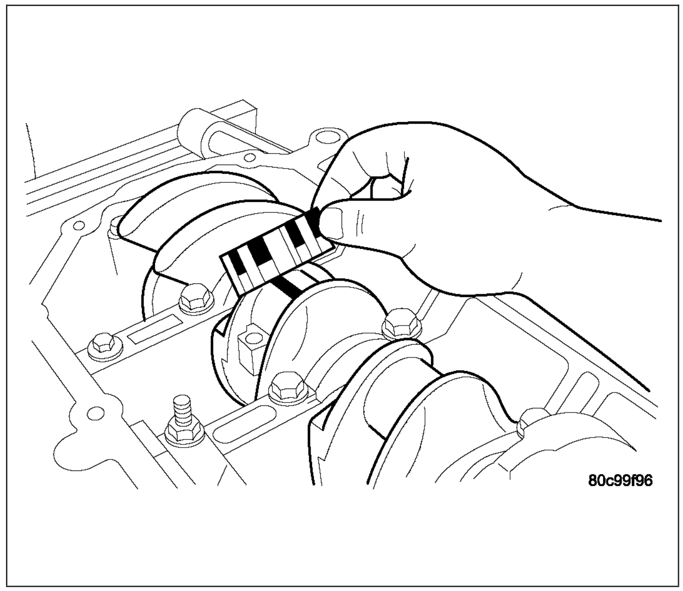
The upper main bearing shell identification is located in the middle of cylinder block on the right side of the engine when viewing from the flywheel. There are three different size bearings available.

UPPER MAIN BEARING SELECTION

CYLINDER BLOCK IDENTIFICATION		UPPER CRANKSHAFT BEARING SELECTION	
MAIN BEARING GRADE	DIMENSION	UPPER MAIN BEARING SIZE CLASSIFICATION	UPPER MAIN BEARING DIMENSION
1	56 mm	1 (Black)	2 mm
2	56 mm	2 (No Color)	2 mm
3	56 mm	3 (Green)	2 mm

BEARINGS-CONNECTING ROD

STANDARD PROCEDURE



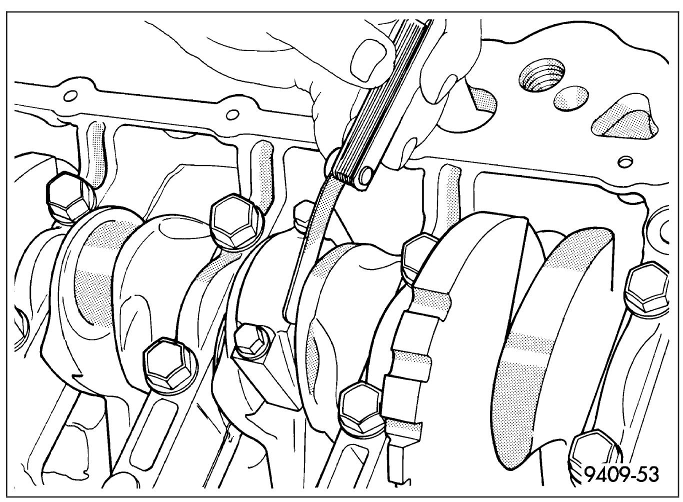
CONNECTING ROD - FITTING

There are three different sizes of rod bearings available. Connecting rod bearing identification can be found on the nose of the crankshaft. Use the table below for proper bearing selection.

CONNECTING ROD BEARING SELECTION

CRANKSHAFT PIN DIAMETER GRADE	DIMENSION	CONNECTING ROD BEARING CLASSIFICATION	CONNECTING ROD BEARING DIMENSION
1	48 mm	1 (Black)	1.5 mm
2	48 mm	2 (No Color)	1.5 mm
3	48 mm	3 (Green)	1.5 mm

1. For measuring connecting rod bearing clearance procedure and use of Plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE) For bearing clearance refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS).



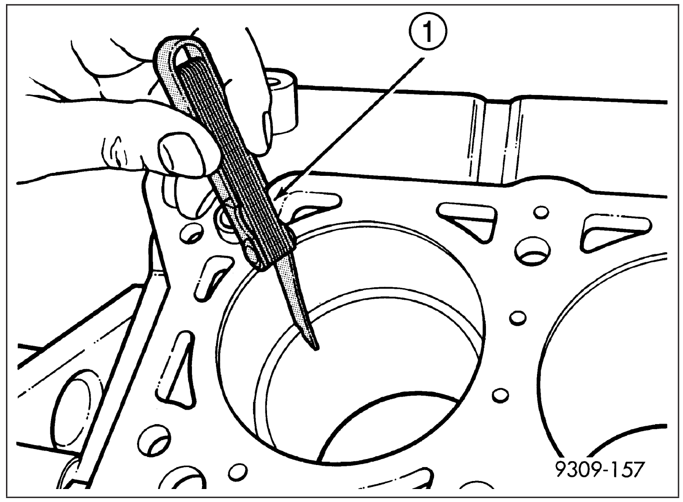
NOTE: The rod bolts should not be reused.

2. Before installing the **NEW** rod bolts the threads and under the bolt head should be oiled with clean engine oil.
3. Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.
4. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

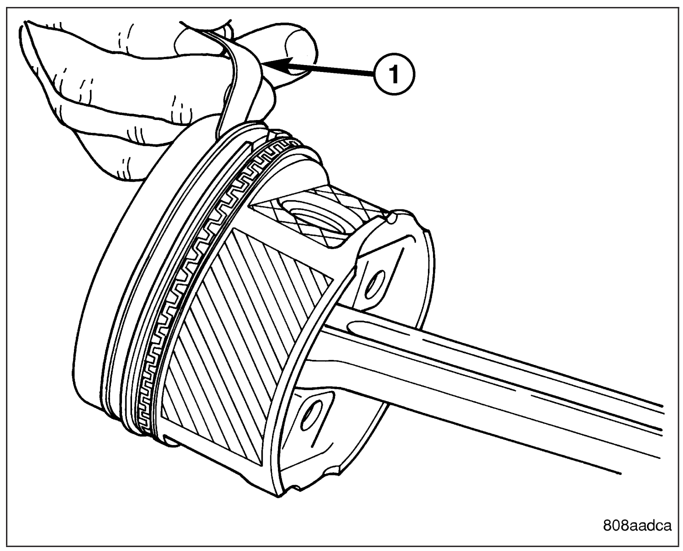
CAUTION: Do not use a torque wrench for the second step.

   1. Tighten the bolts to 27 N·m (20 ft. lbs.).
   2. Tighten the connecting rod bolts an additional 90°.

5. Using a feeler gauge, check connecting rod side clearance. Refer to clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).



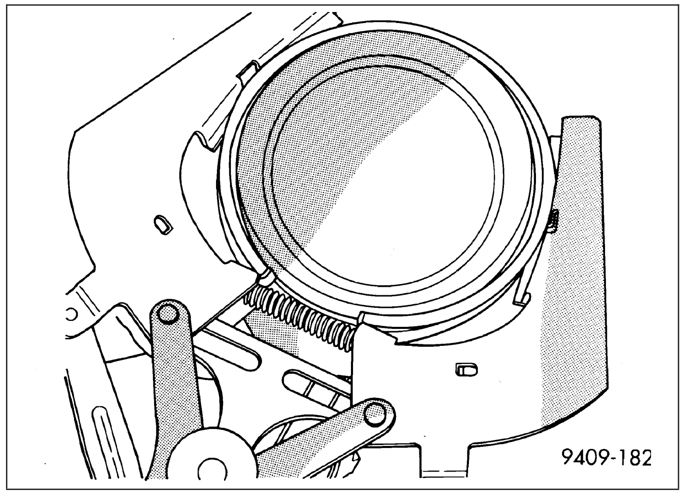
RINGS-PISTON



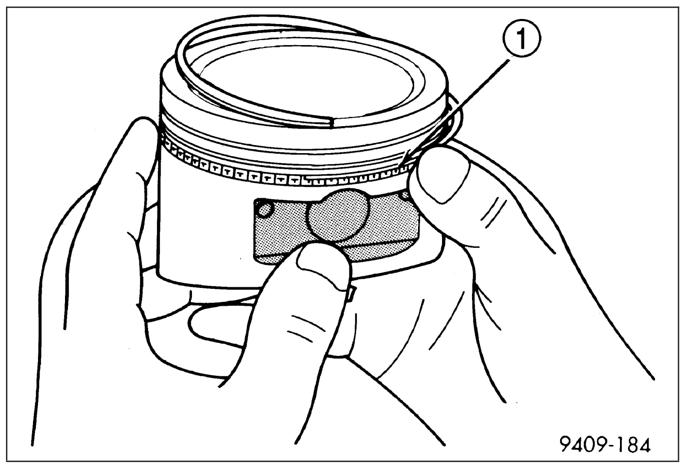
STANDARD PROCEDURE

PISTON RING - FITTING

1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch) from bottom of cylinder bore. Check gap with feeler gauge. Refer to Engine Specifications.



2. Check piston ring to groove side clearance. Refer to Engine Specifications.

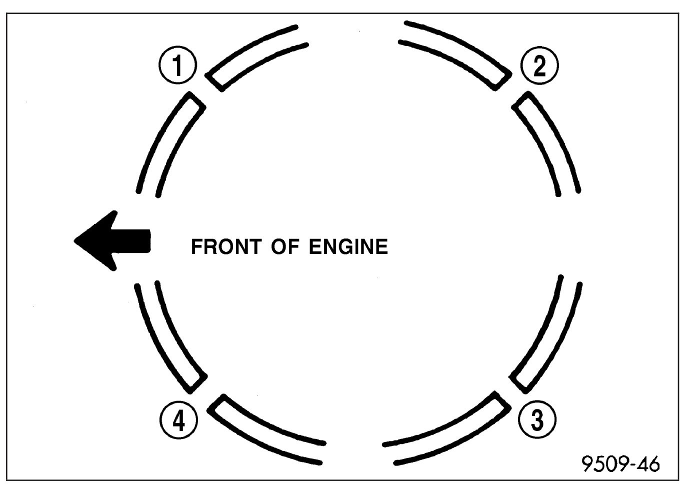


REMOVAL

1. Using a suitable ring expander, remove upper and intermediate piston rings.
2. Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.
3. Clean ring grooves of any carbon deposits.

INSTALLATION

NOTE: The identification mark on face of upper and intermediate piston rings must point toward top of piston.

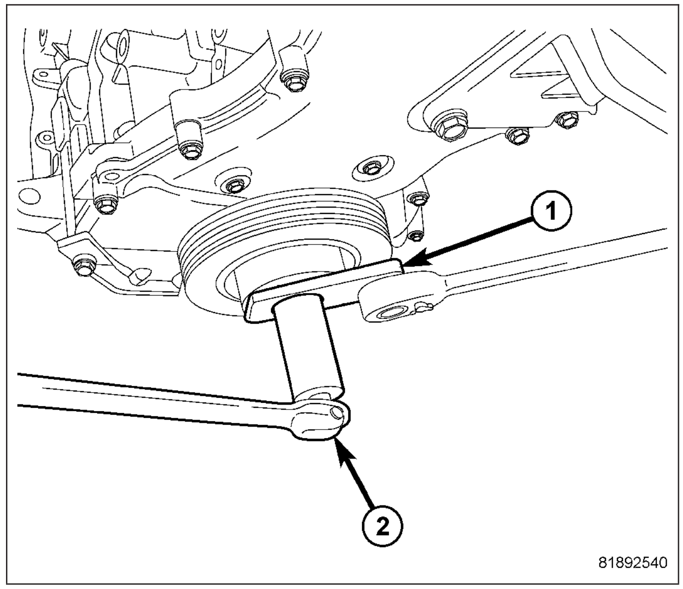


CAUTION: Install piston rings in the following order:

1. Oil ring expander.
2. Upper oil ring side rail.
3. Lower oil ring side rail.
4. No. 2 Intermediate piston ring.
5. No. 1 Upper piston ring.

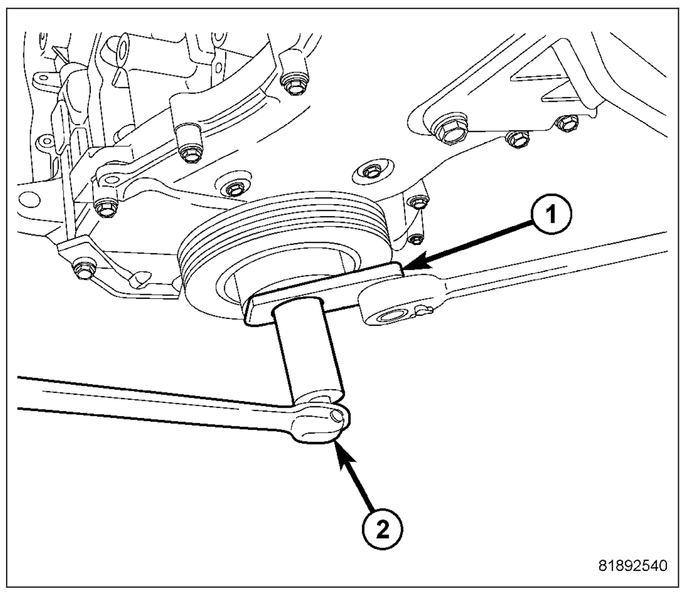
1. Install oil ring expander.
2. Install upper side rail first and then the lower side rail. Install the side rails by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander.**

NOTE: The compression rings are marked Y1 for the upper compression ring and Y2 for the second compression ring. These markings must face upward.



3. Install No. 2 piston ring and then No. 1 piston ring.
4. Position piston ring end gaps as shown in.
5. Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

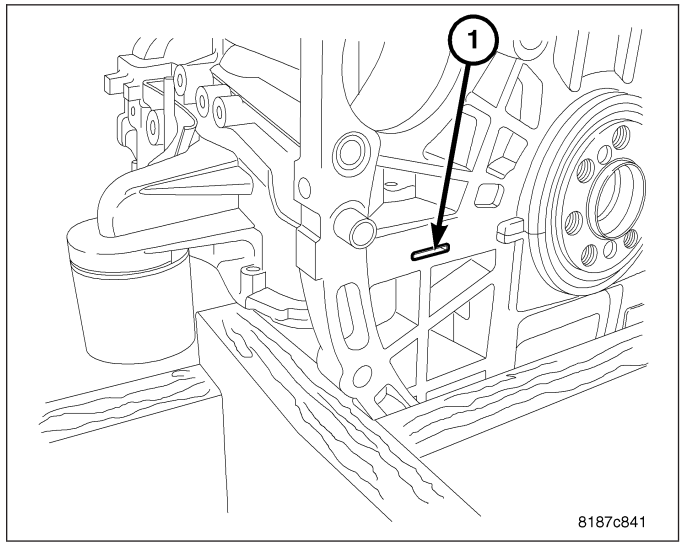
DAMPER-VIBRATION



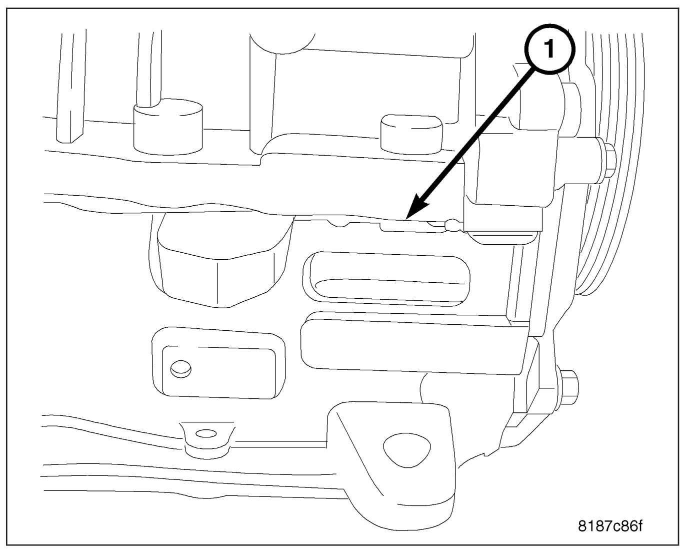
REMOVAL

1. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Install Damper holder 9707 (1).
3. Remove crankshaft damper bolt.
4. Pull damper off crankshaft.

INSTALLATION



1. Install crankshaft damper.
2. Apply clean engine oil crankshaft damper bolt threads and between bolt head and washer. Torque bolt to 210 N·m (155 ft. lbs.).
3. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

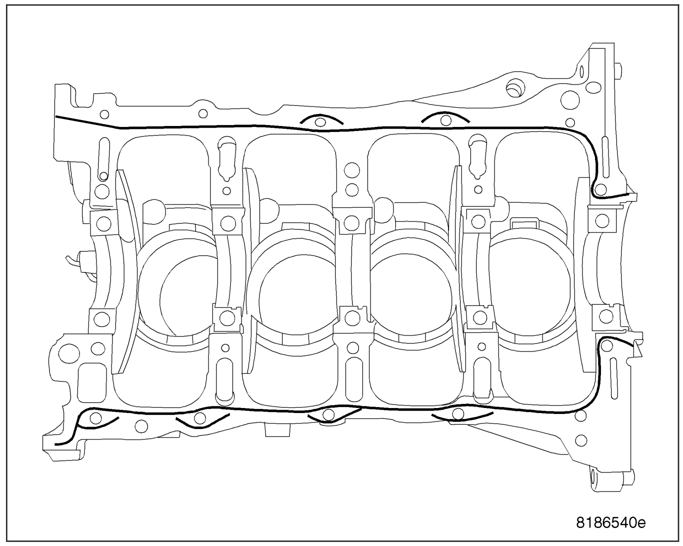


FRAME-LADDER

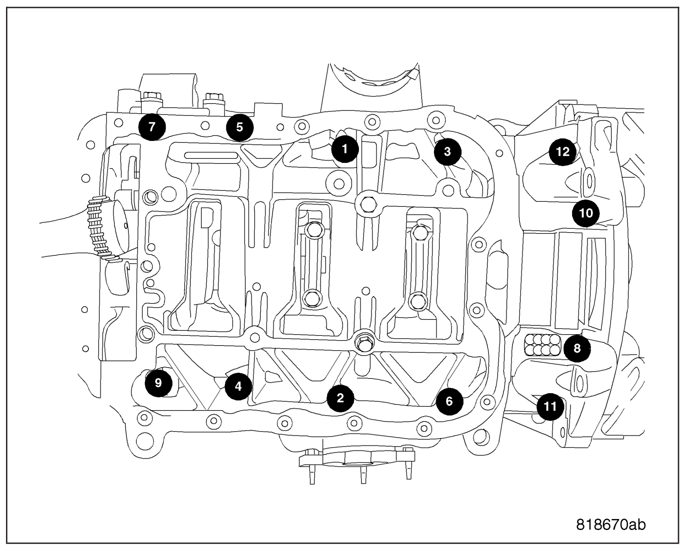
REMOVAL

1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Remove oil pump/balance shaft assembly (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
3. Remove ladder frame retaining bolts.
4. Remove ladder frame using pry points cast in the rear of the block (1).

5. To assist in removing the ladder frame another (1) pry points cast in the left side of the block.



CLEANING



Clean ladder frame with a plastic or wooden scraper and a suitable solvent.

INSTALLATION

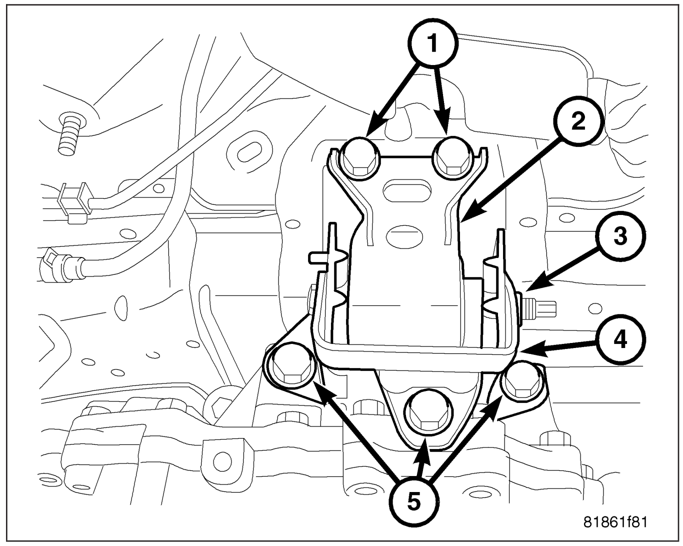
1. Apply a 2 mm bead of sealant as shown.

2. Install bolts and torque shown following a three step method.
   - First: All to 20 N·m (15 ft. lbs.)
   - Second: All to 49 N·m (36 ft. lbs.)
   - Third: All to 49 N·m (36 ft. lbs.)
3. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

ENGINE MOUNTING

DESCRIPTION

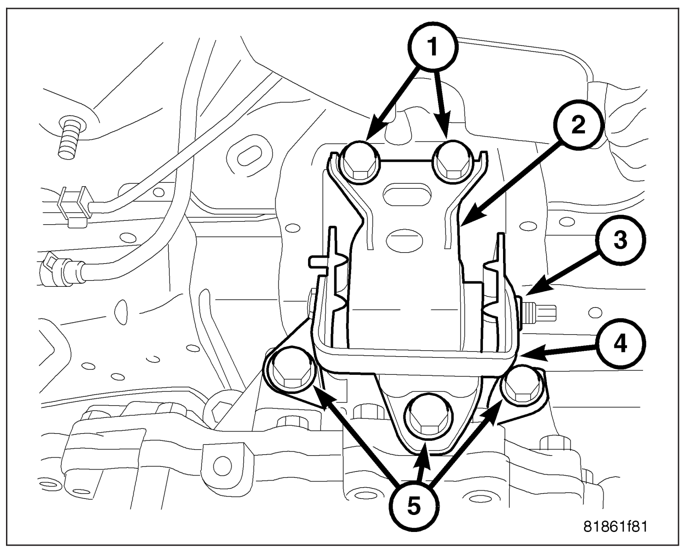
The engine mounting system consists of a four-point system utilizing two load-carrying mounts and two torque controlling mounts. The load-carrying mounts are located on each frame rail. The right mount is a hydro-elastic mount and left mount is a conventional elastomeric isolator. The two torque controlling mounts are attached to a fore/aft member and the front and rear of the engine.



OPERATION

The four-point engine mounting system minimizes the transmission of structure-borne engine noise to the passenger compartment. The load-carrying right and left mounts dampen and isolate vertical motion and vibration. The front and rear mount absorb torque reaction forces and torsional vibrations.

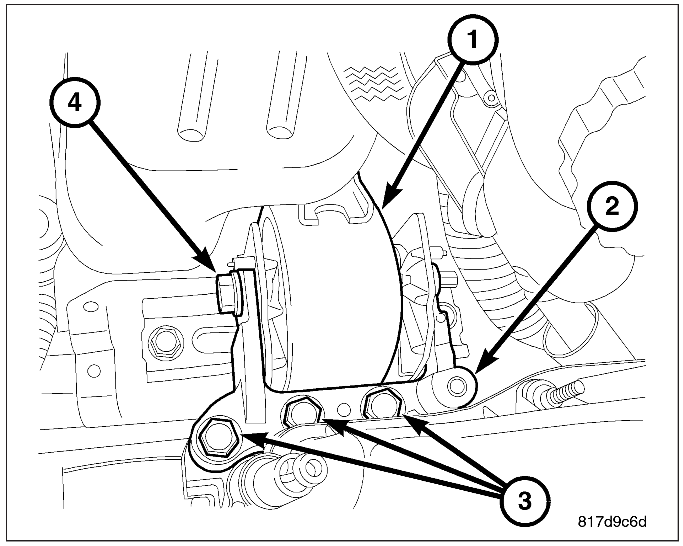
MOUNT-LEFT



REMOVAL

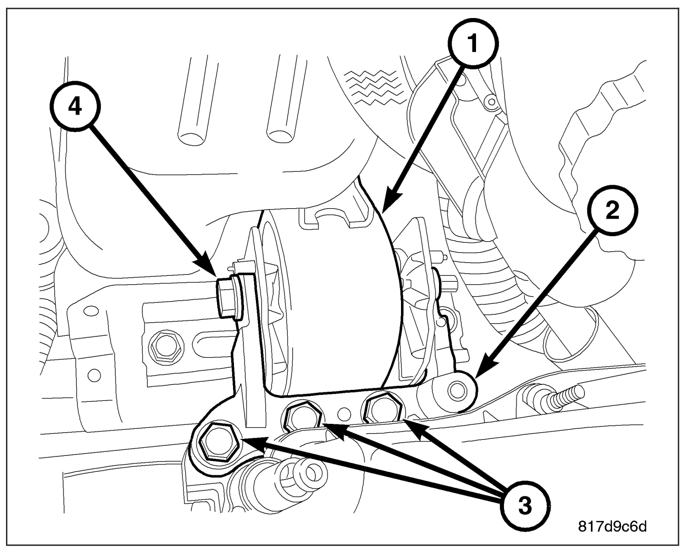
1. Remove air cleaner assembly.
2. Disconnect negative cable from battery.
3. Remove PCM.
4. Remove PCM mounting bracket.
5. Support transaxle with a suitable jack.
6. Remove left mount through bolt (3).
7. Remove mount to transaxle bolts (5).
8. Remove left mount bracket (4).
9. Remove left mount bracket to body frame rail fasteners.
10. Remove mount.

INSTALLATION



1. Install mount.
2. Install left mount to frame rail bolts and torque to 28N·m (250 in. lbs.).
3. Install left mount bracket (4).
4. Install mount to transaxle bolts (5) and torque to 68 N·m (50 ft.lbs.).
5. Install mount through bolt (3) and torque to 115 N·m (85 ft.lbs.).
6. Remove jack.
7. Install PCM mounting bracket.
8. Install PCM.
9. Connect negative battery cable.
10. Install air cleaner assembly.

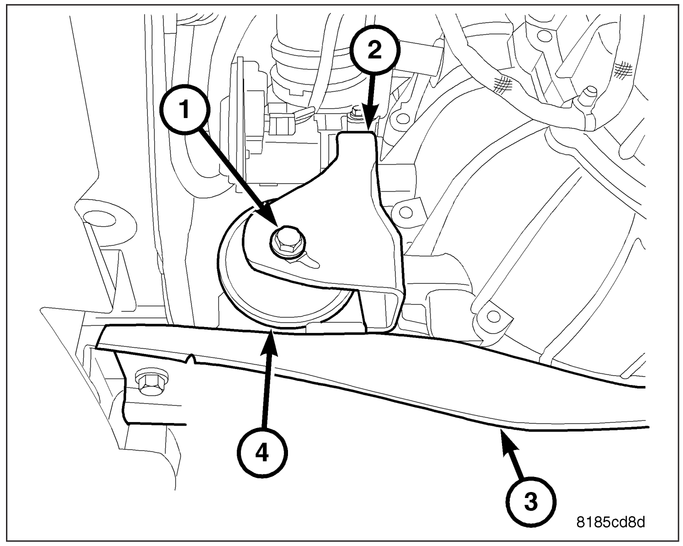
MOUNT-RIGHT



REMOVAL

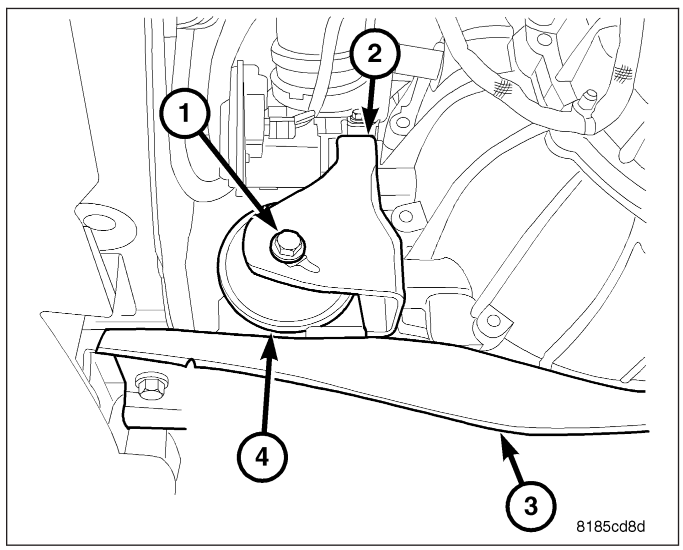
1. Remove coolant reservoir and set aside.
2. Remove power steering reservoir and set aside.
3. Remove windshield washer bottle.
4. Remove power steering line support bracket from engine mount.
5. Support transaxle with a block of wood and a suitable jack.
6. Remove engine mount through bolt (4).
7. Remove engine mount bracket bolts (3).
8. Remove engine mount retaining bolts.
9. Remove engine mount.

INSTALLATION



1. Install engine mount.
2. Install engine mount retaining bolts and torque to 28 N·m (250 in. lbs.).
3. Install engine mount bracket and torque bolts (3) to 68 N·m (50 ft. lbs.).
4. Install engine mount through bolt (4) and torque to 115 N·m (85 ft. lbs.).
5. Remove jack.
6. Install power steering line support bracket at engine mount.
7. Install windshield washer bottle.
8. Install power steering reservoir.
9. Install coolant reservoir.

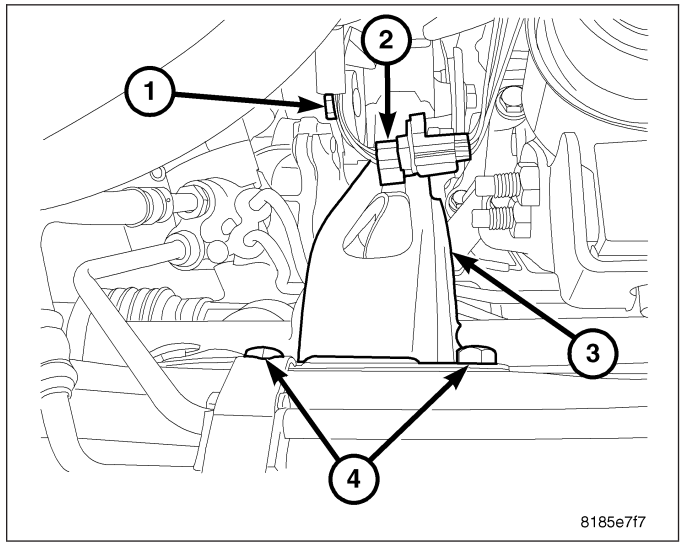
MOUNT-FRONT



REMOVAL

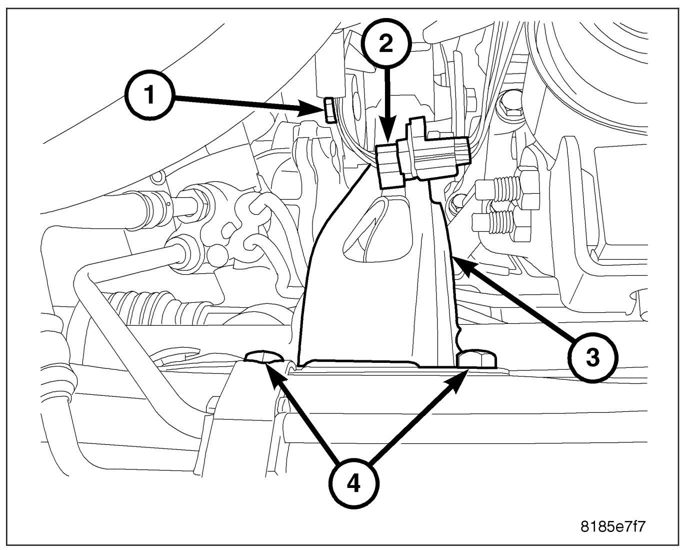
1. Raise vehicle.
2. Remove fore aft member (3) to mount (4) bolts.
3. Remove mount through bolt (1).
4. Remove fore aft member (3) mounting bolts and remove.
5. Remove front mount (4).

INSTALLATION



1. Install mount (4) and tighten bolts.
2. Install fore aft member (3) and tighten bolts.
3. Install mount through bolt (1) and tighten.
4. Lower vehicle.

MOUNT-REAR



REMOVAL

1. Remove rear mount retaining bolts (4).
2. Remove rear mount through bolt (1).
3. Remove oxygen sensor connector (2) from mount.
4. Remove rear mount (3).

INSTALLATION

1. Install rear mount (3).
2. Install rear mount retaining bolts (4) and tighten.
3. Install rear mount through bolt (1) and tighten.
4. Install oxygen sensor connector (2) retainer to mount (3).

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump is mounted in the ladder frame and chain driven by the crankshaft.

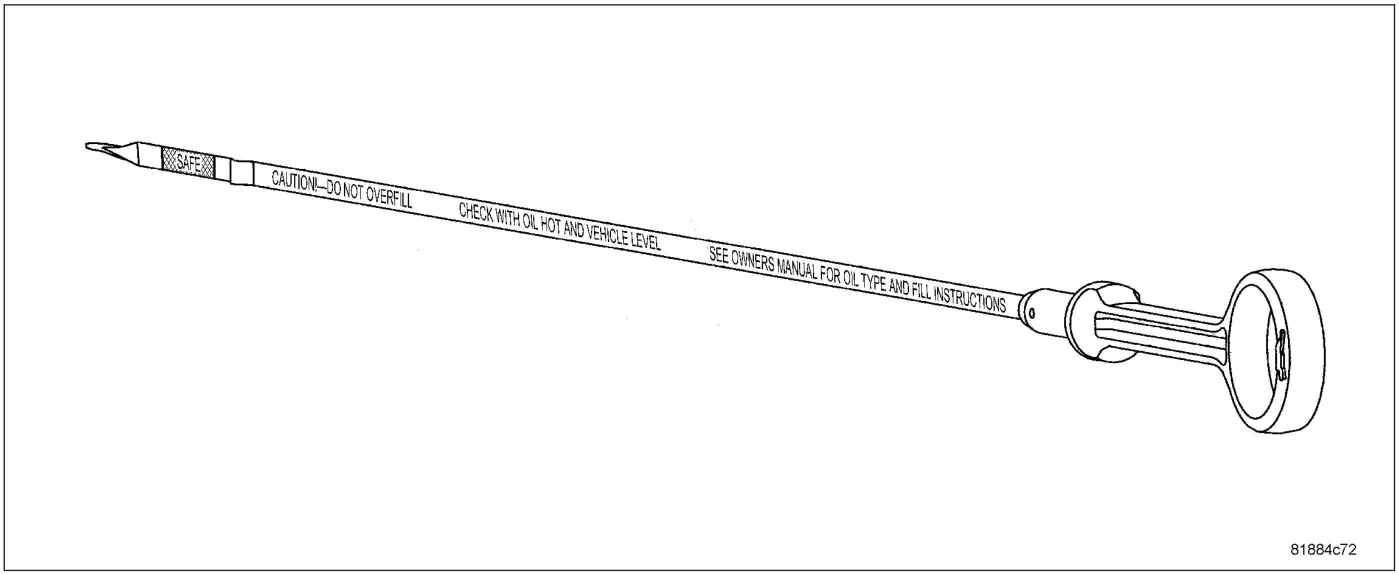
OPERATION

Engine oil drawn up through the pickup tube and is pressurized by the oil pump and routed through the full-flow filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from main bearing journals to connecting rod journals. Balance shaft lubrication is provided through an internal oil passage. A vertical hole at the number one bulkhead routes pressurized oil through a filter screen and head gasket up to the cylinder head. The oil then divides into three passages; one to the intake cam phaser, one to the exhaust cam phaser and one to the camshafts. The passage to the camshafts divides to feed both of the hollow camshafts at the second cam journal.The rest of cam journals are feed oil through the hollow camshafts. The #1 cam journals are feed oil through the VVT oil passages. Oil passages to the phasers are directed through the OCV (oil control valves) to the #1 journals. The oil then flows through the camshafts then to the cam phasers. Oil returning to the pan from pressurized components supplies lubrication to the valve stems, cam lobes, and tappets. Cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collars.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

1. Disconnect and remove oil pressure switch. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL)
2. Install Special Tools C-3292 Gauge with 8406 Adaptor fitting.
3. Start engine and record oil pressure. Refer to Specifications for correct oil pressure requirements. (Refer to 9 - ENGINE - SPECIFICATIONS)

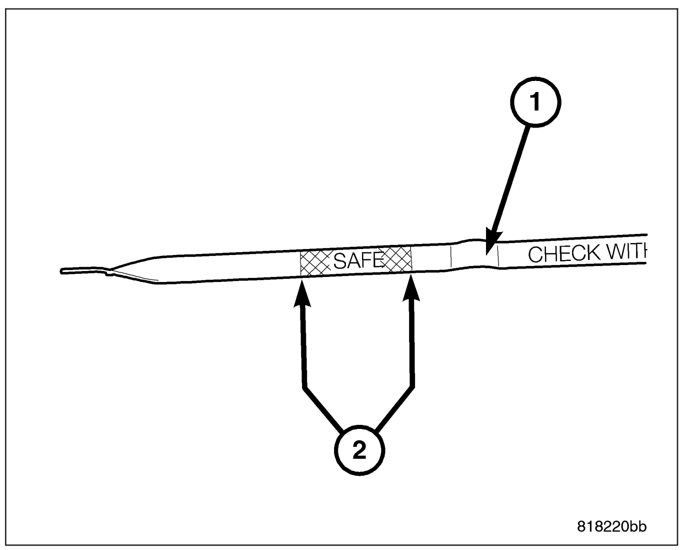


CAUTION: If oil pressure is 0 at idle, do not perform the 3000 RPM test

4. If oil pressure is 0 at idle, shut off engine. check for pressure relief valve stuck open, a clogged oil pick-up screen or a damaged oil pick-up tube O-ring.
5. Remove oil pan and inspect for debris.
6. Remove pressure relief valve and inspect, if damaged replace pressure relief valve.
7. If pressure relief valve is ok, replace balance shaft module assembly.
8. After test is complete, remove test gauge and fitting.
9. Install oil pressure switch and connector. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION).

OIL

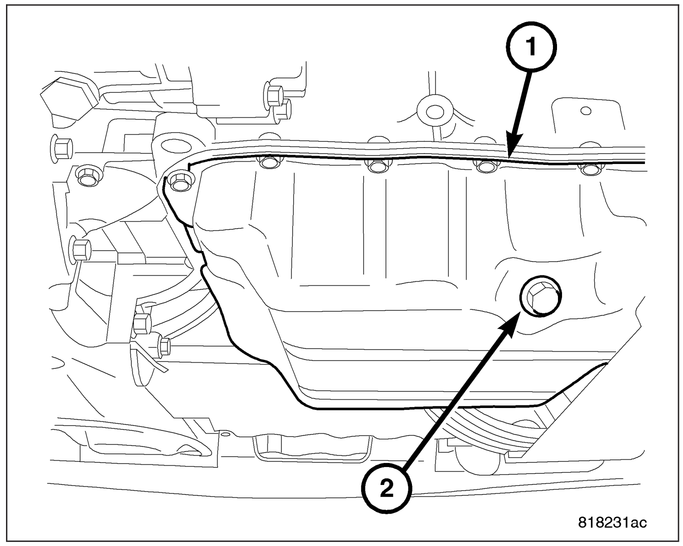
STANDARD PROCEDURE



ENGINE OIL LEVEL CHECK

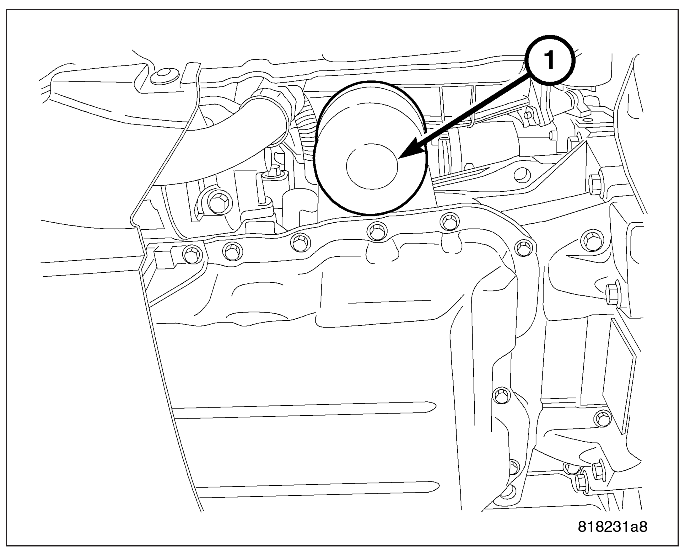
NOTE: The engine must be HOT when checking oil level.

The best time to check engine oil level is after the engine is at operating temperature. Allow the engine to be shut off for at least 5 minutes before checking oil level.



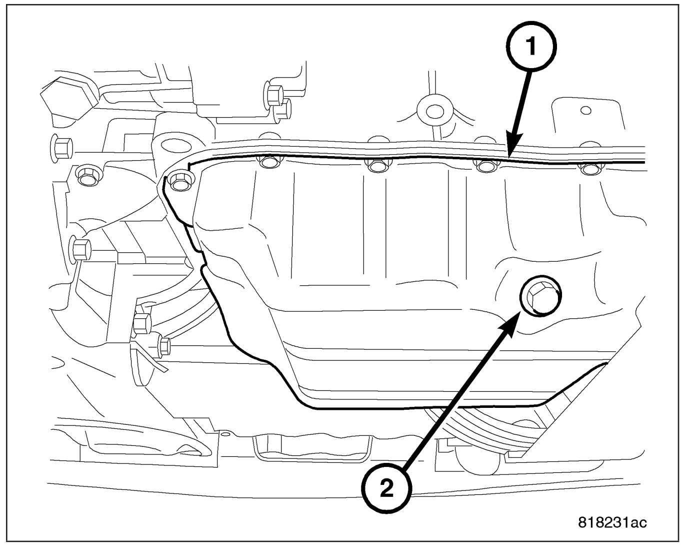
Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Remove dipstick (1), and observe oil level. Add oil only when the level is at or below the SAFE mark. If the oil level is in the safe (2) range, do not add oil.

CAUTION: Do not operate engine if the oil level is above the MAX mark on the dipstick. Excessive oil volume can cause oil aeration which can lead to engine failure due to loss of oil pressure or increase in oil temperature.

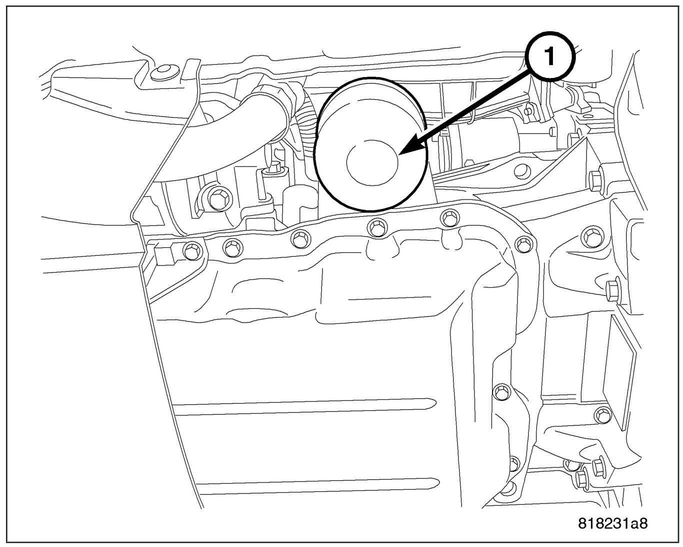


ENGINE OIL AND FILTER CHANGE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.



Change engine oil at mileage and time intervals described in the Maintenance Schedule (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).



1. Run engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn engine off.
3. Remove oil fill cap.
4. Raise vehicle on hoist.
5. Place a suitable oil collecting container under oil pan drain plug (2).
6. Remove oil pan drain plug (2) or and allow oil to drain into collecting container. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
7. Remove oil filter (1) (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

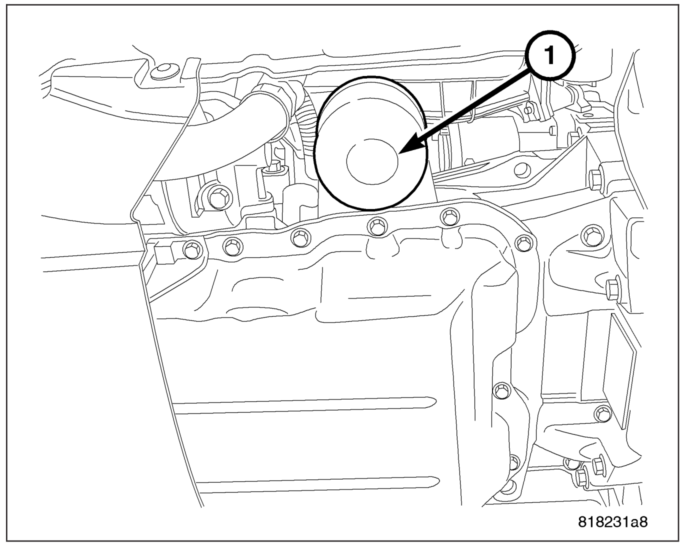
8. Install oil pan drain plug (2). Torque drain plug to 28 N·m (20 ft. lbs.).

9. Install new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).
10. Lower vehicle and fill crankcase with specified type and amount of engine oil (Refer to LUBRICATION & MAINTENANCE/SPECIFICATIONS - FLUID CAPACITIES) and (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
11. Install oil fill cap.
12. Start engine and inspect for leaks.
13. Stop engine and inspect oil level.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. Replace oil filter with a Mopar® or the equivalent.

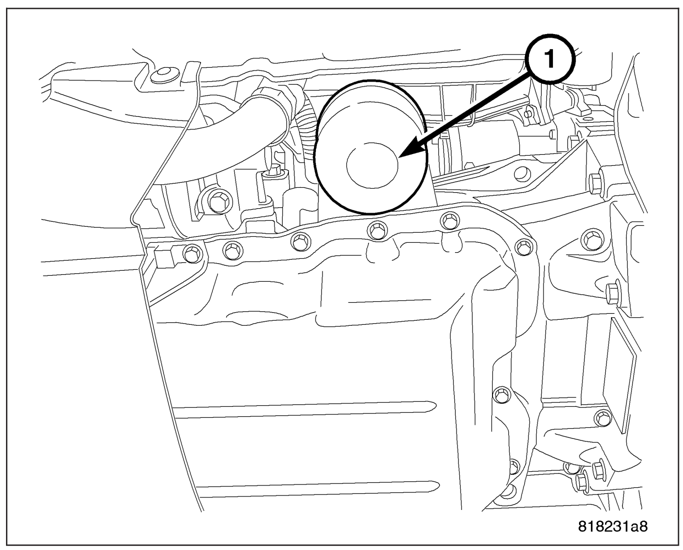
USED ENGINE OIL DISPOSAL



Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

FILTER-OIL

REMOVAL

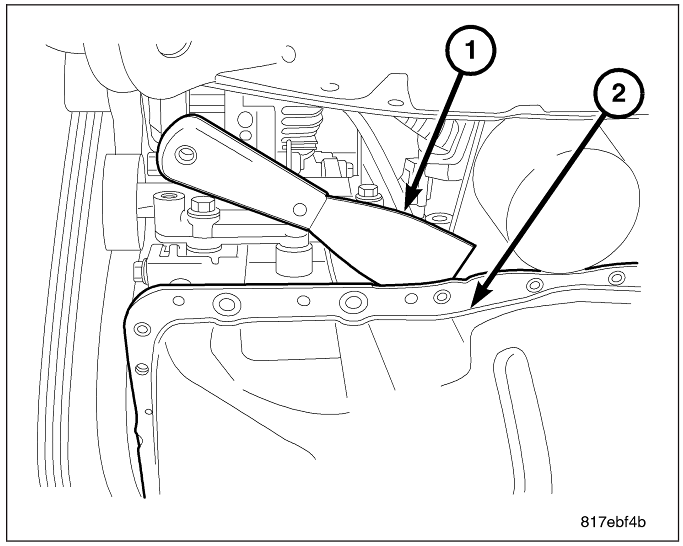


CAUTION: When servicing the oil filter avoid deforming the filter can by installing the remove/ install tool band strap against the can to base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

1. Using a suitable filter wrench, turn oil filter (1) counterclockwise to remove.

INSTALLATION

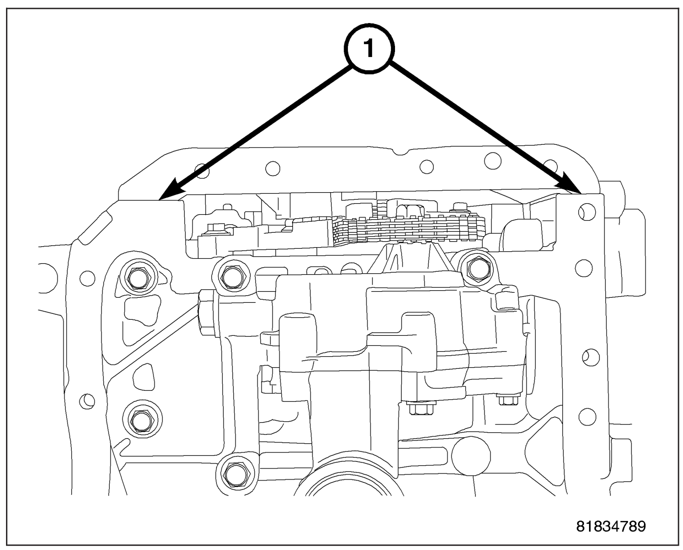
1. Clean and check filter mounting surface. The surface must be smooth, flat and free of debris or pieces of gasket.
2. Lubricate new oil filter gasket.
3. Screw oil filter (1) on until the gasket contacts base. Tighten to 21 N·m (15 ft. lbs.).



PAN-OIL

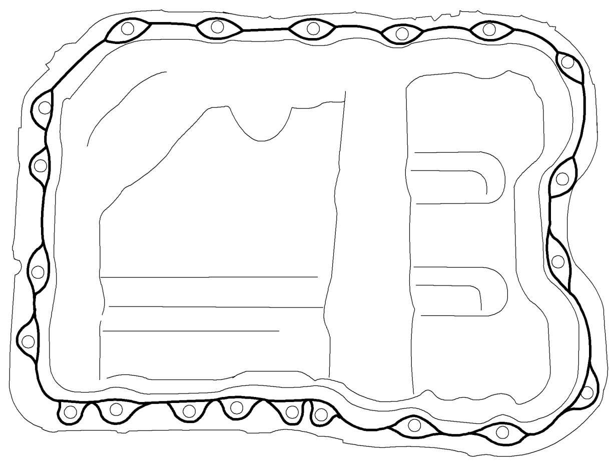
REMOVAL

1. Raise vehicle on hoist.
2. Drain engine oil.
3. Remove accessory drive belt splash shield.
4. Remove lower A/C compressor mounting bolt (if equipped).
5. Remove A/C mounting bracket.



NOTE: Do not use pry points in block to remove oil pan.

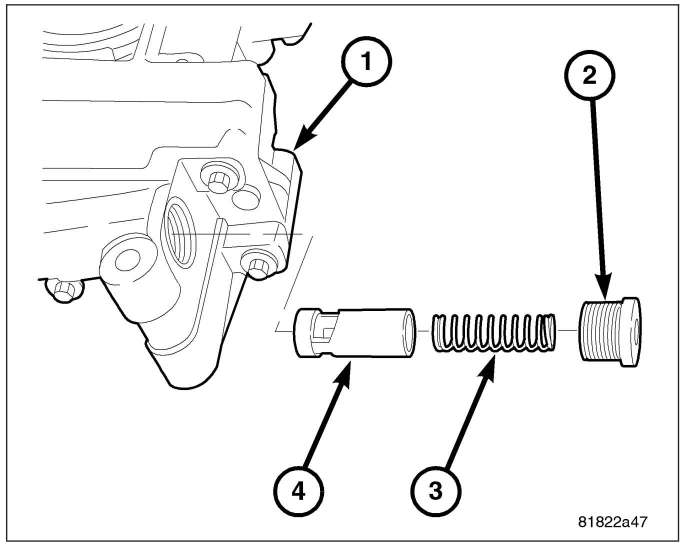
6. Remove oil pan retaining bolts.
7. Using a putty knife (1), loosen seal around oil pan (2).
8. Remove oil pan (2).



INSTALLATION

1. Apply Mopar® Engine RTV GEN II at the front cover to engine block parting lines (1).

2. Apply a 2 mm bead of Mopar® Engine RTV GEN II around the oil pan as shown.

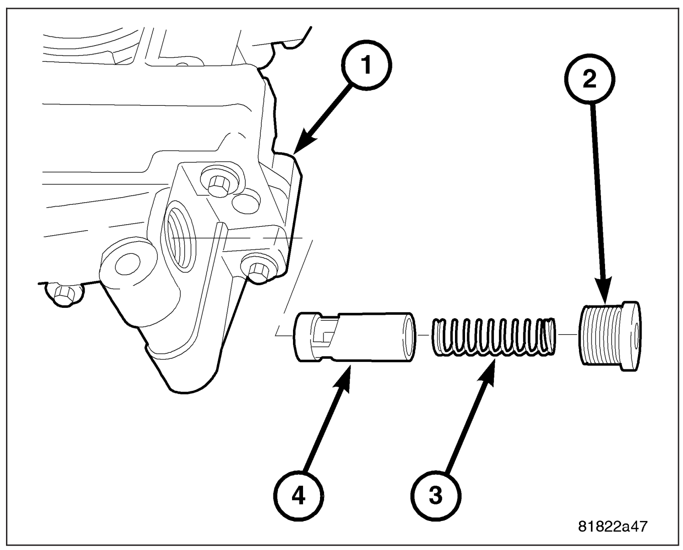


81834782

3. Tighten screws to 12 N·m (105 in. lbs.).
4. Install oil drain plug.
5. Lower vehicle and fill engine crankcase with proper oil to correct level.
6. Start engine and check for leaks.

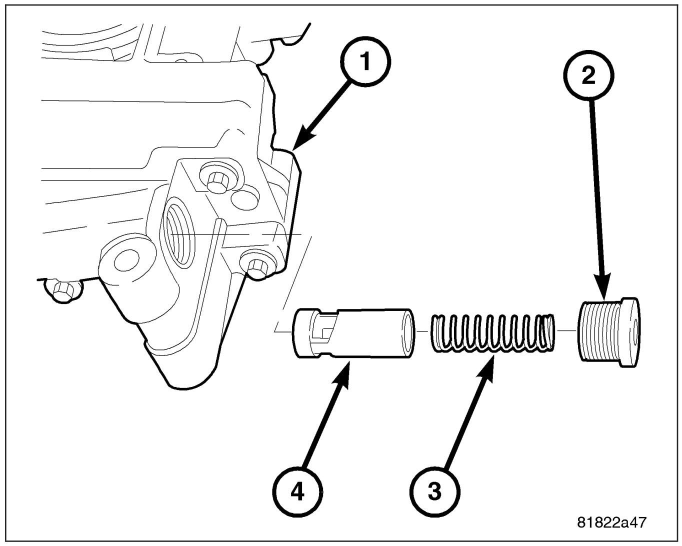
VALVE-OIL PRESSURE RELIEF

REMOVAL



1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
2. Remove pressure regulating valve cap (2).
3. Remove pressure regulating valve spring (3) and valve (4).

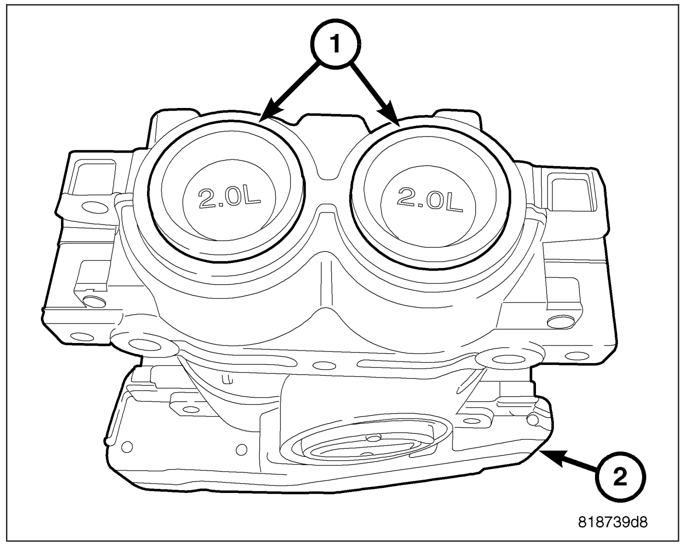
INSPECTION



NOTE: Pressure regulating valve (4) can be service separately from the oil pump assembly.

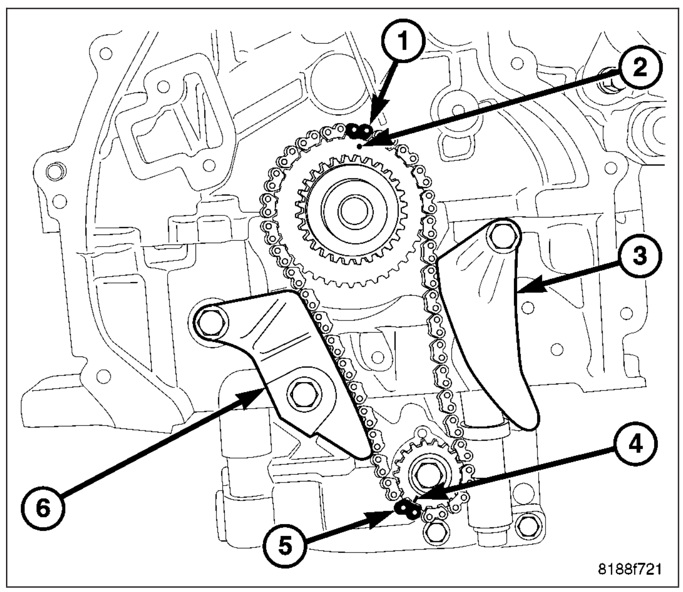
1. Inspect pressure relief valve (4) scoring, gouging, or debris. Replace as needed.
2. Inspect the pressure relief valve bore in the pump for scoring, gouging, or debris.
3. If pump bore is damaged, replace balance shaft module.

INSTALLATION



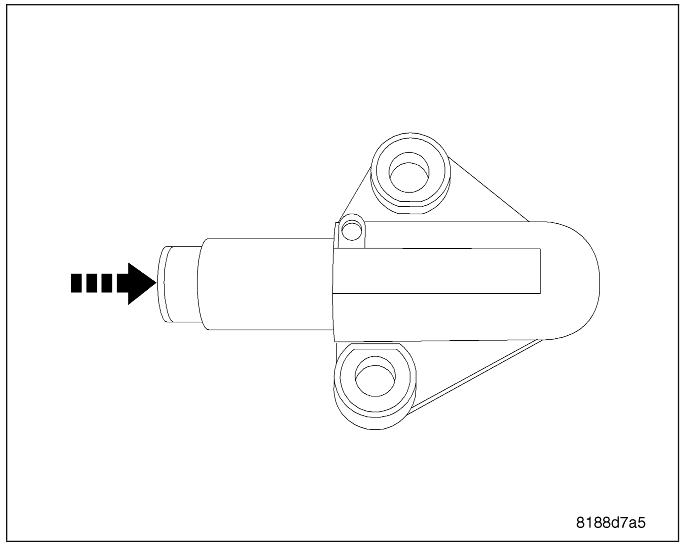
1. Lightly coat pressure regulating valve with clean engine oil and install valve (4).
2. Install spring (3) and cap (2).
3. Torque cap to 42 N·m (31 lbs.ft.).

PUMP-OIL

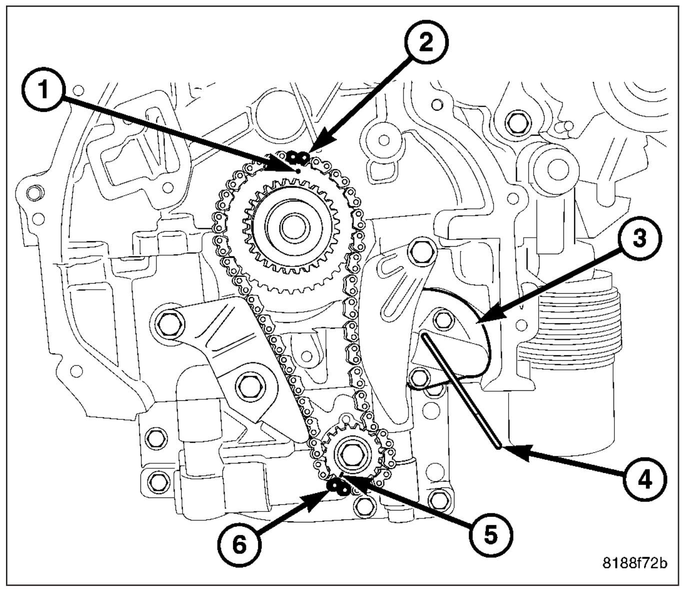


DESCRIPTION

The oil pump is integral to the balance shaft module (BSM) (2). The oil pump cannot be disassembled for inspection. The pressure relief valve is serviceable and can be removed and inspected. The BSM can be identified by the plastic end caps (1).

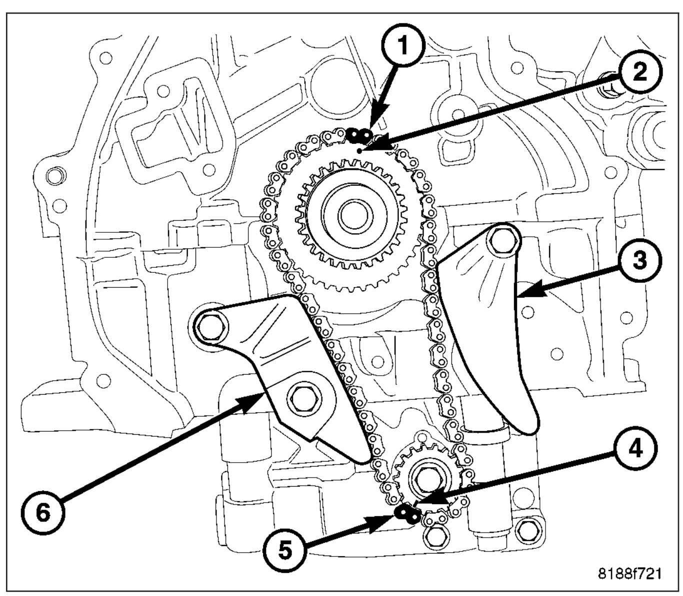


REMOVAL



1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Mark the chain (4) and the sprocket (5) for reassembly.

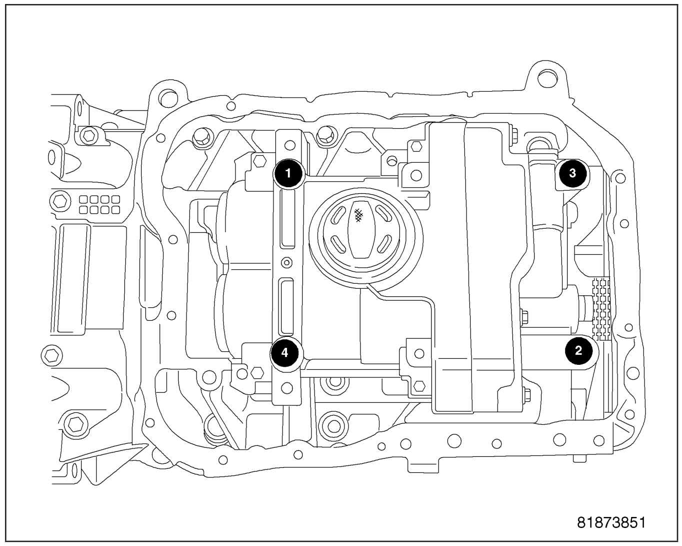
3. Push tensioner toward the front of the vehicle.



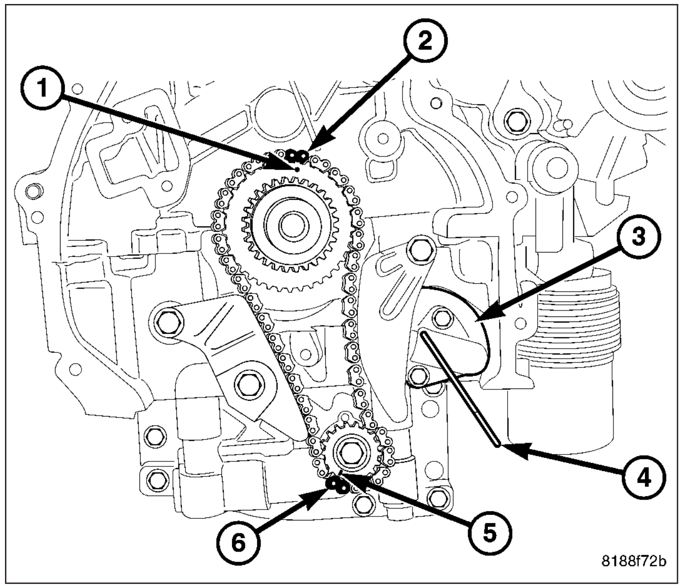
4. Install 9703 (4).
5. Remove BSM mounting bolts and discard.
6. Lower the back of the BSM and remove sprocket from chain.
7. Remove BSM from the engine.

INSTALLATION

CAUTION: Do not reuse Balance Shaft Module (BSM) to engine block bolts. Always discard bolts after removing. Failure to replace bolts can result in engine damage.



1. Align marks on oil pump sprocket (5) and chain (4).
2. Install chain on sprocket.
3. Pivot BSM assembly upwards toward the engine block.



4. Start **new** BSM mounting bolts by hand.

NOTE: Use a three step procedure when torqueing BSM mounting bolts.

5. Torque BSM mounting bolts to 15 N·m (11 ft. lbs.) as shown.
6. Torque BSM mounting bolts to 29 N·m (22 ft. lbs.) as shown.
7. Rotate bolts an additional 90° as shown.

8. Remove tensioner pin 9703 (4).
9. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/ OIL PAN - INSTALLATION).
10. Fill with oil.
11. Start engine and check for leaks.

SENSOR/SWITCH-ENGINE OIL PSI

DESCRIPTION

The oil pressure switch is located on the left front side of the engine block. The oil pressure switch is a pressure sensitive switch that is activated by the engine's oil pressure (in the main oil gallery). The switch is a two terminal device (one terminal is provided to the wiring harness and the other terminal is the switch's metal housing that screws into the engine block).

OPERATION

The oil pressure switch is normally “Closed.” The switch changes from a ″Closed″ circuit to an ″Open″ circuit, on increasing pressure of 7 psig. The oil pressure switch changes from an ″Open″ circuit to a ″Closed″ circuit, on decreasing pressure, between 2 psig and 4 psig.

REMOVAL

1. Raise vehicle.
2. Disconnect electrical connector.
3. Remove oil pressure sending unit using oil pressure socket C-4597.

INSTALLATION

1. Install oil pressure sending unit using oil pressure socket C-4597.
2. Connect electrical connector.

COOLER-OIL

DESCRIPTION

An engine oil cooler is used on some 2.4L engine packages. The cooler is a coolant-to-oil type and mounted between the oil filter and oil filter adapter.

REMOVAL

1. Raise vehicle on hoist.
2. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
3. Disconnect oil cooler coolant hoses.
4. Remove oil filter.
5. Remove oil cooler connector bolt.
6. Remove oil cooler.

INSTALLATION

1. Replace oil cooler seal.
2. Lubricate seal and position oil cooler to oil filter adapter, aligning notch to tab.
3. Install oil cooler connector bolt. Torque connector bolt to 55 N·m (41 ft. lbs.).
4. Install oil filter.
5. Connect oil cooler coolant hose.
6. Lower vehicle.
7. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

MANIFOLD-INTAKE

DIAGNOSIS AND TESTING

INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

1. Start the engine.
2. Spray a small stream of water (Spray Bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

LOWER INTAKE MANIFOLD

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

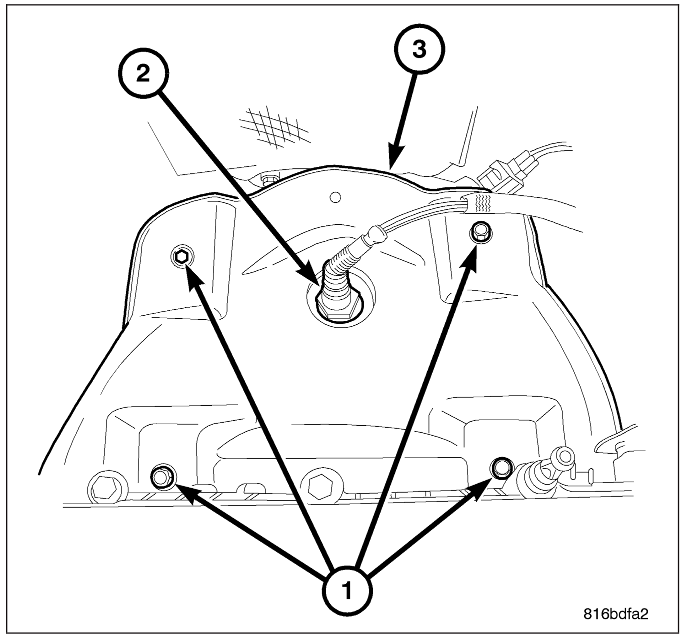
1. Remove engine cover.
2. Perform fuel system pressure release procedure **before attempting any repairs (Refer to 14 - FUEL SYSTEM/ FUEL DELIVERY - STANDARD PROCEDURE).**
3. Remove air cleaner housing.
4. Disconnect negative battery cable.
5. Disconnect fuel line at rail.
6. Remove fuel injector electrical connectors.
7. Remove fuel rail retaining bolts and remove fuel rail.
8. Disconnect oil temperature sensor.
9. Disconnect variable valve timing solenoid electrical connector.
10. Disconnect intake camshaft position sensor electrical connector.
11. Position harness out of the way.
12. Remove throttle body support bracket.
13. Disconnect electronic throttle control electrical connector.
14. Remove wiring harness retainer from the intake manifold.
15. Disconnect MAP sensor electrical connector.
16. Disconnect vacuum lines at intake.
17. Remove upper radiator hose retaining bracket.
18. Remove intake manifold retaining bolts.
19. Remove intake manifold.

CLEANING

1. Discard gasket(s).
2. Clean all sealing surfaces.

INSPECTION

1. Inspect manifold for cracks, distortion, or mounting surface warpage. Replace manifold if necessary.
2. Inspect manifold gasket for surface damage or excessive swelling. Replace gaskets as necessary.



INSTALLATION

LOWER INTAKE MANIFOLD

1. Clean all gasket surfaces.
2. Replace intake manifold gasket.
3. Install intake manifold, torque bolts to 25 N·m (220 in. lbs.).
4. Install the fuel rail assembly to intake manifold. Tighten screws to 23 N·m (200 in. lbs.).
5. Connect fuel injector electrical connectors.
6. Inspect quick connect fittings for damage, replace if necessary (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE). Connect fuel supply hose to fuel rail assembly. Check connection by pulling on connector to insure it locked into position.
7. Connect negative cable to battery.
8. Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

MANIFOLD-EXHAUST

REMOVAL

1. Remove engine cover.
2. Remove clean air hose and air cleaner housing.
3. Disconnect negative cable from battery.
4. Disconnect throttle and speed control cables from the throttle lever and bracket.
5. Disconnect MAP sensor electrical connector.
6. Remove fasteners securing power steering fluid reservoir to cylinder head.
7. Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).
8. Remove bolts attaching upper heat shield.
9. Remove upper heat shield.
10. Raise vehicle.
11. Disconnect exhaust pipe from manifold.
12. Remove engine wiring heat shield.
13. Remove manifold support bracket.
14. Remove lower exhaust manifold heat shield.
15. Disconnect oxygen sensor electrical connector.
16. Remove exhaust manifold lower retaining fasteners.
17. Lower vehicle and remove the upper exhaust manifold retaining fasteners.
18. Remove exhaust manifold from above/between the engine and cowl panel.
19. Remove and discard manifold gasket.
20. Mark prop shaft and differential for proper installation (if equipped).
21. Remove the rear prop shaft (if equipped) (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).
22. Remove the two exhaust to maniverter (exhaust manifold with catalytic converter) bolts.
23. Unplug the down - stream O2 sensor connector.
24. Remove the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL).
25. Lower the vehicle on the hoist.
26. Unplug the up - stream O2 sensor connector.
27. Remove up - stream O2 sensor from the maniverter (exhaust manifold with catalytic converter) using o2 sensor socket 8439 (2).
28. Remove the four maniverter heat shield bolts (1).
29. Remove the two retaining bolts and one nut from the maniverter side heat shield (3).
30. Remove the seven maniverter to head retaining bolts.
31. Slide the maniverter up and to the right, The support the maniverter (1) with the help of a bungie cord.
32. Raise the vehicle on the hoist.
33. Remove the four (1) engine to maniverter bracket bolts.
34. Remove the rear engine mount through bolt (2).
35. Remove the three front engine mount to frame bolts and the mount through bolt.
36. Remove the PTU mounting bolts.
37. Install a screw jack (2)on front engine mount bracket (1).
38. Raise the front of the engine until the rear mount has dropped (1,2).
39. Separate the PTU from the transaxle.

40. Remove and discard old O-ring between Transmission and PTU
41. Roll the PTU (1) forward and down to remove.

CLEANING

1. Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

1. Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.
2. Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

1. Install a new exhaust manifold gasket. **DO NOT APPLY SEALER**.
2. Position exhaust manifold in place. Tighten fasteners, starting at center and progressing outward in both directions to 23 N·m (200 in. lbs.). Raise and lower vehicle for fastener access as necessary. Repeat tightening procedure until all fasteners are at specified torque.
3. Install exhaust manifold heat shields. Tighten bolts to 12 N·m (105 in. lbs.).
4. Install exhaust manifold support bracket.
5. Install engine wiring heat shield.
6. Connect oxygen sensor electrical connector.
7. Install exhaust pipe to manifold. Tighten fasteners to 28 N·m (250 in. lbs.).
8. Install coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).
9. Install fasteners securing power steering fluid reservoir to cylinder head.
10. Connect MAP sensor electrical connector.
11. Connect throttle and speed control cables to the throttle lever and bracket.
12. Connect negative cable to battery.
13. Install clean air hose and air cleaner housing.
14. Roll the PTU in moving from front to back.
15. Rest the PTU on the frame while the engine and transaxle are raised back into position.
16. Lower screw jack until rear mount through bolt can be installed.
17. Install rear mount through bolt and torque bolt to 75 Nm (55 ft. lbs.).
18. Install the transmission crossmember and bolts, torque to 75 Nm (55 ft. lbs.).
19. Install the through bolt at the front transmission mount and torque to 75 Nm (55 ft. lbs.)
20. Insure that the O-ring between the PTU and transaxle is in place.
21. Slide the PTU into place.
22. Install and torque PTU mounting bolts to 58 N-m (43 lbf-ft).
23. Lower the hoist.
24. Place the maniverter back into place and install the seven bolts.
25. Torque the maniverter bolts.
26. Install the maniverter side heat shield into place.
27. Install the two retaining bolts and one retaining nut.
28. Install the maniverter heat shield and the four retaining bolts.
29. Torque the maniverter heat shield bolts.
30. Using tool 8439 install the O2 sensor.
31. Install the air box.
32. Install engine trim cover.
33. Raise the vehicle on the hoist.
34. Install the maniverter to block bracket and four mounting bolts.

35. Torque maniverter to block bracket mounting bolts.
36. Install the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).
37. Install the Prop shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
38. install the right axle shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
39. Install the right front tire.
40. Fill PTU. (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - STANDARD PROCEDURE).
41. lower hoist
42. Connect battery cables.
43. Top off the fluids.

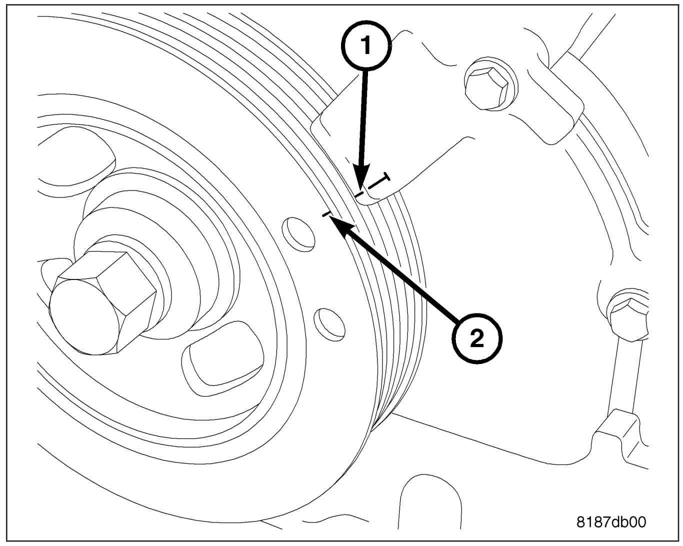
COVER-TIMING CHAIN

REMOVAL

1. Remove engine cover.
2. Perform fuel pressure bleed procedure.
3. Remove air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Disconnect negative battery cable.
5. Drain cooling system
6. Remove coolant recovery bottle.
7. Remove windshield washer bottle.
8. Remove power steering reservoir and set aside.
9. Remove make up air hose.
10. Remove PCV hose.
11. Disconnect ignition coil electrical connectors.
12. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
13. Raise vehicle.
14. Remove right lower splash shield.
15. Set engine to TDC.
16. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
17. Remove lower A/C compressor retaining bolts.
18. Remove A/C compressor lower bracket.
19. Remove accessory drive belt lower idler pulley.
20. Remove crankshaft pulley.
21. Remove water pump pulley.
22. Remove timing chain cover lower bolts.
23. Lower vehicle.
24. Remove power steering pump and set aside.
25. Support engine with a suitable jack.
26. Remove right engine mount.
27. Remove accessory drive belt upper idler pulley.
28. Remove right engine mount bracket.
29. Remove accessory drive belt tensioner.
30. Remove timing chain cover upper retaining bolts.
31. Remove timing chain cover.

INSTALLATION

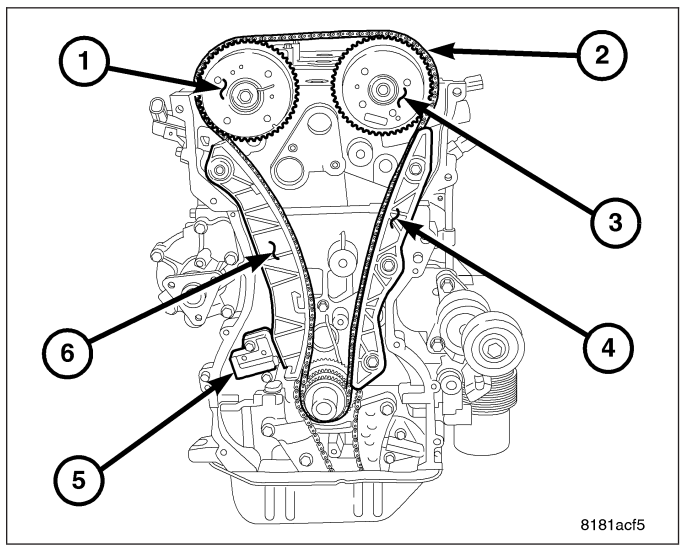
1. Clean all sealing surfaces.
2. Apply RTV as shown at the cylinder head to block parting line.
3. Apply RTV as shown in the corner of the oil pan and block.
4. Apply 2mm bead of RTV as shown.
5. Install timing chain cover.
6. Install timing chain cover upper retaining bolts and torque bolts.
7. Install accessory drive belt tensioner.
8. Install right engine mount bracket and torque.
9. Install accessory drive belt upper idler pulley.
10. Install right engine mount and torque bolts.



11. Remove jack from under engine.
12. Install power steering pump.
13. Raise vehicle.
14. Install timing chain cover lower retaining bolts and torque bolts.
15. Install oil pan to timing chain cover lower retaining bolts and torque bolts.
16. Install water pump pulley.
17. Install crankshaft pulley and torque bolt.
18. Install accessory drive belt lower idler pulley.
19. Install lower A/C compressor mounting bracket.
20. Install A/C compressor.
21. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
22. Install right lower splash shield.
23. Lower vehicle.
24. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)
25. Connect coil electrical connector,
26. Connect PCV hose to PCV valve.
27. Connect make up air hose.
28. Install power steering reservoir.
29. Install windshield washer bottle.
30. Install coolant recovery bottle.
31. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
32. Connect negative battery cable.
33. Install air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
34. Install engine cover.

CHAIN AND SPROCKETS-TIMING

REMOVAL

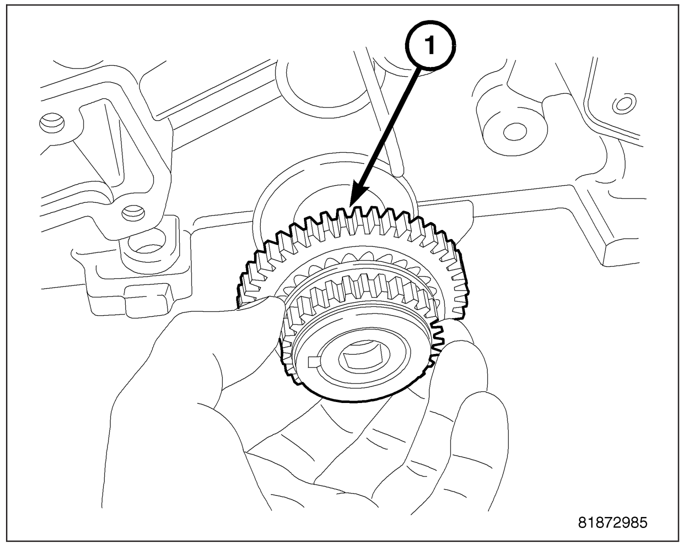


TIMING CHAIN

1. Perform fuel pressure bleed procedure.
2. Remove air cleaner housing.
3. Set engine to TDC.
4. Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

NOTE: If the timing chain plated links can no longer be seen, the timing chain links corresponding the timing marks must be marked prior to removal if the chain is to be reused.

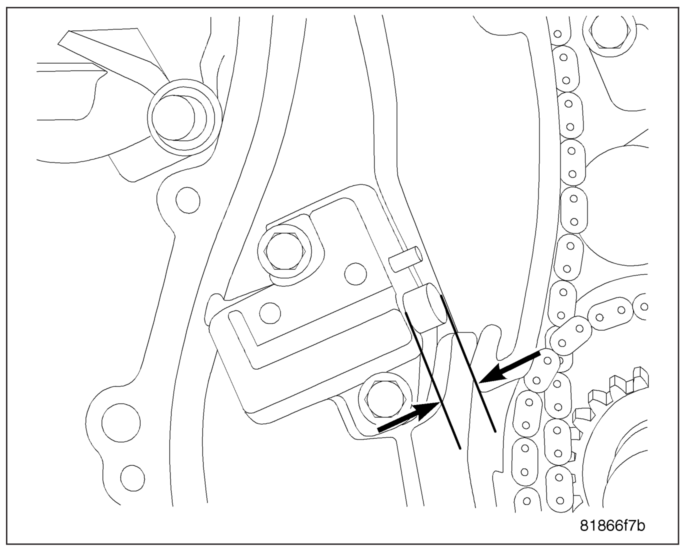
5. Remove timing chain tensioner (5) (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL).
6. Remove timing chain (2).



CAMSHAFT SPROCKET(S)

Refer to camshaft phasor removal (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

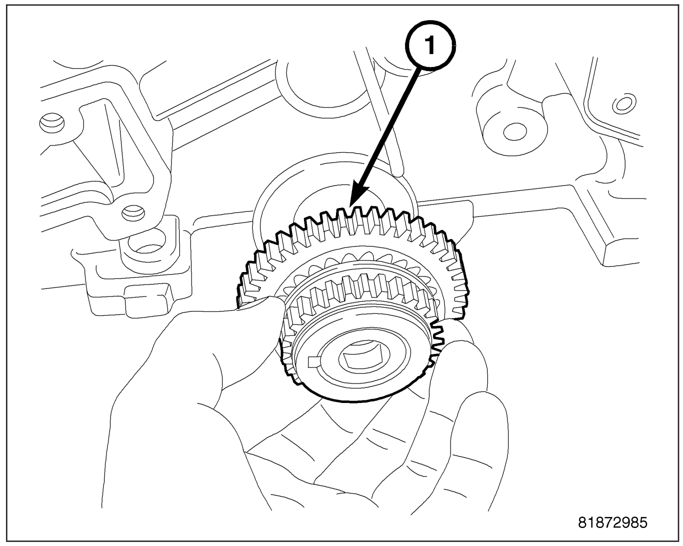
CRANKSHAFT SPROCKET



1. Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
2. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
3. Remove oil pump drive chain tensioner.
4. Remove oil pump drive chain.
5. Remove crankshaft sprocket (1).

INSPECTION

Inspect timing chain for stretching prior to removal.



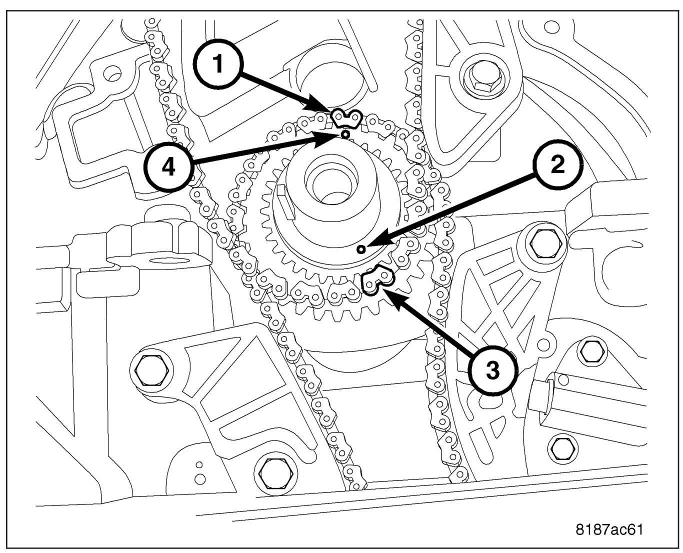
1. Rotate engine while watching timing chain tensioner plunger. When the plunger reaches its maximum travel stop rotating engine.
2. Measure the distance from the tensioner body and the edge of the chain guide as shown.
3. If the distance is greater than 20.5 mm (0.81 in.) inspect guide shoes for excessive wear.
4. If guides are okay, replace timing chain.

INSTALLATION

CRANKSHAFT SPROCKET

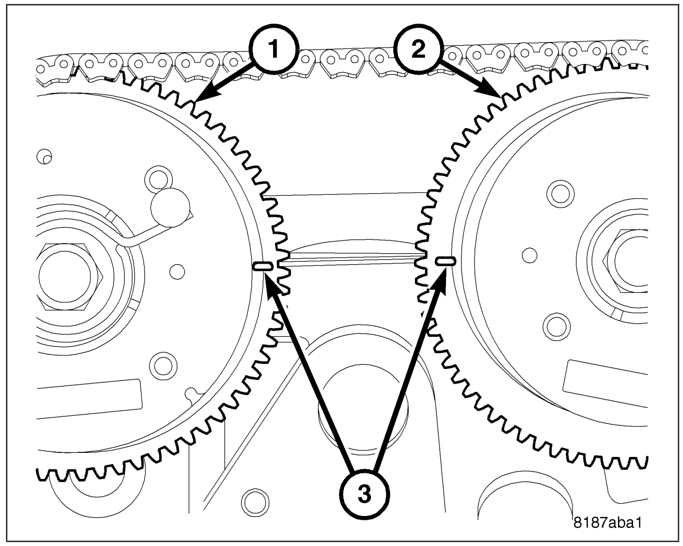
1. Install crankshaft sprocket (1) onto crankshaft.
2. Install oil pump drive chain. Verify that Oil pump is correctly timed.
3. Reset oil pump drive chain tensioner by pushing plunger inward and install Tensioner Pin 8514.
4. Install oil pump drive chain tensioner and remove Tensioner Pin 8514.
5. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
6. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
7. Fill engine with oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).
8. Start engine and check for leaks.

CAMSHAFT SPROCKET(S)



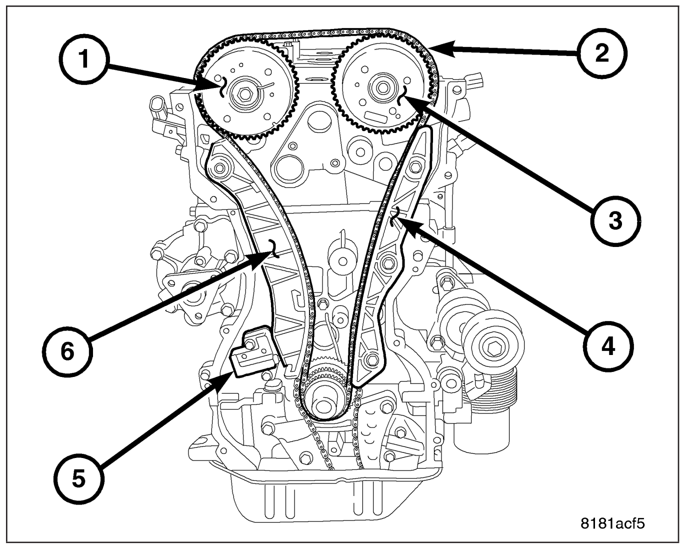
NOTE: The camshaft sprockets and the camshaft phasers are an assembly and cannot be serviced separately.

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin and camshaft phaser may occur.

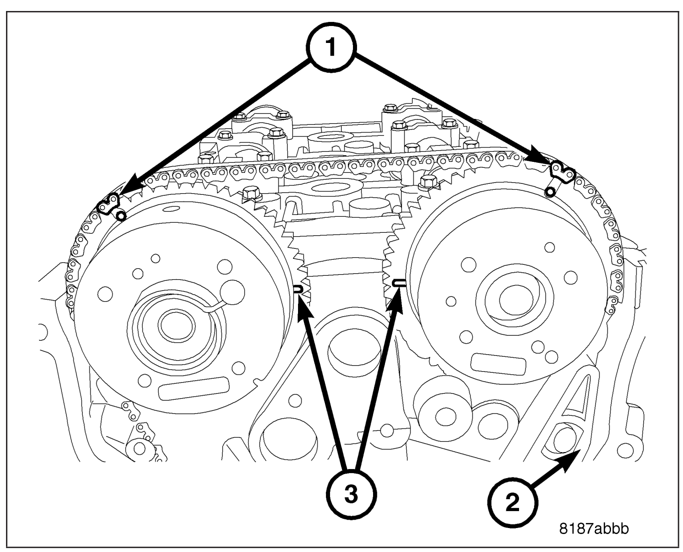


1. Refer to Camshaft phaser installation (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

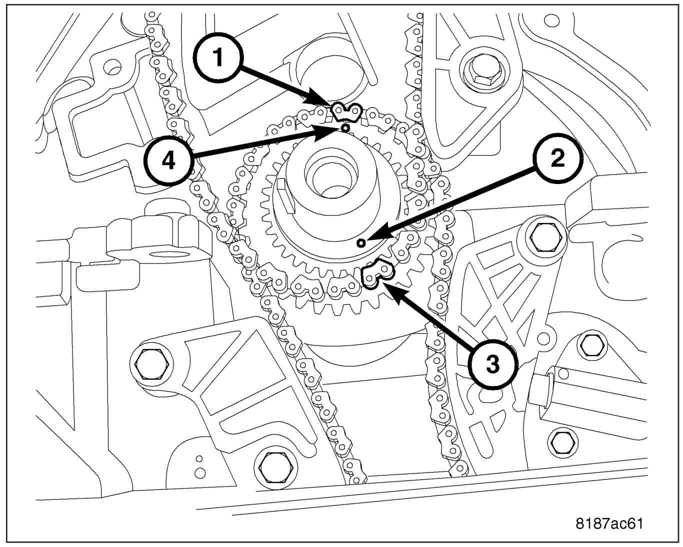
TIMING CHAIN



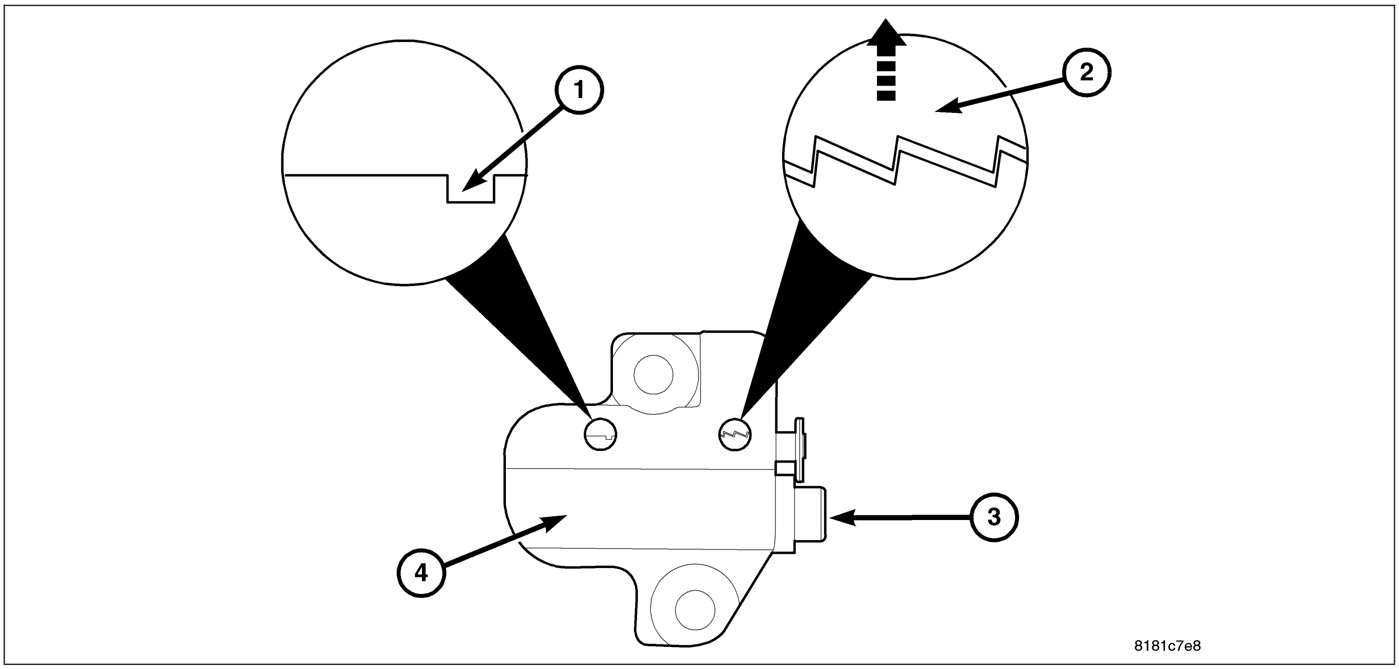
1. Verify that the crankshaft sprocket keyway is at the 9 o’clock position.



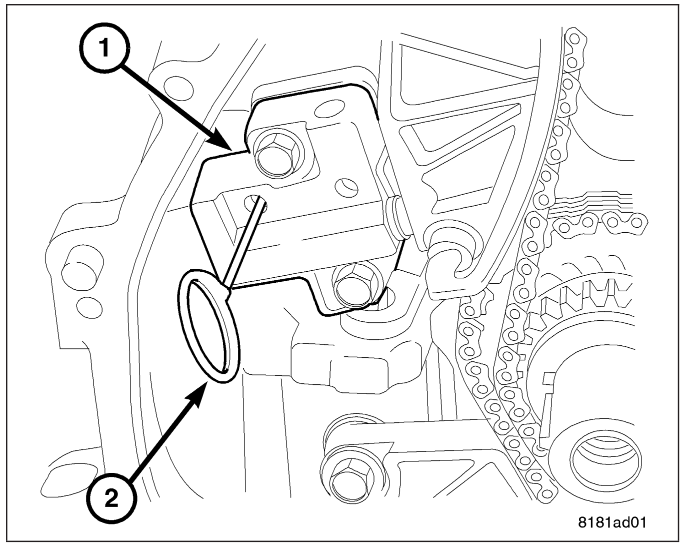
2. Align camshaft timing marks (3) so they are parallel to the cylinder head as shown.



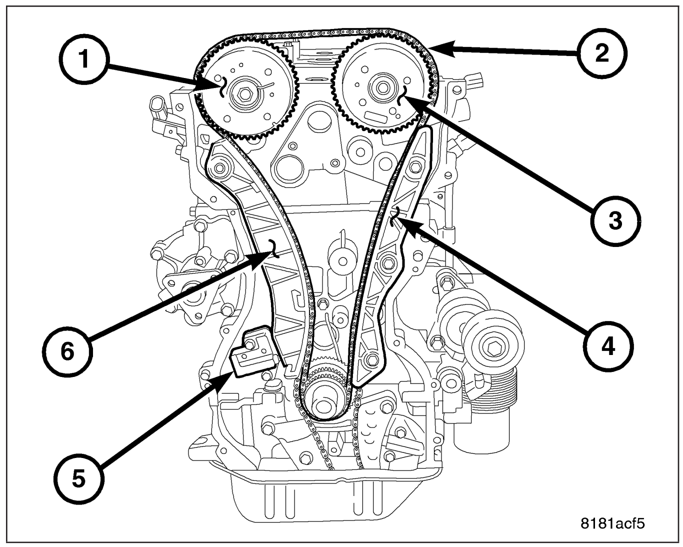
3. Install timing chain guide (4) and torque bolts.



4. Install timing chain so plated links on chain align with timing marks on camshaft sprockets (1).

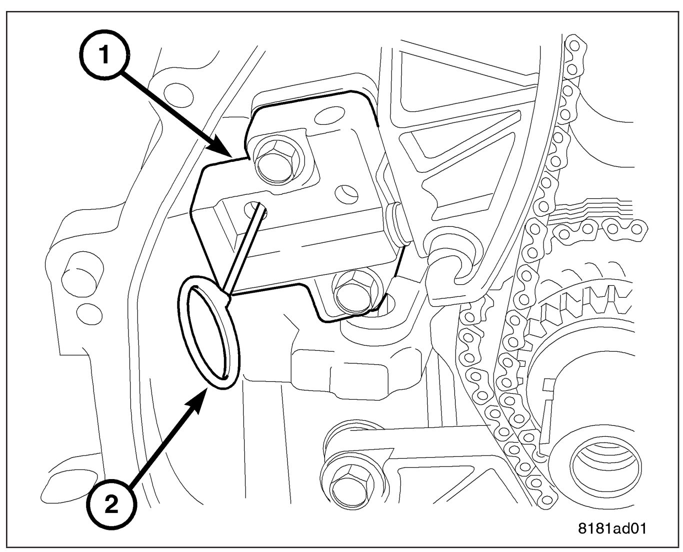


5. Align timing mark on the crankshaft sprocket (2) with the plated link (3) on the timing chain. Position chain so slack will be on the tensioner side.



6. Reset timing chain tensioner (4) by lifting up on ratchet (2) and pushing plunger (3) inward towards the tensioner body (4). Insert tensioner pin 8514 into slot (1) to hold tensioner plunger in the retracted position.

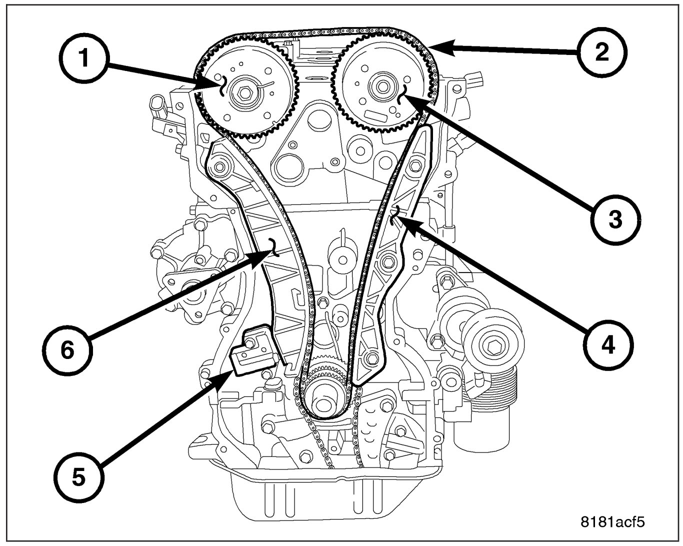
7. Install timing chain tensioner (1) and torque bolts to 12 N·m (105 in. lbs.).



NOTE: Keep the slack in the timing chain on the tensioner side.

8. Install the moveable timing chain pivot guide (6) and torque bolt to 12 N·m (105 in. lbs.).

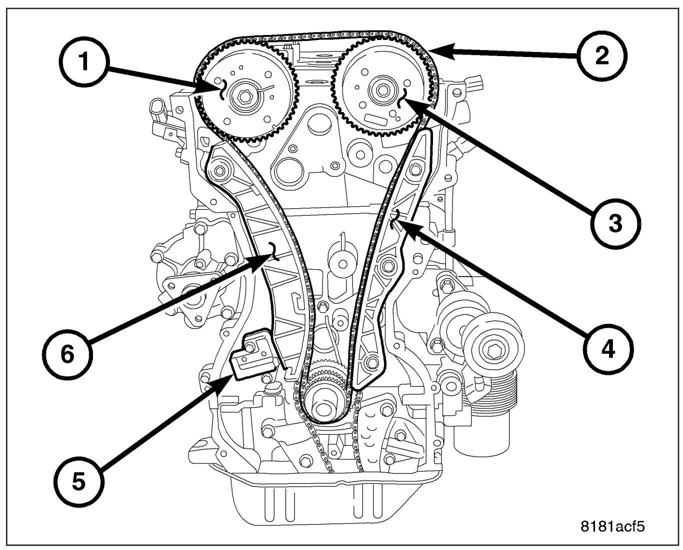
9. Remove timing tensioner pin 8514 (2).
10. Rotate the crankshaft CLOCKWISE two complete revolutions until the crankshaft is repositioned at the TDC position. Verify that the camshaft and crankshaft timing marks are in proper position.
11. Install front timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
12. Connect negative battery cable.
13. Fill with oil, start engine and check for leaks.



TENSIONER-TIMING CHAIN

REMOVAL

1. Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).



NOTE: Tensioner will not come apart during removal.

2. Remove timing chain tensioner retaining bolts and remove tensioner.

INSTALLATION

1. Reset tensioner.
2. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

ENGINE 2.4L WORLD

TABLE OF CONTENTS

ENGINE 2.4L WORLD

DESCRIPTION

The 2.4 Liter (148 cu. in.) in-line four cylinder engine is a double over head camshaft with mechanical lash buckets and four valves per cylinder design. This engine is NOT free-wheeling; meaning that the pistons will contact the valves in the event of a timing chain failure.

The cylinders are numbered from front of the engine to the rear. The firing order is 1–3–4–2.

The engine identification number is located on the rear of the cylinder block.

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to the Engine Mechanical and the Engine Performance diagnostic charts, for possible causes and corrections of malfunctions (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - MECHANICAL) (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING - PERFORMANCE).

For fuel system diagnosis, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING).

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Engine Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Mechanical Valve Tappet Noise Diagnosis
- Engine Oil Leak Inspection

ENGINE DIAGNOSIS - PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING)
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. (Refer to 8 - ELECTRICAL/STARTING - DIAGNOSIS AND TESTING)
	4. Faulty coil(s) or control unit.	4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)
	5. Incorrect spark plug gap.	5. Set gap. (Refer to 8 - ELECTRICAL/IGNITION CONTROL - SPECIFICATIONS)
	6. Contamination in fuel system.	6. Clean system and replace fuel filter.
	7. Faulty fuel pump.	7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)
	8. Incorrect engine timing.	8. Check for a skipped timing belt/chain.
ENGINE STALLS OR IDLES ROUGH	1. Idle speed too low.	1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)
	2. Incorrect fuel mixture.	2. (Refer to Appropriate Diagnostic Information)
	3. Intake manifold leakage.	3. Inspect intake manifold, manifold gasket, and vacuum hoses.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped plugs.	1. Clean plugs and set gap.
	2. Contamination in fuel system.	2. Clean system and replace fuel filter.
	3. Faulty fuel pump.	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Incorrect valve timing.	4. Correct valve timing.
	5. Leaking cylinder head gasket.	5. Replace cylinder head gasket.
	6. Low compression.	6. Test compression of each cylinder.
	7. Burned, warped, or pitted valves.	7. Replace valves.
	8. Plugged or restricted exhaust system.	8. Perform exhaust restriction test. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Install new parts, as necessary.
	9. Faulty ignition coil(s).	9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs.	1. Clean spark plugs and set gap.
	2. Contamination in Fuel System.	2. Clean fuel system and replace fuel filter.
	3. Burned, warped, or pitted valves.	3. Replace valves.
	4. Faulty ignition coil(s).	4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap.	1. Clean spark plugs and set gap.
	2. Faulty ignition coil(s).	2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	3. Dirty fuel injector(s).	3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
	4. Contamination in fuel system.	4. Clean system and replace fuel filter.

ENGINE DIAGNOSIS - MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
VALVETRAIN NOISE	1. High or low oil level in crankcase.	1. Check and correct engine oil level.
	2. Thin or diluted oil.	2. Change oil to correct viscosity.
	3. Thick oil	3. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	4. Low oil pressure.	4. Check and correct engine oil level.
	5. Worn cam lobe.	5. Install new camshaft.
	6. Worn tappet bucket.	6. Install new select fit tappet bucket.
	7. Worn valve guides.	7. Ream guides and install new valves with oversize stems.
	8. Excessive runout of valve seats on valve faces.	8. Grind valve seats and valves.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Connecting rod journal out-of-round.	6. Replace crankshaft or grind surface.
	7. Connecting rod out-of-round.	7. Replace connecting rod.
	8. Misaligned connecting rods.	8. Replace bent connecting rods.

CONDITION	POSSIBLE CAUSES	CORRECTION
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. Inspect oil pump relief valve and spring.
	3. Thin or diluted oil.	3. Change oil to correct viscosity.
	4. Thick oil	4. (a) Change engine oil and filter.
		(b) Run engine to operating temperature.
		(c) Change engine oil and filter again.
	5. Excessive bearing clearance.	5. Measure bearings for correct clearance. Repair as necessary.
	6. Excessive end play.	6. Check thrust bearing for wear on flanges.
	7. Crankshaft journal out-of-round or worn.	7. Replace crankshaft or grind journals.
	8. Loose flywheel or torque converter.	8. Tighten to correct torque.
OIL PRESSURE DROP	1. Low oil level.	1. Check engine oil level.
	2. Faulty oil pressure sending unit.	2. Install new sending unit.
	3. Low oil pressure.	3. Check sending unit and main bearing oil clearance.
	4. Clogged oil filter.	4. Install new oil filter.
	5. Worn parts in oil pump.	5. Replace worn parts or pump.
	6. Thin or diluted oil.	6. Change oil to correct viscosity.
	7. Oil pump relief valve stuck.	7. Remove valve and inspect, clean, or replace.
	8. Oil pump suction tube loose.	8. Remove oil pan and install new tube or clean, if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Excessive bearing clearance.	10. Measure bearings for correct clearance.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket(s).
	2. Loose fastener, broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Misaligned or deteriorated cup or threaded plug.	3. Replace as necessary.

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction.	1. Check system and repair as necessary. (Refer to 25 - EMISSIONS CONTROL/ EVAPORATIVE EMISSIONS/PCV VALVE - DIAGNOSIS AND TESTING)
	2. Worn, scuffed or broken rings.	2. Hone cylinder bores. Install new rings.
	3. Carbon in oil ring slots.	3. Install new rings.
	4. Rings fitted too tightly in grooves.	4. Remove rings and check grooves. If groove is not proper width, replace piston.
	5. Worn valve guide(s).	5. Ream guide(s) and replace valve(s) with oversize valve(s) and seal(s).
	6. Valve stem seal(s) worn or damaged.	6. Replace seal(s).

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Check engine oil level and add oil if necessary.
2. Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.

3. Remove engine cover.
4. Disconnect coil electrical connectors and remove coils.
5. Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
6. Disconnect injector electrical connectors.
7. Be sure throttle blade is fully open during the compression check.
8. Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
9. Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.
10. Repeat the previous step for all remaining cylinders.
11. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
12. If one or more cylinders have abnormally low compression pressures, repeat the compression test.
13. If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.
5. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:
   - Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
   - Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
   - Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.

   - Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
   - If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
6. If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the dipstick tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.
    a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
    b. Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.
4. If no leaks are detected, pressurize the crankcase as previously described.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.
7. After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

1. Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
2. Remove negative battery cable.
3. Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.
4. With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
5. Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).

6. Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
7. Repair engine or components as necessary to prevent this problem from re-occurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

8. Install new spark plugs.
9. Drain engine oil and remove oil filter.
10. Install a new oil filter.
11. Fill engine with specified amount of approved oil.
12. Connect negative battery cable.
13. Start engine and check for any leaks.

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

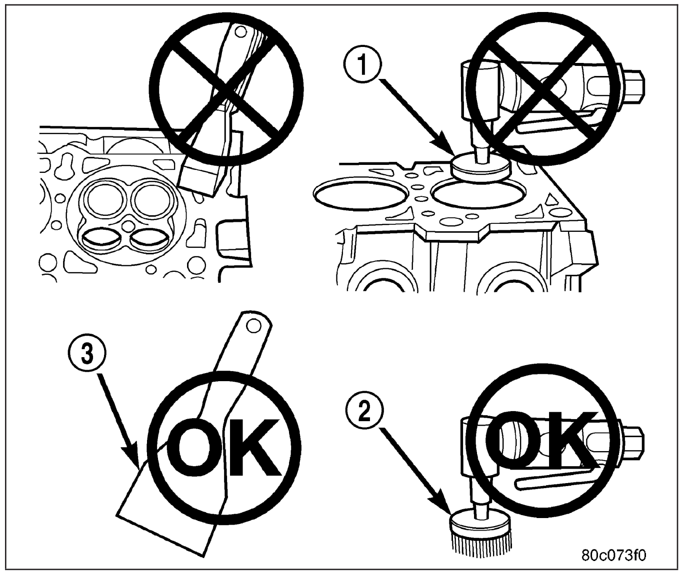
MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION



Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces.

ENGINE GASKET SURFACE PREPARATION

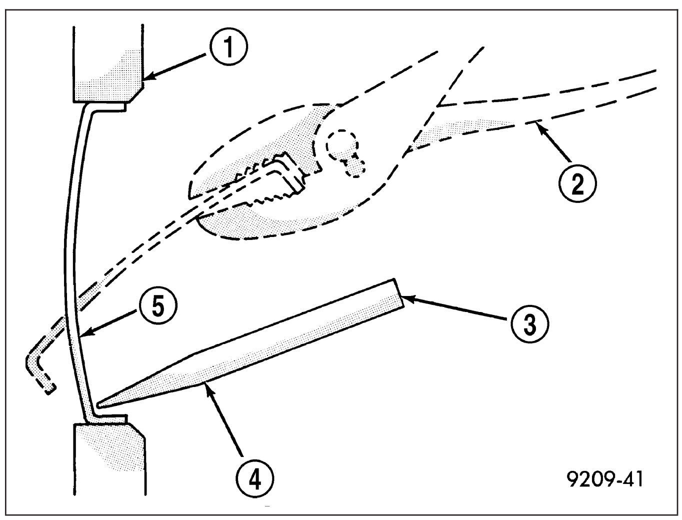
To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:



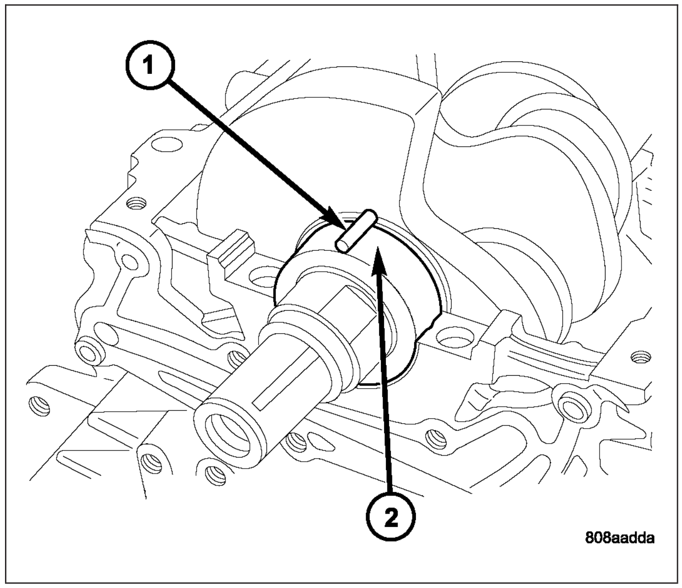
- Solvent or a commercially available gasket remover
- Plastic or wood scraper
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow)

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

CYLINDER HEAD CORE PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug.

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

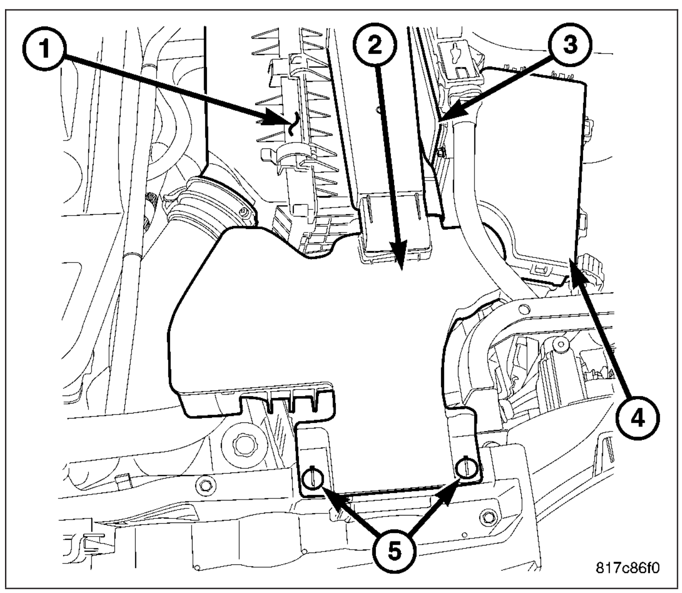


Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

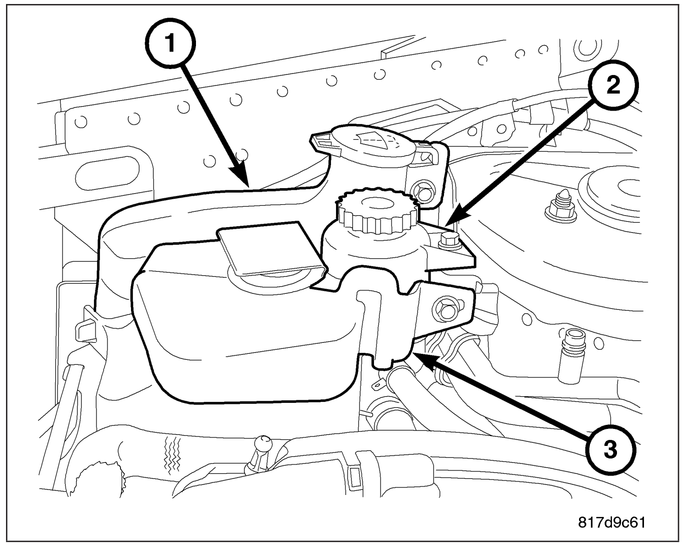
It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Engine crankshaft bearing clearances can be determined by use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:



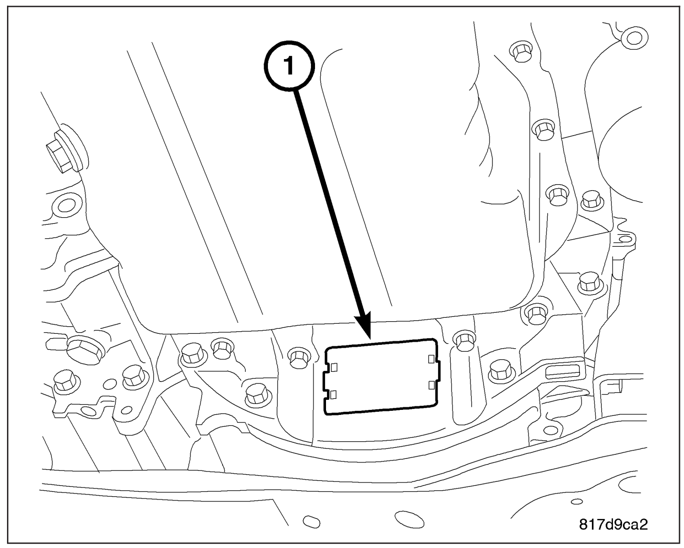
1. Remove oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage across the entire width of the bearing shell in the cap approximately 6.35 mm (1/4 in.) off center and away from the oil holes. (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Torque the bearing cap/bed plate bolts of the bearing being checked to the proper specifications.
3. Remove the bearing cap and compare the width of the flattened Plastigage with the metric scale provided on the package. Locate the band closest to the same width. This band shows the amount of clearance in thousandths of a millimeter. Differences in readings between the ends indicate the amount of taper present. Record all readings taken. Compare clearance measurements to specs found in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). **Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.**



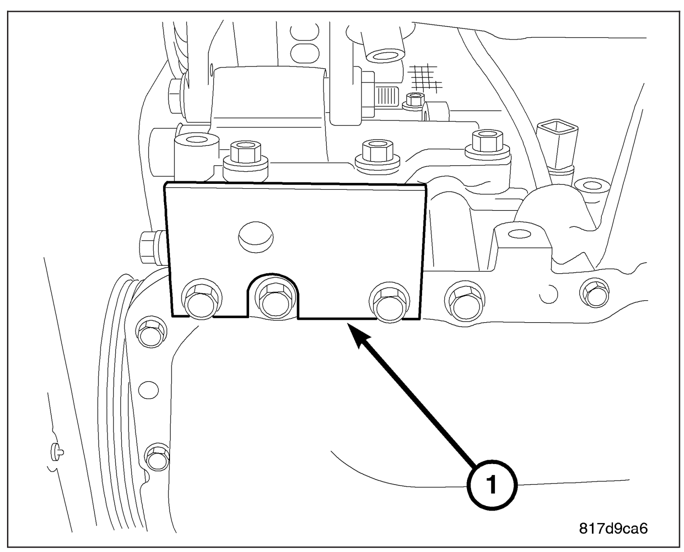
NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking.

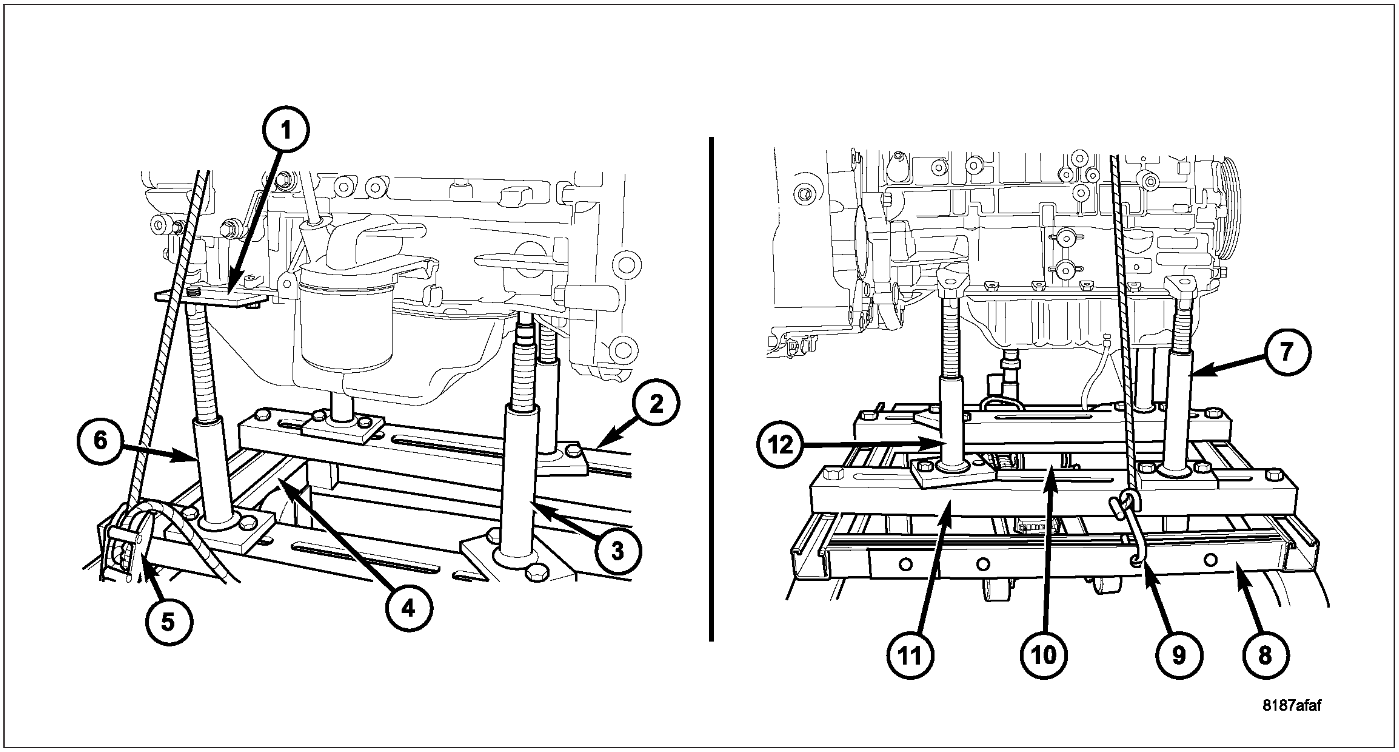
4. Install the proper crankshaft bearings to achieve the specified bearing clearances.

REMOVAL - ENGINE ASSEMBLY



1. Perform fuel pressure release procedure, then disconnect and remove fuel line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Remove air cleaner housing assembly (1) and clean air hose (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect both cables from battery.
4. Remove battery and battery tray.
5. Discharge air conditioning system, if equipped (Refer to 24 - HEATING & AIR CONDITIONING - STANDARD PROCEDURE).
6. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

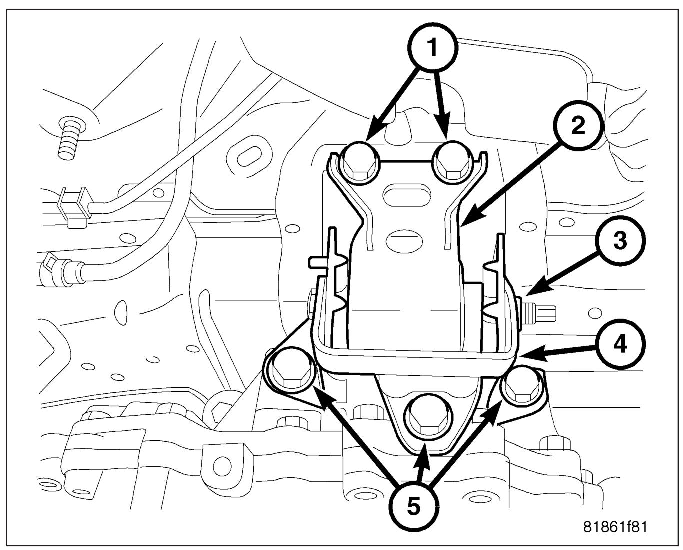


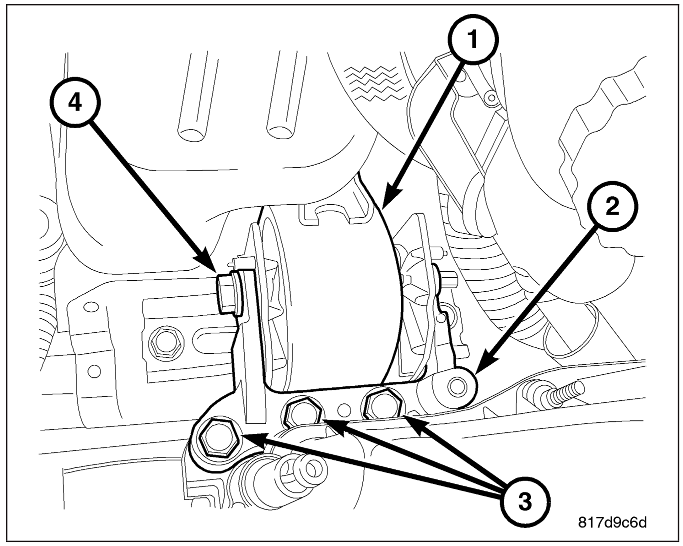


7. Remove coolant reservoir (3).
8. Remove grill trim panel.
9. Remove upper radiator hose from radiator and coolant manifold.
10. Remove upper radiator hose support.
11. Remove lower radiator hose at coolant manifold.
12. Remove coolant hose from coolant manifold.
13. Disconnect the following electrical connectors, variable valve timing solenoids, oil temperature sensor, injectors, map, coils, cmp's, coolant temperature sensors, capacitor, oxygen sensor, intake air temperature sensor.
14. Remove air intake tube from throttle body.
15. Remove vacuum lines from throttle body and intake manifold.
16. Unclip harness from intake.
17. Disconnect electronic throttle control and manifold flow control valve electrical connectors.
18. Remove PCV hose from valve cover.
19. Remove dipstick.
20. Remove throttle body support bracket.
21. Remove intake bolts and remove intake.
22. Disconnect coolant temperature sensor at block, Knock sensor, oil pressure sensor, generator, starter, block heater, A/C compressor, and block ground.
23. Remove accessory drive belt.
24. Remove power steering reservoir.
25. Remove power steering line support.
26. Remove power steering pump and set aside.
27. Remove upper idler pulley.
28. Remove transaxle filler tube.
29. Disconnect transmission linkage.
30. Disconnect transmission range sensor, TIS and TOS.
31. Remove transmission vent hose.
32. Remove ground strap near right tower.
33. Remove rear heat shield.
34. Remove maniverter heat shields.
35. Raise vehicle.
36. Remove wheels.
37. Remove right front splash shield.
38. Remove axle nuts.
39. Remove ball joint pinch bolts and separate steering knuckle from ball joint.
40. Remove axles.
41. Drain oil.
42. Mark drive shaft and flange.
43. Remove carrier bearing and heat shield.
44. Remove driveshaft.
45. Remove exhaust pipe to maniverter/exhaust manifold bolts.
46. Remove maniverter/exhaust manifold support bracket.
47. Lower vehicle.
48. Remove coolant manifold.

49. Remove maniverter/exhaust manifold bolts.
50. Remove maniverter/exhaust manifold to left of engine.
51. Hoist up.
52. Remove front mount through bolt.
53. Remove crossmember.
54. Remove front mount bracket.
55. Remove rear mount through bolt.
56. Remove rear mount.
57. Remove rear mount bracket.
58. Pull engine forward and support.
59. Remove PTU assembly if equiped (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - REMOVAL).
60. Remove inspection cover (1) and mark torque converter to flywheel.
61. Remove torque converter bolts.
62. Remove lower bellhousing bolts.
63. Remove A/C lines from compressor and remove A/C compressor.
64. Remove A/C mounting bracket.

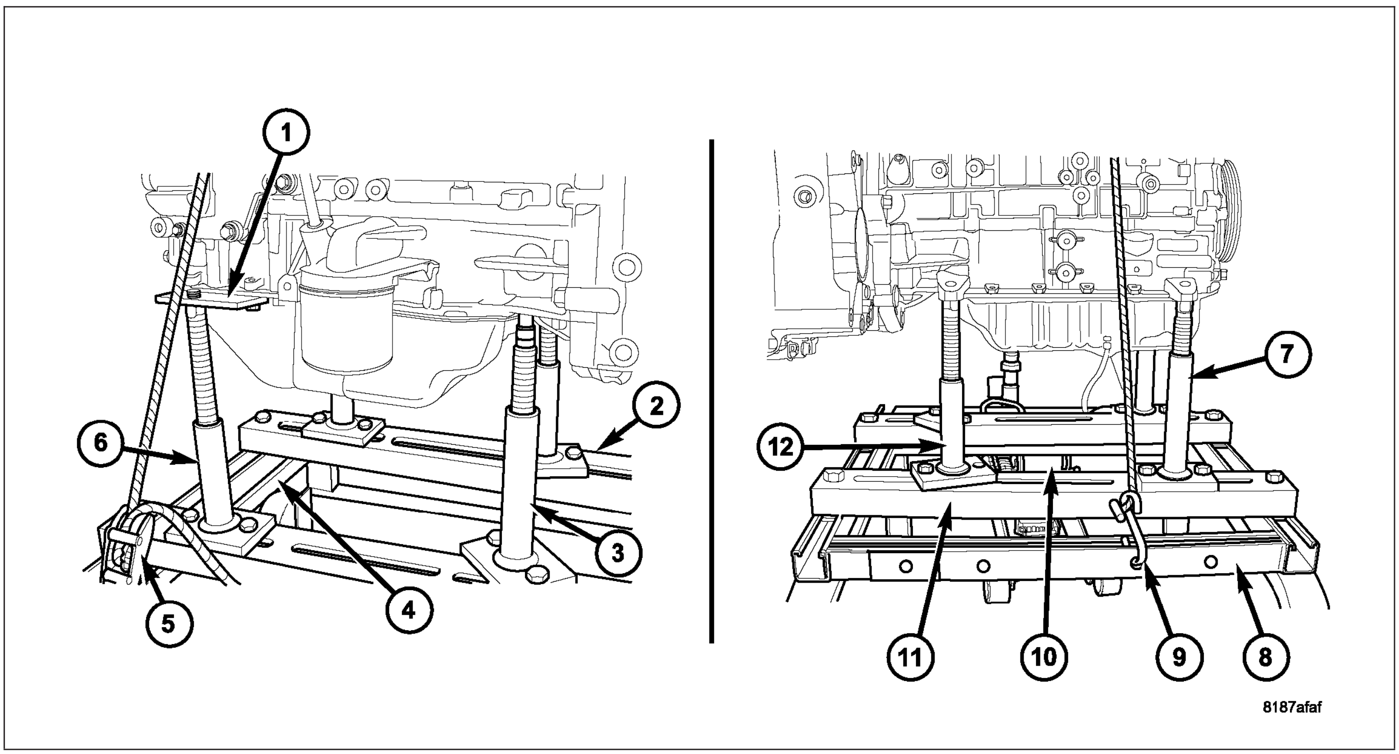
65. Install Adapter 9704 (1).
66. Remove generator and lower idler pulley.
67. Disconnect transmission electrical connector.
68. Disconnect CKP electrical connector.
69. Remove coolant hoses at transaxle cooler.
70. Remove transaxle cooler lines from cooler.





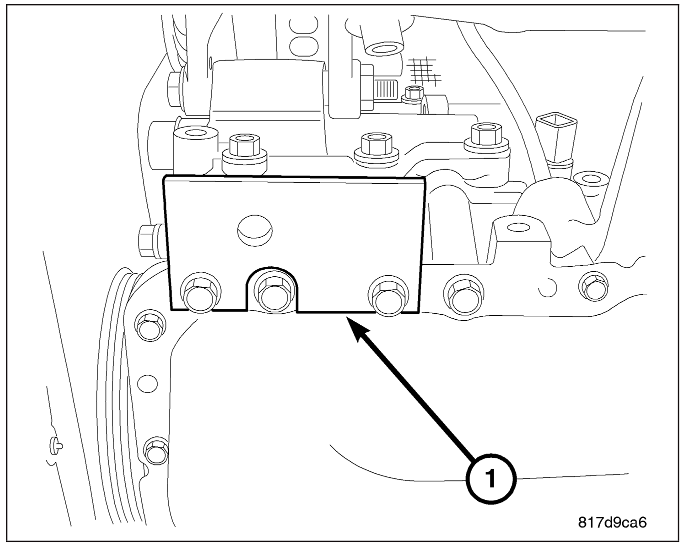
71. Position dolly (4,8) under engine and lower vehicle.

WARNING: Safety straps MUST be used.



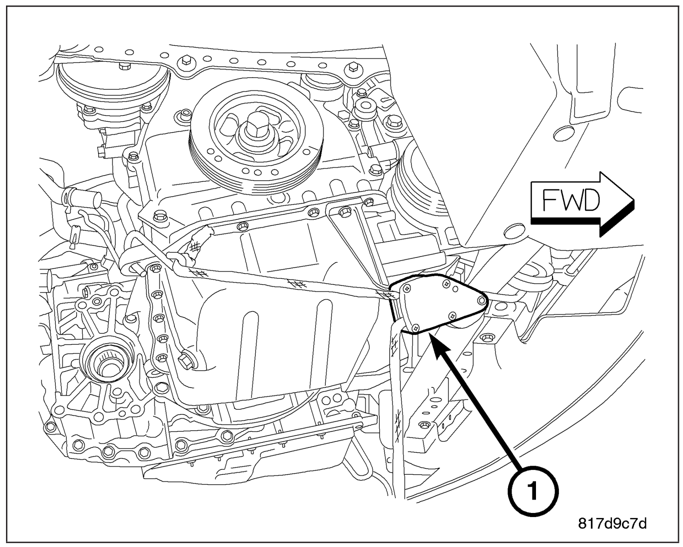
72. Install safety straps (6,9).
73. Remove PCM bracket and set aside.
74. Remove left engine mount through bolt (3).

75. Remove right engine mount through bolt (4).
76. Raise vehicle away from engine and transaxle.
77. Separate engine from transaxle.

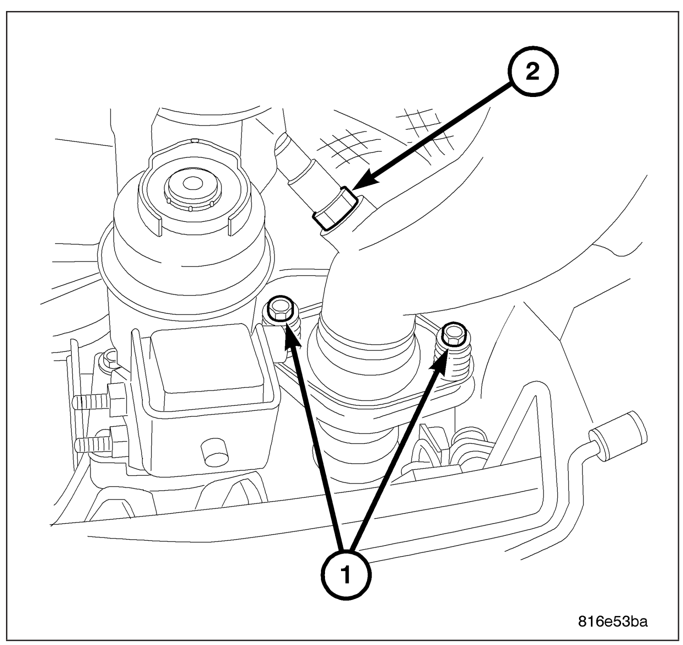


INSTALLATION - ENGINE ASSEMBLY

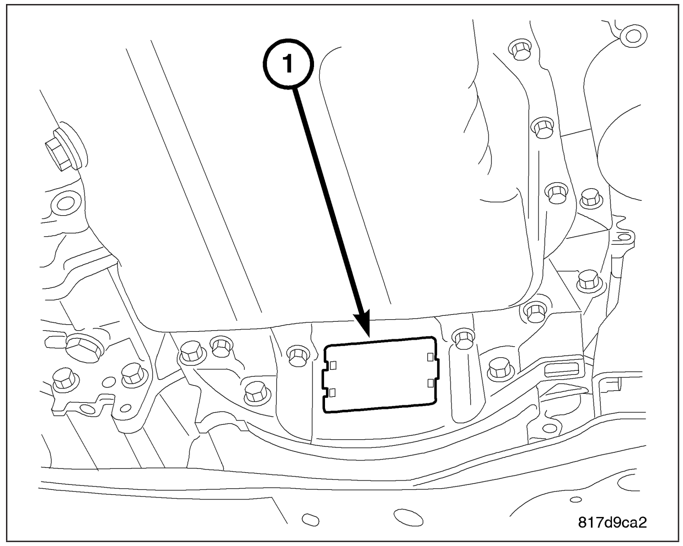
1. Position engine and transmission assembly under vehicle and slowly lower the vehicle over the engine/transaxle assembly.
2. Continue lowering vehicle until engine/transaxle aligns to mounting locations. Install mounting bolts at the right and left engine/transaxle mount bolts and Tighten bolts to 118 N·m (87 ft. lbs.).
3. Remove safety straps from engine/transaxle assembly. Slowly raise vehicle enough to remove the engine dolly and cradle.



4. Remove Adapter 9704 (1).
5. Install pcm bracket.
6. Install maniverter assembly and upper lower heat shields.
7. Install oxygen sensor and connect electrical connector.
8. Install coolant manifold assembly.
9. Install transaxle linkage and adjust as necessary.
10. Install transaxle vent hose.
11. Connect transaxle electrical connectors.
12. Install Ground strap near right strut tower.
13. Raise vehicle.

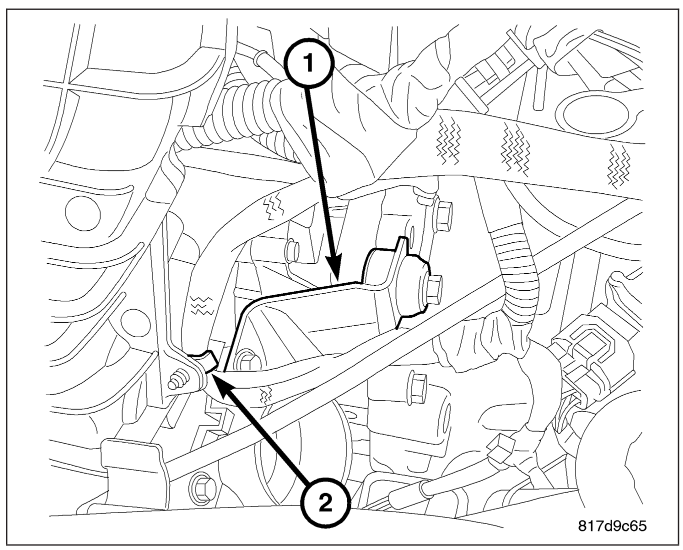


14. Pull engine forward and restrain engine.



NOTE: Be sure to install O-ring prior to installing PTU assembly.

15. Install PTU.
16. Remove engine restraint.
17. Install front mount bracket and tighten bolts.
18. Install frame cross member.
19. Install front engine mount.
20. Install rear mount bracket.
21. Install rear mount and tighten bolts.
22. Connect CKP electrical connector.



23. Install maniverter to exhaust pipe bolts (1) and tighten bolts.
24. Align driveshaft marks and install and heat shield.
25. Install generator
26. Install A/C bracket.
27. Install A/C lines on compressor and install compressor.
28. Install lower bell housing bolts and tighten bolts.
29. Align torque converter and flex plate mark. Install torque converter bolts and tighten.

30. Install inspection cover (1).
31. Install transaxle electrical connectors.
32. Connect trans cooler lines.
33. Install coolant hoses at transmission cooler.
34. Install axles.
35. Install ball joint pinch bolts and tighten.
36. Install axle nuts and tighten.
37. Install splash shields.
38. Install wheels.
39. Install new oil filter.
40. Lower vehicle.
41. Install transaxle filler tube.
42. Install upper idler pulley.
43. Install power steering pump.
44. Install power steering line support bracket.
45. Install power steering pump.
46. Install accessory drive belt.
47. Connect electrical connectors at block ground, starter, A/C compressor, knock sensor, Oil pressure sensor, generator, Coolant temperature sensor at block, and block heater.
48. Install intake manifold and tighten bolts.
49. Install throttle body support bracket (1).

50. Install engine oil dip stick.
51. Install PCV hose to valve cover.
52. Connect manifold flow control valve and electronic throttle control electrical connectors and fasten harness to intake.
53. Install vacuum lines at throttle body and intake manifold.
54. Install intake air tube on throttle body.
55. Connect engine harness electrical connectors.
56. Install upper radiator support bracket.
57. Install coolant hoses at coolant manifold.
58. Install grill trim panel.
59. Install coolant reservoir and connect hose.
60. Connect fuel line to fuel rail.
61. Install battery tray and battery.
62. Connect battery cables.
63. Install air cleaner housing and connect inlet air hose.
64. Install fresh air inlet.
65. Fill with coolant.
66. Fill with oil.

CAUTION: Do NOT run the engine with a vacuum pump in operation or with a vacuum present within the A/C system. Failure to follow this caution will result in serious A/C compressor damage.

67. Evacuate the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
68. Charge the refrigerant system (refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
69. Start engine and check for leaks.

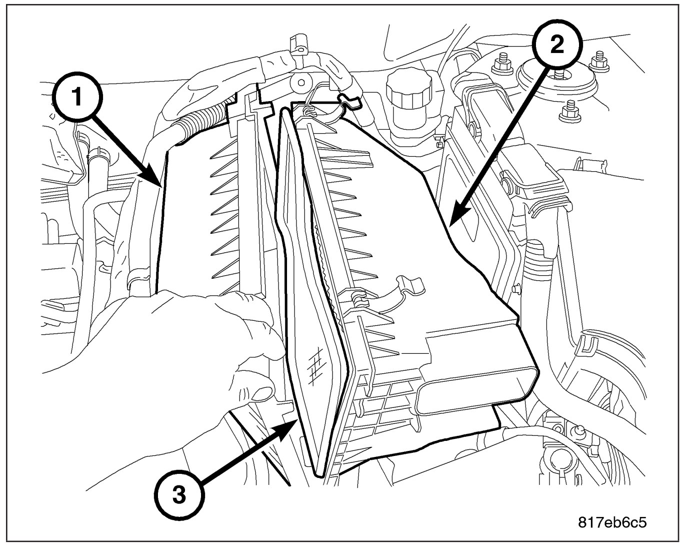
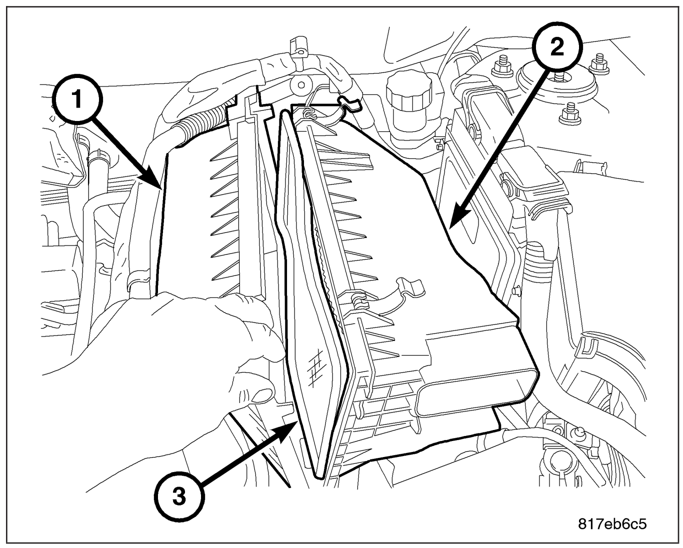
ELEMENT-AIR CLEANER

REMOVAL

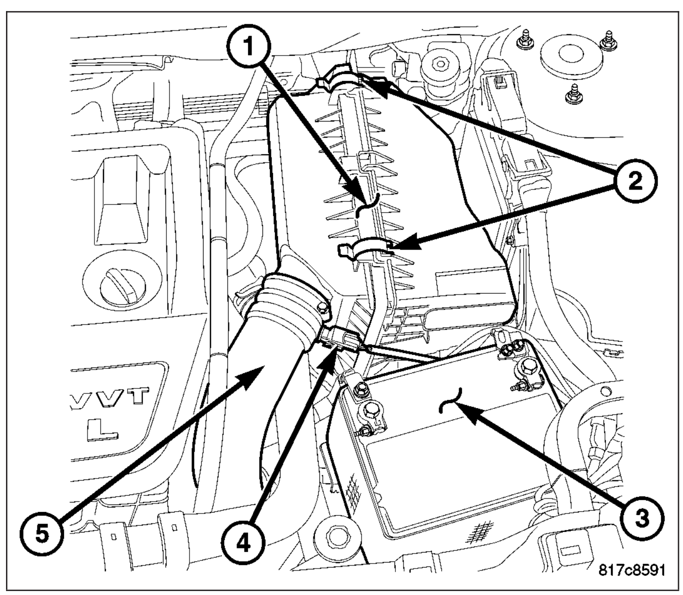


1. Turn Lock Retainers (5) and remove fresh air inlet (2) from air cleaner housing (1).

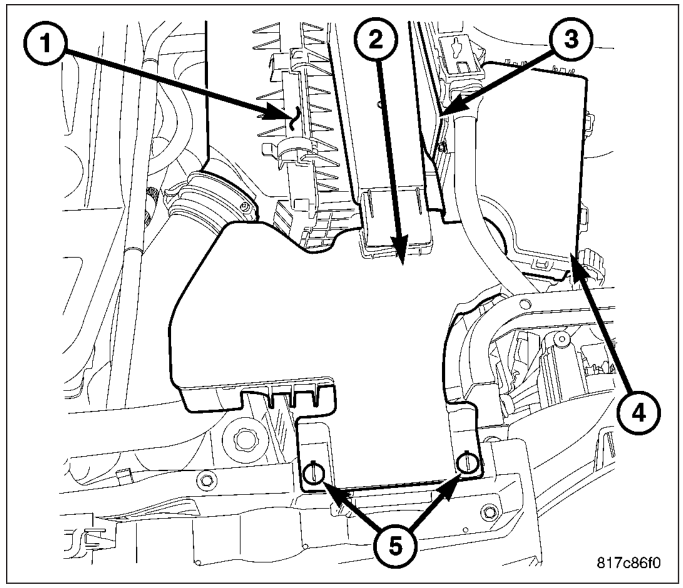
2. Disconnect intake air temperature sensor connector (4).
3. Remove Air inlet tube (5) from air cleaner housing (1).
4. Unfasten clasps (2) on sides of air cleaner housing cover (1).



5. Pull air cleaner cover (1) aside.
6. Remove filter element (3).
7. If necessary, clean the inside of the air cleaner housing (2).

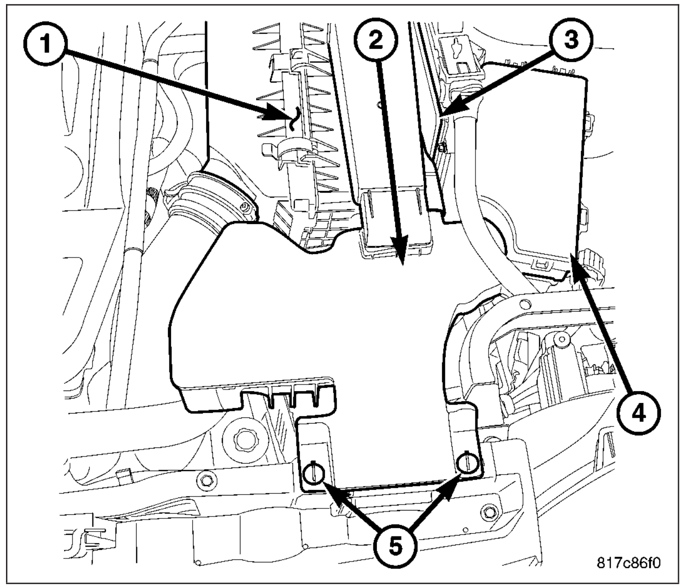


INSTALLATION

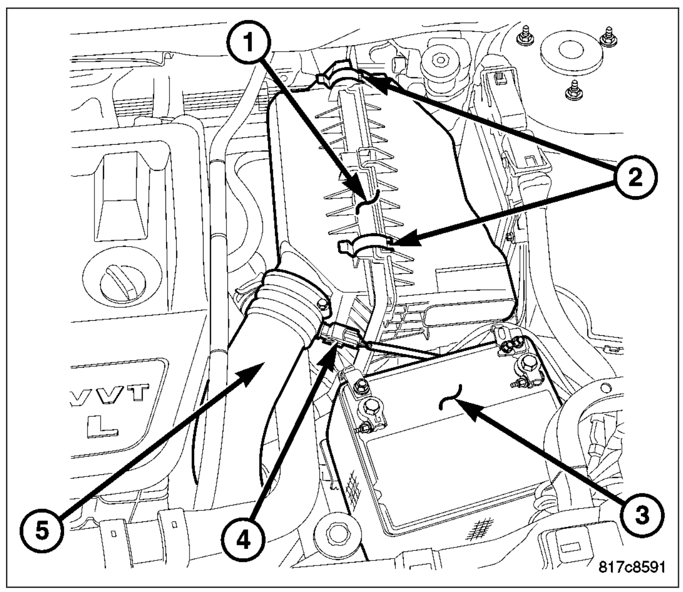


1. Install new filter element.

2. Place cover over air cleaner housing. Snap clasps (2) in place.
3. Install air inlet tube (5).
4. Connect intake air temperature sensor connector (4).



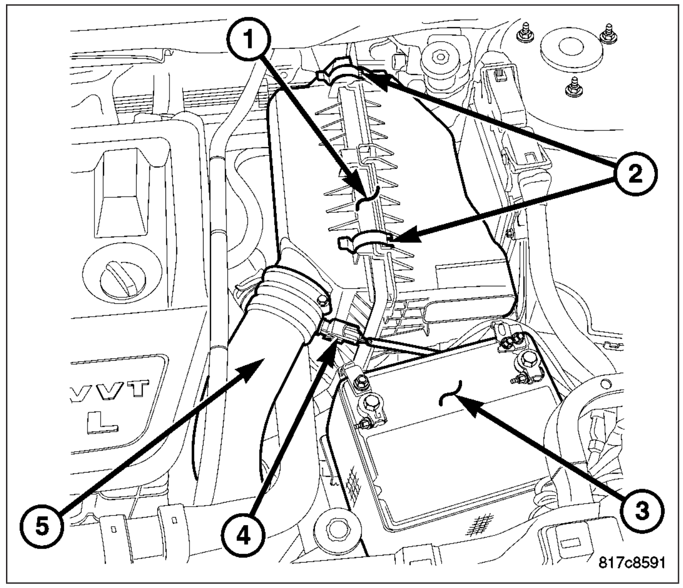
5. Install fresh air inlet (2) on air cleaner housing (1) and lock retainers (5).



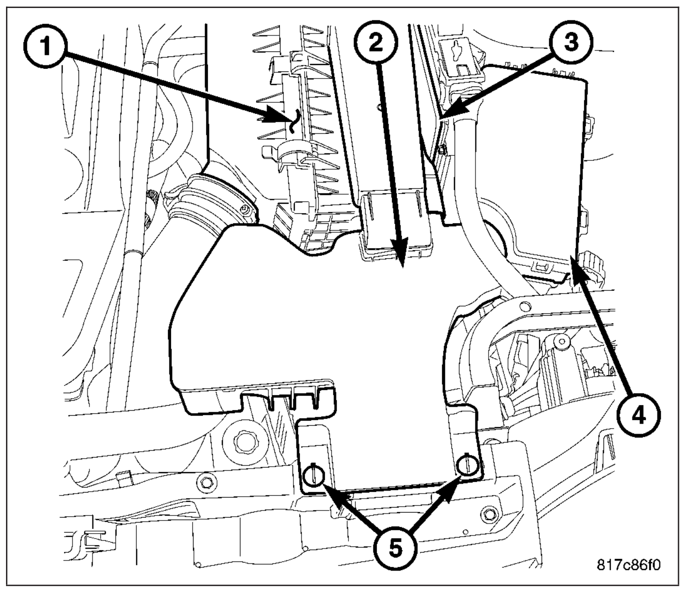
HOUSING-AIR CLEANER

REMOVAL

1. Remove fresh air inlet (2) from air cleaner housing (1).



2. Remove intake air temperature sensor electrical connector (4).
3. Remove air inlet tube (5) from housing (1).
4. Pull housing (1) upward to remove.



INSTALLATION

1. Make sure the rubber grommets, for the air cleaner housing lower pins, are in place when reinstalling the air cleaner housing. The rubber grommets mount to the PDC bracket.
2. Push air cleaner housing (1) down while aligning pins into the grommets.
3. Connect the throttle body air inlet hose (5) to the air cleaner housing (1).
4. Connect intake air temperature sensor connector (4).

5. Install fresh air inlet (2) and lock retainers (5).

CYLINDER HEAD

DESCRIPTION

The cross flow designed, aluminum cylinder head contains dual over-head camshafts with four valves per cylinder. The valves are arranged in two in-line banks. The intake valves face toward the front of the vehicle. The exhaust valves face the dash panel. The cylinder head incorporates powdered metal valve guides and seats. The cylinder head is sealed to the block using a multi-layer steel head gasket and retaining bolts.

Integral oil galleries provide lubrication passages to the variable camshaft timing phasers, camshafts, and valve mechanisms.

NOTE: Replacement cylinder heads will come complete with valves, seals, springs, retainers, keepers, lash buckets, and camshafts.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders, between a cylinder and the adjacent water jacket or from an oil passage to the exterior of the engine.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

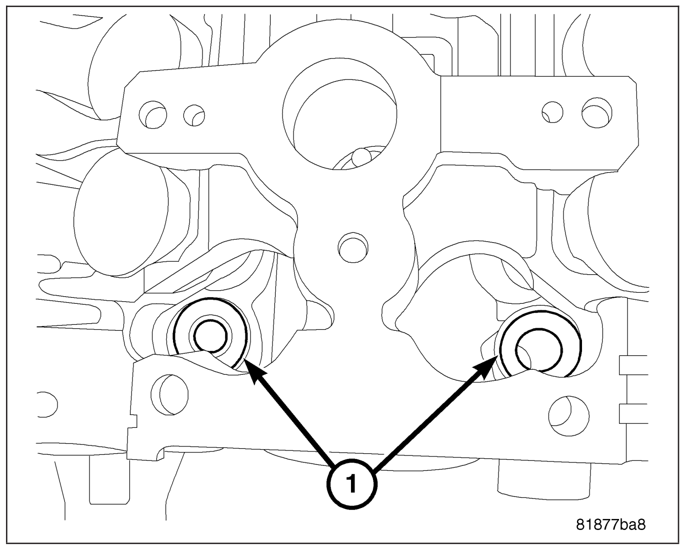
If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester’s pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD



Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL - CYLINDER HEAD

1. Perform fuel system pressure release procedure **before attempting any repairs**
2. Remove clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect negative cable from battery.
4. Drain cooling system.
5. Remove engine cover.
6. Remove coolant recovery bottle.
7. Remove power steering pump and reposition.
8. Remove windshield washer bottle.
9. Disconnect breather hose.
10. Disconnect PCV hose.
11. Disconnect ignition coil electrical connectors.
12. Remove valve cover.
13. Raise vehicle.
14. Remove right splash shield.
15. Set engine to TDC.
16. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
17. Remove lower A/C compressor bolts if equiped.
18. Remove lower A/C compressor mount.
19. Remove accessory drive belt lower idler pulley.
20. Remove crankshaft and water pump pulleys.
21. Remove right side engine mount bracket lower bolt.
22. Remove timing chain cover lower bolts.
23. Disconnect oxygen sensor electrical connectors.
24. Remove exhaust pipe at manaverter (AWD).
25. Remove manaverter support bracket retaining bolts (AWD).
26. Lower vehicle.
27. Remove power steering pump and set aside.
28. Support engine with suitable jack.
29. Remove right engine mount.
30. Remove accessory drive upper idler pulley.
31. Remove right upper engine mount bracket.
32. Remove accessory drive belt tensioner.
33. Remove upper timing chain cover retaining bolts.
34. Remove timing chain cover.
35. Remove timing chain tensioner.
36. Remove timing chain.
37. Remove timing chain guides.
38. Disconnect fuel line at the fuel rail.
39. Disconnect fuel injector electrical connectors.
40. Disconnect top engine electrical connectors and reposition harness.
41. Remove fuel rail.
42. Remove lower intake manifold support bracket retaining bolt.

43. Disconnect electronic throttle control electrical connector.
44. Disconnect map sensor electrical connector.
45. Disconnect vacuum lines at intake.
46. Remove intake manifold retaining bolts.
47. Remove upper radiator hose retaining bolts.
48. Remove intake manifold.
49. Remove coolant outlet manifold and set aside.
50. Remove ground strap at right rear of cylinder head.
51. Remove oxygen sensor from maniverter (AWD).
52. Remove maniverter heat shields (AWD).
53. Remove maniverter retaining bolts (AWD).
54. Remove maniverter from cylinder head and reposition out of the way (AWD).
55. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

NOTE: All of the cylinder head bolts have captured washersEXCEPTthe front two (1).

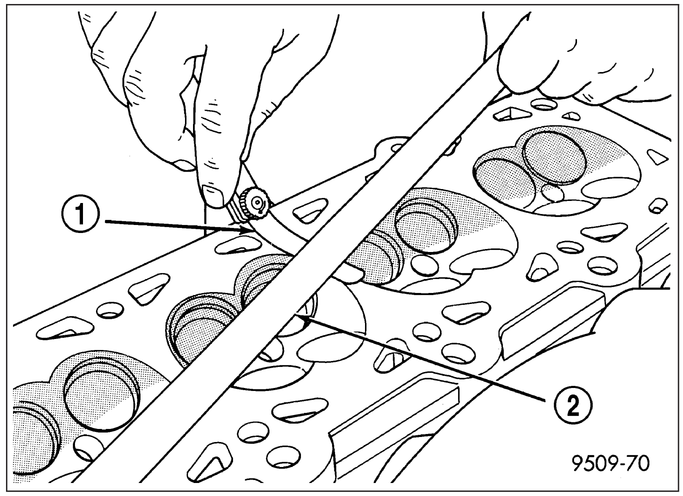
56. Remove cylinder head bolts.
57. Remove cylinder head from engine block.
58. Inspect and clean cylinder head and block sealing surfaces. Refer to Cleaning and Inspection in this section for procedures.

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.

CLEANING

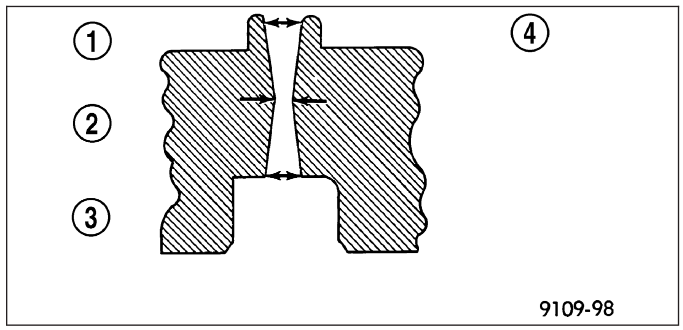
To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.



Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

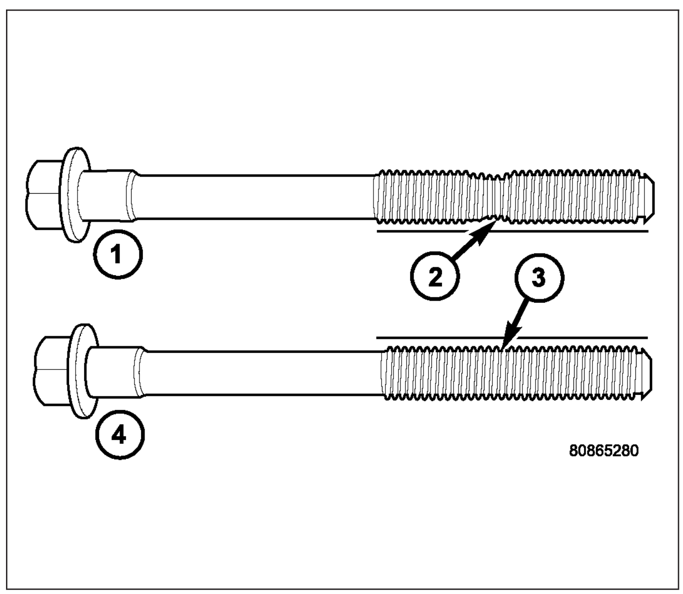


INSPECTION

NOTE: Replacement cylinder heads will come complete with valves, seals, springs, retainers, keepers, lash buckets, and camshafts.

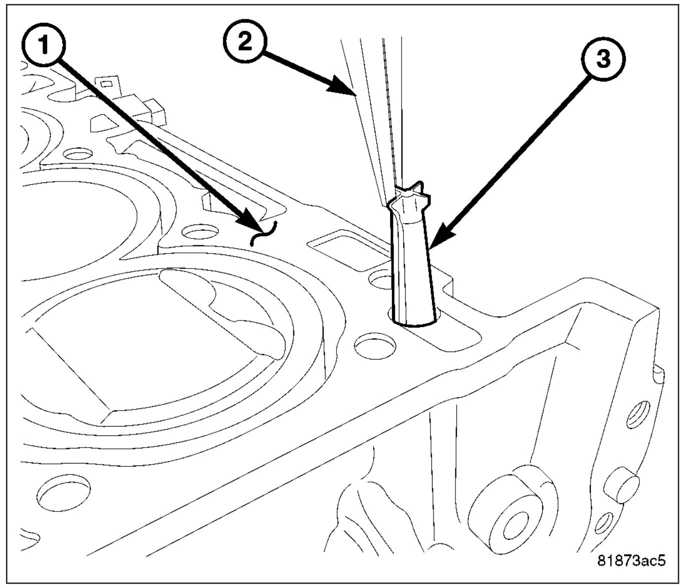
1. Cylinder head must be flat within 0.1 mm (0.004 in.).

2. Inspect camshaft bearing journals for scoring.
3. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
4. Using a small hole gauge and a micrometer, measure valve guides in 3 places top (1), middle (2), and bottom (3). (Refer to 9 - ENGINE - SPECIFICATIONS) Replace guides if they are not within specification.
5. Check valve guide height.
6. Prior to installing cylinder head, the cylinder block should be checked for flatness (Refer to 9 - ENGINE/ENGINE BLOCK - INSPECTION).



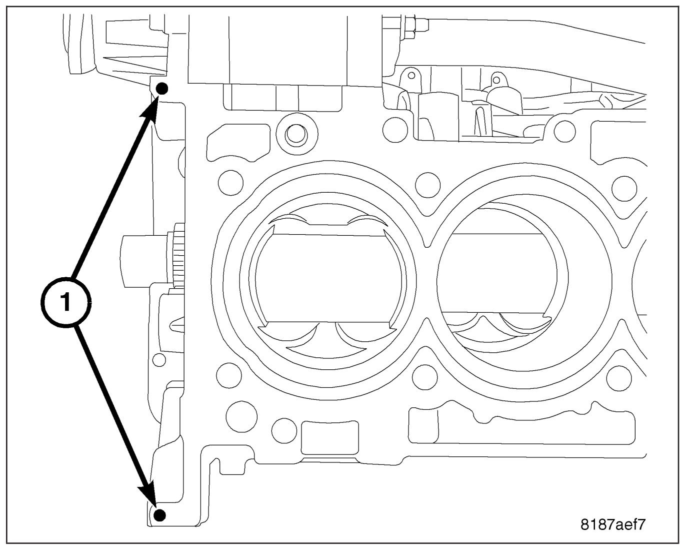
INSTALLATION - CYLINDER HEAD

NOTE: Ensure cylinder head bolt holes in the block are clean, dry (free of residual oil or coolant), and threads are not damaged.



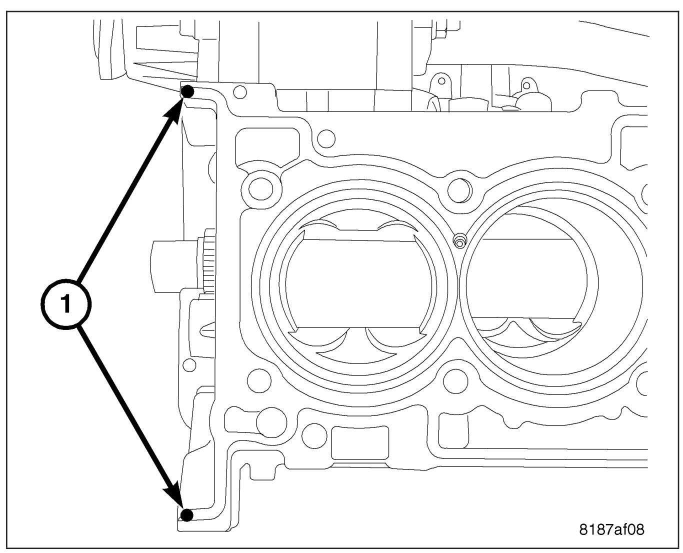
NOTE: The Cylinder head bolts should be examined BEFORE reuse. If the threads are necked down, the bolts should be replaced.

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2), the bolt should be replaced.

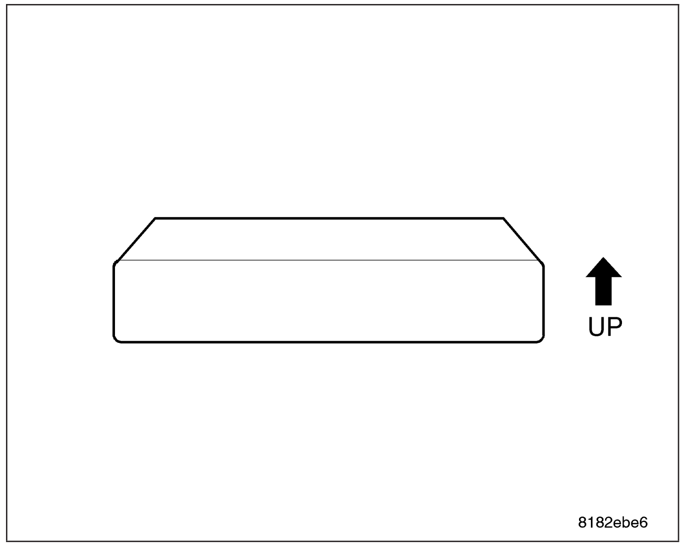


CAUTION: Always replace the variable valve timing filter screen (3) when servicing the head gasket or engine damage could result.

1. Replace the variable valve timing filter screen (3).

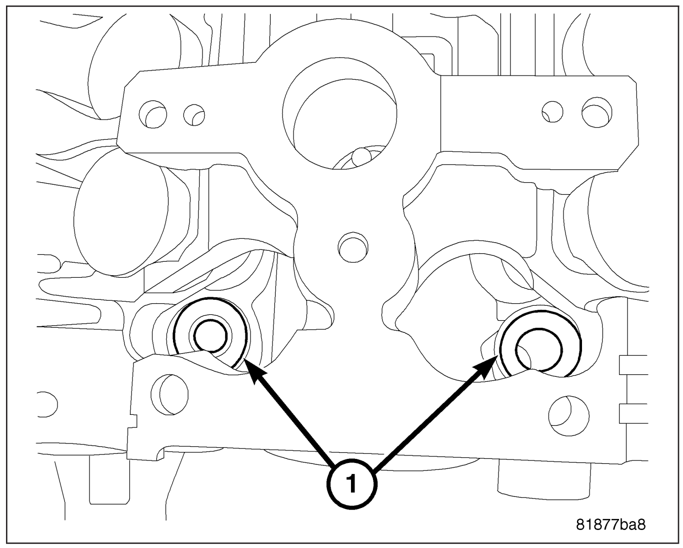


2. Place two pea size dots of RTV (1) on cylinder block as shown.



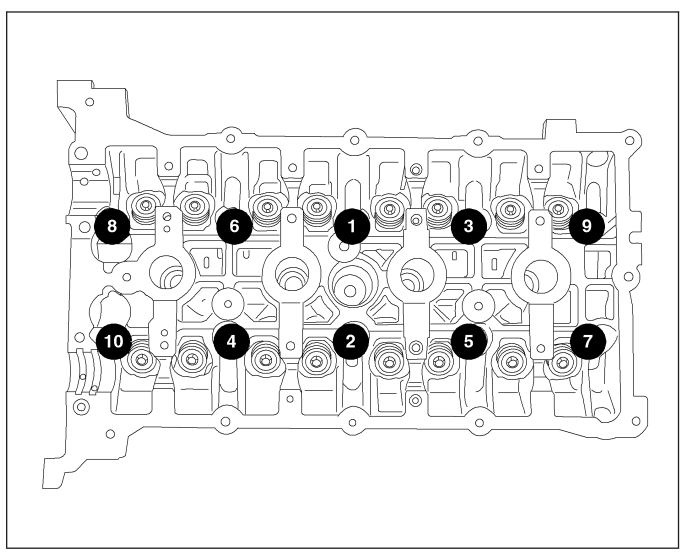
3. Position the new cylinder head gasket on engine block with the part number facing up. Ensure gasket is seated over the locating dowels in block.
4. Place two pea size dots of RTV (1) on cylinder head gasket as shown.

NOTE: The head must be installed within 15 minutes before the RTV skins.



5. Position cylinder head onto engine block.

NOTE: The front two cylinder head bolts do not have captured washers. The washers must be installed with the bevel up towards the bolt head.



6. Install washers (1) for the front two cylinder head bolts.

7. Before installing the bolts, the threads should be lightly coated with engine oil.
8. Install the cylinder head bolts and torque in the sequence shown above.
   - First: All to 30 N·m (25 ft. lbs.)
   - Second: All to 61 N·m (50 ft. lbs.)
   - Third: All to 61 N·m (45 ft. lbs.)
   - Fourth: All an additional 90°

CAUTION: Do not use a torque wrench for the Fourth step.

9. Install camshafts. (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

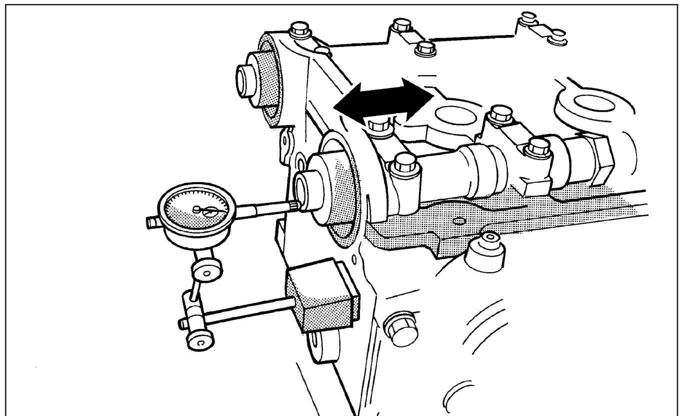
10. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER - INSTALLATION).
11. Install maniverter/exhaust manifold to cylinder head. Torque fasteners to 34 N·m (25 ft.lbs.).
12. Install heat shields.Torque fasteners to 9 N·m ( ).

13. Install oxygen sensor in maniverter.
14. Install ground strap at right rear of cylinder head.
15. Install coolant manifold.
16. Install intake manifold.
17. Install intake manifold bolts and torque to 24 N·m (18 ft.lbs.).
18. Install upper radiator hose retaining bracket.
19. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
20. Install timing chain cover, torque m6 bolts to 12 N·m (105 in.lbs.) and m8 bolts to 23 N·m (17 ft.lbs.).
21. Connect cam sensor wiring connector.
22. Install spark plugs and torque to 27 N·m (20 ft.lbs.).
23. Install ignition coils and torque to 8 N·m (70 in.lbs.).
24. Install power steering pump reservoir/bracket to cylinder head.
25. Install exhaust pipe to manifold. Torque fasteners to 28 N·m (20 ft. lbs.).
26. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
27. Connect engine coolant temperature sensor connector.
28. Connect upper radiator hose. Connect heater hoses to thermostat housing.
29. Install heater tube support bracket to cylinder head.
30. Install fastener attaching dipstick tube to lower intake manifold
31. Connect fuel supply line quick-connect at the fuel rail assembly (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
32. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
33. Connect negative cable to battery.
34. Install clean air hose and air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

CAMSHAFT(S)

DESCRIPTION

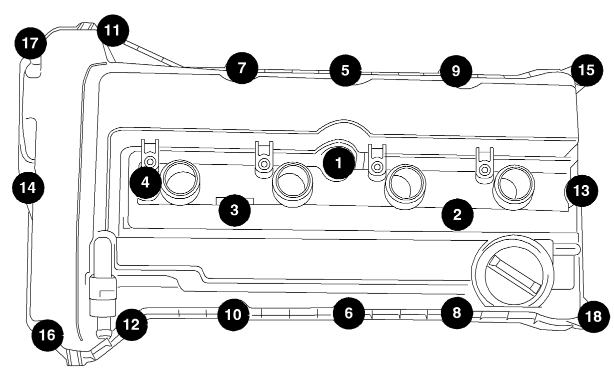
Both camshafts have six bearing journal surfaces and two cam lobes per cylinder. Flanges on the third journal control camshaft end play. Cam position sensors are located on the intake and exhaust camshafts on the rear of the cylinder head.



OPERATION

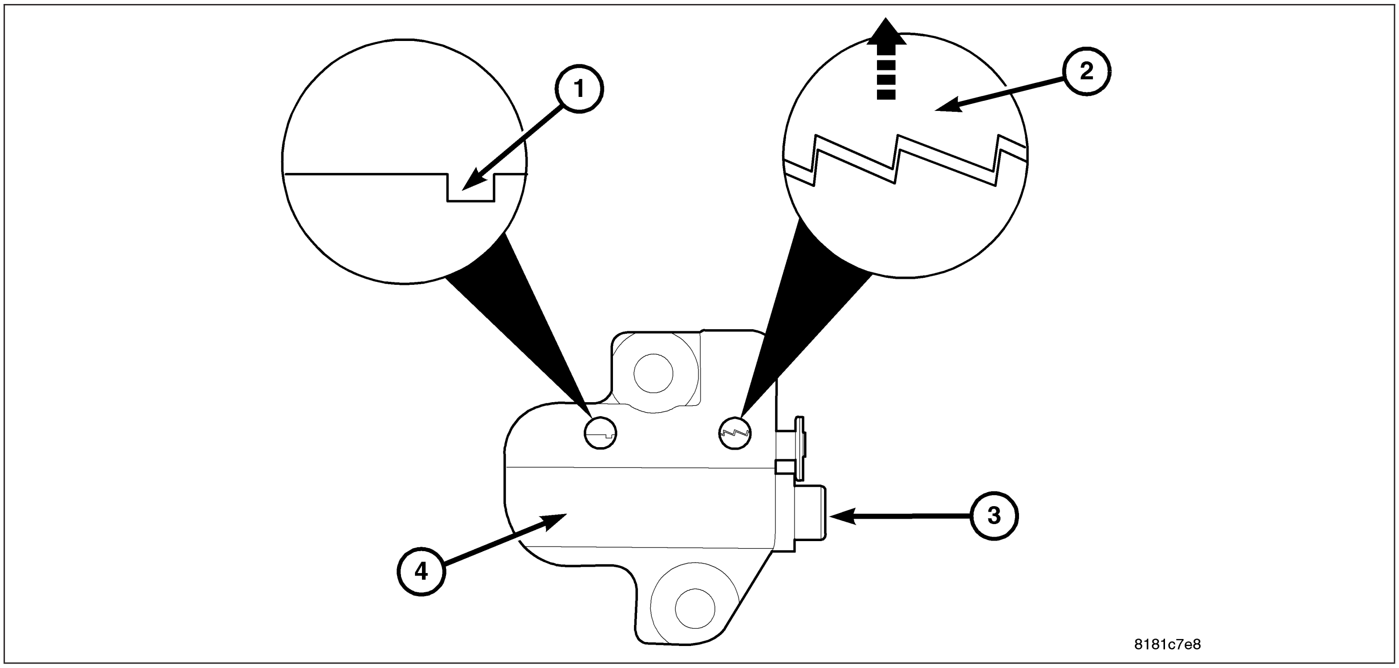
The camshaft is driven by the crankshaft via drive sprockets and a chain. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

STANDARD PROCEDURE



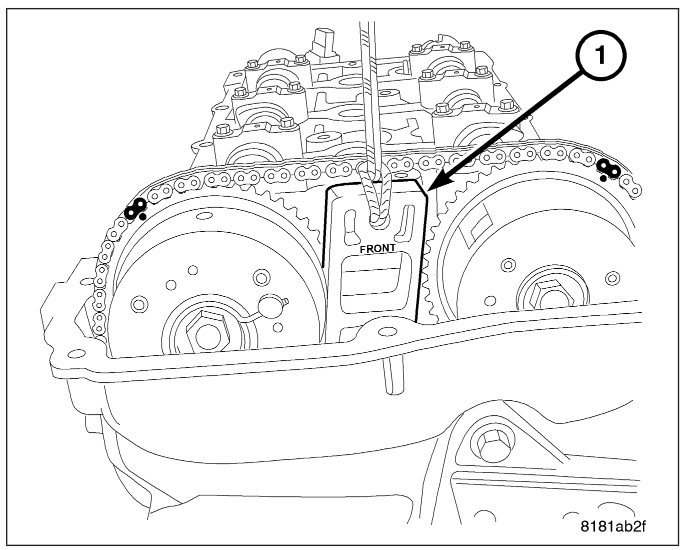
MEASURING CAMSHAFT END PLAY

1. Using a suitable tool, move camshaft as far rearward as it will go.
2. Zero dial indicator.
3. Move camshaft as far forward as it will go.
4. Record reading on dial indicator. For end play specification, (Refer to 9 - ENGINE - SPECIFICATIONS).
5. If end play is excessive, check cylinder head and camshaft for wear; replace as necessary.

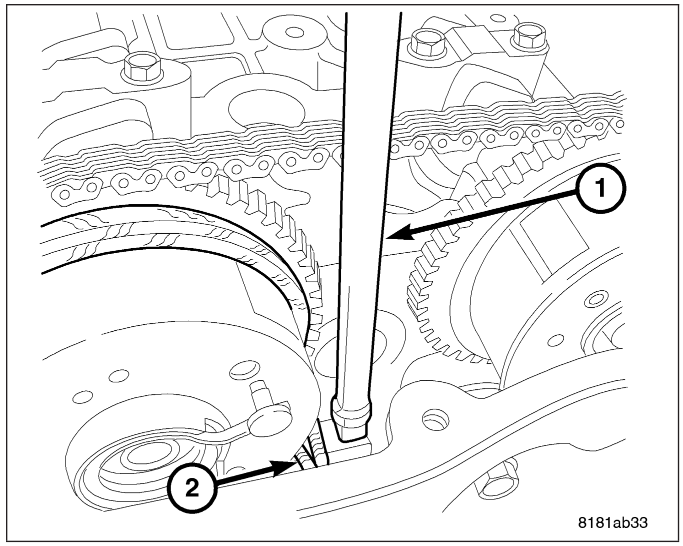


9509-115

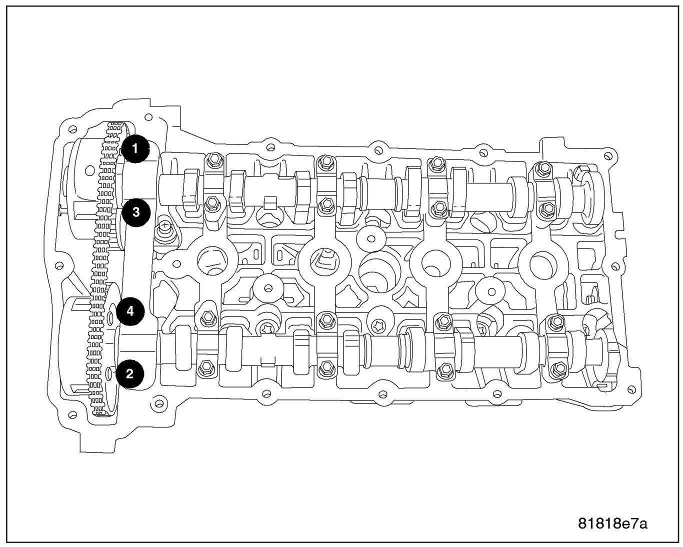
REMOVAL



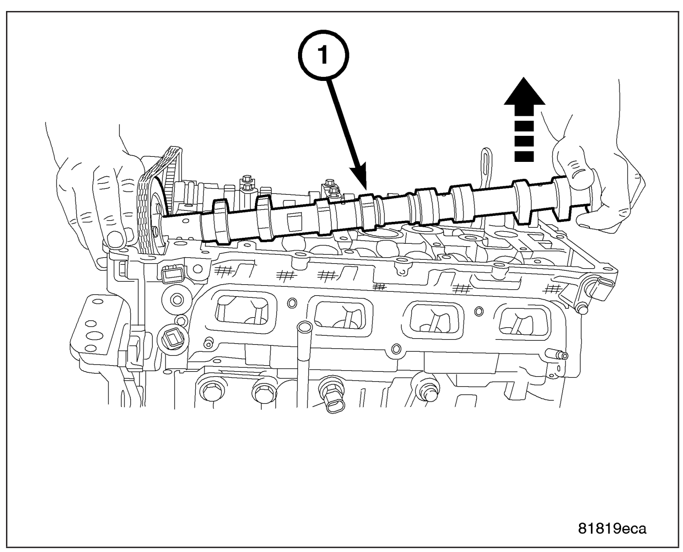
1. Remove engine cover by pulling upward.
2. Disconnect negative battery cable.
3. Remove cylinder head cover (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
4. Raise vehicle.
5. Remove right splash shield.



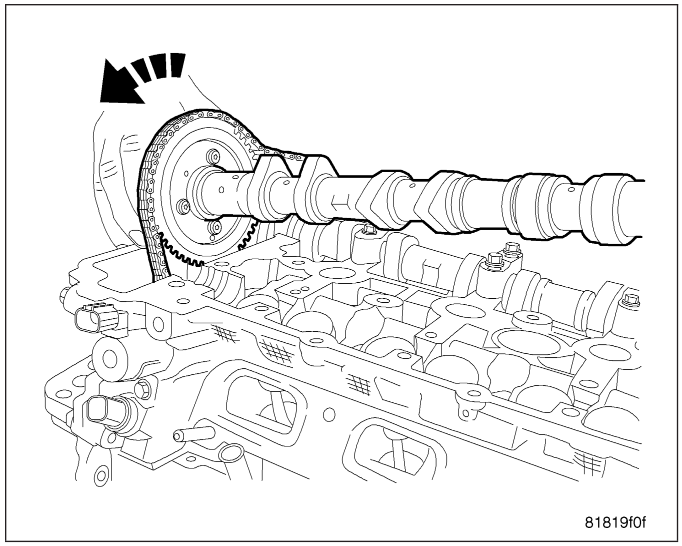
8182e337



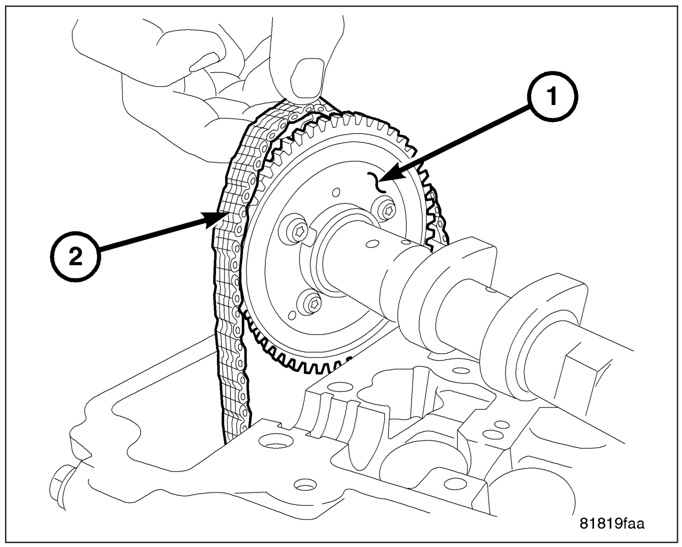
6. Remove timing tensioner plug from front cover.
7. Insert small allen wrench and lift ratchet (2) upward to release the tensioner. Leave the allen wrench installed during the remainder of this procedure.
8. Insert wedge 9701 (1).



9. Lightly tap Wedge 9701(2) into place.



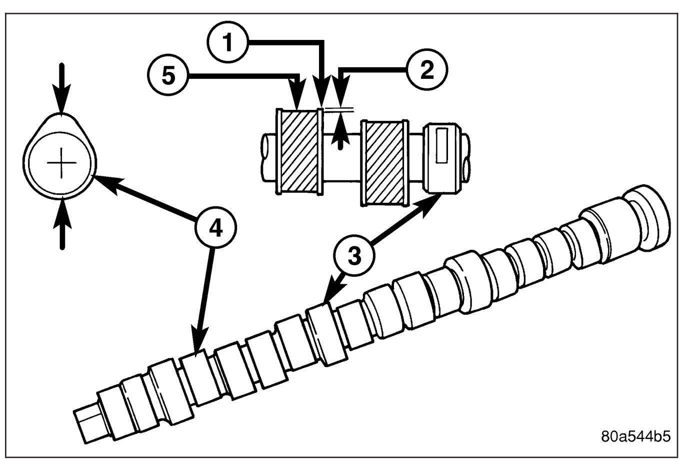
10. Remove the front camshaft bearing cap.
11. Slowly remove the remaining camshaft bearing bolts one turn at a time following the above sequence.



12. Remove intake camshaft (1) by lifting the rear of the camshaft upward.

13. Rotate the camshaft while lifting out of the front bearing cradle.

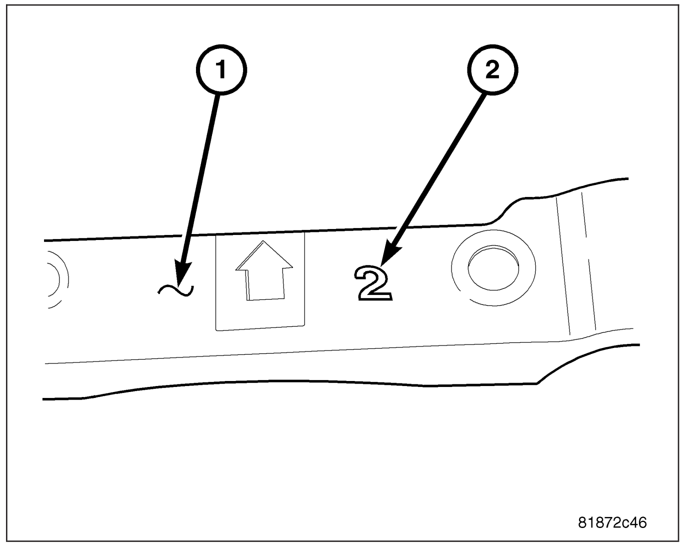
14. Lift the timing chain (2) off the sprocket (1).
15. Remove exhaust camshaft.



CLEANING

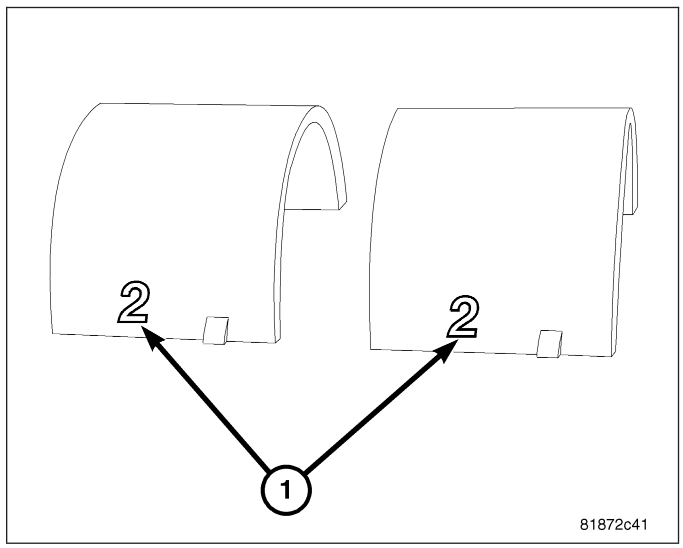
Clean camshafts with a suitable solvent.

INSPECTION

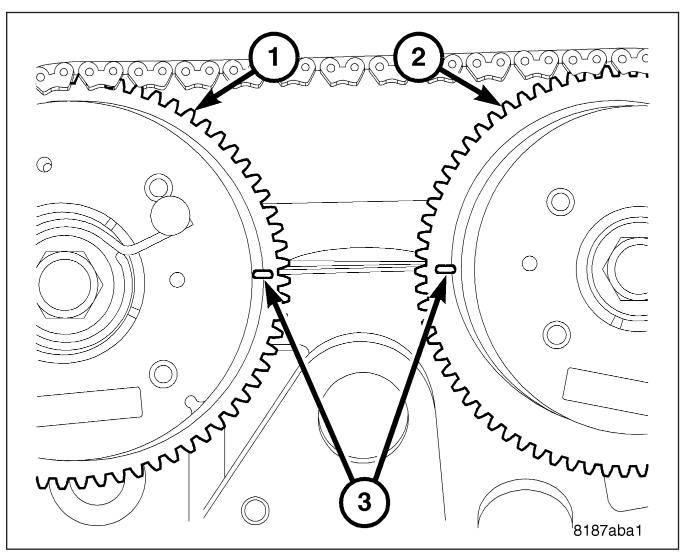


1. Inspect camshaft bearing journals for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Check the cam lobe and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

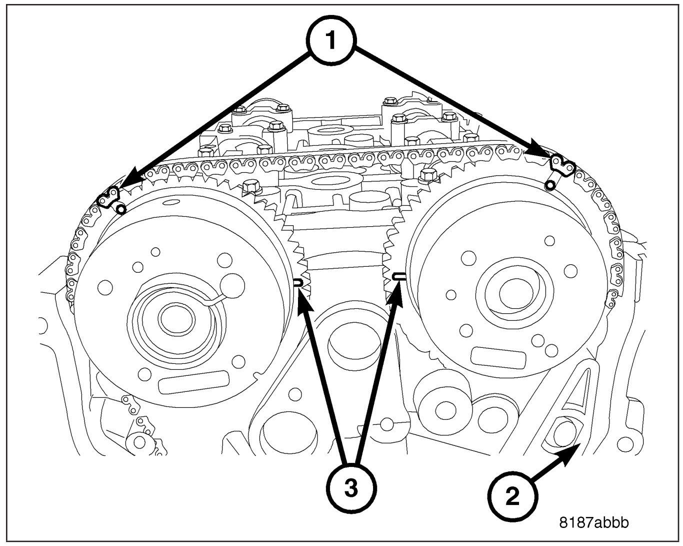
NOTE: If camshaft is replaced due to lobe wear or damage, always replace the lash buckets.



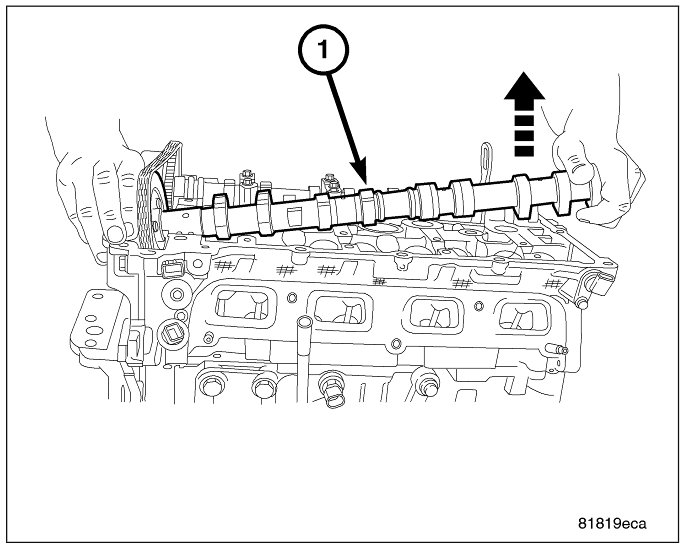
INSTALLATION



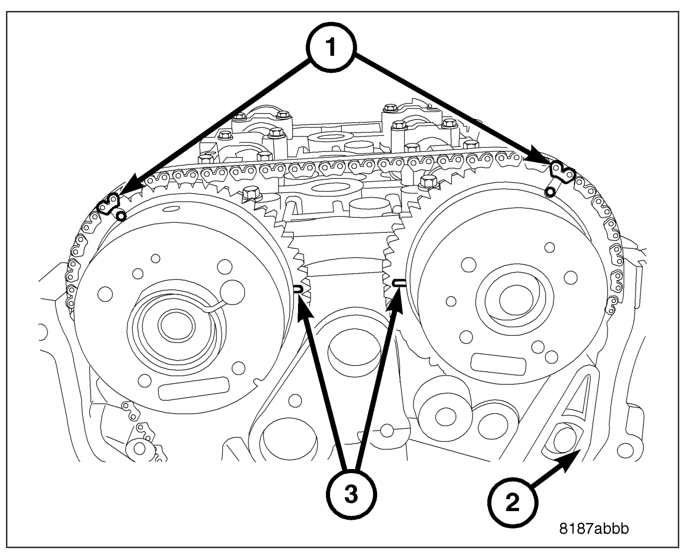
1. Identify which front cam cap (1) is installed on the engine you are working on.
2. The cam cap (1) is numbered (2) either one, two, or three, this corresponds to the select fit bearing to use.



3. Install the corresponding select fit bearing that will also be numbered (1) one, two, or three.
4. Oil all of the camshaft journals with clean engine oil.
5. Install exhaust camshaft and position on bearing journals in the cylinder head.

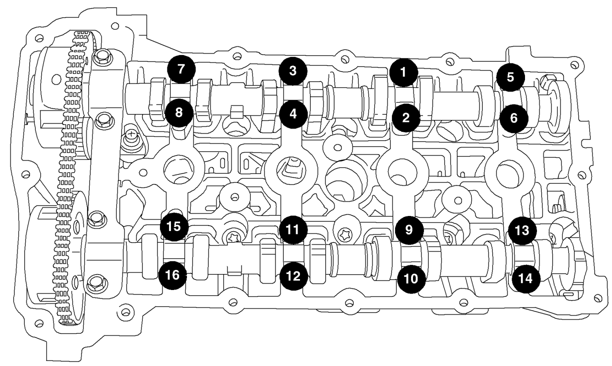


6. Align exhaust cam timing mark so it is parallel to the cylinder head as shown.



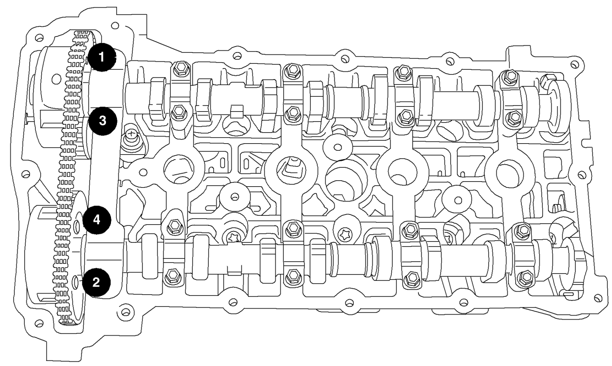
7. Install timing chain onto exhaust cam sprocket making sure that the timing marks (1) on the sprocket and chain are aligned.

8. Install intake camshaft by raising the rear of the camshaft upward and roll the sprocket into the chain.



9. Align the timing marks (1) on the intake cam sprocket with the mark in the chain.
10. Position the intake camshaft into the bearing journals in the cylinder head.
11. Verify that the timing marks (1) are aligned on both camshafts and that the timing marks (3) are parallel with the cylinder head.

CAUTION: Install the front intake and exhaust camshaft bearing cap last. Ensure that the dowels are seated and follow torque sequence or damage to engine could result.

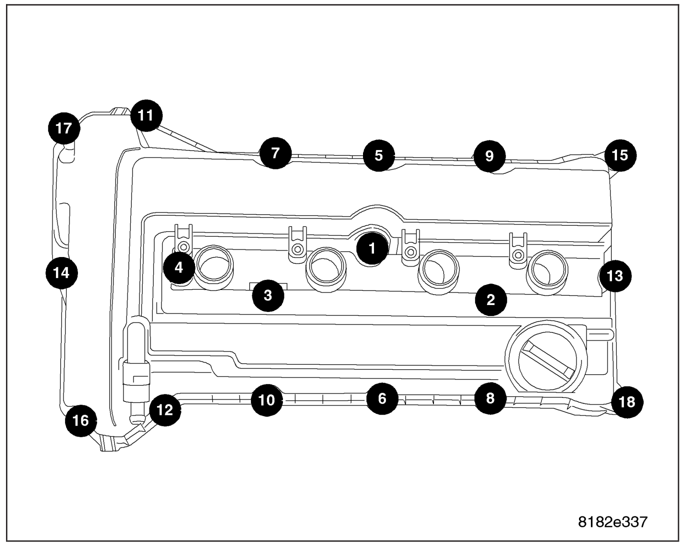


NOTE: If the front camshaft bearing cap is broken, the cylinder head MUST be replaced.

12. Install intake and exhaust camshaft bearing caps slowly torque bolts in the sequence shown.

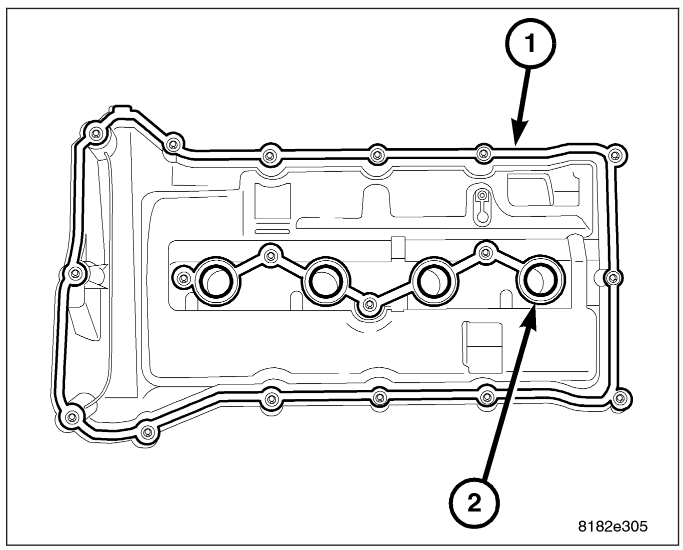
81818e70

13. Install the front intake and exhaust bearing cap and torque bolts in the sequence shown.
14. Verify that all timing marks are aligned.
15. Remove allen wrench from timing chain tensioner.
16. Remove locking wedge 9701.
17. Apply MOPAR® thread sealant to timing tensioner plug and Install.
18. Install right splash shield.
19. Install cylinder head cover (Refer to 9 - ENGINE/ CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
20. Install engine cover.
21. Connect negative battery cable.
22. Fill cooling system.
23. Fill with oil.
24. Start engine and check for leaks.



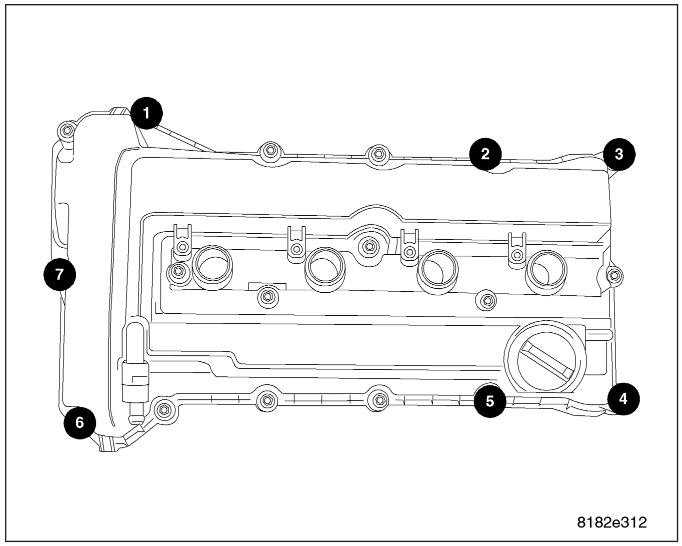
81818e7a

COVER-CYLINDER HEAD

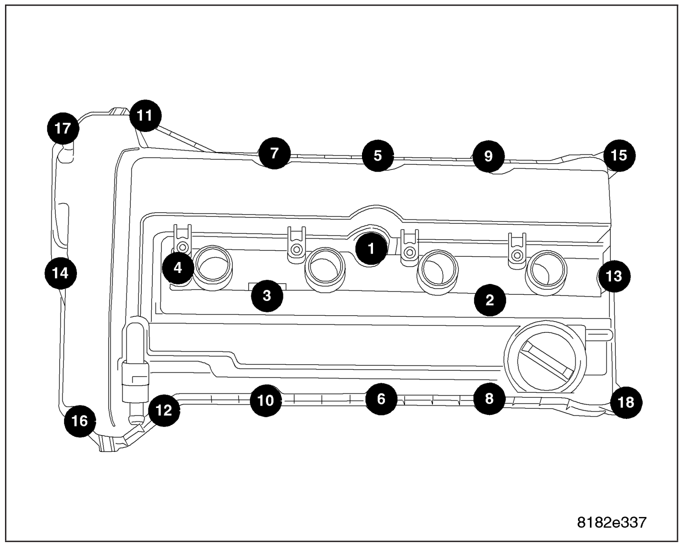


REMOVAL

1. Remove engine cover.
2. Disconnect ignition coil electrical connectors.
3. Disconnect PCV and make-up air hoses from cylinder head cover.
4. Use compressed air to blow dirt and debris off the cylinder head cover prior to removal.
5. Remove cylinder head cover bolts.
6. Remove cylinder head cover from cylinder head.



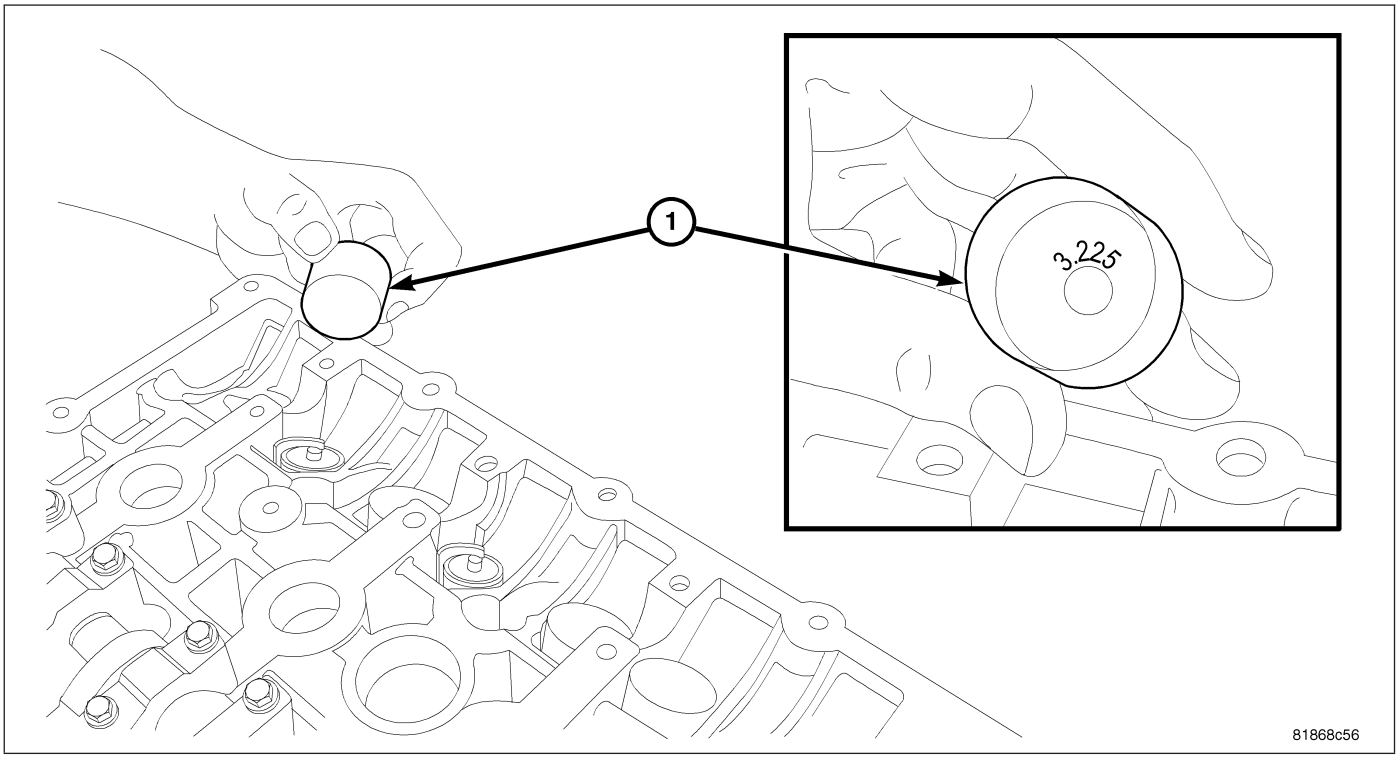
INSTALLATION



1. Install new cylinder head cover gaskets (1,2).

2. Install studs in cover as shown.

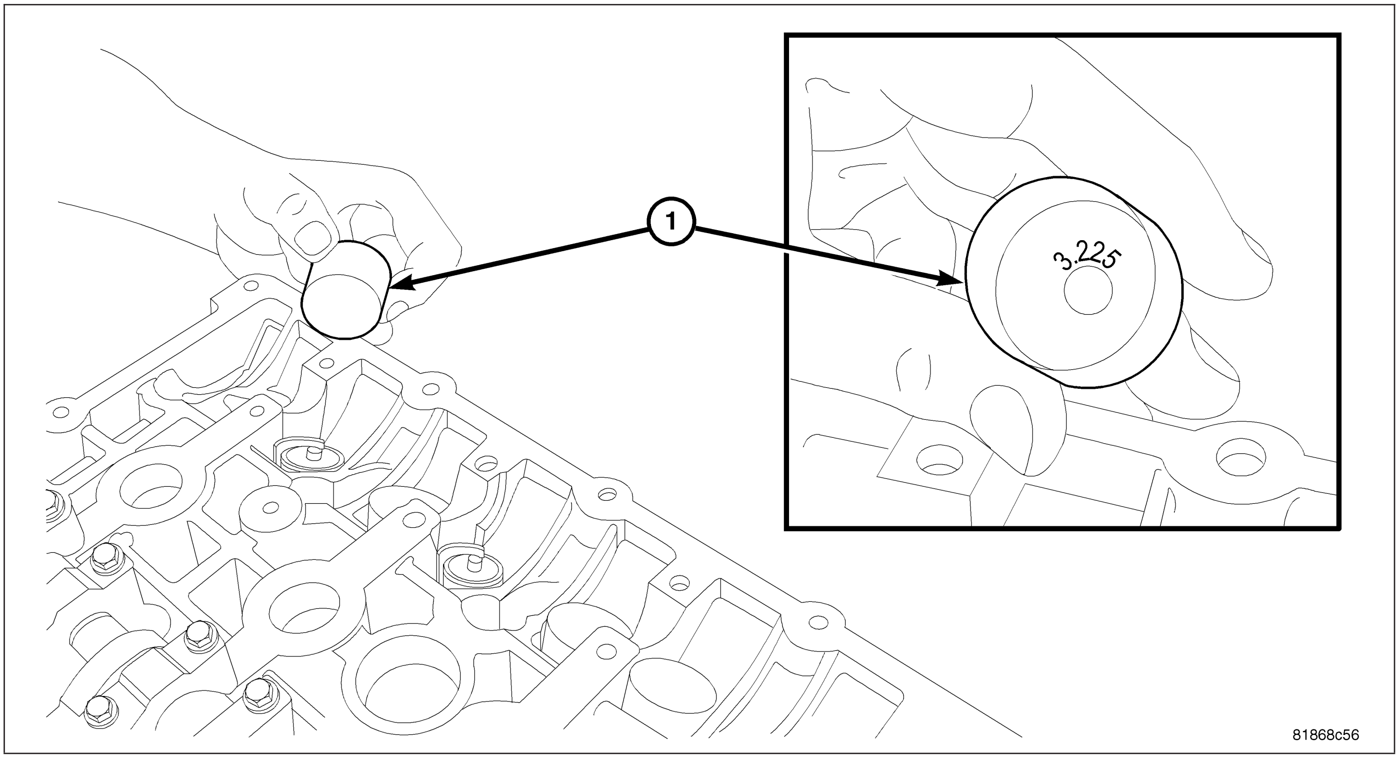
3. Clean all RTV from cylinder head.
4. Apply RTV to cylinder head/front cover joint.
5. Install cylinder head cover assembly to cylinder head and install all bolts, ensuring the studs are located as shown.
6. Tighten bolts in sequence shown in Using a 2 step torque method as follows:
   a. Tighten all bolts to 4.5 N·m (40 in. lbs.)
   b. Tighten all bolts to 10 N·m (90 in. lbs.).
7. Install ignition coils. Tighten fasteners to 8 N·m (70 in. lbs.).
8. If the PCV valve was removed, tighten PCV valve to 4.5 N·m (40 in. lbs.).
9. Connect PCV and make-up air hoses to cylinder head cover.
10. Install engine cover.



TAPPETS-VALVE

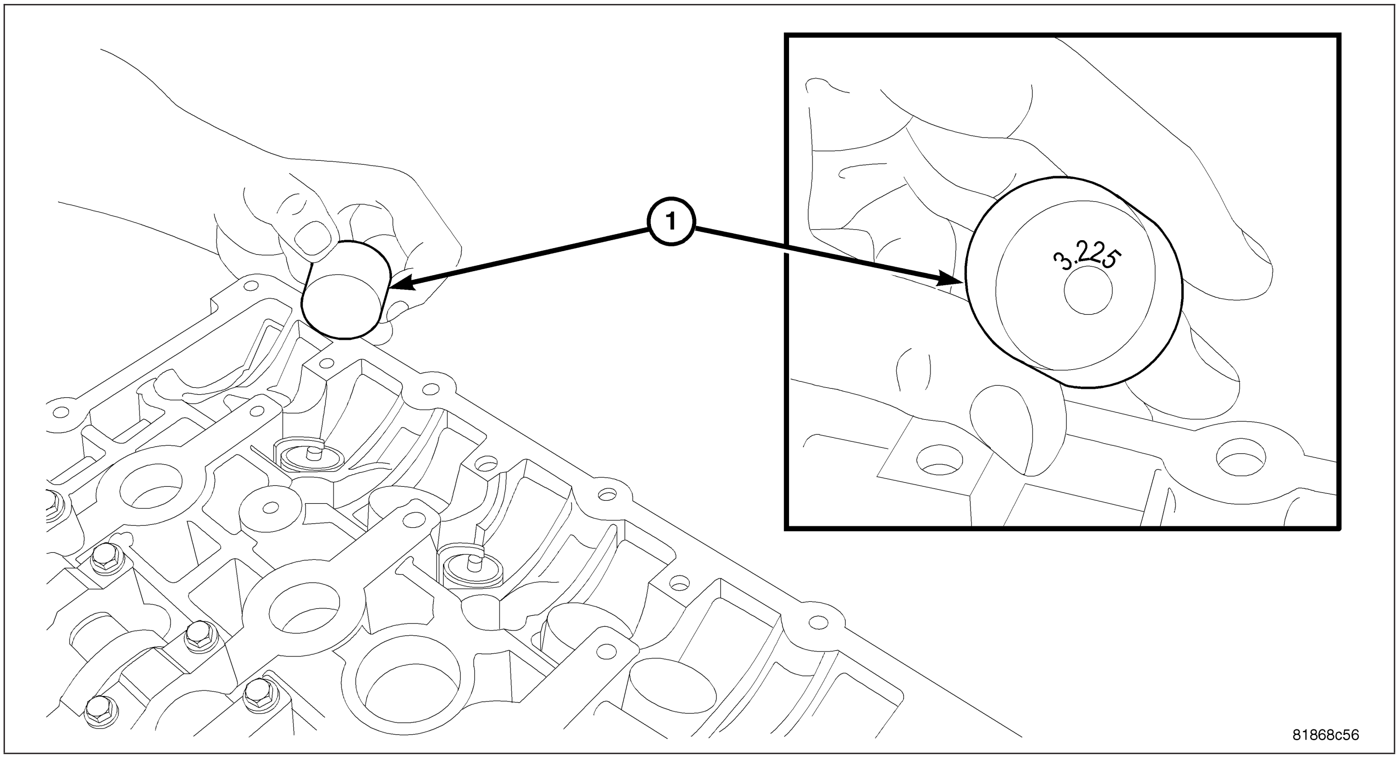
DIAGNOSIS AND TESTING

MECHANICAL VALVE TAPPET NOISE DIAGNOSIS



A tappet-like noise may be produced from several items. Check the following items.

STANDARD PROCEDURE - MEASURING VALVE LASH



1. Remove engine cover.
2. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
3. Rotate camshaft so lobes are vertical.
4. Check clearance using feeler gauges.
5. Repeat for all tappets.
6. If clearance was too small Clearance too Small .
7. If clearance was too large Clearance too Large .

Clearance too Small

1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. spec – measured = delta
3. Decrease bucket thickness by delta.
4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Verify that valve lash is correct.

Clearance too Large

1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. Measured – spec = delta
3. Increase bucket thickness by delta.
4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Verify that valve lash is correct.

REMOVAL

NOTE: This procedure is for in-vehicle service with camshafts installed.

NOTE: Camshaft buckets must be replaced if cylinder head or camshafts are replaced.

1. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
3. Remove camshaft buckets.
4. Repeat removal procedure for each camshaft bucket.
5. If reusing, mark each camshaft bucket for reassembly in original position.

INSTALLATION

NOTE: If reinstalling original buckets they must go back in their original location or engine damage could result.

1. Apply a light coat of clean engine oil to camshafts buckets prior to assembly.
2. Install camshaft bucket into cylinder head.
3. Repeat installation procedure for each camshaft bucket.

NOTE: If installing new buckets, the valve lash procedure must be performed.

4. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
5. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

VALVES & SEATS-INTAKE/EXHAUST

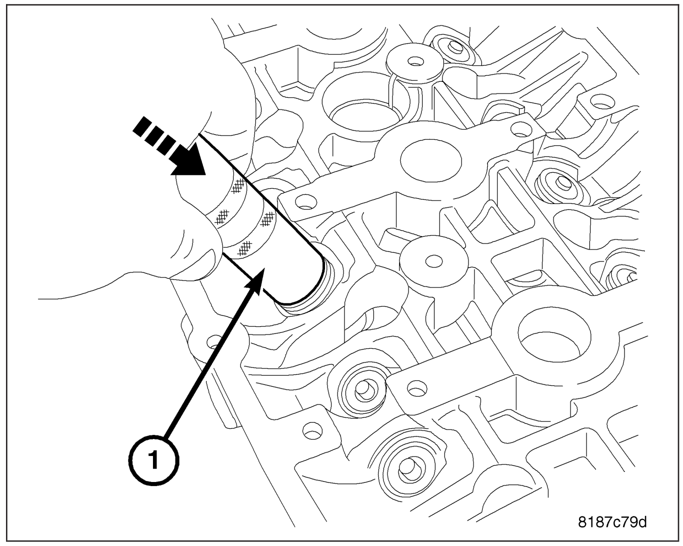
DESCRIPTION

The valves are made of heat resistant steel. They have nitrided stems to prevent scuffing. Viton rubber valve stem seals are integral with the spring seats. The valves have a single bead lock keepers to retain the springs.

OPERATION

The four valves per cylinder (two intake and two exhaust) are opened by using direct acting buckets which are actuated by the camshaft.

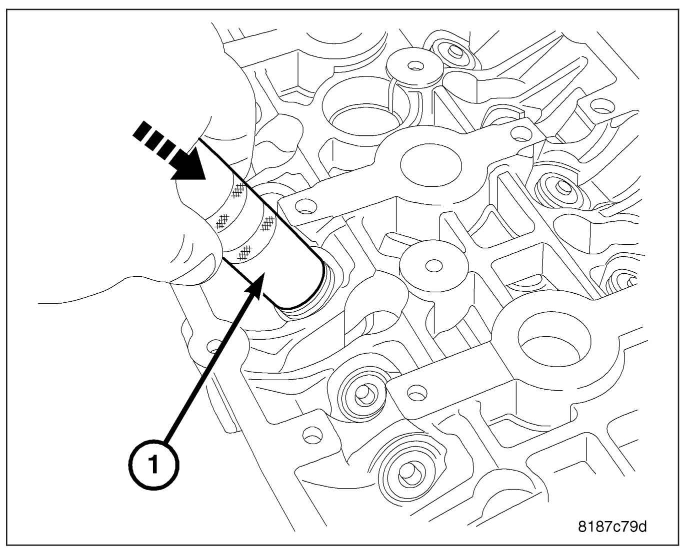
CLEANING



1. Clean all valves thoroughly and discard burned, warped and cracked valves.

SPRINGS & SEALS-VALVE

REMOVAL

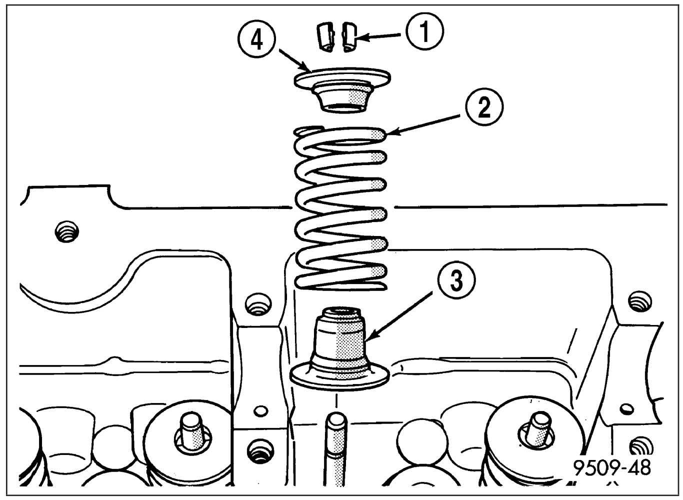


CYLINDER HEAD ON

1. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
2. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
3. Rotate crankshaft until piston is at TDC on compression.
4. With air hose attached to adapter tool installed in spark plug hole, apply 90-120 psi air pressure.
5. Using metric valve keeper remover (1), and remove valve spring keepers and retainer.
6. Remove valve spring(s).
7. Remove valve stem seal(s) by a using valve stem seal tool.

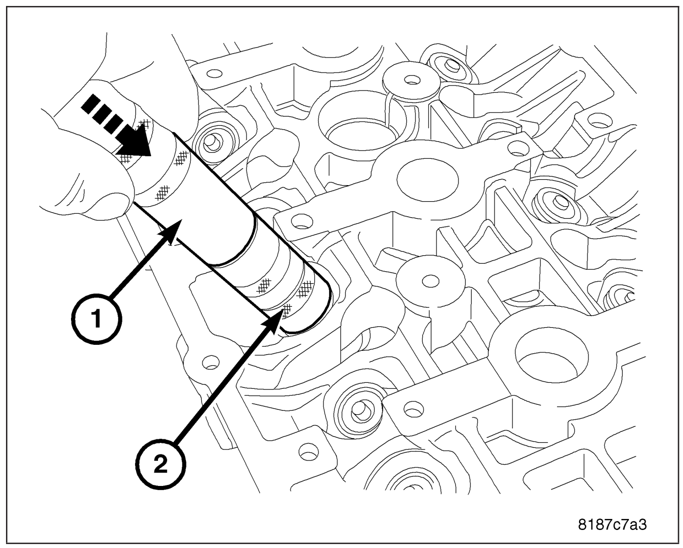
CYLINDER HEAD OFF

1. With cylinder head removed from cylinder block, place a ball of rags in the combustion chamber.
2. Using Snap On metric valve keeper remover (1) or equivalent, remove valve keepers with a downward push.
3. Remove retainer and springs.
4. Before removing valves, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves, locks and retainers to insure installation in original location.
5. Inspect the valves. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSPECTION).



INSPECTION

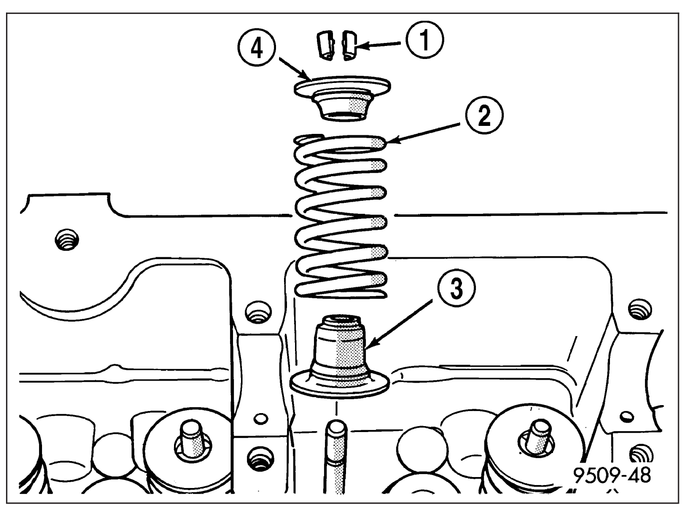
1. Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested for correct tension. Discard the springs that do not meet specifications. The following specifications apply to both intake and exhaust valves springs:
   - Valve Closed Nominal Tension—75 lbs. @ 38.0 mm (1.50 in.)
   - Valve Open Nominal Tension—134 lbs. @ 29.75 mm (1.17 in.)
2. Inspect each valve spring for squareness with a steel square and surface plate, test springs from both ends. If the spring is more than 1.5 mm (1/16 inch) out of square, install a new spring.



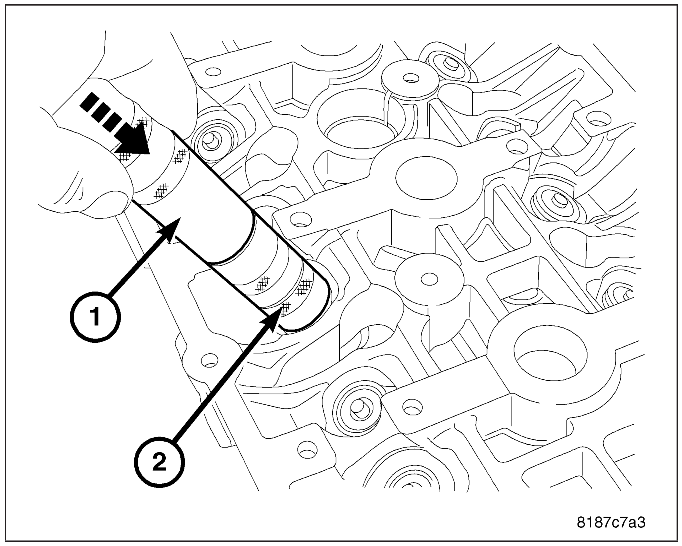
INSTALLATION

CYLINDER HEAD ON

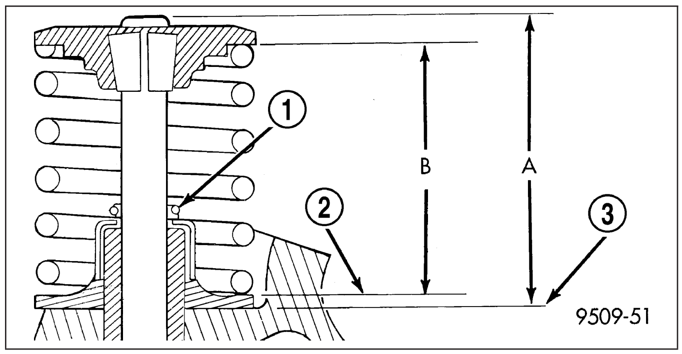
1. Install valve seal/valve spring seat (3) assembly. Push the assembly down with appropriate size socket to seat it onto the valve guide.
2. Install valve spring (2) and retainer (4) with keepers (1).



3. Place the valve keepers in the retainer. Using Snap On metric valve keeper installer (2) and remover (1) as a handle, install valve keepers with a downward push.
4. Remove air hose and install spark plugs.
5. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).
6. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

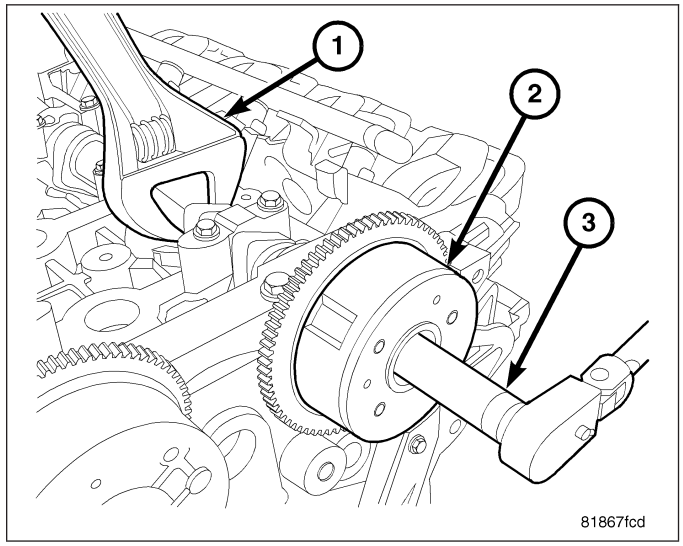


CYLINDER HEAD OFF



1. Coat valve stems with clean engine oil and insert in cylinder head.
2. Install new valve stem seals (3) on all valves using an appropriate sized socket to seat the seal/spring seat. The valve stem seals should be pushed firmly and squarely over valve guide.
3. Install valve springs (2), retainers (4), and keepers (1) in place.

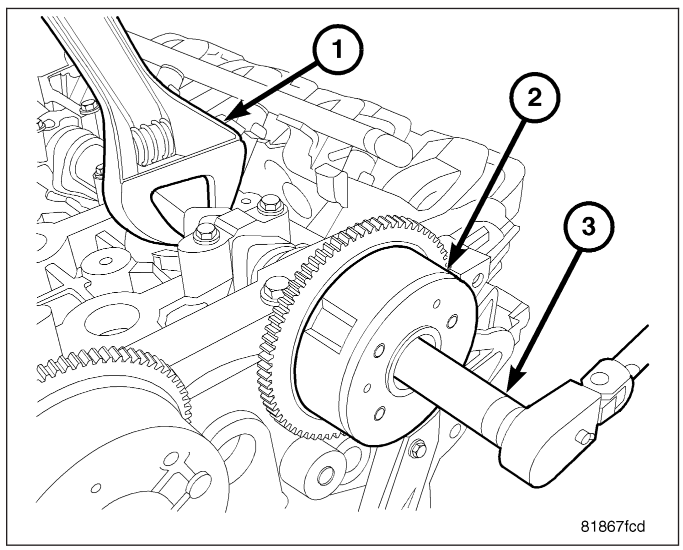
4. Using Snap-on metric valve keeper installer (2) and remover (1) as a handle, push downward to install keepers.



5. Check the valve spring installed height B after refacing the valve and seat. Make sure measurements are taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.525 in.), install a 0.762 mm (0.030 in.) spacer under the valve spring seat to bring spring height back within specification.

PHASERS-CAMSHAFT

REMOVAL

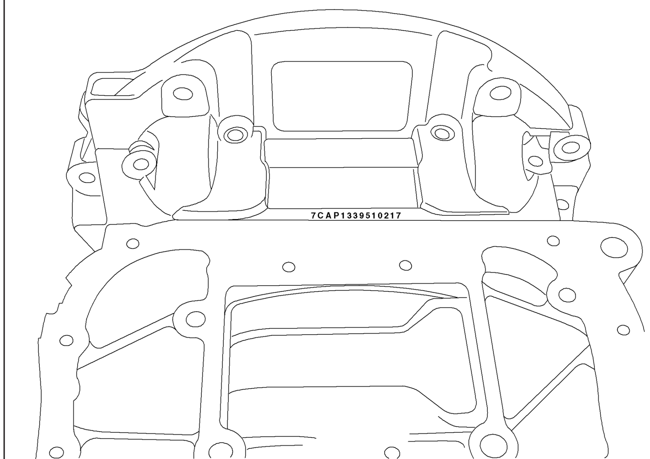


1. Remove camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).
2. Remove camshaft phaser (2) retaining bolt while holding the camshaft in place with a wrench (1).
3. Remove phaser (2) assembly from camshaft.

INSTALLATION

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin and camshaft phaser may occur.

1. Install phaser (2) assembly on camshaft.
2. Install phaser retaining bolt and torque while holding camshaft in place with a wrench (1).
3. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

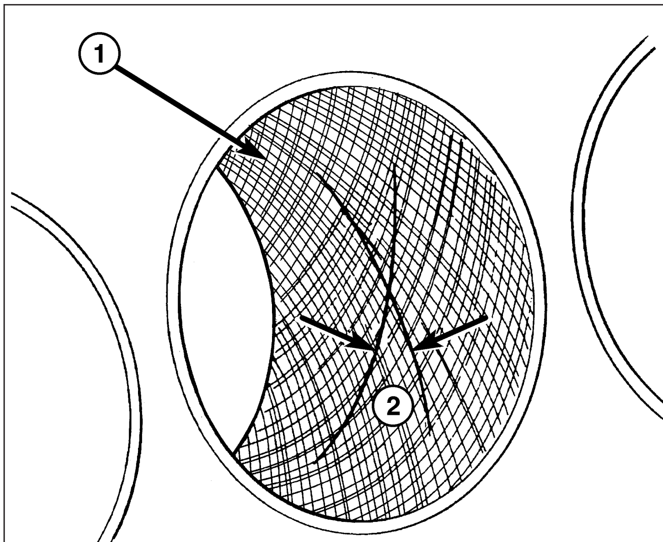


ENGINE BLOCK

DESCRIPTION

The die cast aluminum cylinder block is a two-piece assembly, consisting of the cylinder block and ladder frame. The block is an open deck design with cast in place cast iron cylinder liners. The cast iron cylinder liners are recessed below the aluminum deck surface. The ladder frame bolts to the cylinder block and does not incorporate the main bearing caps. This design offers a much stronger lower end and increased cylinder block and transaxle rigidity. The rear oil seal retainer is integral with the block and ladder frame. The ladder frame and block are serviced as an assembly.

The engine build date is located on the bottom of the ladder frame just behind the oil pan. The date can be seen with the oil pan in place.



81877211

STANDARD PROCEDURE

CYLINDER BORE HONING

1. Used carefully, a quality commercially available cylinder bore resizing hone equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.
2. Deglazing of the cylinder walls may be done using a quality commercially available cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

808a6311

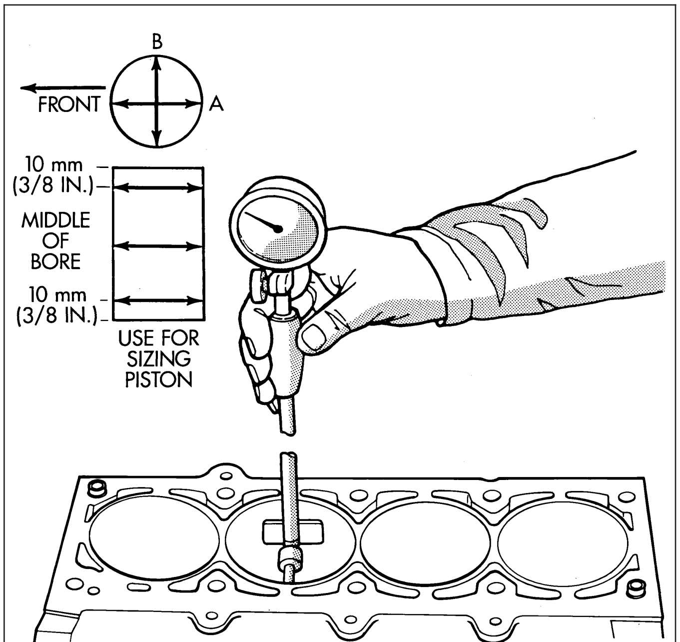
3. Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern. When hone marks **intersect** at 30-50 degrees, the cross hatch angle is most satisfactory for proper seating of rings.
4. A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle. Faster up and down strokes increase the cross-hatch angle.
5. After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

CAUTION: Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION



ENGINE BLOCK

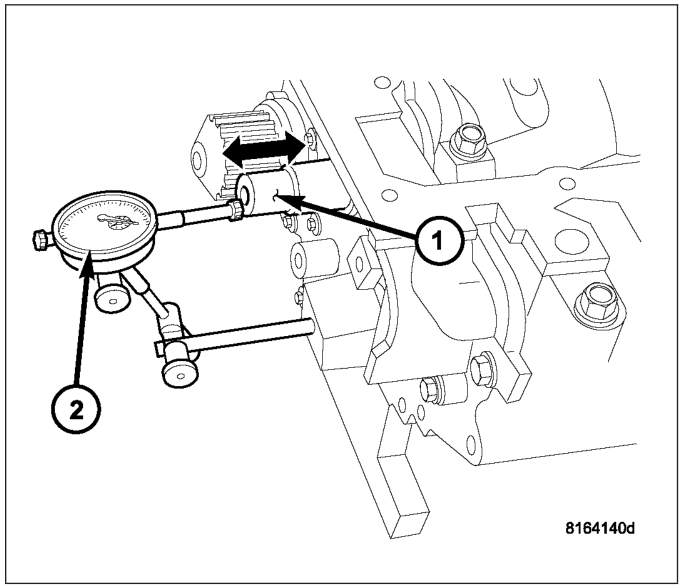
1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.
2. If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).
3. Examine block and cylinder bores for cracks or fractures.
4. Check block deck surfaces for flatness. Deck surface must be within service limit of 0.050 mm (0.002 in.).

CYLINDER BORE

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

9509-27



Measure the cylinder bore at three levels in directions A and B. Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

CRANKSHAFT

STANDARD PROCEDURE

MEASURING CRANKSHAFT END PLAY

1. Mount a dial indicator (2) to front of engine with the locating probe on nose of crankshaft (1).
2. Move crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move crankshaft all the way to the front and read the dial indicator. (Refer to 9 - ENGINE - SPECIFICATIONS) for end play specification.

REMOVAL - CRANKSHAFT

NOTE: Crankshaft can not be removed when engine is in vehicle.

1. Remove engine assembly from vehicle (Refer to 9 - ENGINE - REMOVAL).
2. Separate transaxle from engine.
3. Remove drive plate/flex plate.
4. Remove crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).
5. Mount engine on a suitable repair stand.
6. Drain engine oil and remove oil filter.
7. Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
8. Remove engine mount support bracket.
9. Remove timing chain cover.
10. Remove the timing chain
11. Remove the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
12. Remove balance shaft module.
13. Remove the crankshaft sprocket.
14. Remove crankshaft position sensor.
15. Remove all ladder frame bolts from the engine block.
16. Using a pry bar gently pry the ladder frame loose from the engine block dowel pins using the pry points cast into the block and ladder frame.
17. Ladder frame should be removed evenly from the cylinder block dowel pins to prevent damage to the dowel pins.

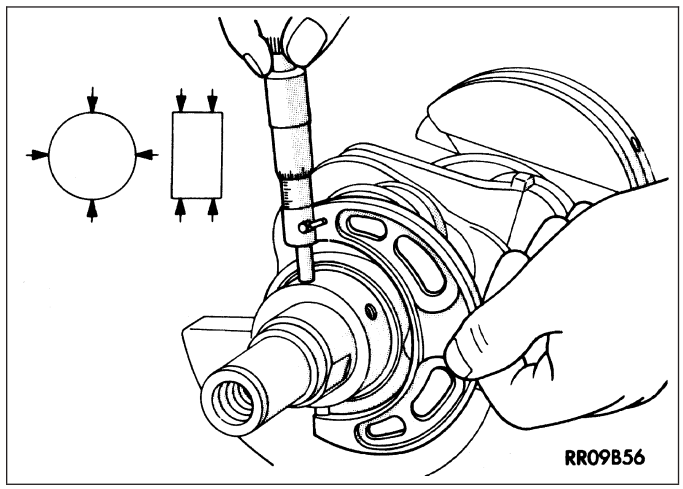
NOTE: If piston/connecting rod replacement is necessary, remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

18. Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

19. Remove all connecting rod bolts and caps. Care should be taken not to damage the fracture rod and cap surfaces.

NOTE: Do not reuse connecting rod bolts.



20. Remove main bearing caps.

CAUTION: Use extreme care when handling crankshaft. Tone wheel damage can occur if crankshaft is mishandled.

21. Lift out crankshaft from cylinder block. Do not damage the main bearings or journals when removing the crankshaft.

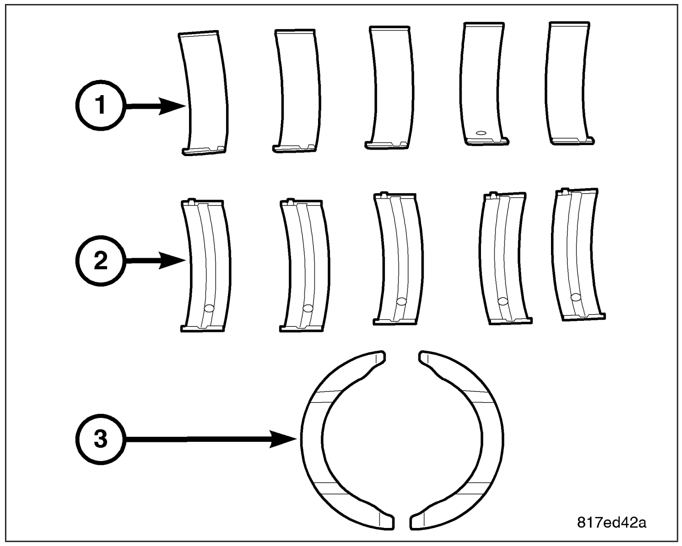
INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring. Limits of taper or out of round on any crankshaft journals should be held to 0.025 mm (0.001 in.). Journal grinding should not exceed 0.305 mm (0.012 in.) under the standard journal diameter. DO NOT grind thrust faces of No. 3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

INSTALLATION - CRANKSHAFT

The crankshaft is supported in five main bearings. All upper bearing shells in the crankcase have oil grooves and holes. All lower bearing shells are smooth. Crankshaft end play is controlled by a two piece thrust bearing on the number three main bearing journal.

1. Install the main bearing upper shells with the lubrication groove and oil hole in the engine block.
2. Make certain oil holes in block line up with oil hole in bearings and bearing tabs seat in the block tab slots.



NOTE: If the crankshaft is sent out for machine work, it must be balanced as an assembly with the target ring installed.

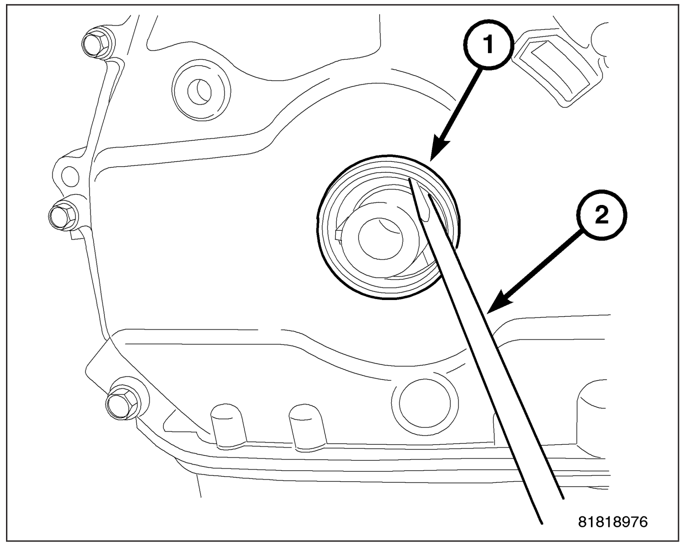
3. Clean crankshaft and target ring with MOPAR® Brake Parts cleaner and dry with compressed air to ensure that the crankshaft mating surface and target ring mounting holes are free from oil and lock patch debris.

NOTE: Always use NEW mounting screws whether installing original or new target ring.

4. Install **NEW**mounting screws finger tight starting with the #1 location. Make sure engagement occurs with the shoulder of the screws and mounting hole before starting all other screws.
5. Torque all mounting screws with T30 torx bit to 13 Nm (110 in-lbs) following the torque sequence.

NOTE: Lightly apply trans gel to thrust bearings to hold bearings in block.

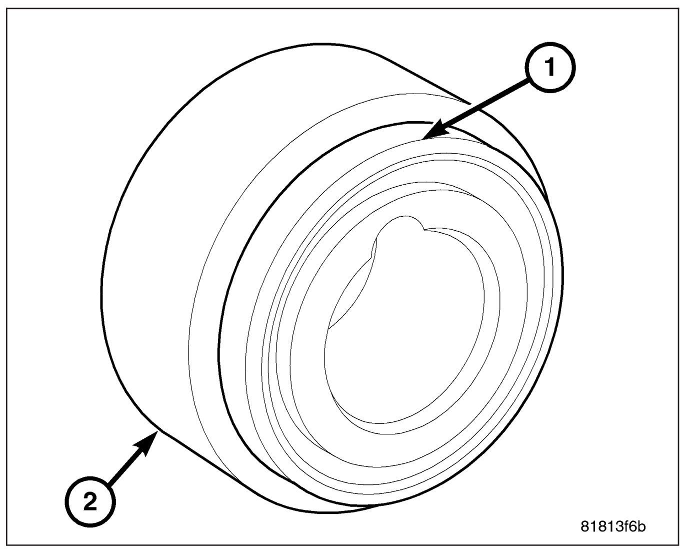
6. Install thrust bearings (3) in block.



CAUTION: Do not get oil on the ladder frame mating surface. It will affect the ability of the RTV to seal the ladder frame to cylinder block.

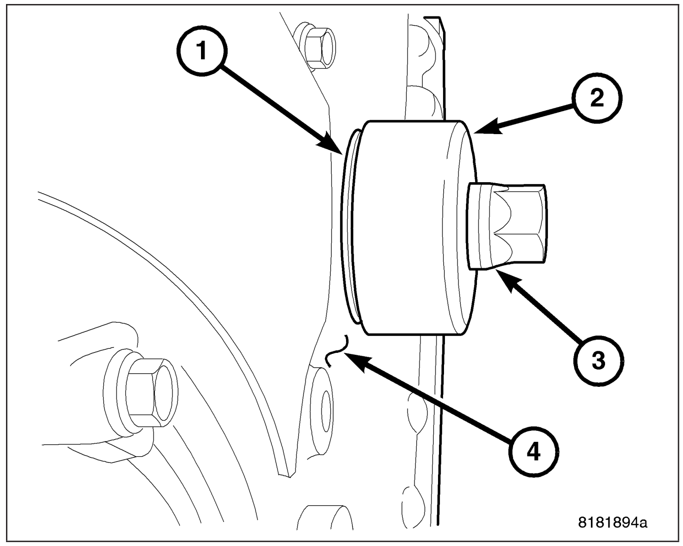
7. Oil the bearings and journals. Install crankshaft in engine block.
8. Install lower main bearings (1) into main bearing cap. Make certain the bearing tabs are seated into the bearing cap slots.
9. Before installing the bolts the threads should be clean and dry.
10. Install main bearing caps to engine block, install bolts finger tight.
11. To ensure correct thrust bearing alignment, perform the following steps:
    - Step 1: Rotate crankshaft until number 4 piston is at TDC.
    - Step 2: Move crankshaft rearward to limits of travel.
    - Step 3: Then, move crankshaft forward to limits of travel.
    - Step 4: Wedge an appropriate tool between the rear of the cylinder block and the rear crankshaft counterweight. This will hold the crankshaft in it's furthest forward position.
12. Tighten bolts (1–10) again to 41 N·m (30 ft. lbs.) in sequence shown.
13. Remove wedge tool used to hold crankshaft.
14. Check the crankshaft turning torque, it should not exceed 5.6 N·m (50 in. lbs.).
15. Check crankshaft end play (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).
16. Install connecting rod bearings and caps. **Do Not Reuse Connecting Rod Bolts.** Torque connecting rod bolts to 27 N·m (20 ft. lbs.) plus 1/4 turn.
17. Install the ladder frame assembly (Refer to 9 - ENGINE/ENGINE BLOCK/LADDER FRAME - INSTALLATION).
18. Install the balance shaft module (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
19. Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
20. Install crankshaft position sensor.
21. Install cylinder head if it was removed (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
22. Install front crankshaft sprocket.
23. Install the timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
24. Install the timing chain front cover.
25. Install front crankshaft oil seal.
26. Install engine mount support bracket.
27. Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
28. Remove engine from repair stand and position on Special Tools 6135 and 6710 Engine Dolly and Cradle. Install safety straps around the engine to cradle and tighten and lock them into position.
29. Install crankshaft rear oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION).
30. Install drive plate/flex plate. Apply Mopar® Lock & Seal Adhesive to bolt threads and tighten to 95 N·m (70 ft. lbs.).
31. Attach transaxle to engine. Tighten attaching bolts to 101 N·m (75 ft. lbs.).
32. Install the engine assembly (Refer to 9 - ENGINE - INSTALLATION).
33. Install new oil filter and fill with oil.
34. Start engine and check for leaks.

SEAL-FRONT CRANKSHAFT OIL

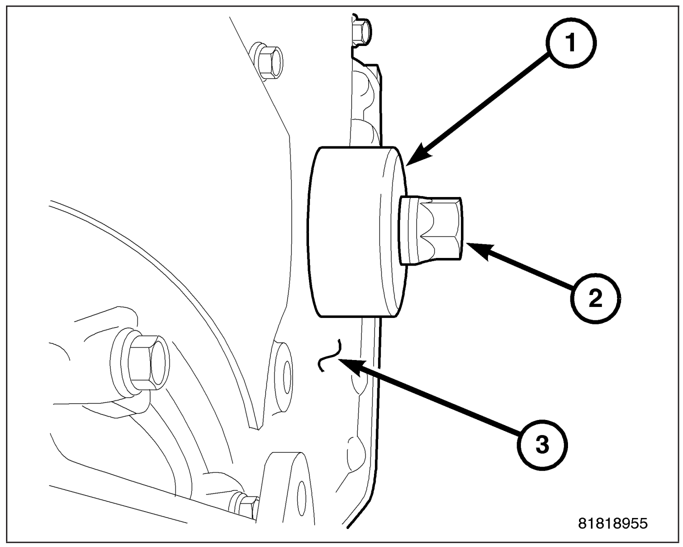


REMOVAL

1. Remove the crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
2. Remove front crankshaft oil seal (1) by prying out with a screw driver (2). Be careful not to damage the cover seal surface.

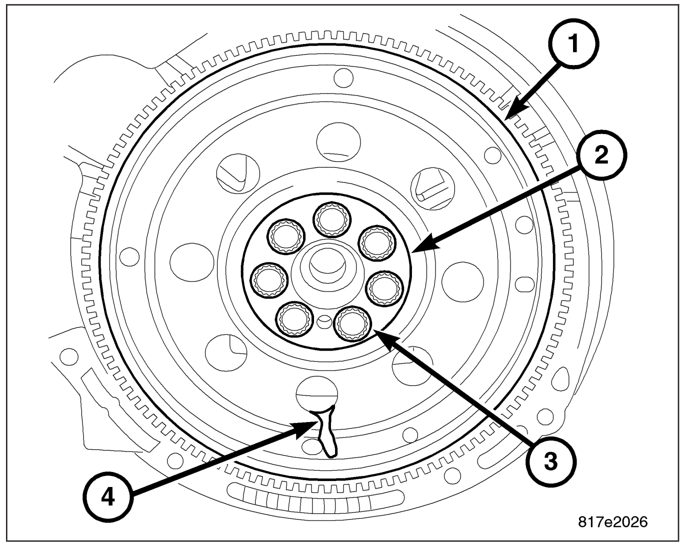


INSTALLATION



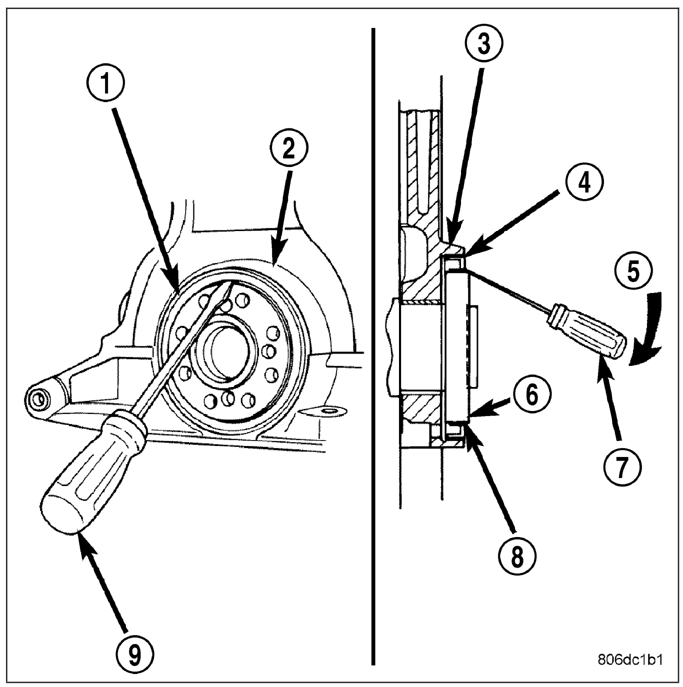
1. Place seal (1) onto Seal installer 9506 (2) with seal spring towards the inside of engine.

2. Install new seal (1) by using Seal installer 9506 (2) and crankshaft damper bolt (3).



3. Press seal into front cover until Seal Installer 9506 (1) seats against timing chain cover (3).
4. Remove seal installer 9506 (1).
5. Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION.

SEAL- REAR CRANKSHAFT OIL

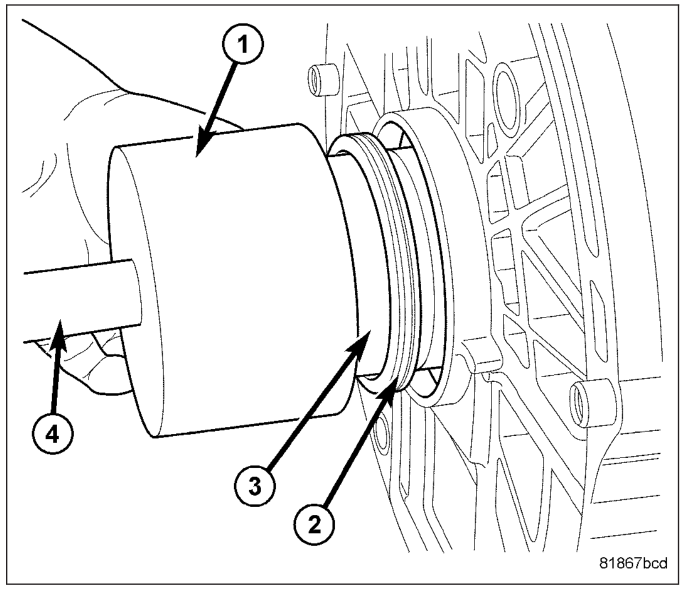


REMOVAL

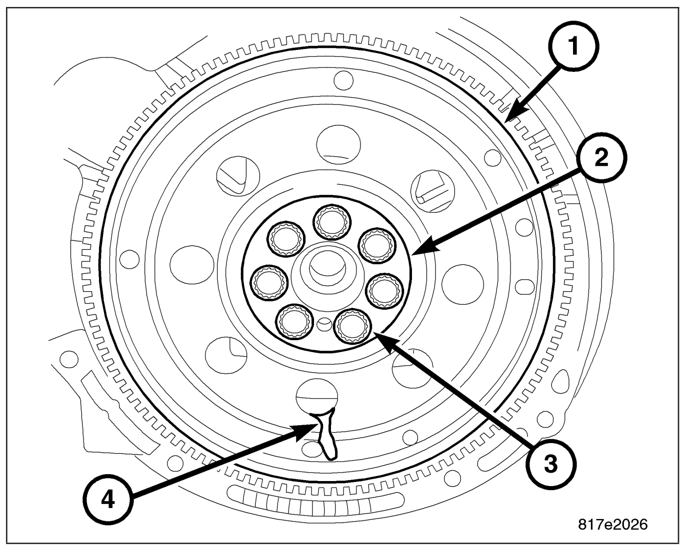
1. Remove transaxle
2. Remove flex plate bolts and discard.
3. Remove flex plate (1).

4. Insert a 3/16 flat bladed screwdriver (7) between the dust lip (8) and the metal case (4) of the crankshaft seal (1). Angle the screwdriver through the dust lip against metal case of the seal. Pry out seal.

CAUTION: Do not permit the screwdriver blade to contact crankshaft seal surface. Contact of the screwdriver blade against crankshaft edge (chamfer) is permitted.



INSTALLATION



CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), cleanup with 400 grit sand paper to prevent seal damage during installation of new seal.

NOTE: When installing seal, no lube on seal is needed.

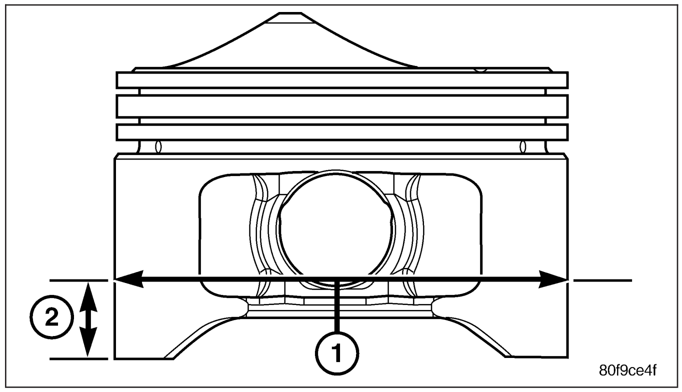
1. Place Special Tool 9509 (3) Seal Guide on crankshaft.
2. Position seal (2) over guide tool. Guide tool should remain on crankshaft during installation of seal. Ensure that the lip of the seal is facing towards the crankcase during installation.
3. Drive the seal into the block using Special Tool 9706 (1) and handle C-4171 (4) until the tool bottoms out against the block.

4. Install flex plate (1). Install new flex plate bolts and torque to 95 N·m (70 ft. lbs.).
5. Install transaxle. Refer to TRANSMISSION/TRANSAXLE - INSTALLATION for procedure.

PISTON & ROD-CONNECTING

DESCRIPTION

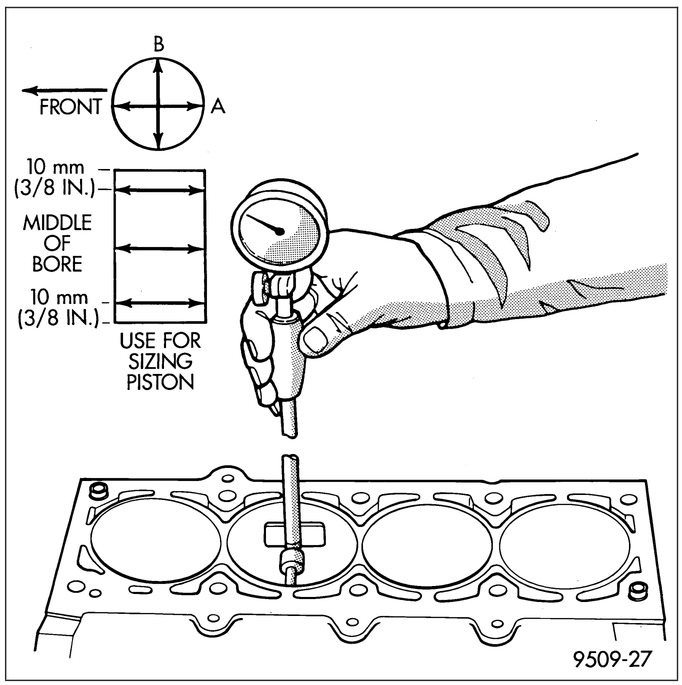
The pistons are made of a cast aluminum alloy. The pistons have pressed-in pins attached to forged connecting rods. The pistons pin is offset 0.8 mm (0.0314 in.) towards the thrust side of the piston. The connecting rods are a cracked cap design and are not repairable. The pistons with rings and connecting rods are serviced as an assembly.



STANDARD PROCEDURE

PISTON TO CYLINDER BORE FITTING

NOTE: Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).



Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin (1).

1. Measurement should be taken approximately 16 mm (0.629 in.) from the bottom of the skirt (2) as shown in.

NOTE: Correct piston to bore clearance must be established in order to assure quiet and economical operation.

2. Cylinder bores should be measured halfway down the cylinder bore and transverse (measurement location B) to the engine crankshaft center line shown in. Refer to for Engine Specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

REMOVAL

NOTE: Pistons, rings, and rods are serviced as an assembly.

CAUTION: All four piston/rod assemblies must be replaced as a set or engine damage may result.

1. Remove engine (Refer to 9 - ENGINE - REMOVAL).
2. Separate engine from transaxle.
3. Remove cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).

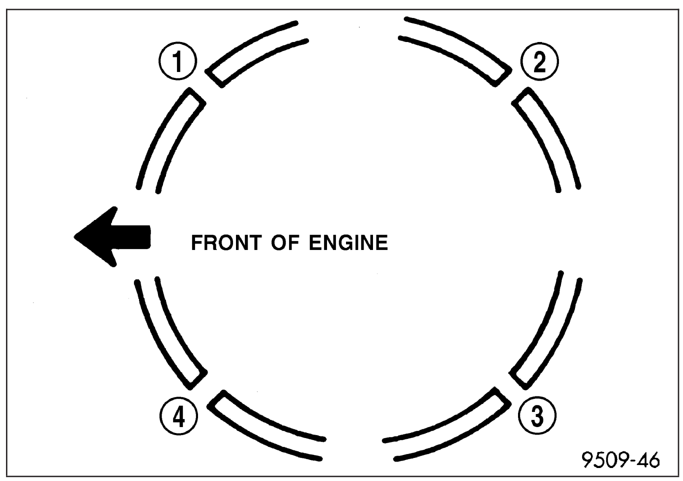
4. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
5. Remove balance shaft assembly.

NOTE: Remove any carbon build up prior to piston removal.

6. Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation**.
7. Rotate crankshaft so that each connecting rod is centered in cylinder bore.
8. Using a permanent ink or paint marker, identify cylinder number on each connecting rod cap.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods, as damage to connecting rod could occur.

CAUTION: Care must be taken not to damage the fractured rod and cap joint surfaces, as engine damage many occur.



9. Remove connecting rod bolts and cap.

NOTE: Do not reuse connecting rod bolts.

10. Carefully push each piston and rod assembly out of cylinder bore. Re-install bearing cap on the mating rod.
11. Repeat procedure for each piston and connecting rod assembly.

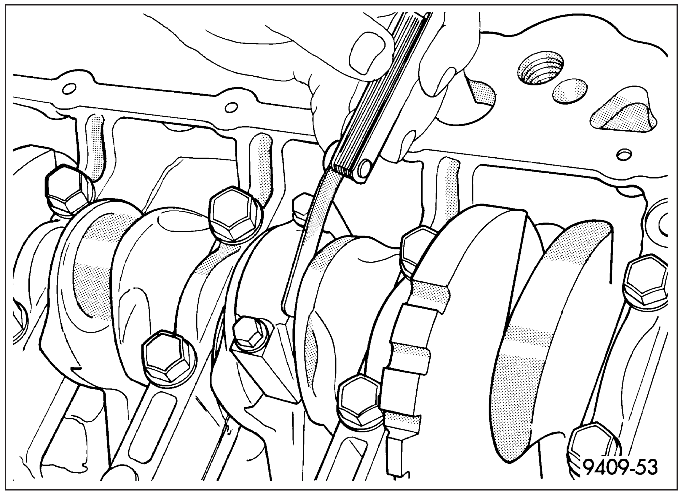
INSTALLATION

1. Install piston rings on piston (Refer to 9 - ENGINE/ ENGINE BLOCK/PISTON RINGS - INSTALLATION).
2. Before installing pistons and connecting rod assemblies into the bore, be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.
3. Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located as shown above. As viewed from the top of the piston.
4. Immerse the piston head and rings in clean engine oil, slide the ring compressor, over the piston. **Be sure position of rings does not change during this operation**.

5. The directional arrow stamped on the piston should face toward the front of the engine.
6. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Lubricate connecting rod journal with clean engine oil.

NOTE: There are three different size rod bearings, perform rod bearing selection procedure.

7. The rod bearing sizes are indicated on the nose of the crankshaft.
8. Install connecting rod upper bearing half into connecting rod.
9. Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.



NOTE: The connecting rod cap bolts should NOT be reused.

10. Before installing the **NEW** bolts, the threads should be coated with clean engine oil.
11. Install connecting rod lower bearing half into connecting rod cap. Install connecting rod cap.
12. Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.
13. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

1. Tighten the bolts to 27 N·m (20 ft. lbs.).
2. Tighten the connecting rod bolts an additional **1/4 TURN.**

14. Using a feeler gauge, check connecting rod side clearance. (Refer to 9 - ENGINE - SPECIFICATIONS) for connecting rod side clearance.
15. Install the ladder frame.
16. Install oil pump/Balance Shaft Carrier Assembly (Refer to 9 - ENGINE/VALVE TIMING/BALANCE SHAFT CARRIER - INSTALLATION).
17. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
18. Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

BEARINGS-MAIN

STANDARD PROCEDURE - MAIN BEARING SELECTION

NOTE: There are three different possibilities for the upper main bearings and five different lower main bearings. The upper and lower bearing shells are not interchangeable.

The lower main bearing identification is stamped in the nose of the crankshaft (1). There are 5 different bearing sizes available 0 through 4.

CRANKSHAFT IDENTIFICATION		LOWER CRANKSHAFT BEARING SELECTION	
JOURNAL DIAMETER GRADE	DIMENSION	LOWER MAIN BEARING SIZE CLASSIFICATION	LOWER MAIN BEARING DIMENSION
0	52 mm	0 (Pink or Red)	2 mm
1	52 mm	1 (Black)	2 mm
2	52 mm	2 (No Color)	2 mm
3	52 mm	3 (Green)	2 mm
4	52 mm	4 (Blue)	2 mm

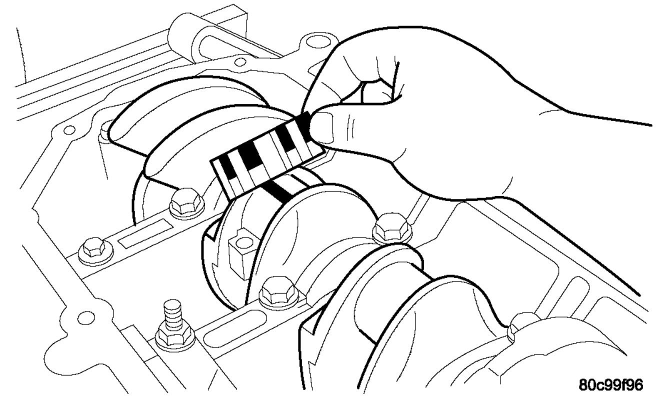
The upper main bearing shell identification is located in the middle of cylinder block on the right side of the engine when viewing from the flywheel. There are three different size bearings available.

UPPER MAIN BEARING SELECTION

CYLINDER BLOCK IDENTIFICATION		UPPER CRANKSHAFT BEARING SELECTION	
MAIN BEARING GRADE	DIMENSION	UPPER MAIN BEARING SIZE CLASSIFICATION	UPPER MAIN BEARING DIMENSION
1	56 mm	1 (Black)	2 mm
2	56 mm	2 (No Color)	2 mm
3	56 mm	3 (Green)	2 mm

BEARINGS-CONNECTING ROD

STANDARD PROCEDURE



CONNECTING ROD - FITTING

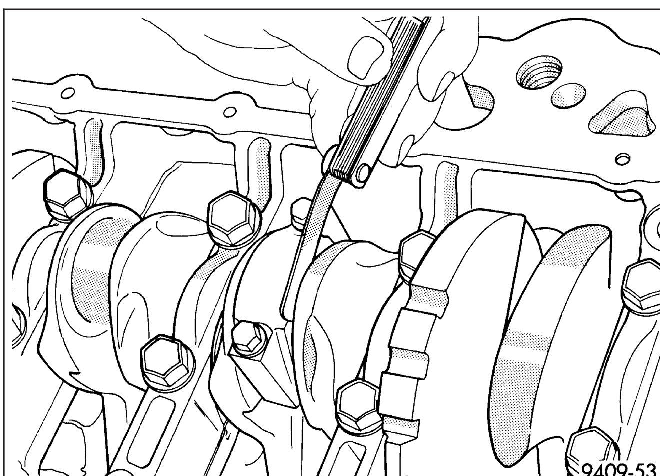
There are three different sizes of rod bearings available. Connecting rod bearing identification can be found on the nose of the crankshaft. Use the table below for proper bearing selection.

CONNECTING ROD BEARING SELECTION

CRANKSHAFT PIN DIAMETER GRADE	DIMENSION	CONNECTING ROD BEARING CLASSIFICATION	CONNECTING ROD BEARING DIMENSION
1	48 mm	1 (Black)	1.5 mm
2	48 mm	2 (No Color)	1.5 mm
3	48 mm	3 (Green)	1.5 mm

1. For measuring connecting rod bearing clearance procedure and use of Plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE) For bearing clearance refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS).

80c99f96



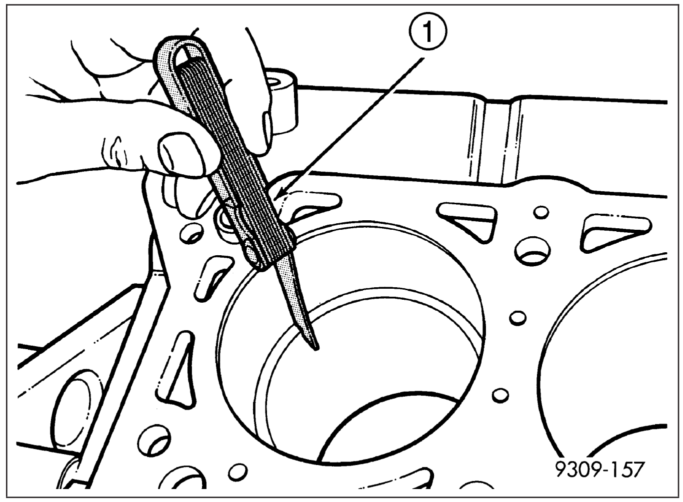
NOTE: The rod bolts should not be reused.

2. Before installing the **NEW** rod bolts the threads and under the bolt head should be oiled with clean engine oil.
3. Install each bolt finger tight then alternately torque each bolt to assemble the cap properly.
4. Tighten the connecting rod bolts using the 2 step torque-turn method. Tighten according to the following values:

CAUTION: Do not use a torque wrench for the second step.

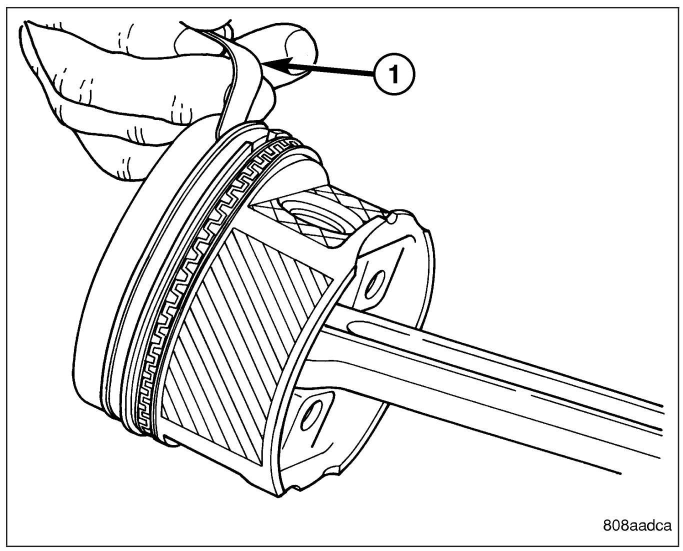
   1. Tighten the bolts to 27 N·m (20 ft. lbs.).
   2. Tighten the connecting rod bolts an additional 90°.

5. Using a feeler gauge, check connecting rod side clearance. Refer to clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).



9409-53

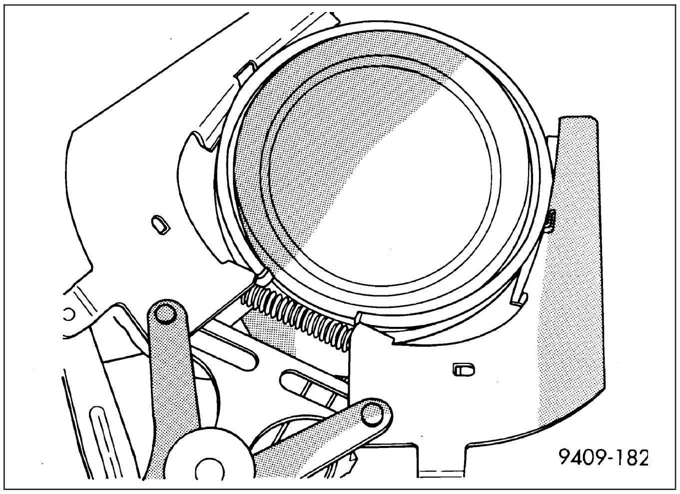
RINGS-PISTON



STANDARD PROCEDURE

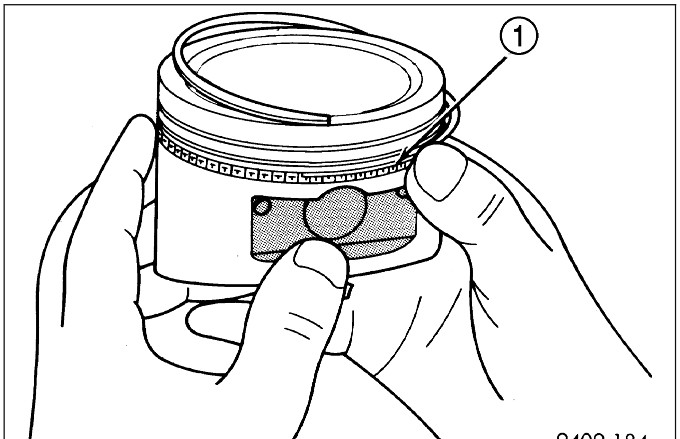
PISTON RING - FITTING

1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch) from bottom of cylinder bore. Check gap with feeler gauge. Refer to Engine Specifications.



2. Check piston ring to groove side clearance. Refer to Engine Specifications.

REMOVAL



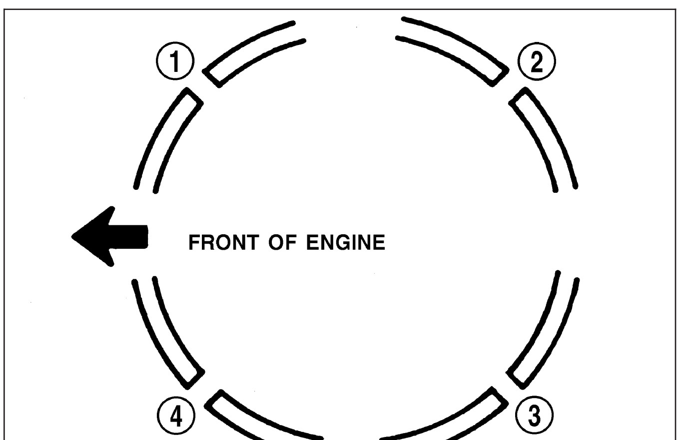
1. Using a suitable ring expander, remove upper and intermediate piston rings.
2. Remove the upper oil ring side rail, lower oil ring side rail and then oil ring expander from piston.
3. Clean ring grooves of any carbon deposits.

9409-182

INSTALLATION

NOTE: The identification mark on face of upper and intermediate piston rings must point toward top of piston.

9409-184



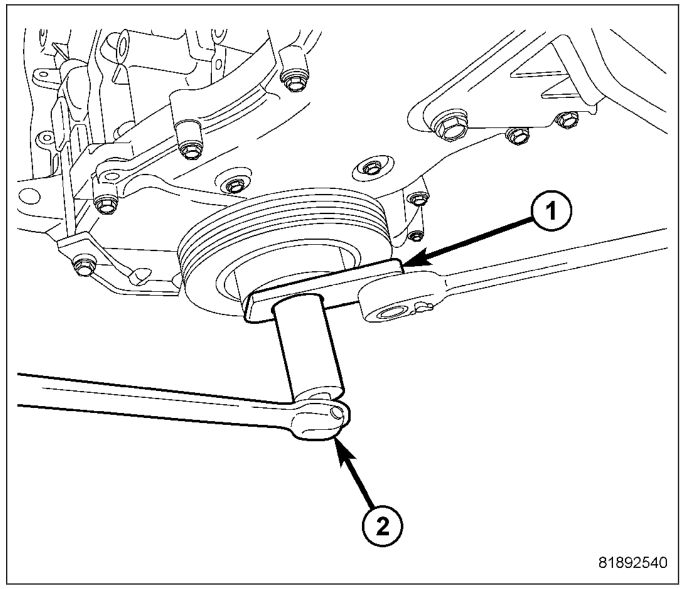
CAUTION: Install piston rings in the following order:

1. Oil ring expander.
2. Upper oil ring side rail.
3. Lower oil ring side rail.
4. No. 2 Intermediate piston ring.
5. No. 1 Upper piston ring.

1. Install oil ring expander.
2. Install upper side rail first and then the lower side rail. Install the side rails by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander.**

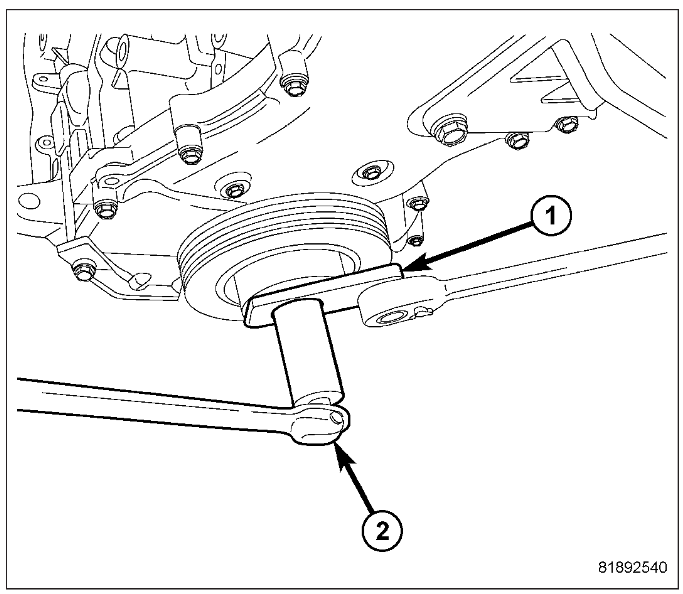
NOTE: The compression rings are marked Y1 for the upper compression ring and Y2 for the second compression ring. These markings must face upward.

3. Install No. 2 piston ring and then No. 1 piston ring.
4. Position piston ring end gaps as shown in.
5. Position oil ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.



9509-46

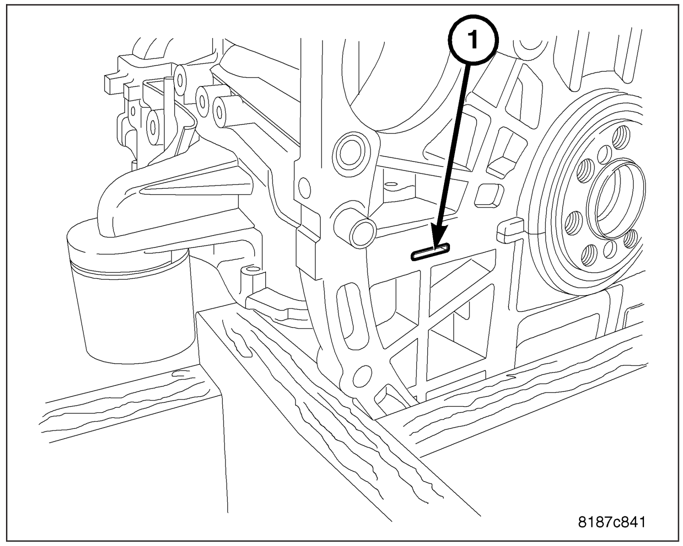
DAMPER-VIBRATION



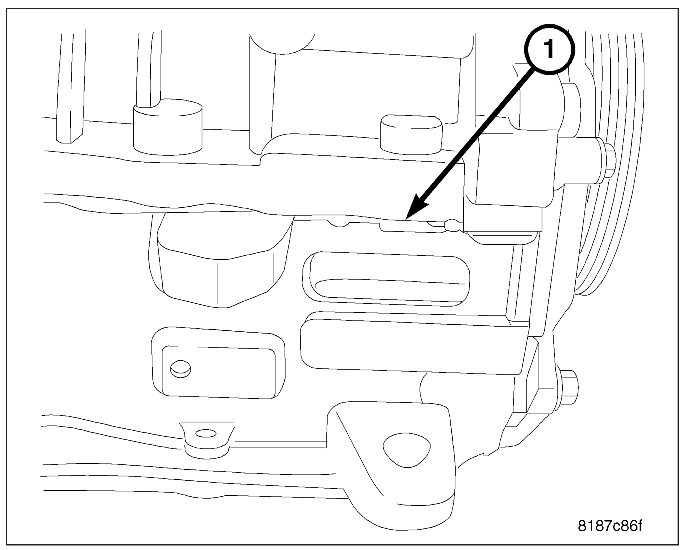
REMOVAL

1. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Install Damper holder 9707 (1).
3. Remove crankshaft damper bolt.
4. Pull damper off crankshaft.

INSTALLATION



1. Install crankshaft damper.
2. Apply clean engine oil crankshaft damper bolt threads and between bolt head and washer. Torque bolt to 210 N·m (155 ft. lbs.).
3. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

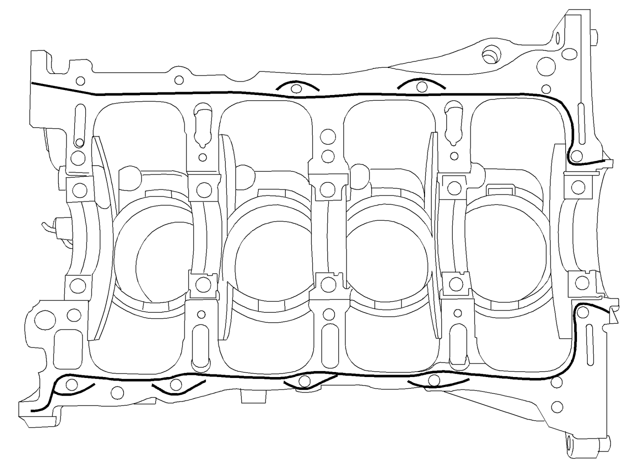


FRAME-LADDER

REMOVAL

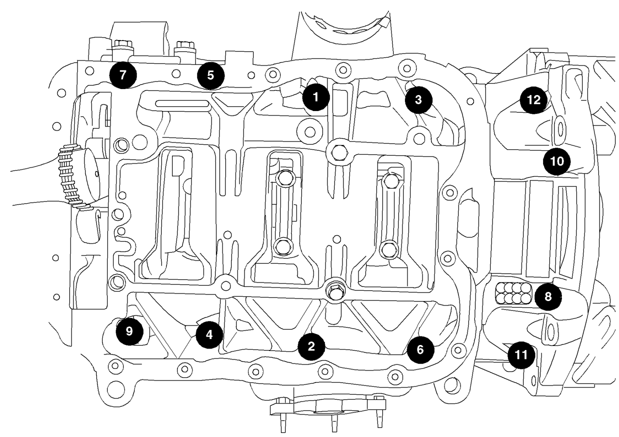
1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Remove oil pump/balance shaft assembly (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
3. Remove ladder frame retaining bolts.
4. Remove ladder frame using pry points cast in the rear of the block (1).

5. To assist in removing the ladder frame another (1) pry points cast in the left side of the block.



CLEANING

Clean ladder frame with a plastic or wooden scraper and a suitable solvent.



INSTALLATION

1. Apply a 2 mm bead of sealant as shown.

8186540e

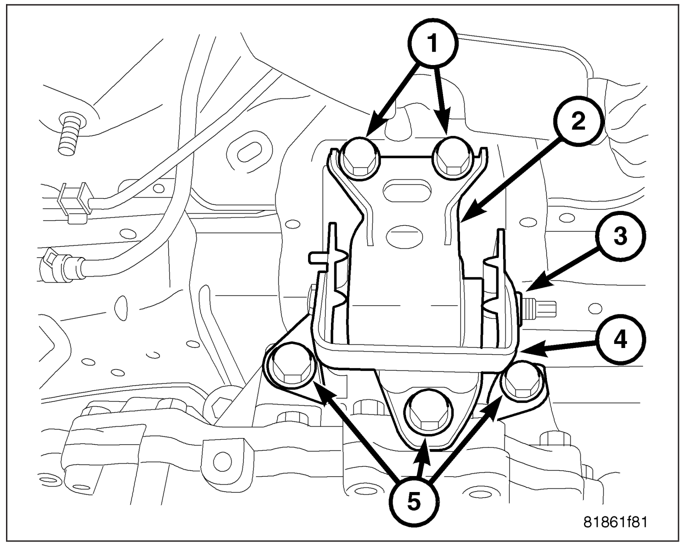
2. Install bolts and torque shown following a three step method.
   - First: All to 20 N·m (15 ft. lbs.)
   - Second: All to 49 N·m (36 ft. lbs.)
   - Third: All to 49 N·m (36 ft. lbs.)
3. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/ OIL PAN - INSTALLATION).

818670ab

ENGINE MOUNTING

DESCRIPTION

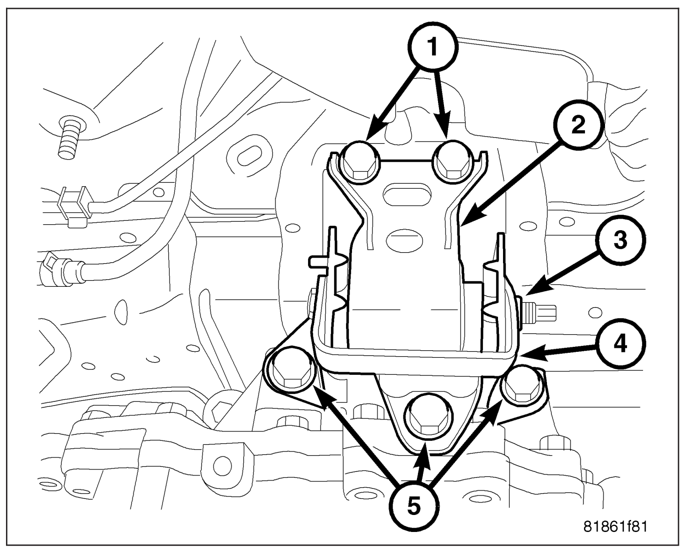
The engine mounting system consists of a four-point system utilizing two load-carrying mounts and two torque controlling mounts. The load-carrying mounts are located on each frame rail. The right mount is a hydro-elastic mount and left mount is a conventional elastomeric isolator. The two torque controlling mounts are attached to a fore/aft member and the front and rear of the engine.



OPERATION

The four-point engine mounting system minimizes the transmission of structure-borne engine noise to the passenger compartment. The load-carrying right and left mounts dampen and isolate vertical motion and vibration. The front and rear mount absorb torque reaction forces and torsional vibrations.

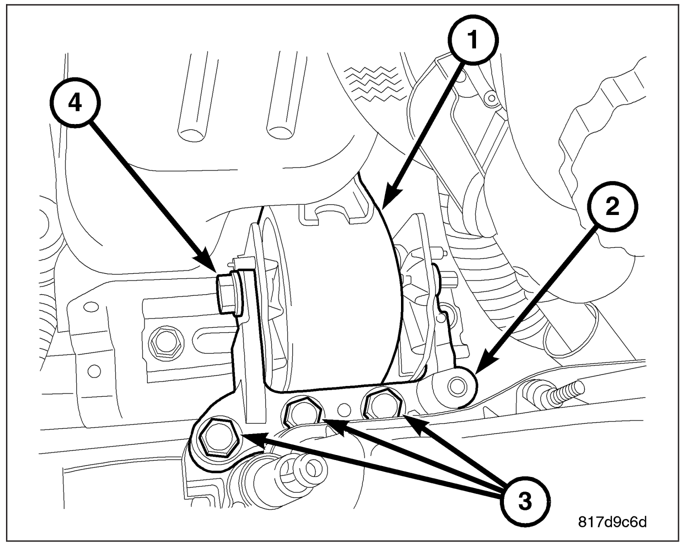
MOUNT-LEFT



REMOVAL

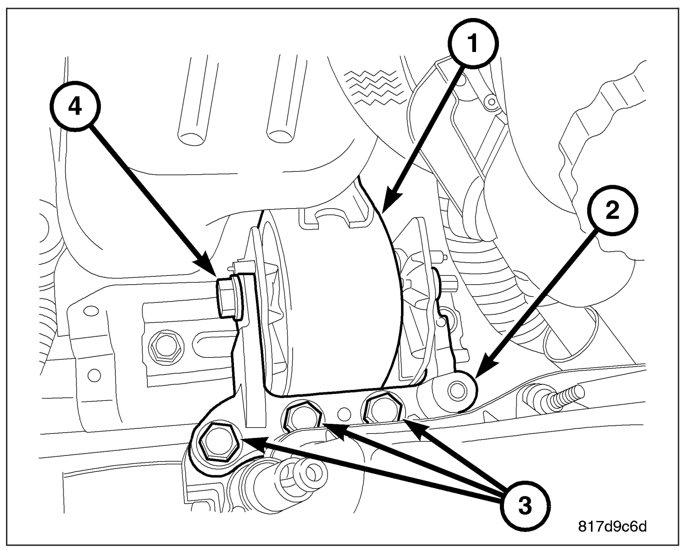
1. Remove air cleaner assembly.
2. Disconnect negative cable from battery.
3. Remove PCM.
4. Remove PCM mounting bracket.
5. Support transaxle with a suitable jack.
6. Remove left mount through bolt (3).
7. Remove mount to transaxle bolts (5).
8. Remove left mount bracket (4).
9. Remove left mount bracket to body frame rail fasteners.
10. Remove mount.

INSTALLATION



1. Install mount.
2. Install left mount to frame rail bolts and torque to 28N·m (250 in. lbs.).
3. Install left mount bracket (4).
4. Install mount to transaxle bolts (5) and torque to 68 N·m (50 ft.lbs.).
5. Install mount through bolt (3) and torque to 115 N·m (85 ft.lbs.).
6. Remove jack.
7. Install PCM mounting bracket.
8. Install PCM.
9. Connect negative battery cable.
10. Install air cleaner assembly.

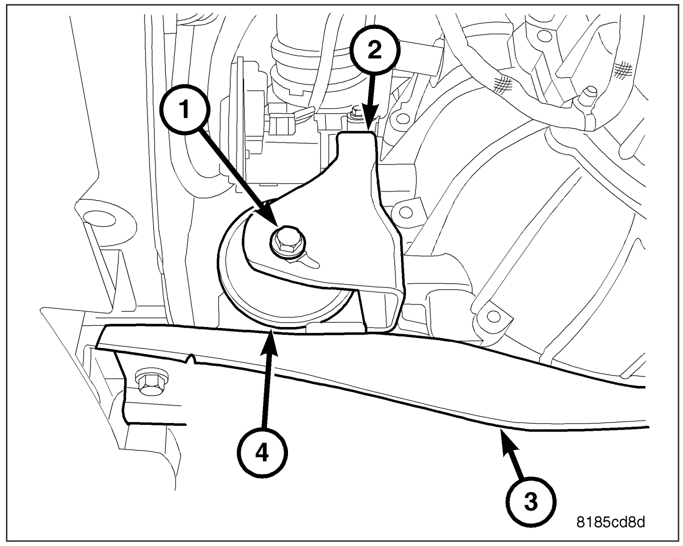
MOUNT-RIGHT



REMOVAL

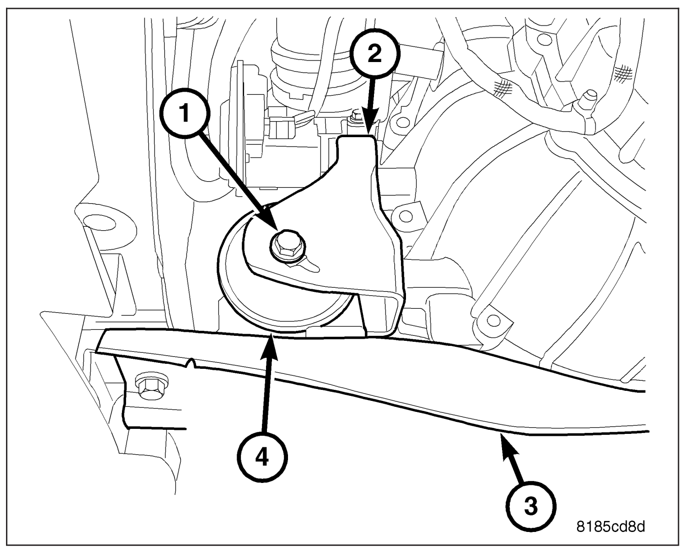
1. Remove coolant reservoir and set aside.
2. Remove power steering reservoir and set aside.
3. Remove windshield washer bottle.
4. Remove power steering line support bracket from engine mount.
5. Support transaxle with a block of wood and a suitable jack.
6. Remove engine mount through bolt (4).
7. Remove engine mount bracket bolts (3).
8. Remove engine mount retaining bolts.
9. Remove engine mount.

INSTALLATION



1. Install engine mount.
2. Install engine mount retaining bolts and torque to 28 N·m (250 in. lbs.).
3. Install engine mount bracket and torque bolts (3) to 68 N·m (50 ft. lbs.).
4. Install engine mount through bolt (4) and torque to 115 N·m (85 ft. lbs.).
5. Remove jack.
6. Install power steering line support bracket at engine mount.
7. Install windshield washer bottle.
8. Install power steering reservoir.
9. Install coolant reservoir.

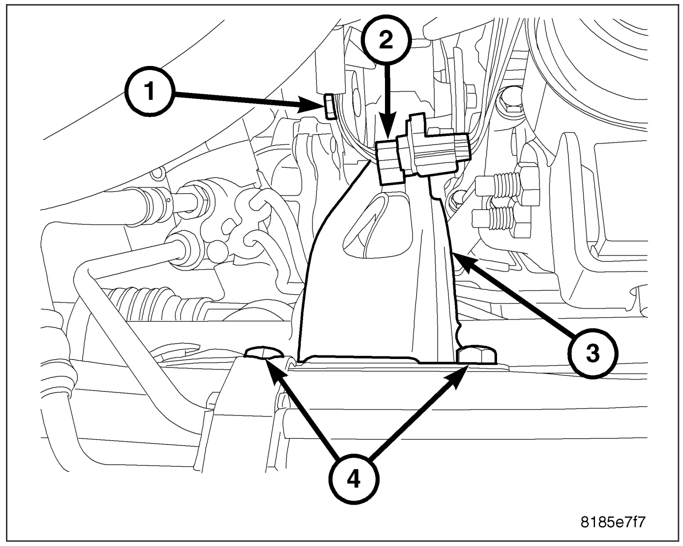
MOUNT-FRONT



REMOVAL

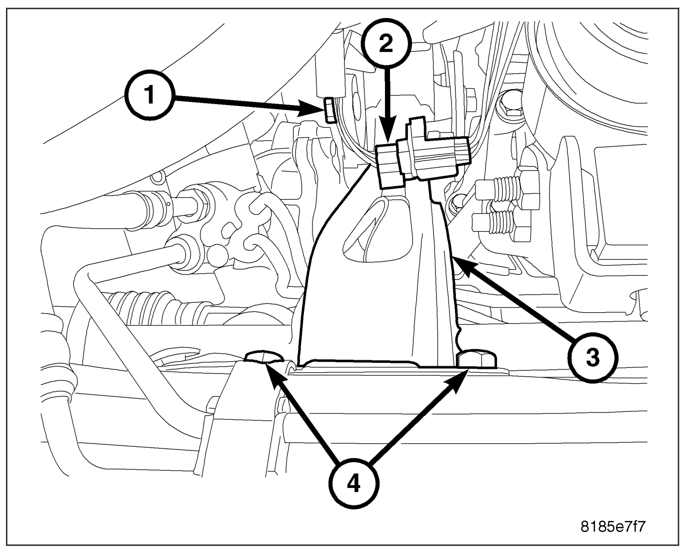
1. Raise vehicle.
2. Remove fore aft member (3) to mount (4) bolts.
3. Remove mount through bolt (1).
4. Remove fore aft member (3) mounting bolts and remove.
5. Remove front mount (4).

INSTALLATION



1. Install mount (4) and tighten bolts.
2. Install fore aft member (3) and tighten bolts.
3. Install mount through bolt (1) and tighten.
4. Lower vehicle.

MOUNT-REAR



REMOVAL

1. Remove rear mount retaining bolts (4).
2. Remove rear mount through bolt (1).
3. Remove oxygen sensor connector (2) from mount.
4. Remove rear mount (3).

INSTALLATION

1. Install rear mount (3).
2. Install rear mount retaining bolts (4) and tighten.
3. Install rear mount through bolt (1) and tighten.
4. Install oxygen sensor connector (2) retainer to mount (3).

LUBRICATION

DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump is mounted in the ladder frame and chain driven by the crankshaft.

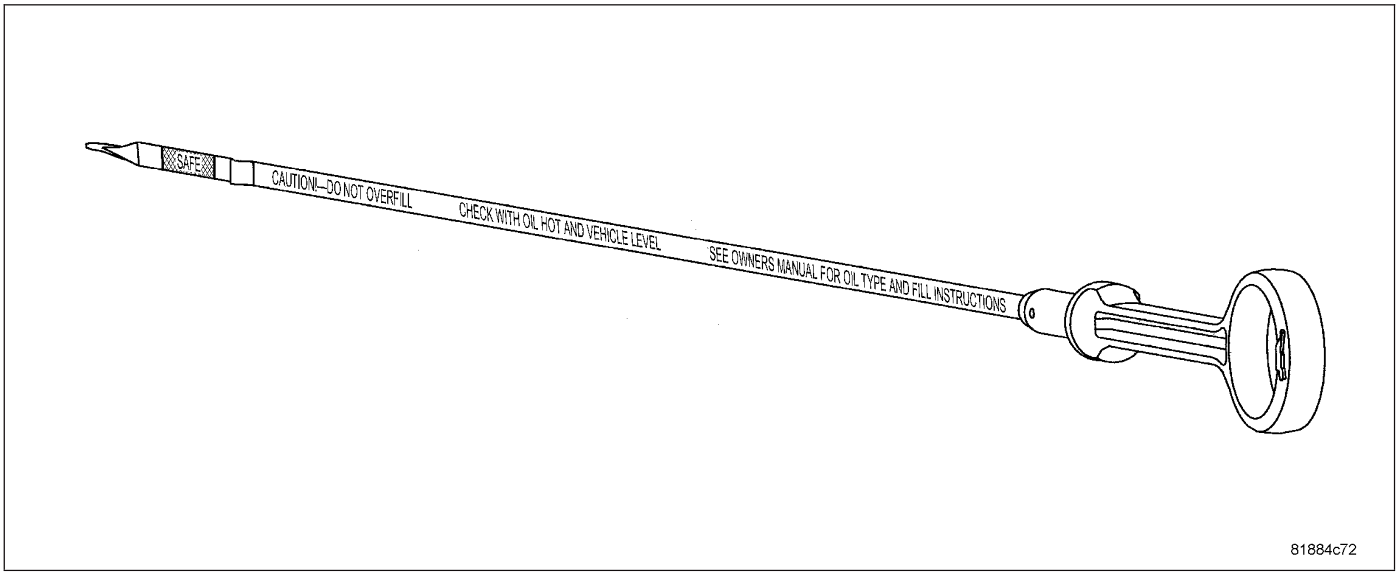
OPERATION

Engine oil drawn up through the pickup tube and is pressurized by the oil pump and routed through the full-flow filter to the main oil gallery running the length of the cylinder block. A diagonal hole in each bulkhead feeds oil to each main bearing. Drilled passages within the crankshaft route oil from main bearing journals to connecting rod journals. Balance shaft lubrication is provided through an internal oil passage. A vertical hole at the number one bulkhead routes pressurized oil through a filter screen and head gasket up to the cylinder head. The oil then divides into three passages; one to the intake cam phaser, one to the exhaust cam phaser and one to the camshafts. The passage to the camshafts divides to feed both of the hollow camshafts at the second cam journal.The rest of cam journals are feed oil through the hollow camshafts. The #1 cam journals are feed oil through the VVT oil passages. Oil passages to the phasers are directed through the OCV (oil control valves) to the #1 journals. The oil then flows through the camshafts then to the cam phasers. Oil returning to the pan from pressurized components supplies lubrication to the valve stems, cam lobes, and tappets. Cylinder bores and wrist pins are splash lubricated from directed slots on the connecting rod thrust collars.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

1. Disconnect and remove oil pressure switch. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL)
2. Install Special Tools C-3292 Gauge with 8406 Adaptor fitting.
3. Start engine and record oil pressure. Refer to Specifications for correct oil pressure requirements. (Refer to 9 - ENGINE - SPECIFICATIONS)

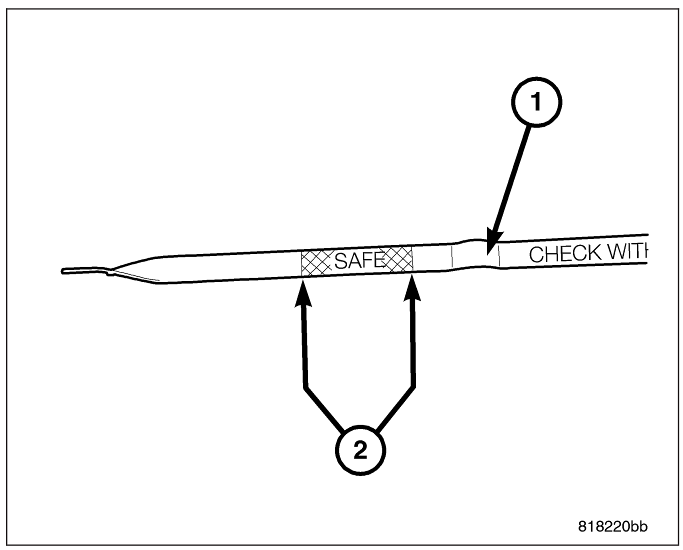


CAUTION: If oil pressure is 0 at idle, do not perform the 3000 RPM test

4. If oil pressure is 0 at idle, shut off engine. check for pressure relief valve stuck open, a clogged oil pick-up screen or a damaged oil pick-up tube O-ring.
5. Remove oil pan and inspect for debris.
6. Remove pressure relief valve and inspect, if damaged replace pressure relief valve.
7. If pressure relief valve is ok, replace balance shaft module assembly.
8. After test is complete, remove test gauge and fitting.
9. Install oil pressure switch and connector. (Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION).

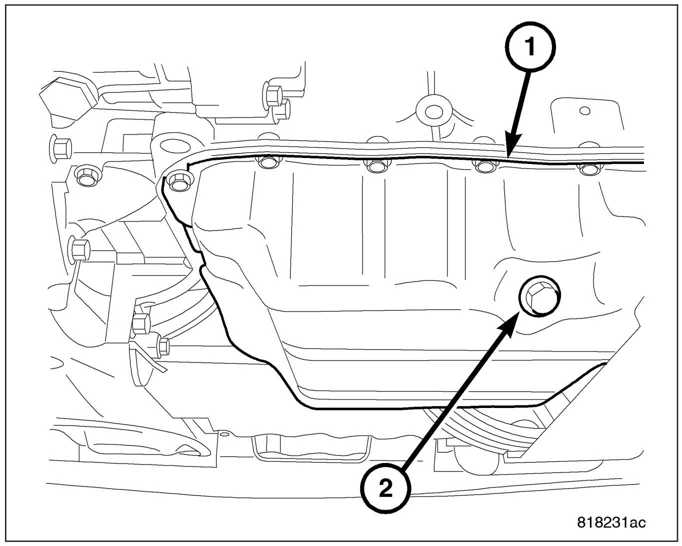
OIL

STANDARD PROCEDURE



ENGINE OIL LEVEL CHECK

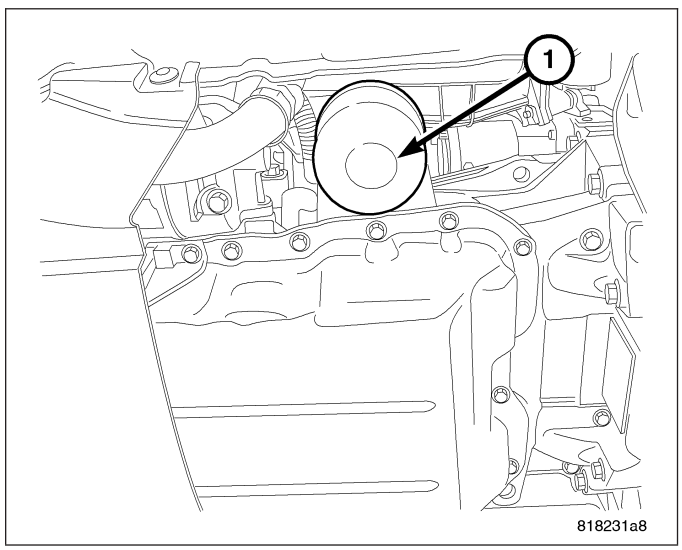
NOTE: The engine must be HOT when checking oil level.



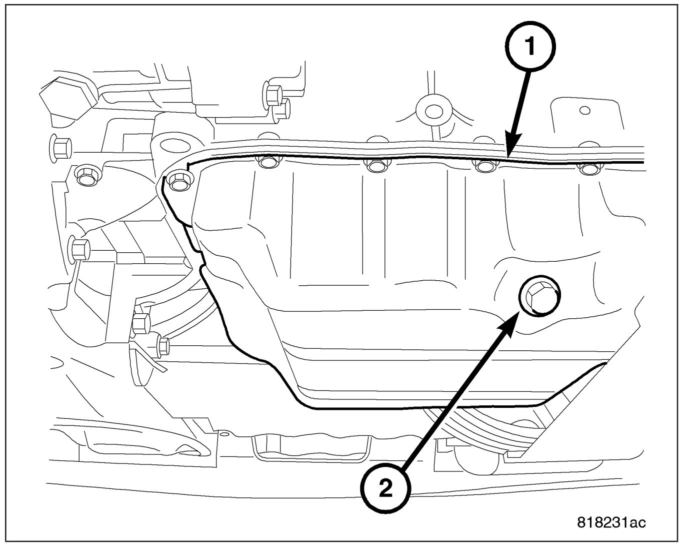
The best time to check engine oil level is after the engine is at operating temperature. Allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Remove dipstick (1), and observe oil level. Add oil only when the level is at or below the SAFE mark. If the oil level is in the safe (2) range, do not add oil.

CAUTION: Do not operate engine if the oil level is above the MAX mark on the dipstick. Excessive oil volume can cause oil aeration which can lead to engine failure due to loss of oil pressure or increase in oil temperature.

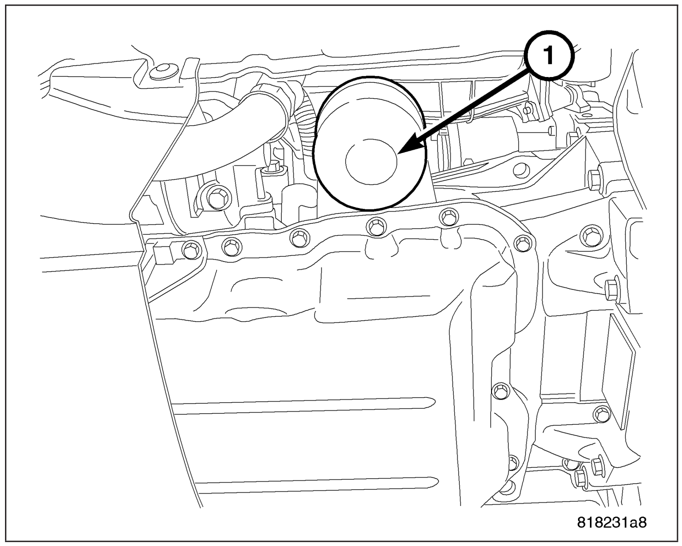


ENGINE OIL AND FILTER CHANGE



WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Change engine oil at mileage and time intervals described in the Maintenance Schedule (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).



1. Run engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn engine off.
3. Remove oil fill cap.
4. Raise vehicle on hoist.
5. Place a suitable oil collecting container under oil pan drain plug (2).
6. Remove oil pan drain plug (2) or and allow oil to drain into collecting container. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
7. Remove oil filter (1) (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL).

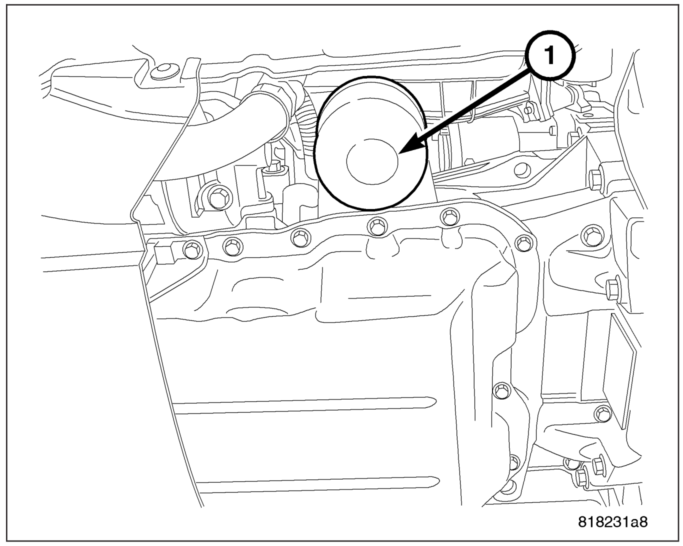
8. Install oil pan drain plug (2). Torque drain plug to 28 N·m (20 ft. lbs.).

9. Install new oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - INSTALLATION).
10. Lower vehicle and fill crankcase with specified type and amount of engine oil (Refer to LUBRICATION & MAINTENANCE/SPECIFICATIONS - FLUID CAPACITIES) and (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION).
11. Install oil fill cap.
12. Start engine and inspect for leaks.
13. Stop engine and inspect oil level.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. Replace oil filter with a Mopar® or the equivalent.

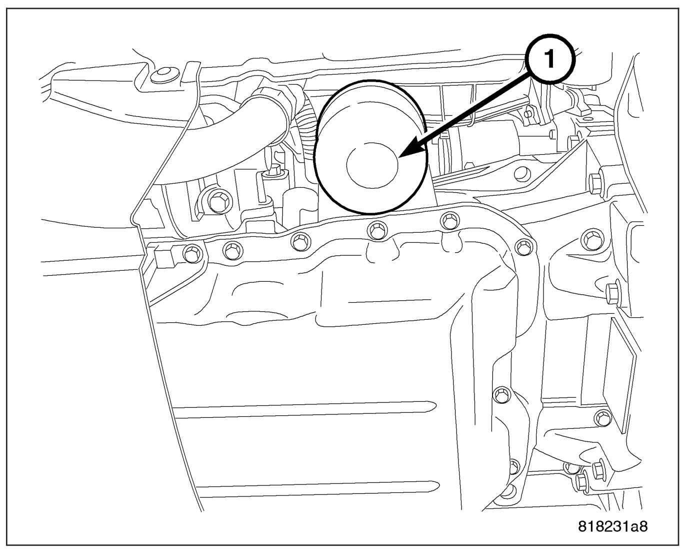
USED ENGINE OIL DISPOSAL



Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

FILTER-OIL

REMOVAL

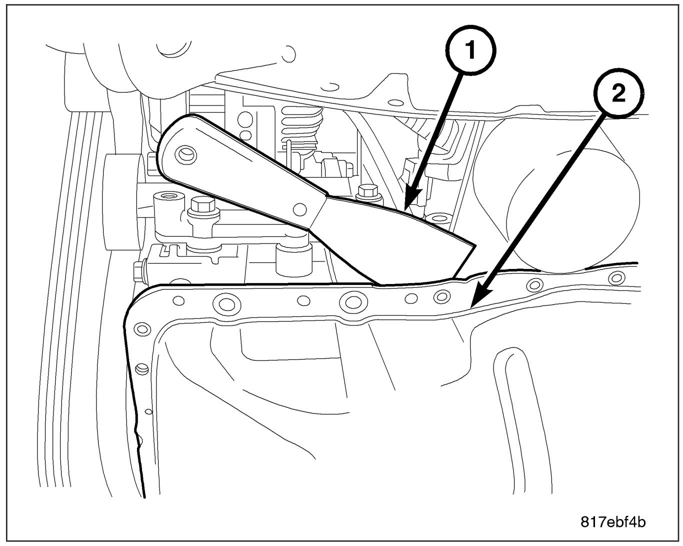


CAUTION: When servicing the oil filter avoid deforming the filter can by installing the remove/ install tool band strap against the can to base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

1. Using a suitable filter wrench, turn oil filter (1) counterclockwise to remove.

INSTALLATION

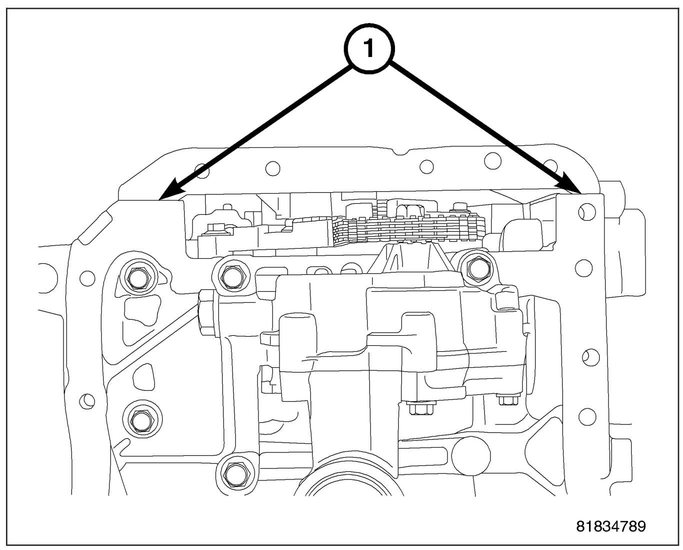
1. Clean and check filter mounting surface. The surface must be smooth, flat and free of debris or pieces of gasket.
2. Lubricate new oil filter gasket.
3. Screw oil filter (1) on until the gasket contacts base. Tighten to 21 N·m (15 ft. lbs.).



PAN-OIL

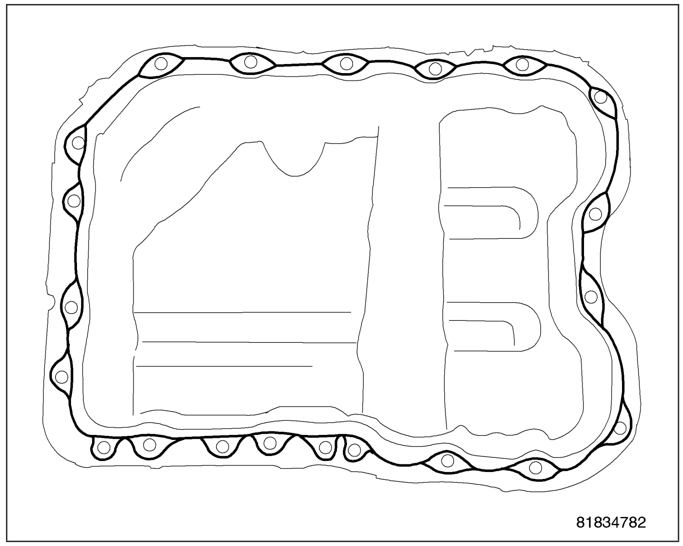
REMOVAL

1. Raise vehicle on hoist.
2. Drain engine oil.
3. Remove accessory drive belt splash shield.
4. Remove lower A/C compressor mounting bolt (if equipped).
5. Remove A/C mounting bracket.



NOTE: Do not use pry points in block to remove oil pan.

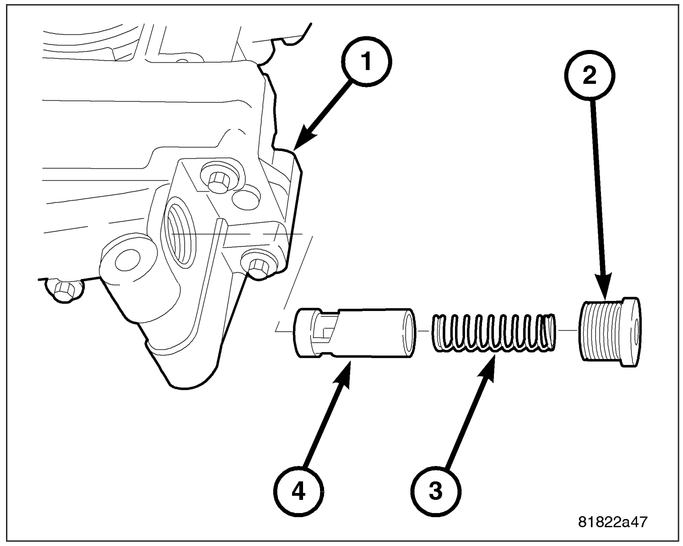
6. Remove oil pan retaining bolts.
7. Using a putty knife (1), loosen seal around oil pan (2).
8. Remove oil pan (2).



INSTALLATION

1. Apply Mopar® Engine RTV GEN II at the front cover to engine block parting lines (1).

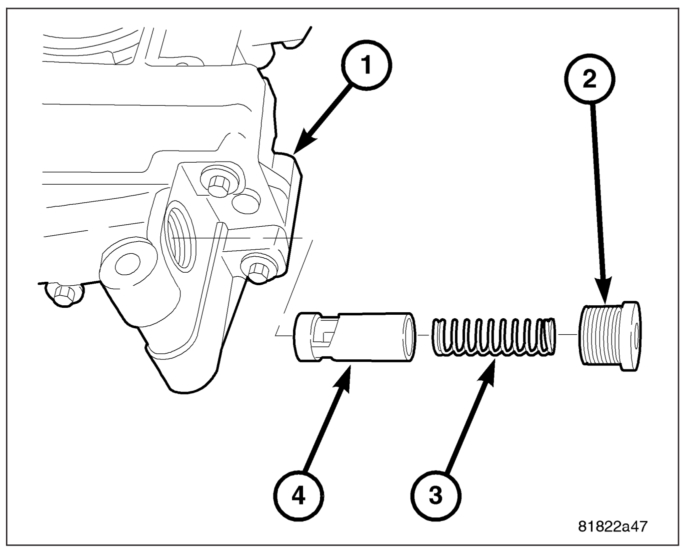
2. Apply a 2 mm bead of Mopar® Engine RTV GEN II around the oil pan as shown.



3. Tighten screws to 12 N·m (105 in. lbs.).
4. Install oil drain plug.
5. Lower vehicle and fill engine crankcase with proper oil to correct level.
6. Start engine and check for leaks.

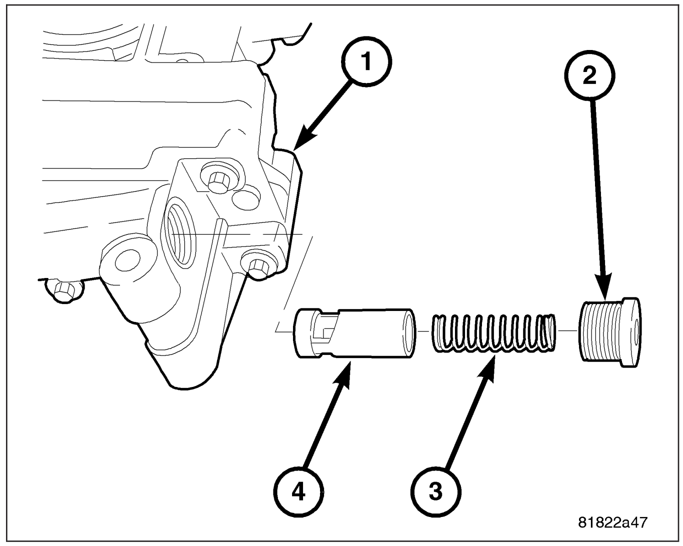
VALVE-OIL PRESSURE RELIEF

REMOVAL



1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
2. Remove pressure regulating valve cap (2).
3. Remove pressure regulating valve spring (3) and valve (4).

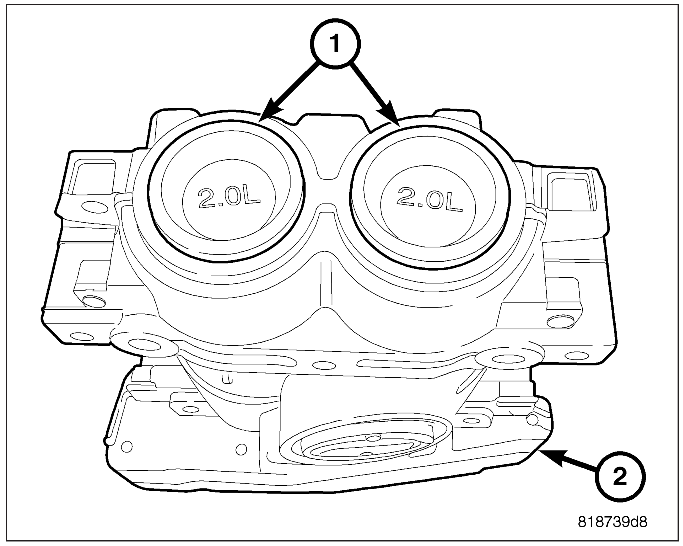
INSPECTION



NOTE: Pressure regulating valve (4) can be service separately from the oil pump assembly.

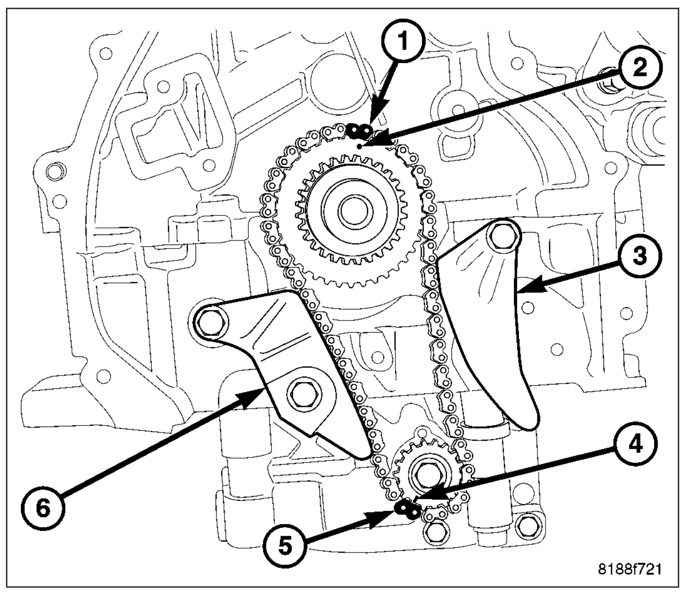
1. Inspect pressure relief valve (4) scoring, gouging, or debris. Replace as needed.
2. Inspect the pressure relief valve bore in the pump for scoring, gouging, or debris.
3. If pump bore is damaged, replace balance shaft module.

INSTALLATION



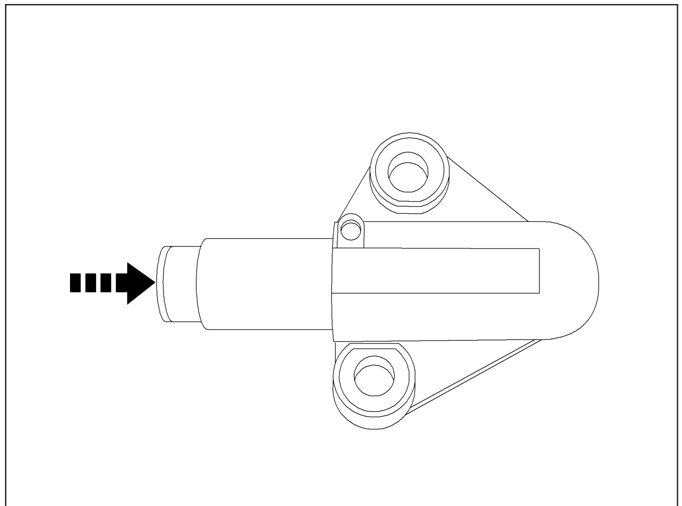
1. Lightly coat pressure regulating valve with clean engine oil and install valve (4).
2. Install spring (3) and cap (2).
3. Torque cap to 42 N·m (31 lbs.ft.).

PUMP-OIL

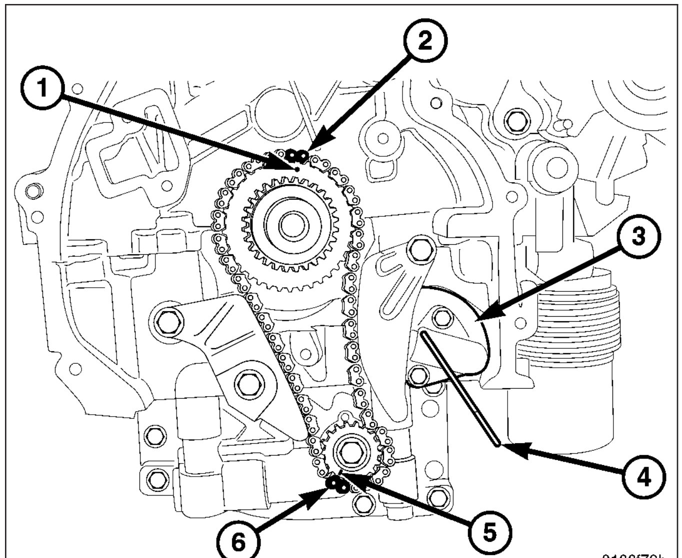


DESCRIPTION

The oil pump is integral to the balance shaft module (BSM) (2). The oil pump cannot be disassembled for inspection. The pressure relief valve is serviceable and can be removed and inspected. The BSM can be identified by the plastic end caps (1).



REMOVAL

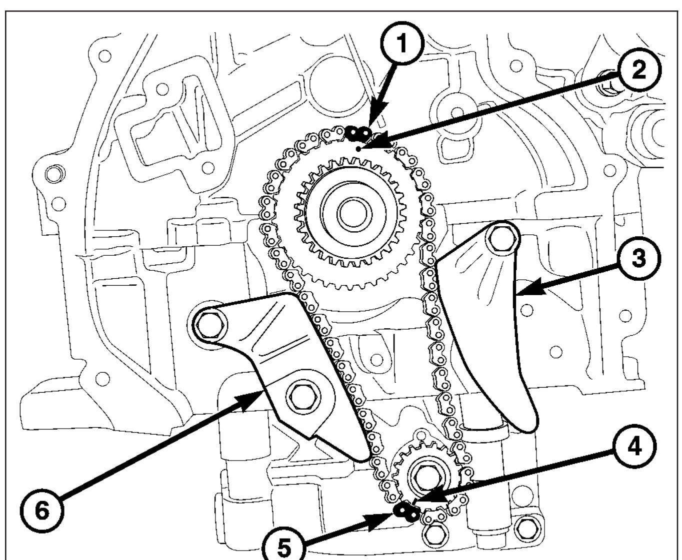


1. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Mark the chain (4) and the sprocket (5) for reassembly.

3. Push tensioner toward the front of the vehicle.

8188d7a5

4. Install 9703 (4).
5. Remove BSM mounting bolts and discard.
6. Lower the back of the BSM and remove sprocket from chain.
7. Remove BSM from the engine.

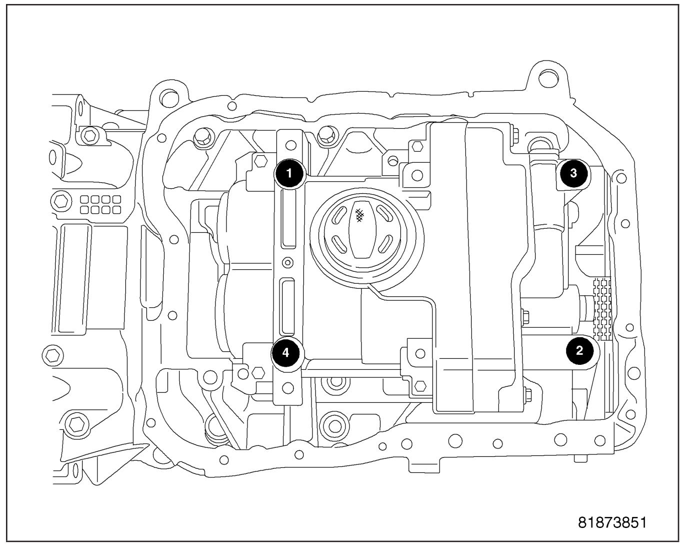


8188f72b

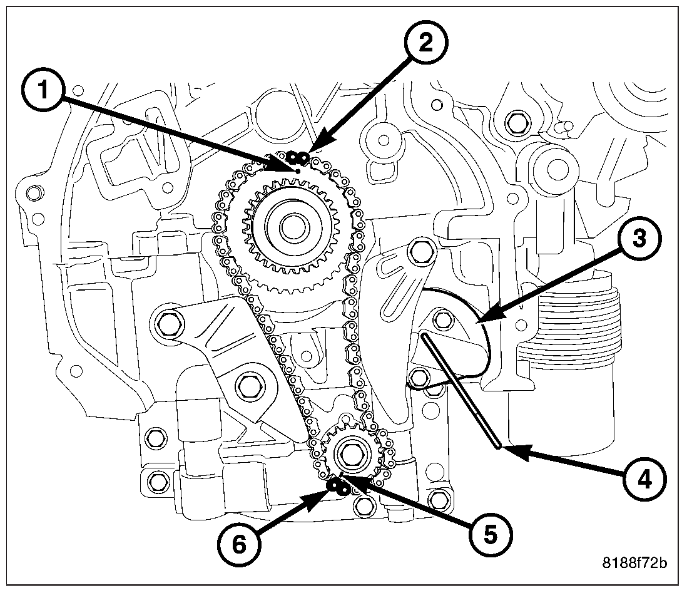
INSTALLATION

CAUTION: Do not reuse Balance Shaft Module (BSM) to engine block bolts. Always discard bolts after removing. Failure to replace bolts can result in engine damage.

1. Align marks on oil pump sprocket (5) and chain (4).
2. Install chain on sprocket.
3. Pivot BSM assembly upwards toward the engine block.



8188f721



4. Start **new** BSM mounting bolts by hand.

NOTE: Use a three step procedure when torqueing BSM mounting bolts.

5. Torque BSM mounting bolts to 15 N·m (11 ft. lbs.) as shown.
6. Torque BSM mounting bolts to 29 N·m (22 ft. lbs.) as shown.
7. Rotate bolts an additional 90° as shown.

8. Remove tensioner pin 9703 (4).
9. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
10. Fill with oil.
11. Start engine and check for leaks.

SENSOR/SWITCH-ENGINE OIL PSI

DESCRIPTION

The oil pressure switch is located on the left front side of the engine block. The oil pressure switch is a pressure sensitive switch that is activated by the engine's oil pressure (in the main oil gallery). The switch is a two terminal device (one terminal is provided to the wiring harness and the other terminal is the switch's metal housing that screws into the engine block).

OPERATION

The oil pressure switch is normally "Closed." The switch changes from a ″Closed″ circuit to an ″Open″ circuit, on increasing pressure of 7 psig. The oil pressure switch changes from an ″Open″ circuit to a ″Closed″ circuit, on decreasing pressure, between 2 psig and 4 psig.

REMOVAL

1. Raise vehicle.
2. Disconnect electrical connector.
3. Remove oil pressure sending unit using oil pressure socket C-4597.

INSTALLATION

1. Install oil pressure sending unit using oil pressure socket C-4597.
2. Connect electrical connector.

COOLER-OIL

DESCRIPTION

An engine oil cooler is used on some 2.4L engine packages. The cooler is a coolant-to-oil type and mounted between the oil filter and oil filter adapter.

REMOVAL

1. Raise vehicle on hoist.
2. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
3. Disconnect oil cooler coolant hoses.
4. Remove oil filter.
5. Remove oil cooler connector bolt.
6. Remove oil cooler.

INSTALLATION

1. Replace oil cooler seal.
2. Lubricate seal and position oil cooler to oil filter adapter, aligning notch to tab.
3. Install oil cooler connector bolt. Torque connector bolt to 55 N·m (41 ft. lbs.).
4. Install oil filter.
5. Connect oil cooler coolant hose.
6. Lower vehicle.
7. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

MANIFOLD-INTAKE

DIAGNOSIS AND TESTING

INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

1. Start the engine.
2. Spray a small stream of water (Spray Bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

LOWER INTAKE MANIFOLD

WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING SYSTEM COMPONENTS. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.

1. Remove engine cover.
2. Perform fuel system pressure release procedure **before attempting any repairs (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).**
3. Remove air cleaner housing.
4. Disconnect negative battery cable.
5. Disconnect fuel line at rail.
6. Remove fuel injector electrical connectors.
7. Remove fuel rail retaining bolts and remove fuel rail.
8. Disconnect oil temperature sensor.
9. Disconnect variable valve timing solenoid electrical connector.
10. Disconnect intake camshaft position sensor electrical connector.
11. Position harness out of the way.
12. Remove throttle body support bracket.
13. Disconnect electronic throttle control electrical connector.
14. Remove wiring harness retainer from the intake manifold.
15. Disconnect MAP sensor electrical connector.
16. Disconnect vacuum lines at intake.
17. Remove upper radiator hose retaining bracket.
18. Remove intake manifold retaining bolts.
19. Remove intake manifold.

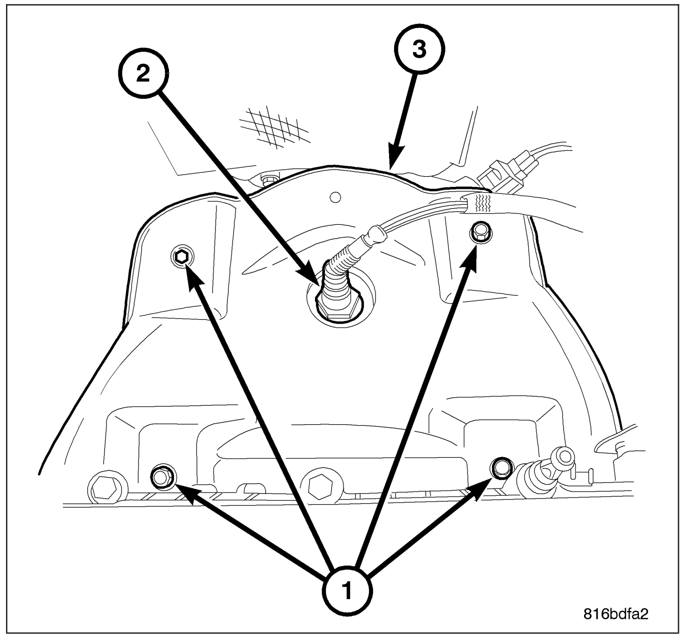
CLEANING

1. Discard gasket(s).
2. Clean all sealing surfaces.

INSPECTION

1. Inspect manifold for cracks, distortion, or mounting surface warpage. Replace manifold if necessary.
2. Inspect manifold gasket for surface damage or excessive swelling. Replace gaskets as necessary.

INSTALLATION



LOWER INTAKE MANIFOLD

1. Clean all gasket surfaces.
2. Replace intake manifold gasket.
3. Install intake manifold, torque bolts to 25 N·m (220 in. lbs.).
4. Install the fuel rail assembly to intake manifold. Tighten screws to 23 N·m (200 in. lbs.).
5. Connect fuel injector electrical connectors.
6. Inspect quick connect fittings for damage, replace if necessary (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE). Connect fuel supply hose to fuel rail assembly. Check connection by pulling on connector to insure it locked into position.
7. Connect negative cable to battery.
8. Fill the cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

MANIFOLD-EXHAUST

REMOVAL

1. Remove engine cover.
2. Remove clean air hose and air cleaner housing.
3. Disconnect negative cable from battery.
4. Disconnect throttle and speed control cables from the throttle lever and bracket.
5. Disconnect MAP sensor electrical connector.
6. Remove fasteners securing power steering fluid reservoir to cylinder head.
7. Remove coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL).
8. Remove bolts attaching upper heat shield.
9. Remove upper heat shield.
10. Raise vehicle.
11. Disconnect exhaust pipe from manifold.
12. Remove engine wiring heat shield.
13. Remove manifold support bracket.
14. Remove lower exhaust manifold heat shield.
15. Disconnect oxygen sensor electrical connector.
16. Remove exhaust manifold lower retaining fasteners.
17. Lower vehicle and remove the upper exhaust manifold retaining fasteners.
18. Remove exhaust manifold from above/between the engine and cowl panel.
19. Remove and discard manifold gasket.
20. Mark prop shaft and differential for proper installation (if equipped).
21. Remove the rear prop shaft (if equipped) (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL).
22. Remove the two exhaust to maniverter (exhaust manifold with catalytic converter) bolts.
23. Unplug the down - stream O2 sensor connector.
24. Remove the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL).
25. Lower the vehicle on the hoist.
26. Unplug the up - stream O2 sensor connector.
27. Remove up - stream O2 sensor from the maniverter (exhaust manifold with catalytic converter) using o2 sensor socket 8439 (2).

28. Remove the four maniverter heat shield bolts (1).
29. Remove the two retaining bolts and one nut from the maniverter side heat shield (3).
30. Remove the seven maniverter to head retaining bolts.
31. Slide the maniverter up and to the right, The support the maniverter (1) with the help of a bungie cord.
32. Raise the vehicle on the hoist.
33. Remove the four (1) engine to maniverter bracket bolts.
34. Remove the rear engine mount through bolt (2).
35. Remove the three front engine mount to frame bolts and the mount through bolt.
36. Remove the PTU mounting bolts.
37. Install a screw jack (2)on front engine mount bracket (1).
38. Raise the front of the engine until the rear mount has dropped (1,2).
39. Separate the PTU from the transaxle.

40. Remove and discard old O-ring between Transmission and PTU
41. Roll the PTU (1) forward and down to remove.

CLEANING

1. Discard gasket (if equipped) and clean all surfaces of manifold and cylinder head.

INSPECTION

1. Inspect manifold gasket surfaces for flatness with straight edge. Surface must be flat within 0.15 mm per 300 mm (0.006 in. per foot) of manifold length.
2. Inspect manifolds for cracks or distortion. Replace manifold as necessary.

INSTALLATION

1. Install a new exhaust manifold gasket. **DO NOT APPLY SEALER**.
2. Position exhaust manifold in place. Tighten fasteners, starting at center and progressing outward in both directions to 23 N·m (200 in. lbs.). Raise and lower vehicle for fastener access as necessary. Repeat tightening procedure until all fasteners are at specified torque.
3. Install exhaust manifold heat shields. Tighten bolts to 12 N·m (105 in. lbs.).
4. Install exhaust manifold support bracket.
5. Install engine wiring heat shield.
6. Connect oxygen sensor electrical connector.
7. Install exhaust pipe to manifold. Tighten fasteners to 28 N·m (250 in. lbs.).
8. Install coolant recovery container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION).
9. Install fasteners securing power steering fluid reservoir to cylinder head.
10. Connect MAP sensor electrical connector.
11. Connect throttle and speed control cables to the throttle lever and bracket.
12. Connect negative cable to battery.
13. Install clean air hose and air cleaner housing.
14. Roll the PTU in moving from front to back.
15. Rest the PTU on the frame while the engine and transaxle are raised back into position.
16. Lower screw jack until rear mount through bolt can be installed.
17. Install rear mount through bolt and torque bolt to 75 Nm (55 ft. lbs.).
18. Install the transmission crossmember and bolts, torque to 75 Nm (55 ft. lbs.).
19. Install the through bolt at the front transmission mount and torque to 75 Nm (55 ft. lbs.)
20. Insure that the O-ring between the PTU and transaxle is in place.
21. Slide the PTU into place.
22. Install and torque PTU mounting bolts to 58 N-m (43 lbf-ft).
23. Lower the hoist.
24. Place the maniverter back into place and install the seven bolts.
25. Torque the maniverter bolts.
26. Install the maniverter side heat shield into place.
27. Install the two retaining bolts and one retaining nut.
28. Install the maniverter heat shield and the four retaining bolts.
29. Torque the maniverter heat shield bolts.
30. Using tool 8439 install the O2 sensor.
31. Install the air box.
32. Install engine trim cover.
33. Raise the vehicle on the hoist.
34. Install the maniverter to block bracket and four mounting bolts.

35. Torque maniverter to block bracket mounting bolts.
36. Install the exhaust system (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).
37. Install the Prop shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION).
38. install the right axle shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION).
39. Install the right front tire.
40. Fill PTU. (Refer to 21 - TRANSMISSION/TRANSAXLE/POWER TRANSFER UNIT - STANDARD PROCEDURE).
41. lower hoist
42. Connect battery cables.
43. Top off the fluids.

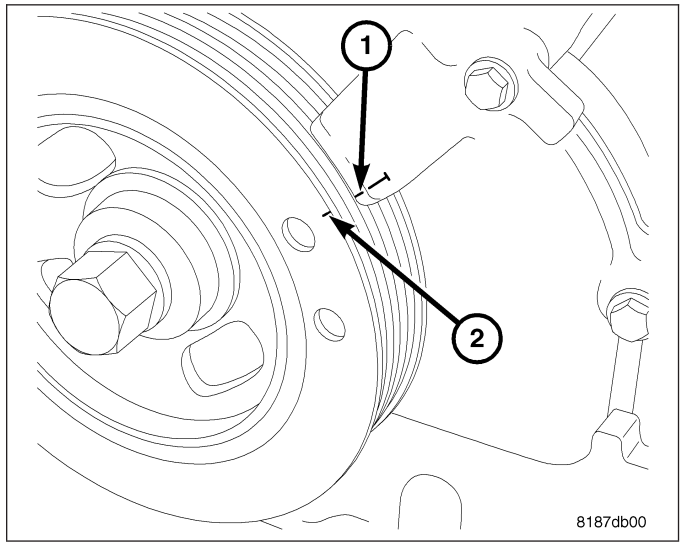
COVER-TIMING CHAIN

REMOVAL

1. Remove engine cover.
2. Perform fuel pressure bleed procedure.
3. Remove air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Disconnect negative battery cable.
5. Drain cooling system
6. Remove coolant recovery bottle.
7. Remove windshield washer bottle.
8. Remove power steering reservoir and set aside.
9. Remove make up air hose.
10. Remove PCV hose.
11. Disconnect ignition coil electrical connectors.
12. Remove cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
13. Raise vehicle.
14. Remove right lower splash shield.
15. Set engine to TDC.
16. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
17. Remove lower A/C compressor retaining bolts.
18. Remove A/C compressor lower bracket.
19. Remove accessory drive belt lower idler pulley.
20. Remove crankshaft pulley.
21. Remove water pump pulley.
22. Remove timing chain cover lower bolts.
23. Lower vehicle.
24. Remove power steering pump and set aside.
25. Support engine with a suitable jack.
26. Remove right engine mount.
27. Remove accessory drive belt upper idler pulley.
28. Remove right engine mount bracket.
29. Remove accessory drive belt tensioner.
30. Remove timing chain cover upper retaining bolts.
31. Remove timing chain cover.

INSTALLATION

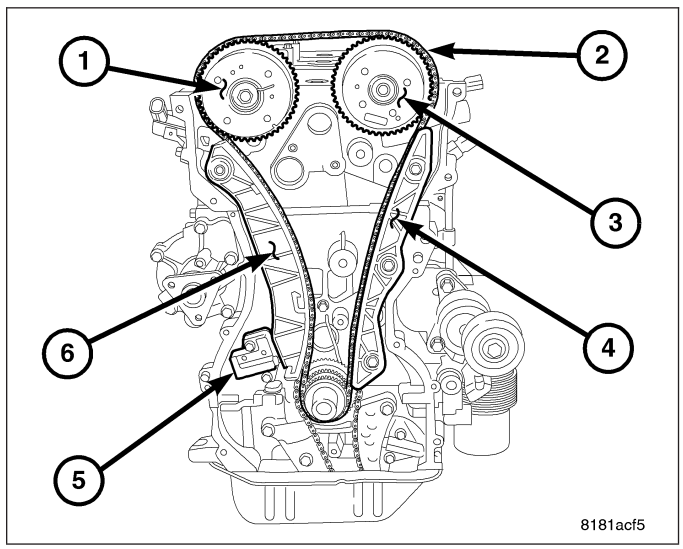
1. Clean all sealing surfaces.
2. Apply RTV as shown at the cylinder head to block parting line.
3. Apply RTV as shown in the corner of the oil pan and block.
4. Apply 2mm bead of RTV as shown.
5. Install timing chain cover.
6. Install timing chain cover upper retaining bolts and torque bolts.
7. Install accessory drive belt tensioner.
8. Install right engine mount bracket and torque.
9. Install accessory drive belt upper idler pulley.
10. Install right engine mount and torque bolts.



11. Remove jack from under engine.
12. Install power steering pump.
13. Raise vehicle.
14. Install timing chain cover lower retaining bolts and torque bolts.
15. Install oil pan to timing chain cover lower retaining bolts and torque bolts.
16. Install water pump pulley.
17. Install crankshaft pulley and torque bolt.
18. Install accessory drive belt lower idler pulley.
19. Install lower A/C compressor mounting bracket.
20. Install A/C compressor.
21. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
22. Install right lower splash shield.
23. Lower vehicle.
24. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)
25. Connect coil electrical connector,
26. Connect PCV hose to PCV valve.
27. Connect make up air hose.
28. Install power steering reservoir.
29. Install windshield washer bottle.
30. Install coolant recovery bottle.
31. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
32. Connect negative battery cable.
33. Install air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
34. Install engine cover.

CHAIN AND SPROCKETS-TIMING

REMOVAL

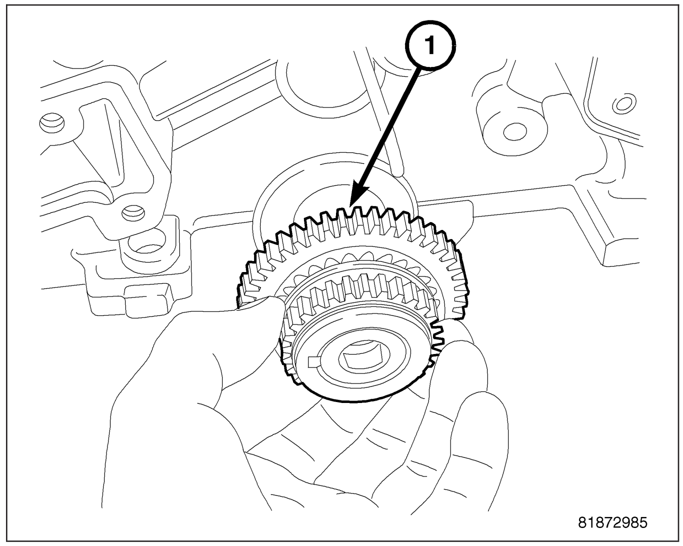


TIMING CHAIN

1. Perform fuel pressure bleed procedure.
2. Remove air cleaner housing.
3. Set engine to TDC.
4. Remove timing chain cover (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

NOTE: If the timing chain plated links can no longer be seen, the timing chain links corresponding the timing marks must be marked prior to removal if the chain is to be reused.

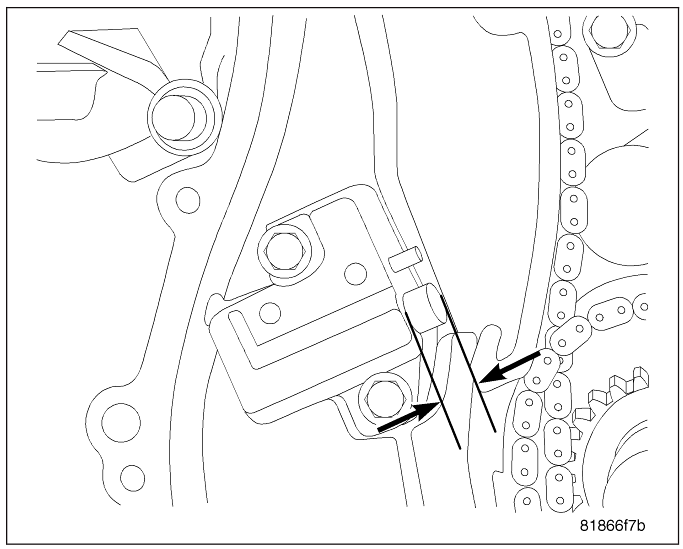
5. Remove timing chain tensioner (5) (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL).
6. Remove timing chain (2).



CAMSHAFT SPROCKET(S)

Refer to camshaft phasor removal (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

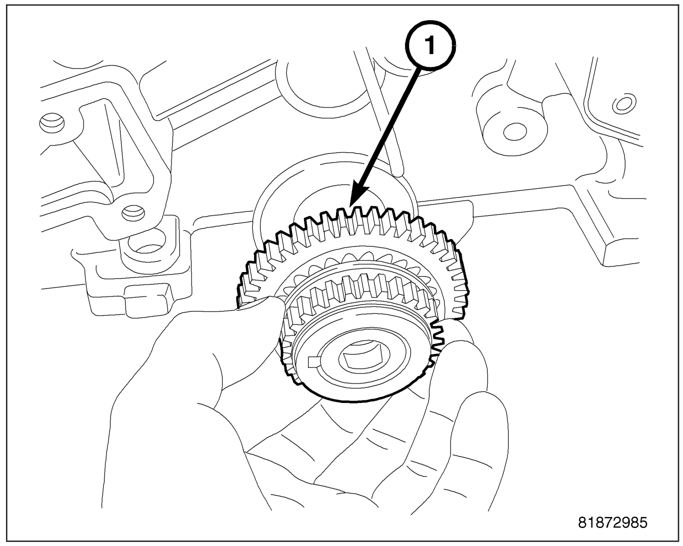
CRANKSHAFT SPROCKET



1. Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
2. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
3. Remove oil pump drive chain tensioner.
4. Remove oil pump drive chain.
5. Remove crankshaft sprocket (1).

INSPECTION

Inspect timing chain for stretching prior to removal.



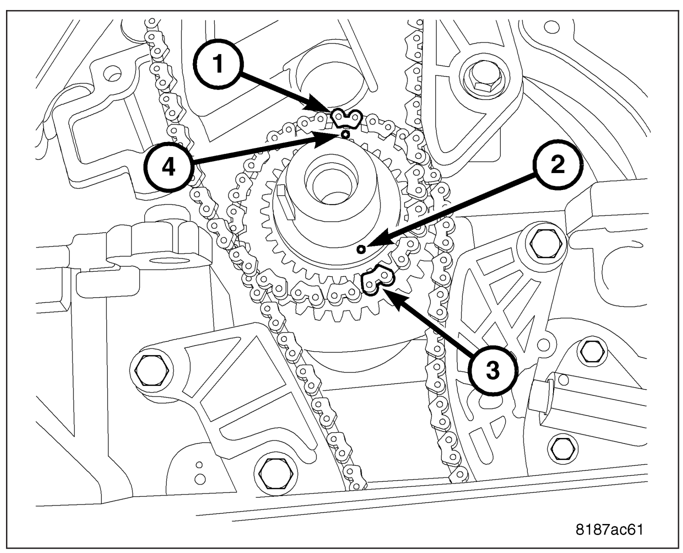
1. Rotate engine while watching timing chain tensioner plunger. When the plunger reaches its maximum travel stop rotating engine.
2. Measure the distance from the tensioner body and the edge of the chain guide as shown.
3. If the distance is greater than 20.5 mm (0.81 in.) inspect guide shoes for excessive wear.
4. If guides are okay, replace timing chain.

INSTALLATION

CRANKSHAFT SPROCKET

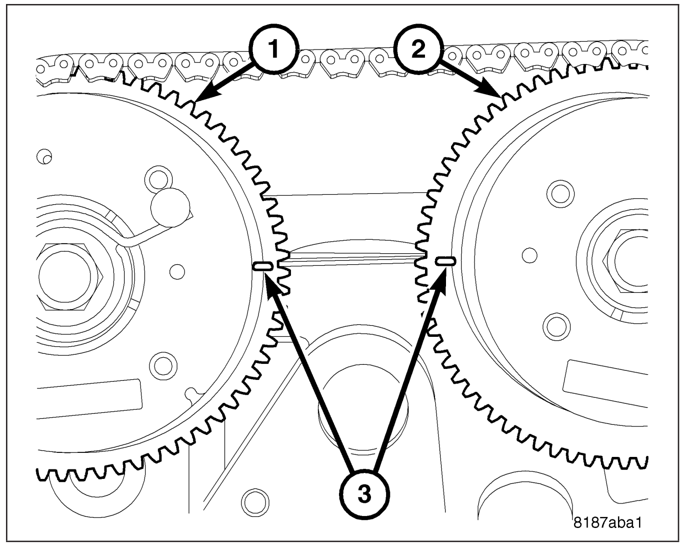
1. Install crankshaft sprocket (1) onto crankshaft.
2. Install oil pump drive chain. Verify that Oil pump is correctly timed.
3. Reset oil pump drive chain tensioner by pushing plunger inward and install Tensioner Pin 8514.
4. Install oil pump drive chain tensioner and remove Tensioner Pin 8514.
5. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
6. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/ OIL PAN - INSTALLATION).
7. Fill engine with oil (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).
8. Start engine and check for leaks.

CAMSHAFT SPROCKET(S)



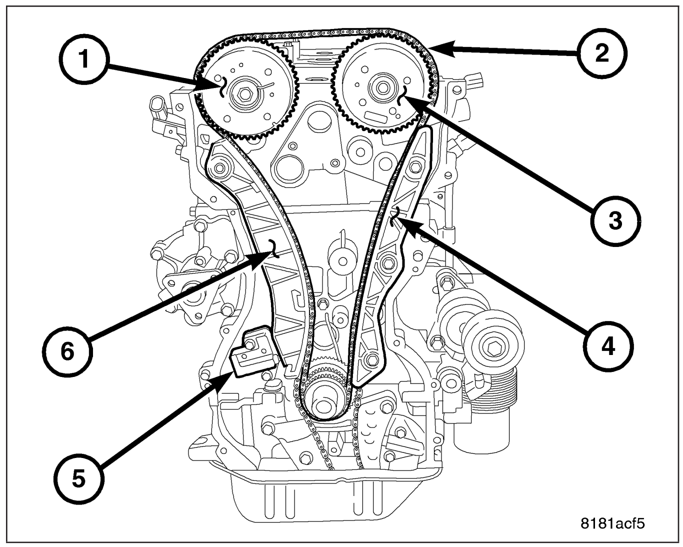
NOTE: The camshaft sprockets and the camshaft phasers are an assembly and cannot be serviced separately.

CAUTION: Do not use an impact wrench to tighten camshaft sprocket bolts. Damage to the camshaft-to-sprocket locating dowel pin and camshaft phaser may occur.

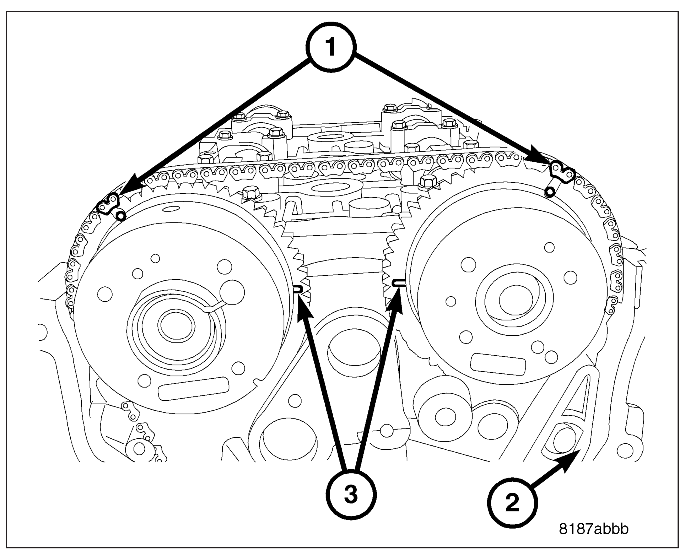


1. Refer to Camshaft phaser installation (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION).

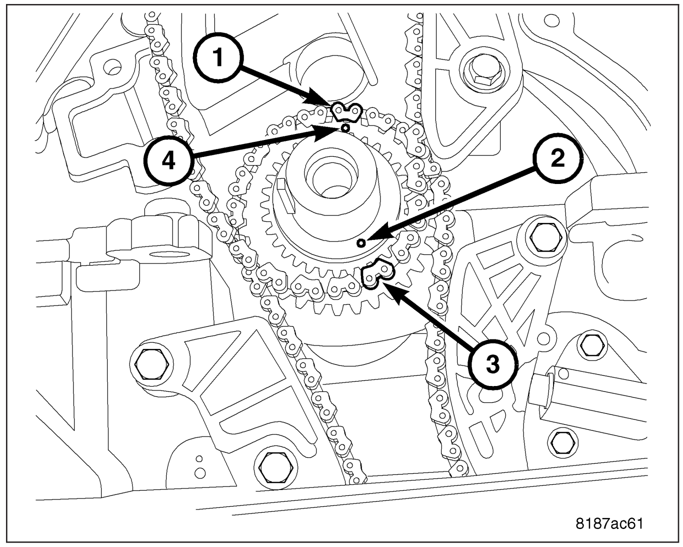
TIMING CHAIN



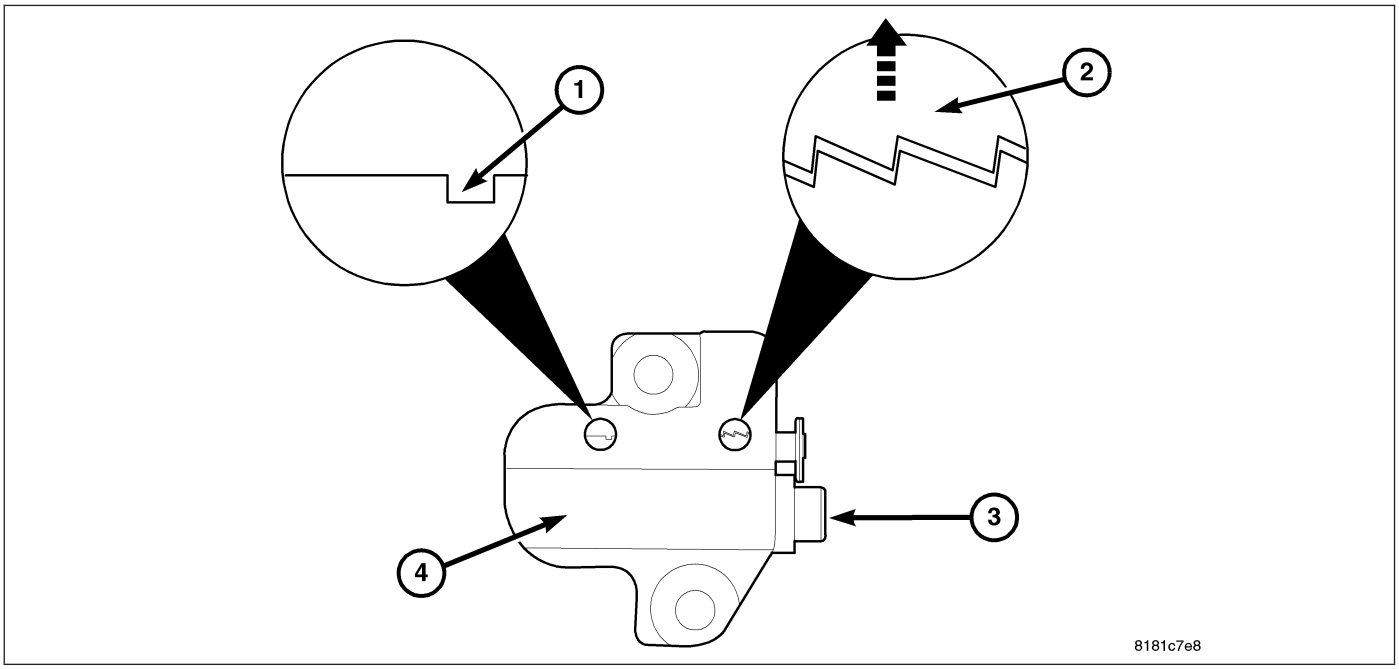
1. Verify that the crankshaft sprocket keyway is at the 9 o'clock position.



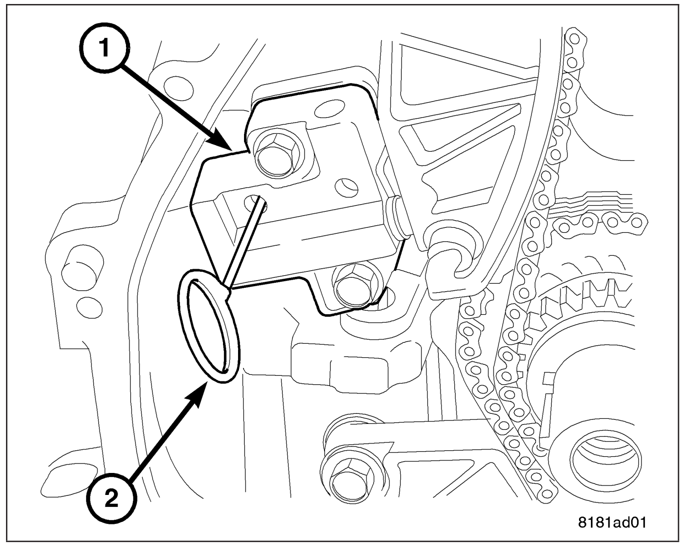
2. Align camshaft timing marks (3) so they are parallel to the cylinder head as shown.



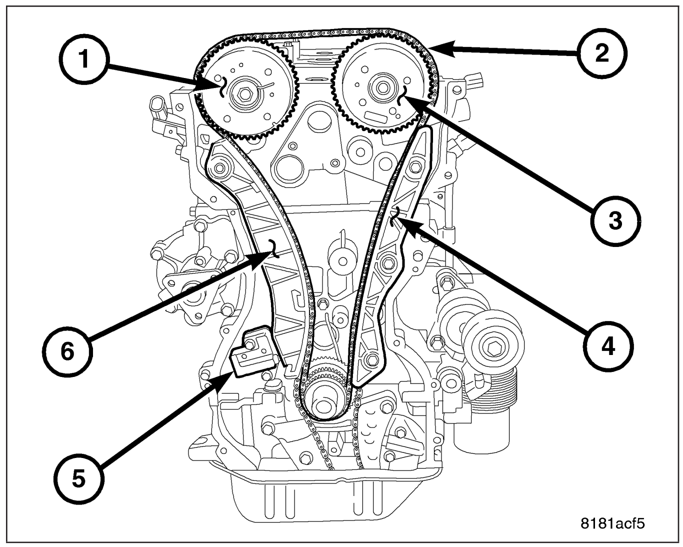
3. Install timing chain guide (4) and torque bolts.



4. Install timing chain so plated links on chain align with timing marks on camshaft sprockets (1).

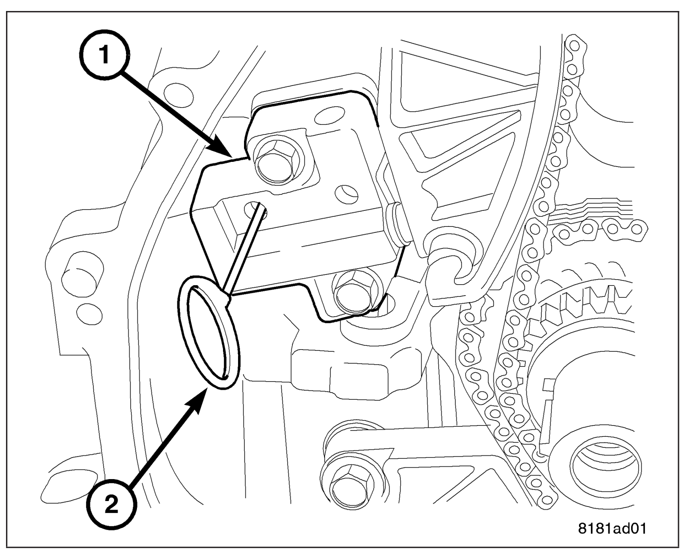


5. Align timing mark on the crankshaft sprocket (2) with the plated link (3) on the timing chain. Position chain so slack will be on the tensioner side.



6. Reset timing chain tensioner (4) by lifting up on ratchet (2) and pushing plunger (3) inward towards the tensioner body (4). Insert tensioner pin 8514 into slot (1) to hold tensioner plunger in the retracted position.

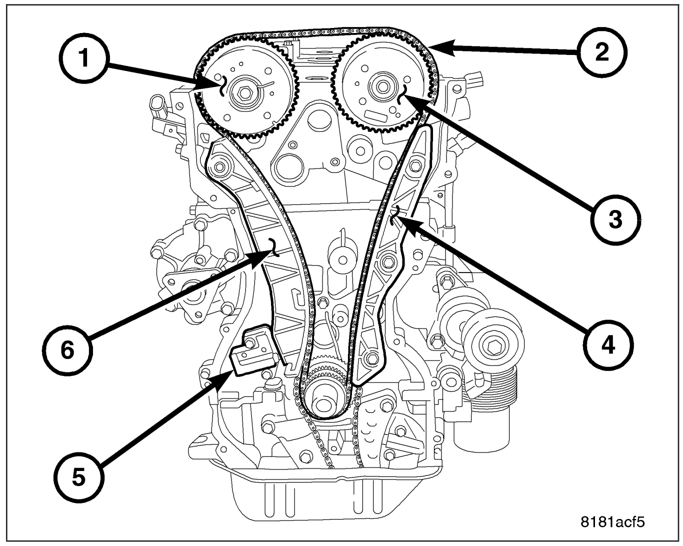
7. Install timing chain tensioner (1) and torque bolts to 12 N·m (105 in. lbs.).



NOTE: Keep the slack in the timing chain on the tensioner side.

8. Install the moveable timing chain pivot guide (6) and torque bolt to 12 N·m (105 in. lbs.).

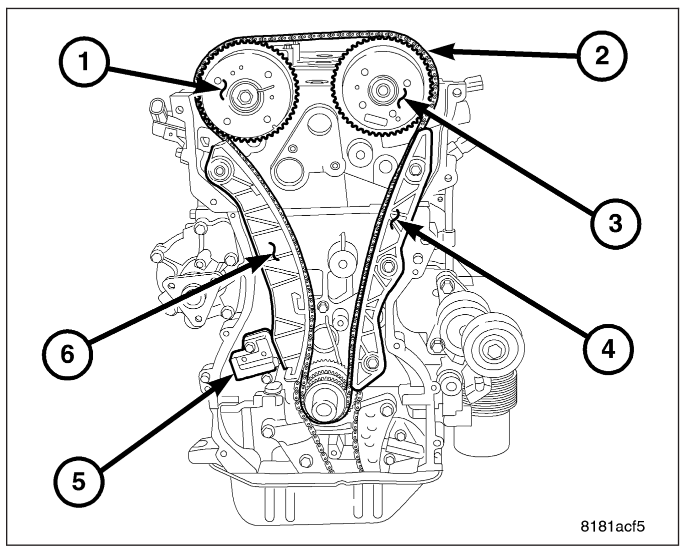
9. Remove timing tensioner pin 8514 (2).
10. Rotate the crankshaft CLOCKWISE two complete revolutions until the crankshaft is repositioned at the TDC position. Verify that the camshaft and crankshaft timing marks are in proper position.
11. Install front timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
12. Connect negative battery cable.
13. Fill with oil, start engine and check for leaks.



TENSIONER-TIMING CHAIN

REMOVAL

1. Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

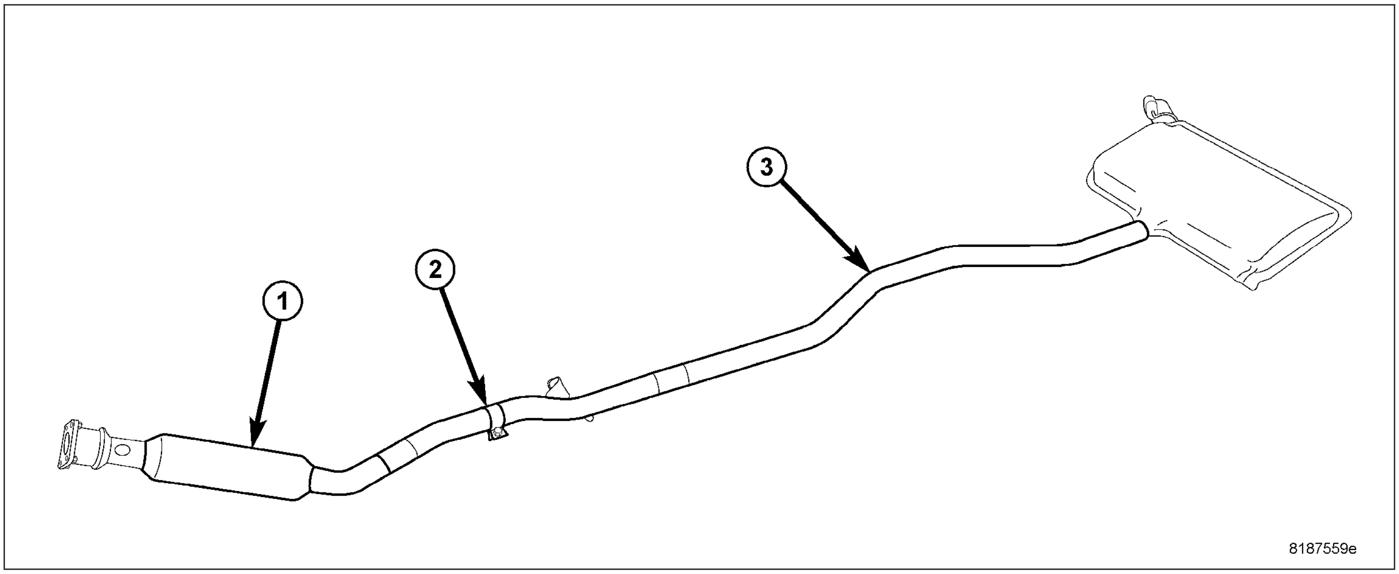


NOTE: Tensioner will not come apart during removal.

2. Remove timing chain tensioner retaining bolts and remove tensioner.

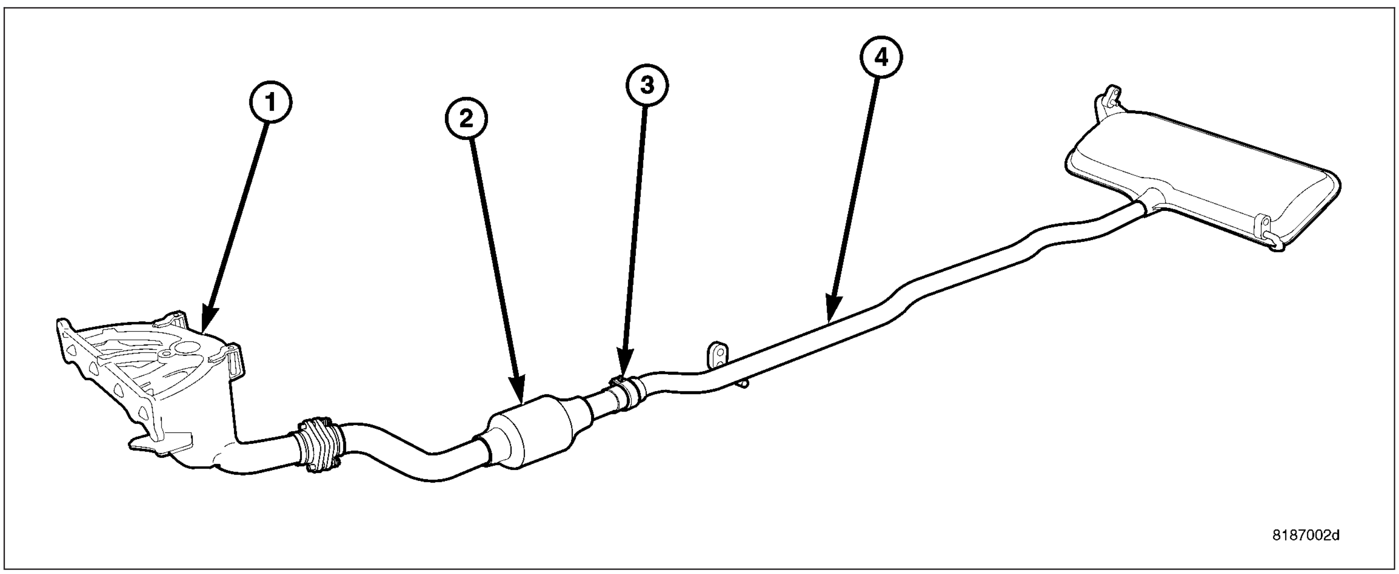
INSTALLATION

1. Reset tensioner.
2. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).



EXHAUST SYSTEM

TABLE OF CONTENTS



EXHAUST SYSTEM AND TURBOCHARGER

DESCRIPTION

GAS ENGINE

The FWD gas engine exhaust system components consist of a catalytic converter, intermediate pipe, muffler, clamps and support isolators

The AWD gas engine exhaust system components consist of a maniverter, under floorcatalytic converter, intermediate pipe, muffler, clamps and support isolators

DIAGNOSIS AND TESTING

EXHAUST SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST NOISE (UNDER HOOD)	1. Exhaust manifold cracked or broken.	1. Replace manifold.
	2. Manifold to cylinder head leak.	2. Tighten manifold and/or replace gasket.
	3. Exhaust flex joint to manifold leak.	3.Tighten fasteners or replace gasket.
	4. Exhaust flex joint.	4. Replace catalytic converter assembly.
	5. Pipe and shell noise from front exhaust pipe.	5. Characteristic of single wall pipes.
EXCESSIVE EXHAUST NOISE	1. Leaks at pipe joints.	1. Tighten or replace clamps at leaking joints.
	2. Burned, blown, or rusted out exhaust pipe or muffler.	2. Replace muffler or exhaust pipes.
	3. Restriction in muffler or tailpipe.	3. Remove restriction, if possible or replace as necessary.
	4. Catalytic converter material in muffler.	4. Replace muffler and converter assembly. Check fuel injection and ignition systems for proper operation.

DIAGNOSIS AND TESTING - EXHAUST SYSTEM RESTRICTION CHECK

Exhaust system restriction can be checked by measuring back pressure using the DRB III® and PEP module pressure tester.

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

NOTE: For Special Tool identification, (Refer to 11 - EXHAUST SYSTEM - SPECIAL TOOLS).

1. Disconnect and remove the upstream (before catalytic converter) oxygen sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/O2 SENSOR - REMOVAL)
2. Install the Back Pressure Test Adaptor CH8519.
3. Connect the Pressure Transducer CH7063 to the back pressure fitting.
4. Following the PEP module instruction manual, connect all required cables to the DRB III® and PEP module. Select the available menu options on the DRBIII® display screen for using the digital pressure gauge function.
5. Apply the park brake and start the engine.
6. With transmission in Park or Neutral, raise engine speed to 2000 RPM. Monitor the pressure readings on the DRBIII®. Back pressure should not exceed specified limit. Refer to specification in table below EXHAUST BACK PRESSURE LIMITS .
7. If pressure exceeds maximum limits, inspect exhaust system for restricted component. For further catalytic converter inspection procedures, (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSPECTION). Replace component(s) as necessary.

EXHAUST BACK PRESSURE LIMITS

Exhaust Back Pressure Limit (Max)	
Vehicle in Park/Neutral (no load) @2000 RPM	3.45 Kpa (0.5 psi)

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

NOTE: Slip joint band clamps are spot welded to exhaust system. If a band clamp must be replaced, the spot weld must be ground off.

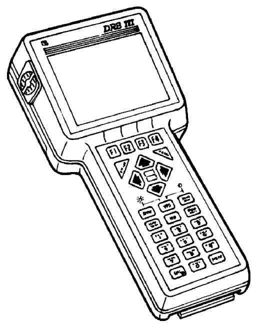
ADJUSTMENTS

EXHAUST SYSTEM ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, insulators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

1. Loosen clamps and support brackets.
2. Align the exhaust system starting at the front, working rearward.
3. Tighten all clamps and brackets once alignment and clearances are achieved.



SPECIFICATIONS

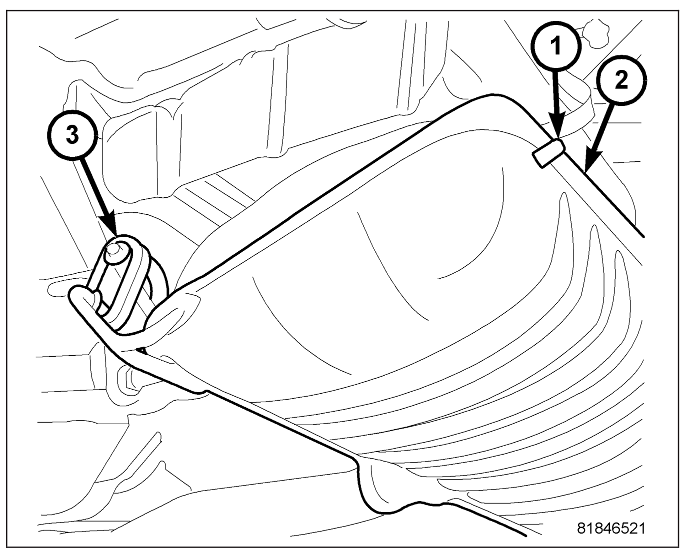
MUFFLER

REMOVAL

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operating time.

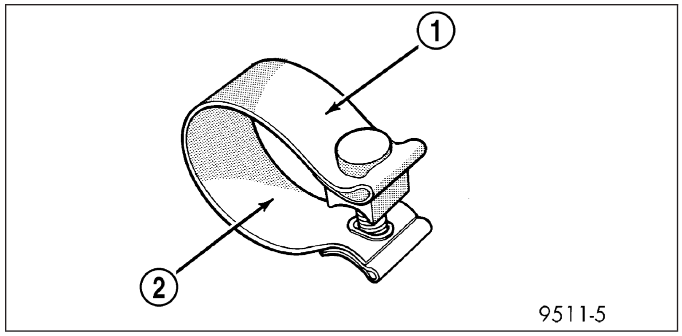
NOTE: When replacement is required on any component of the exhaust system, you must use original equipment parts (or their equivalent).



1. Raise vehicle on hoist and apply penetrating oil to band clamp nut and bolt of component being removed.

NOTE: Do not use petroleum-based lubricants when removing/installing muffler or exhaust pipe isolators (3) as it may compromise the life of the part. A suitable substitute is a mixture of liquid dish soap and water.

2. Remove exhaust system ground strap (1) at rear of I-Pipe/Muffler assembly (2).
3. Loosen band clamp and remove support isolators (3) at I-Pipe/Muffler assembly (2). Remove I-Pipe/Muffler assembly (2) from catalytic converter.
4. Clean ends of pipes and muffler to assure mating of all parts. Discard broken or worn isolators, rusted or overused clamps, supports, and attaching parts.



INSTALLATION

When assembling exhaust system **do not** tighten clamp until components are aligned and clearances are checked.

1. Install the I-Pipe/Muffler assembly to catalytic converter and the isolator supports to the underbody.

2. Working from the front of system; align each component to maintain position and proper clearance with underbody parts. For clearance specifications (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS). Tighten band clamp to 55 N·m (40 ft. lbs.).

CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp band has been stretched and has lost its clamping force and must be replaced.
To replace the band clamp; remove the nut and peel back the ends of the clamp until spot weld breaks. File or grind remaining weld material until pipe surface is smooth.

NOTE: Maintain proper clamp orientation when replacing with new clamp.

3. Connect the exhaust system ground strap.
4. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
5. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

CONVERTER CATALYTIC

DESCRIPTION

The combination exhaust manifold/catalytic converter is attached to the intermediate pipe using fasteners and a gasket for sealing.

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never work around or attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

CAUTION: DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.

The stainless steel catalytic converter body is designed to last the life of the vehicle. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

Unleaded gasoline must be used to avoid contaminating the catalyst core.

FWD vehicles use a catalytic converter located after the exhaust manifold and before the I-Pipe/Muffler assembly.

AWD vehicles use a maniverter and a underfloor catalytic converter. The underfloor catalytic converter is located between the maniverter and the I-Pipe/muffler assembly.

Diesel engine vehicles use a catalytic converter located between the turbocharger and the I-Pipe/Muffler assembly.

OPERATION - GAS ENGINE

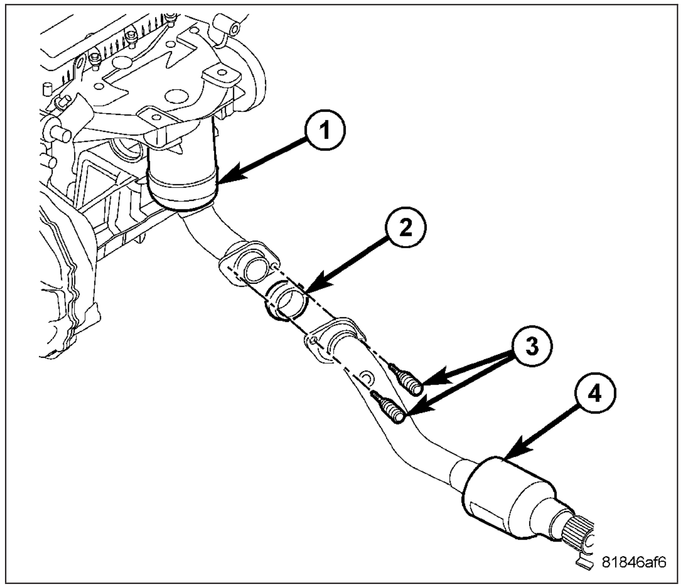
The three-way catalytic converter simultaneously converts three exhaust emissions into harmless gases. Specifically, HC and CO emissions are converted into water (H2O) and carbon dioxide (CO2). Oxides of Nitrogen (NOx) are converted into Nitrogen (N) and Oxygen. The three-way catalyst is most efficient in converting HC, CO and NOx at the stoichiometric air fuel ratio of 14.7:1.

The oxygen content in a catalyst is important for efficient conversion of exhaust gases. When a high oxygen content (lean) air/fuel ratio is present for an extended period, oxygen content in a catalyst can reach a maximum. When a rich air/fuel ratio is present for an extended period, the oxygen content in the catalyst can become totally depleted. When this occurs, the catalyst fails to convert the gases. This is known as catalyst ″punch through.″

Catalyst operation is dependent on its ability to store and release the oxygen needed to complete the emissions-reducing chemical reactions. As a catalyst deteriorates, its ability to store oxygen is reduced. Since the catalyst's ability to store oxygen is somewhat related to proper operation, oxygen storage can be used as an indicator of catalyst performance. Refer to the appropriate Diagnostic Information for diagnosis of a catalyst related Diagnostic Trouble Code (DTC).

The combustion reaction caused by the catalyst releases additional heat in the exhaust system, causing temperature increases in the area of the reactor under severe operating conditions. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency. **Do not** remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to temperature increases caused by unburned fuel passing through the converter. This deterioration of the catalyst core can result in excessively high emission levels, noise complaints, and exhaust restrictions.

Unleaded gasoline must be used to avoid ruining the catalyst core. Do not allow engine to operate above 1200 RPM in neutral for extended periods over 5 minutes. This condition may result in excessive exhaust system/floor pan temperatures because of no air movement under the vehicle.



The flex joint allows flexing as the engine moves, preventing breakage that could occur from the back-and-forth motion of a transverse mounted engine.

CAUTION: Due to exterior physical similarities of some catalytic converters with pipe assemblies, extreme care should be taken with replacement parts. There are internal converter differences required in some parts of the country (particularly vehicles built for States with strict emission requirements) and between model years.

REMOVAL

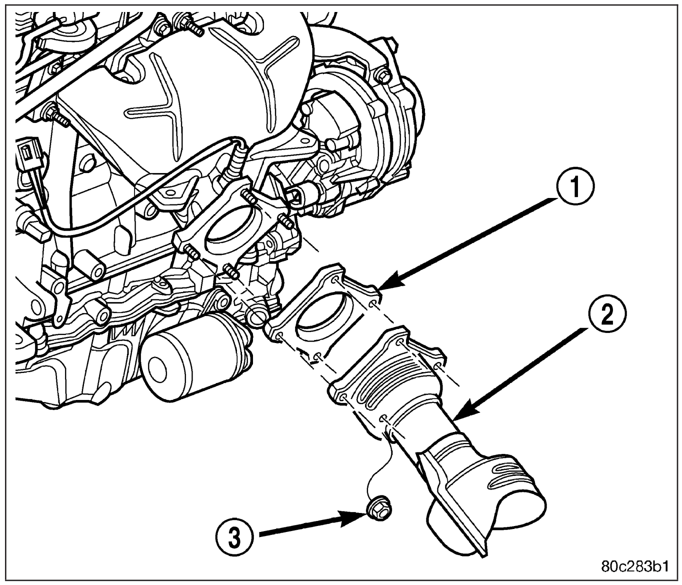
UNDER FLOOR CATALYTIC CONVERTER

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATING TIME.

1. Raise vehicle on hoist and apply penetrating oil to band clamp fastener of component being removed.

NOTE: Do not use petroleum-based lubricants when removing/installing muffler or exhaust pipe isolators as it may compromise the life of the part. A suitable substitute is a mixture of liquid dish soap and water.

2. Remove I-Pipe/Muffler assembly (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL).
3. Disconnect oxygen sensor electrical connectors.



NOTE: If spherical gasket is to be reused, mark orientation.

4. Remove flange bolts (3), springs and spherical gasket.
5. Remove under floor catalytic converter (3) from combination manifold/catalytic converter assembly (1).
6. Clean ends of pipes to assure mating of all parts. Discard broken or worn isolators, rusted or overused clamps, supports, and attaching parts.

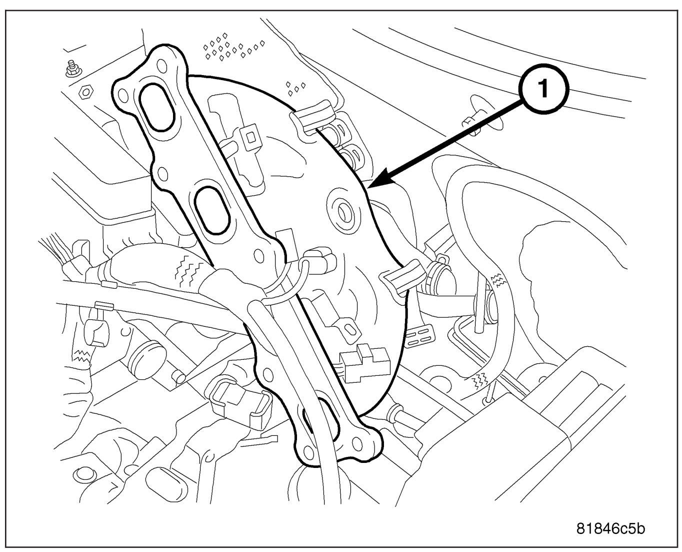
NOTE: When replacement is required on any component of the exhaust system, you must use original equipment parts (or their equivalent).

CATALYTIC CONVERTER - FWD

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. Refer to the appropriate service diagnostic information for repair procedures.

1. Loosen intermediate pipe-to catalytic converter clamp.



NOTE: Do not use petroleum-based lubricants when removing/installing muffler or exhaust pipe isolators as it may compromise the life of the part. A suitable substitute is a mixture of liquid dish soap and water.

2. Remove catalytic converter to exhaust manifold attaching fasteners and remove converter from vehicle.
3. Remove I-Pipe/Muffler assembly insolators as necessary to slide I-Pipe/Muffler assembly out of catalytic converter.
4. Remove and discard flange gasket.

NOTE: When replacement is required on any component of the exhaust system, original equipment parts (or equivalent) must be used.

REMOVAL - MANIVERTER

WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. Refer to the appropriate service diagnostic information for repair procedures.

1. Remove under floor catalytic converter (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - REMOVAL).

NOTE: When replacement is required on any component of the exhaust system, original equipment parts (or equivalent) must be used.

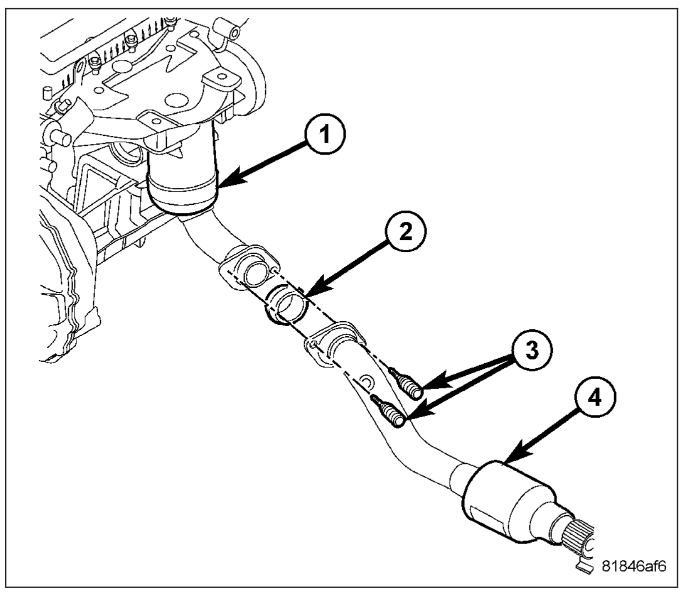
2. Lower vehicle.
3. Remove secondary thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).
4. Remove maniverter mounting bolts.
5. Remove maniverter and gasket from the engine compartment.

INSPECTION

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

Check catalytic converter for a flow restriction. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

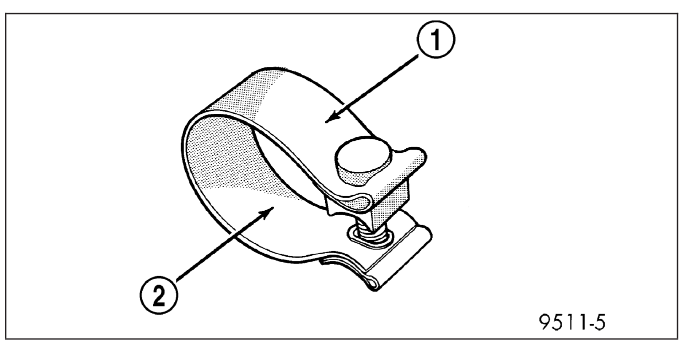


NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.

INSTALLATION

UNDER FLOOR CATALYTIC CONVERTER

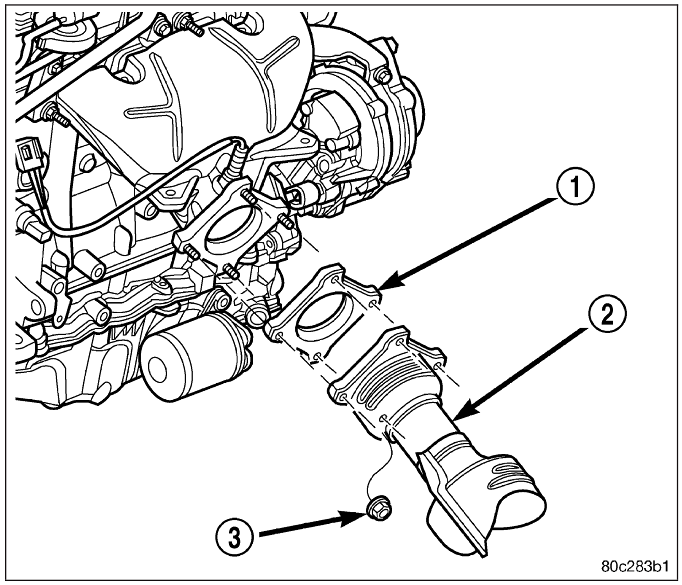
When assembling exhaust system **do not** tighten clamps until components are aligned and clearances are checked.



1. Install under floor catalytic converter and the isolator supports to the underbody.
2. Position spherical gasket (2) with white side facing rear of vehicle, install springs, and bolts (3). Tighten bolts to 33 N·m (24 ft. lbs.).
3. Install I-Pipe/muffler assembly (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION)
4. Working from the front of system; align each component to maintain position and proper clearance with underbody parts.

5. Tighten band clamps to 55 N·m (40 ft. lbs.).

CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp band has been stretched and has lost its clamping force and must be replaced.

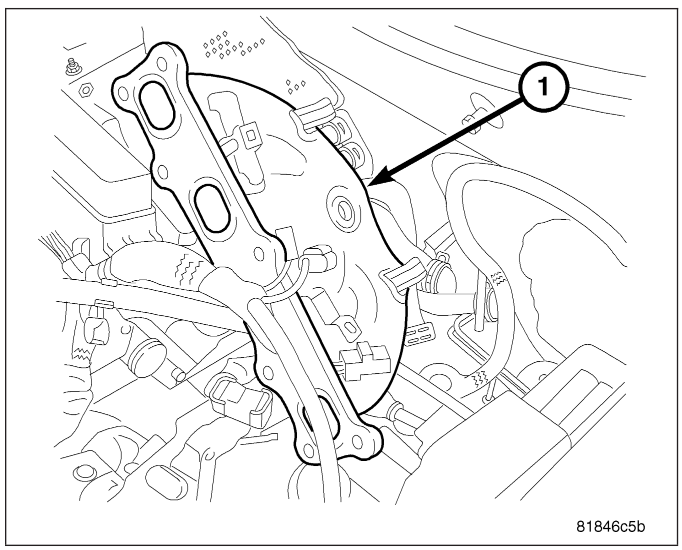


NOTE: Maintain proper clamp orientation when replacing with new clamp.

6. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

CATALYTIC CONVERTER - FWD

1. Position catalytic converter into I-Pipe/muffler assembly.
2. Using new gasket position catalytic converter against exhaust manifold.
3. Install flange bolts. Tighten to 29 N·m (21 ft. lbs.).
4. Working from the front of system; align each component to maintain position and proper clearance with underbody parts.
5. Tighten band clamps to 55 N·m (40 ft. lbs.).

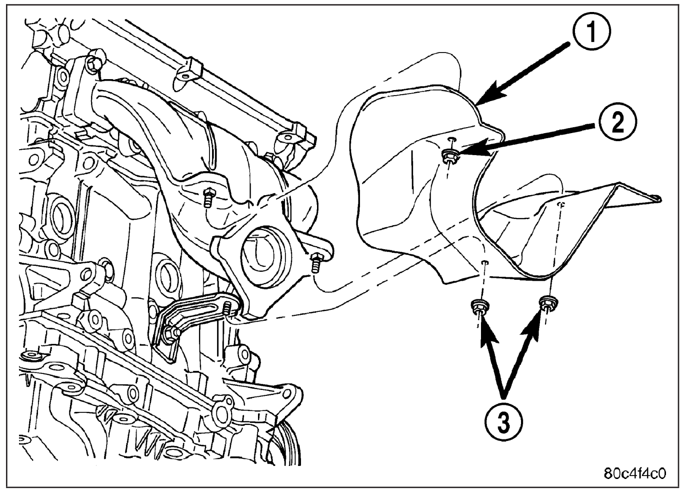


CAUTION: Band clamps should never be tightened such that the two sides of the clamps are bottomed out against the center hourglass shaped center block. Once this occurs, the clamp has lost clamping force and must be replaced.

6. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

INSTALLATION - MANIVERTER

NOTE: When assembling exhaust system do not tighten clamps until all components are aligned and clearances are checked.

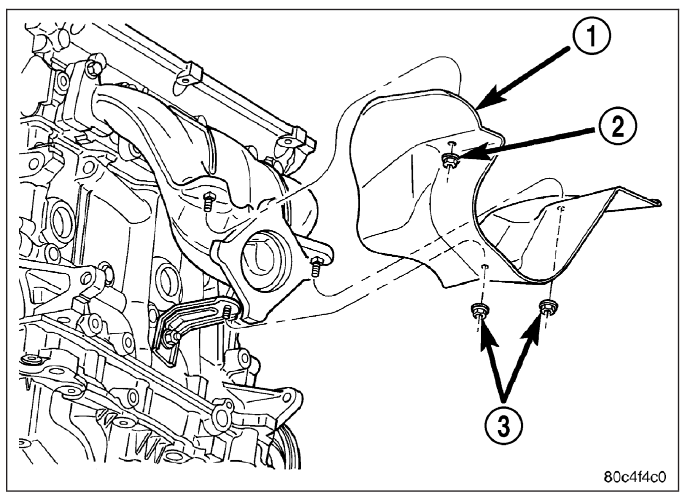


1. Position maniverter (1) in vehicle. Use a new flange gasket.
2. Using new gasket, install maniverter (1) and mounting bolts. Tighten bolts to 28 N·m (250 in. lbs.).
3. Install secondary thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION).
4. Install under floor catalytic converter (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSTALLATION).
5. Working from the front of system; align each component to maintain position and proper clearance with underbody parts.
6. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
7. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

SHIELDS HEAT

DESCRIPTION

Heat shields (1), are needed to protect both the vehicle and the environment from the high temperatures developed in the vicinity of the catalytic converter.



CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan heat shield on cars if equipped. Light over-spray near the edges is permitted. Application of coating will greatly reduce the efficiency of the heat shields resulting in excessive floor pan temperatures and objectionable fumes.

REMOVAL

1. Raise vehicle on hoist.
2. Remove fasteners attaching heat shield.
3. Remove heat shield (s)

INSTALLATION

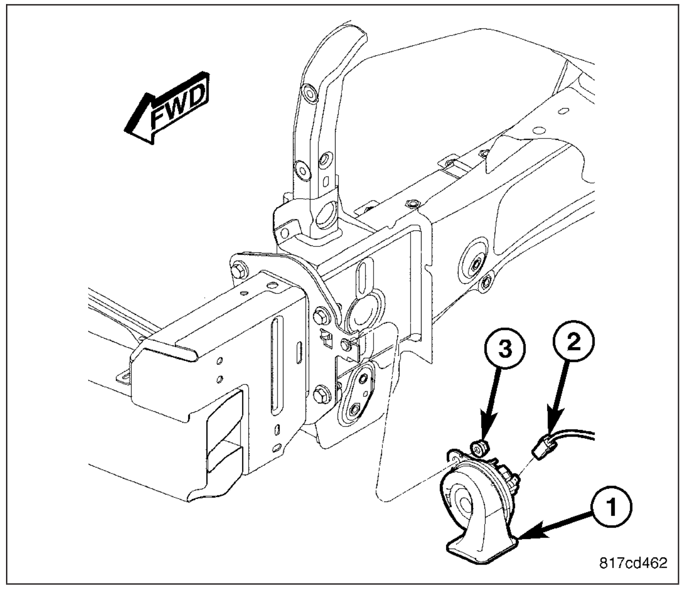
1. Position heat shield(s) to underbody.
2. Install heat shield fasteners.
3. Inspect heat shield to exhaust system clearances and adjust as necessary. For clearance specifications (Refer to 11 - EXHAUST SYSTEM - SPECIFICATIONS).
4. Lower vehicle.
5. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.
6. Check the exhaust system for contact with the body panels. Make the necessary adjustments, if needed.

FRAME & BUMPERS

TABLE OF CONTENTS

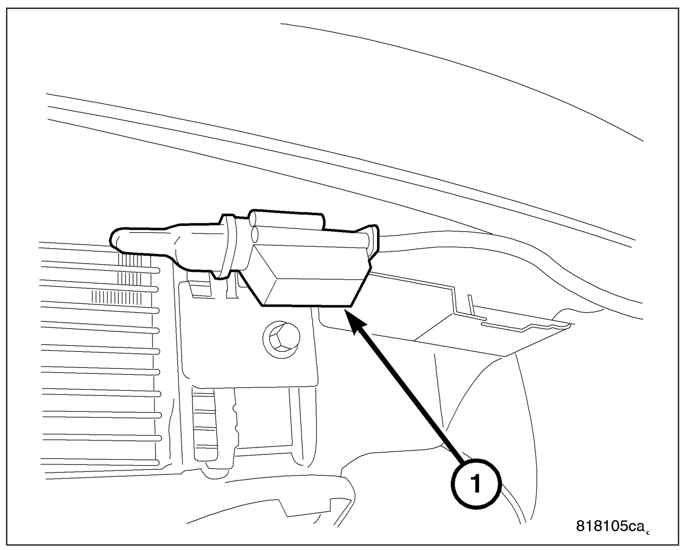
BUMPERS

SPECIFICATIONS



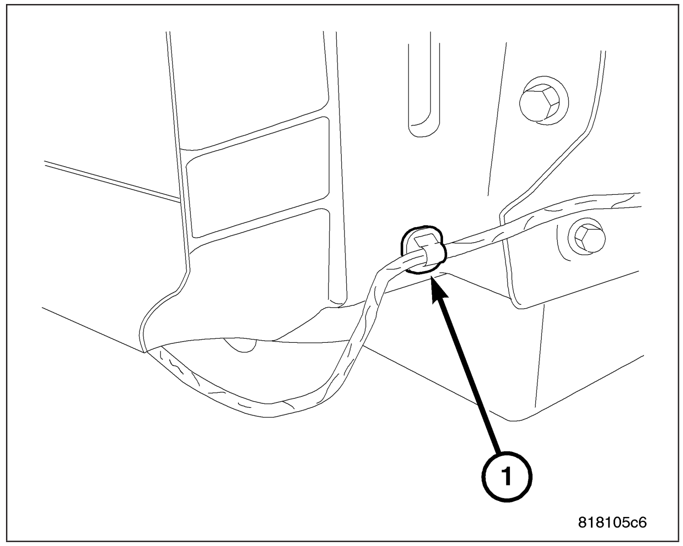
TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Front bumper reinforcement nuts	23	–	204
Rear bumper reinforcement nuts	23	–	204

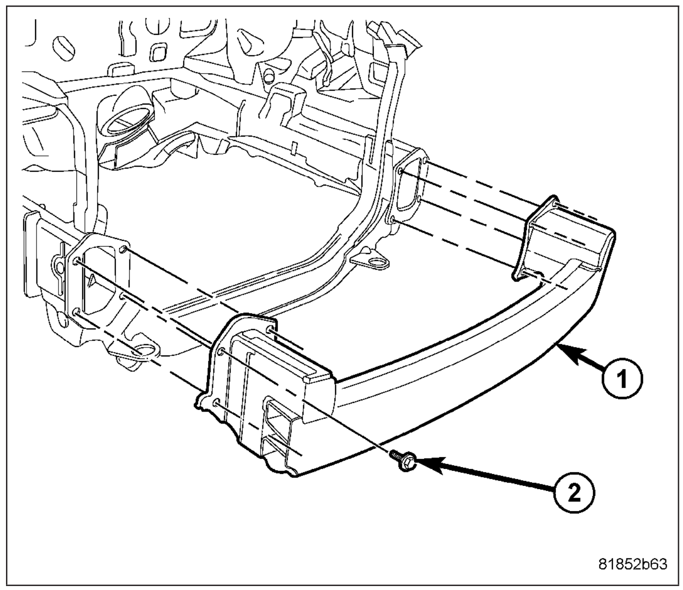


FRONT BUMPER REINFORCEMENT

REMOVAL

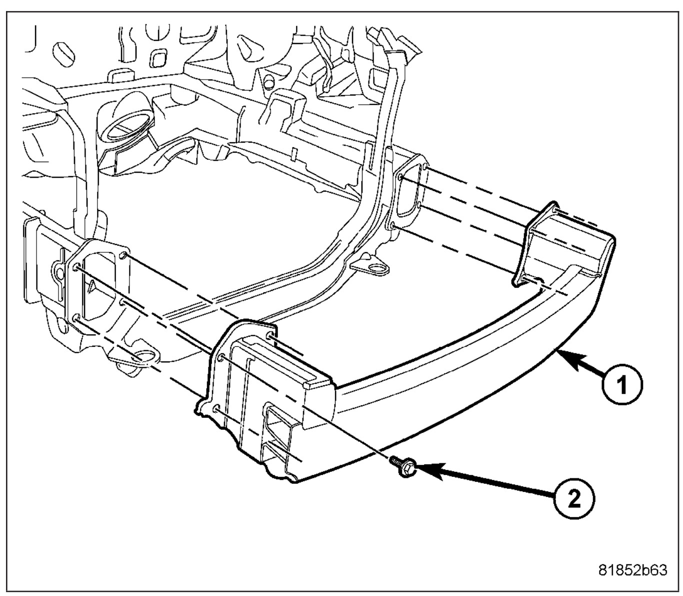


1. Remove fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL)
2. Disconnect wire connector (2) and remove horn (3). (Refer to 8 - ELECTRICAL/HORN/HORN - REMOVAL)

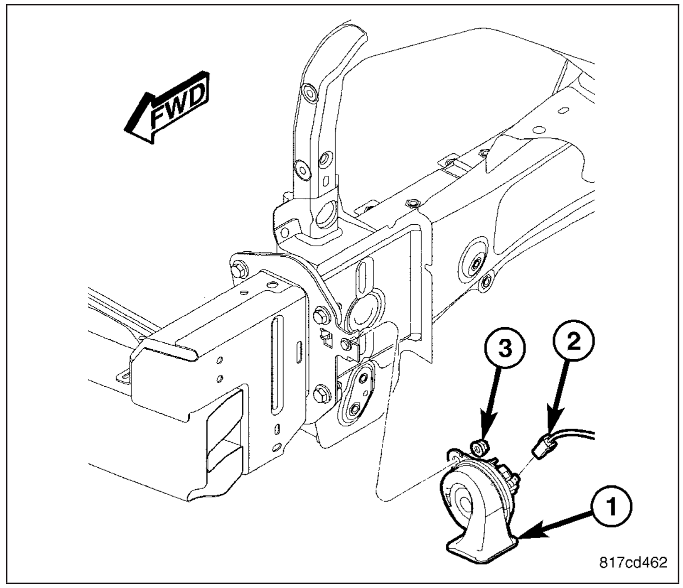


3. Remove wire harness push pin fastener (1).

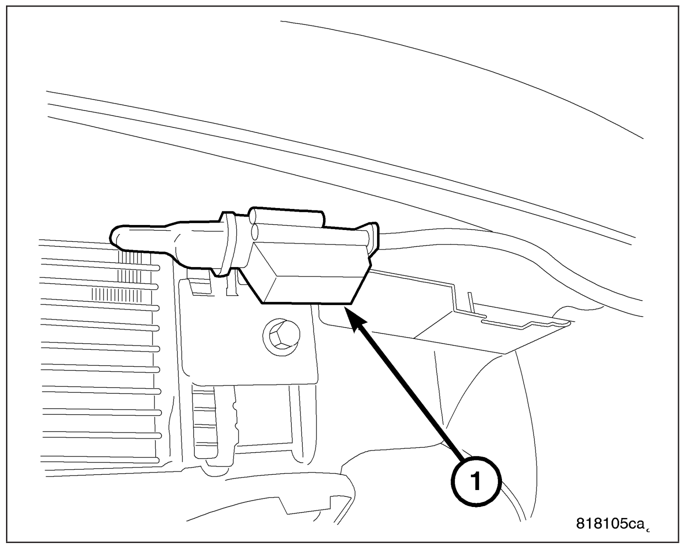
4. Remove wire harness (1) from bottom of bumper reinforcement.



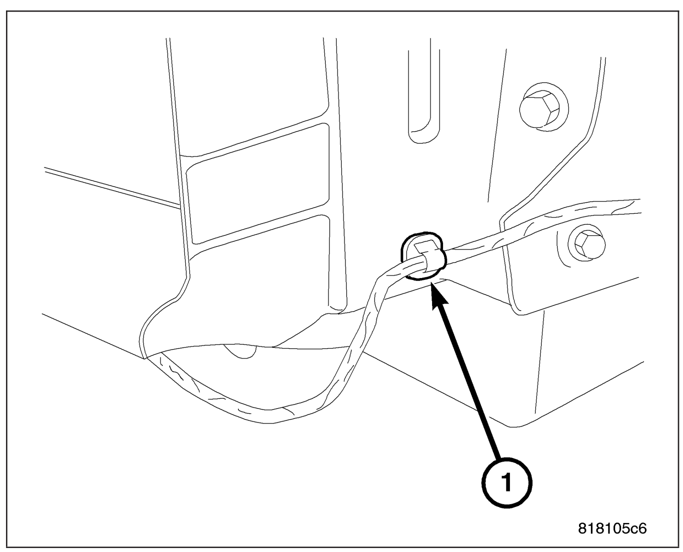
5. Remove 8 fasteners (2) from bumper reinforcement (1).



INSTALLATION

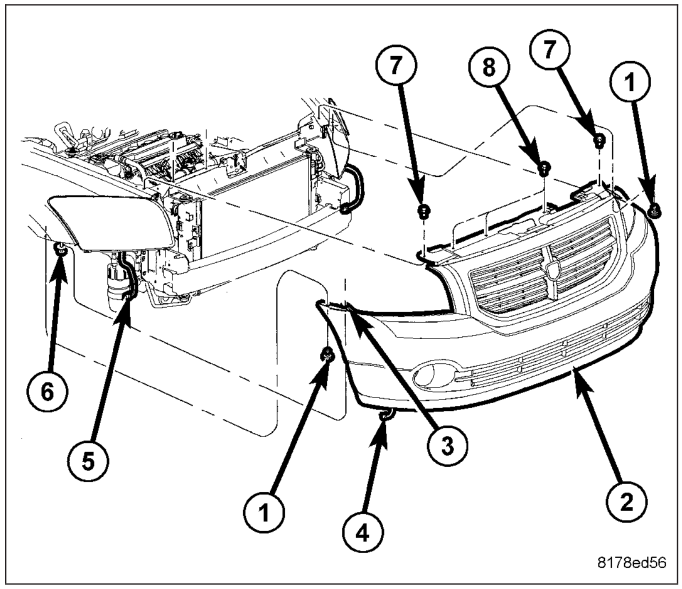


1. Install fasteners (2) and torque to 23 N·m (204 in. lbs.).

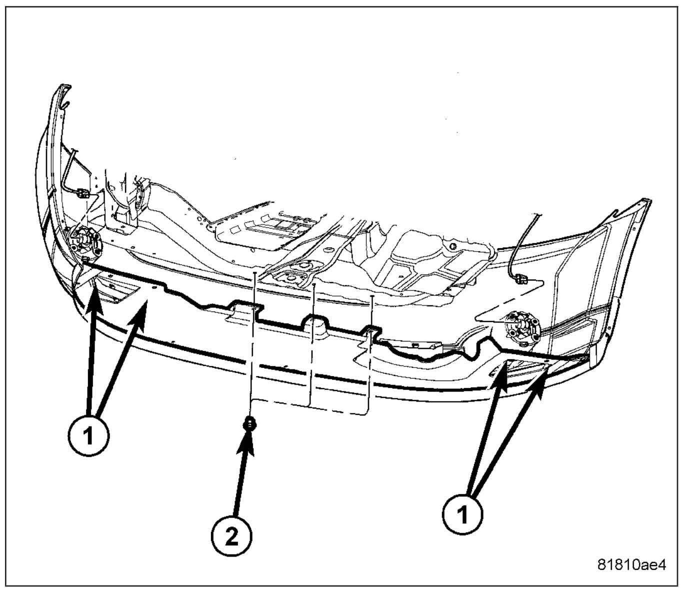


2. Connect wire connector (2) and install horn (1). (Refer to 8 - ELECTRICAL/HORN/HORN - INSTALLATION)

3. Install wiring harness push pin.



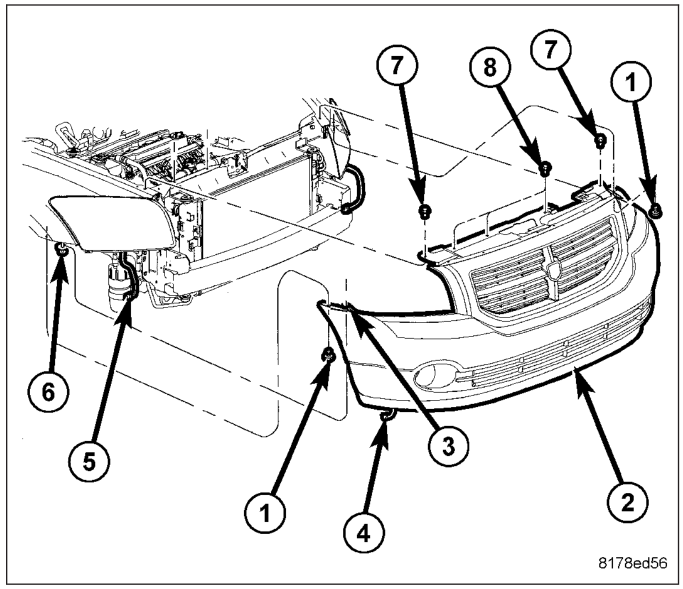
4. Install wire connector (1) to bumper reinforcement.
5. Install front fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION)



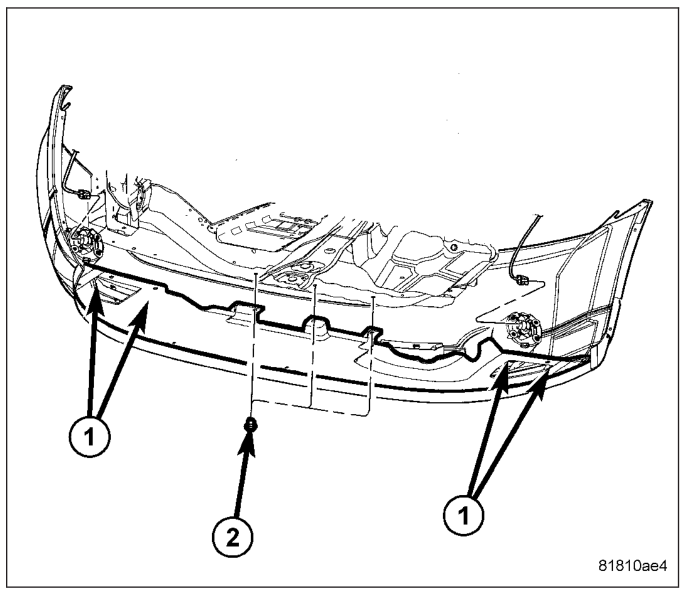
FRONT BUMPER FASCIA

REMOVAL

1. Remove splash shield. (Refer to 23 - BODY/EXTERIOR/LF WHEELHOUSE SPLASH SHIELD - REMOVAL)
2. Remove left and right side fastener (1) located in the wheel well.
3. Remove three fasteners (2) located at the bottom of fascia.
4. Remove middle fasteners (8) located on the top of the fascia.

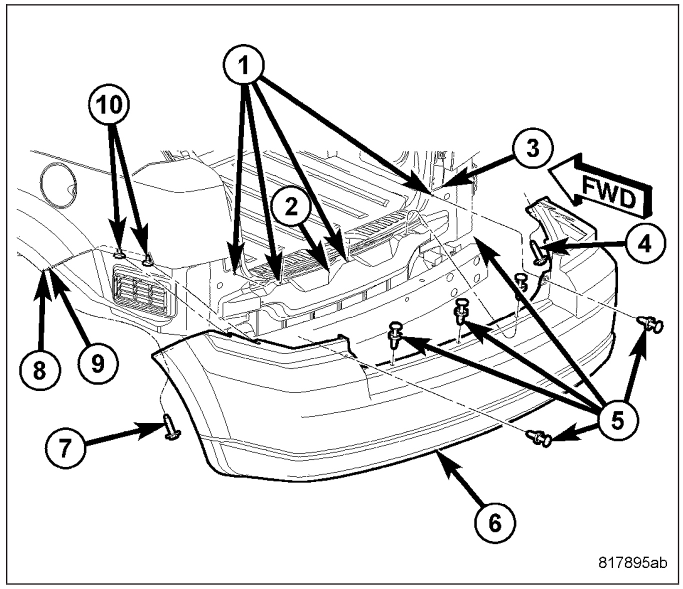


5. If equipped, disconnect fog lamps (1).
6. Remove two fasteners located at the top of fascia (7).
7. Carefully, remove fascia from vehicle.



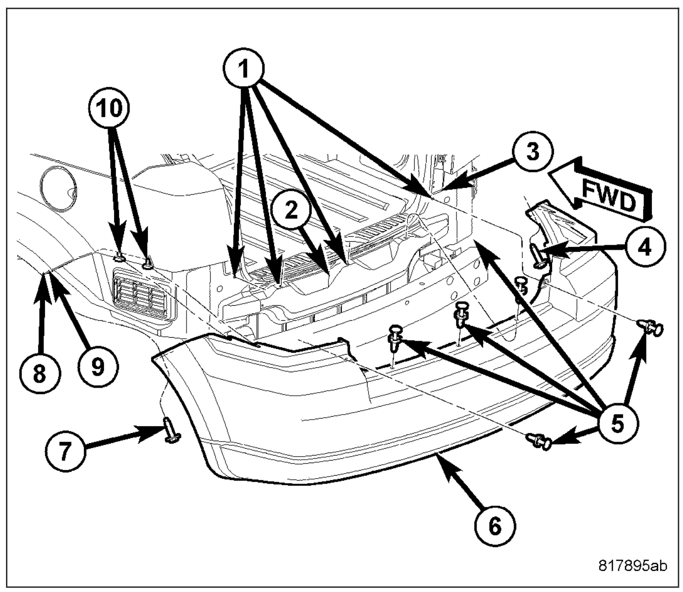
INSTALLATION

1. Lift fascia (2) and fasten both sides of fascia notch (3) onto push pin (6).
2. Install fasteners (1) located inside wheel well up through fascia.
3. Install fascia fasteners (7).
4. Install fascia fasteners (8) through fascia.
5. If equipped, connect wire harness (5) to fog lamp (4).
6. Raise vehicle.



7. Install push pins into locations (1).
8. Install fasteners (2).

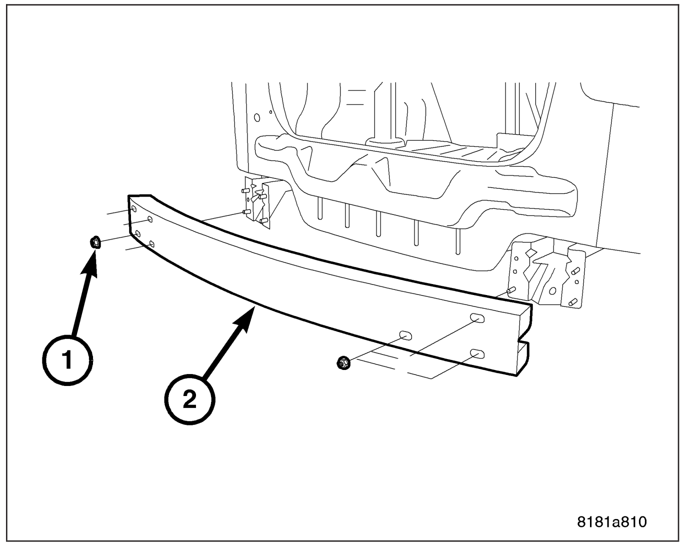
REAR BUMPER FASCIA



REMOVAL

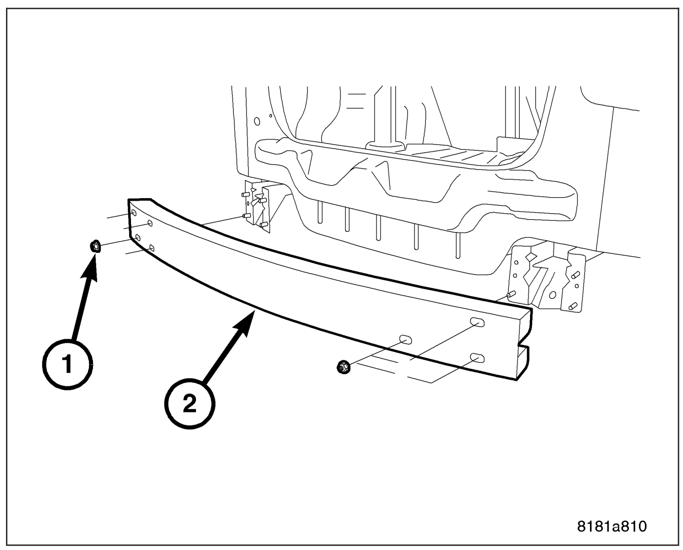
1. Remove push pins (5) from holes (1) located on vehicle (2).
2. Remove rear splash shields.
3. Remove both left (7) and right screws (4).
4. Remove fascia from push pins (10).

INSTALLATION



1. Raise fascia (6) and hang fascia onto push pins (10).
2. Install push pins (5) into push pin locations (1).
3. Install left (7) and right (4) screws into their respective locations.
4. Install splash shields.

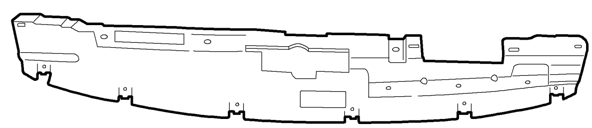
REAR BUMPER REINFORCEMENT



REMOVAL

1. Remove rear fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - REMOVAL)
2. Remove seven bumper reinforcement nuts (1).
3. Remove bumper reinforcement (2).

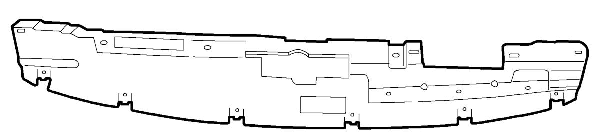
INSTALLATION



1. Place bumper reinforcement (2) up to frame locations.
2. Install seven nuts (1) and tighten to 23 N·m (204 in. lbs.)
3. Install fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR BUMPER - INSTALLATION)

FRONT FASCIA CLOSEOUT PANEL

REMOVAL



1. Remove fasteners and push pins.

8180f353

INSTALLATION

1. Install fasteners and push pins.

8180f353

FRAME

SPECIFICATIONS

SPECIFICATIONS - FRAME DIMENSIONS

Frame dimensions are listed in metric scale. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location.

VEHICLE PREPARATION

Position the vehicle on a level work surface. Using screw or bottle jacks, adjust the vehicle PLP heights to the specified dimension above a level work surface. Vertical dimensions can be taken from the work surface to the locations indicated were applicable.

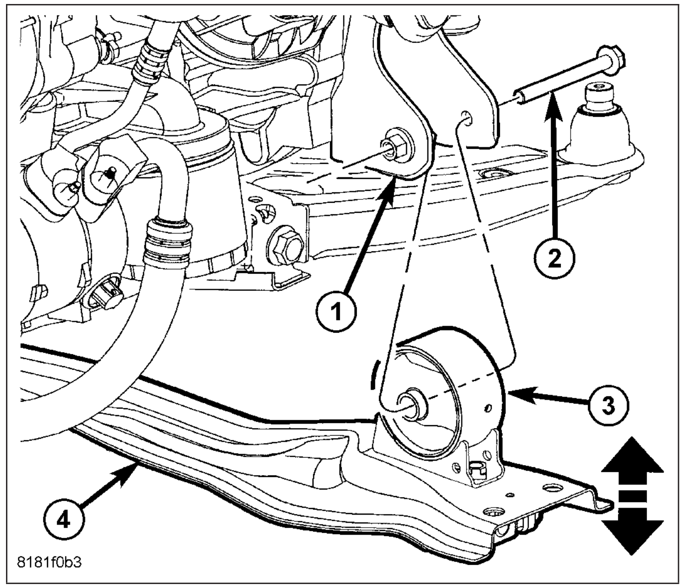
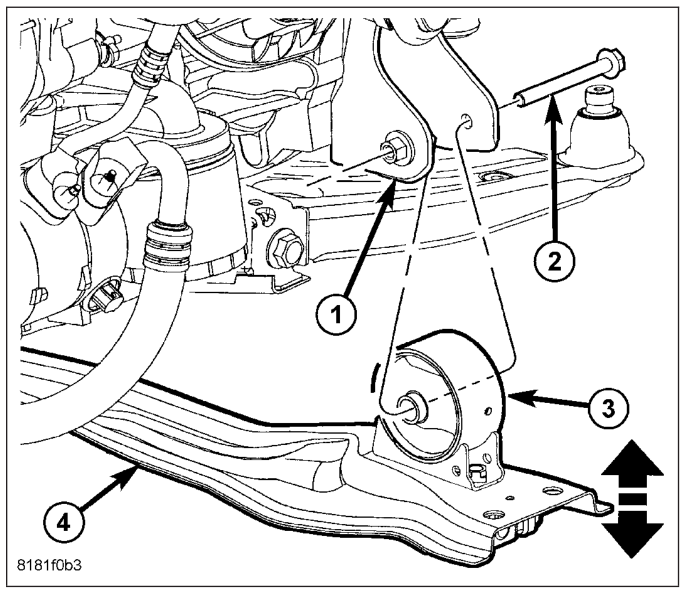
CROSSMEMBER-FRONT FORE/AFT

REMOVAL

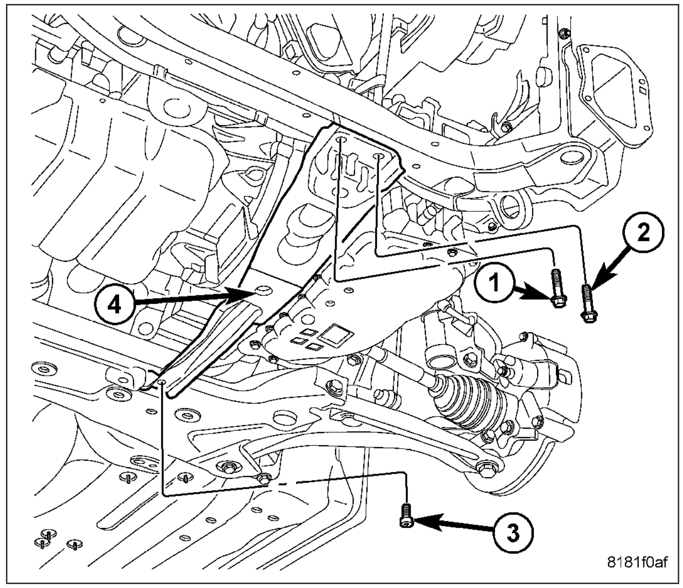


1. Raise and support the vehicle, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
2. Remove the four wheel well screws.
3. If equipped, remove the three front screws (4), the three rear screws (2) and one push pin fastener from the center of the belly pan.

4. Remove the crossmember bolts (1, 2 and 3).



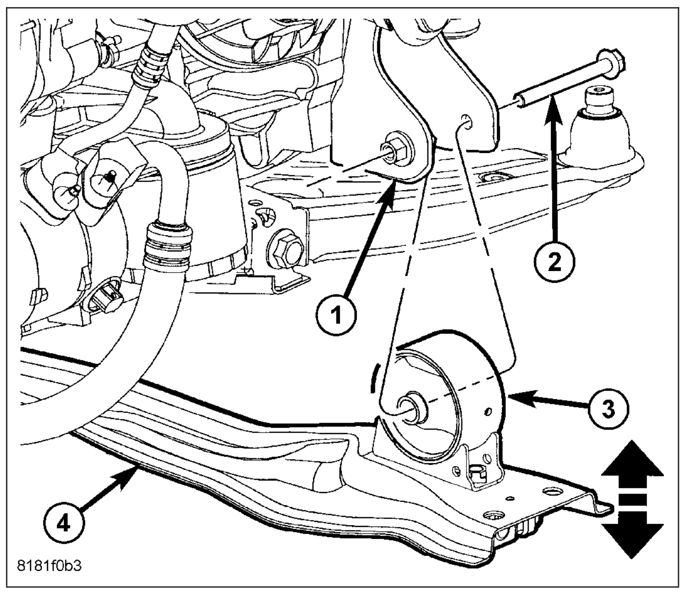
5. Remove the engine roll mount (3) through bolt (2) and remove the fore/aft crossmember (4).



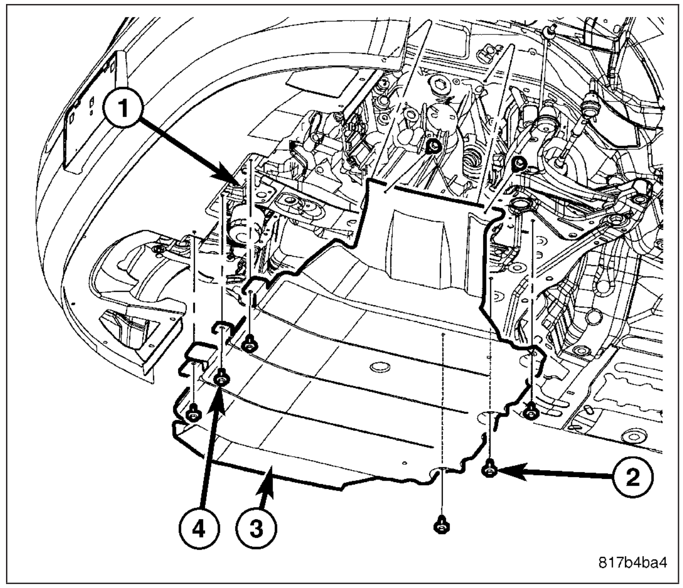
INSTALLATION

1. Install the fore/aft crossmember and install the engine anti-roll mount (3) through bolt (2).

2. Install the bolts (1, 2 and 3), and tighten using the following sequence:



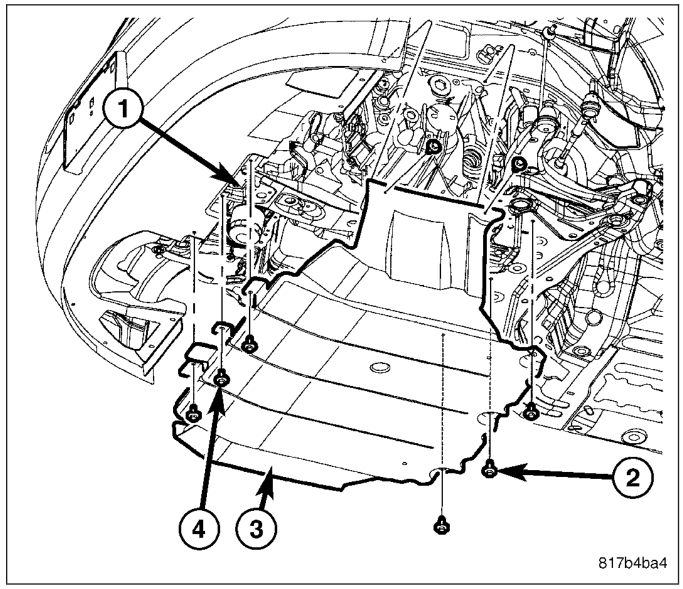
a. Tighten the bolt (1) to 78 N·m (58 ft. lbs.).



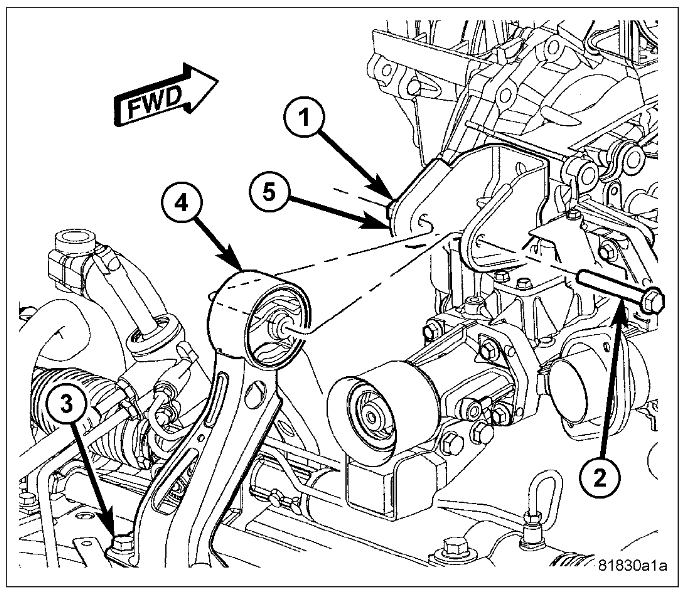
b. Tighten the bolt (2) to 78 N·m (58 ft. lbs.).

c. Tighten the bolt (3) to 129 N·m (95 ft. lbs.).

3. Tighten the bolt (2) to 65 N·m (48 ft. lbs.).

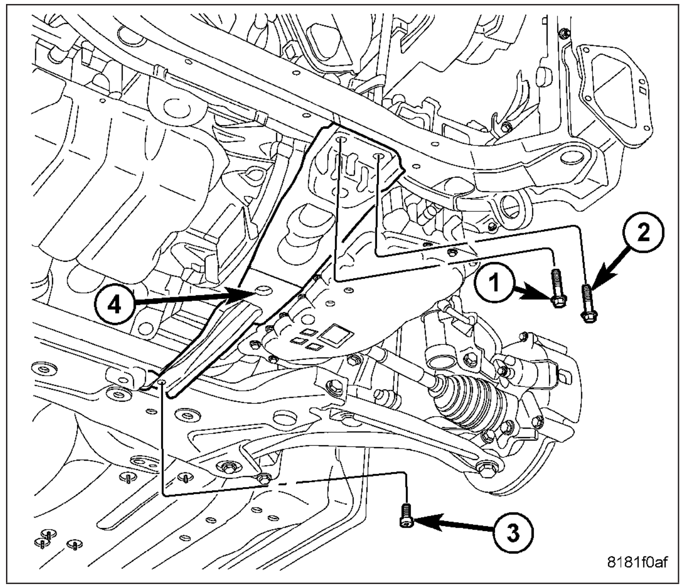


4. If equipped, install the belly pan.
5. Install the three front screws (4), the three rear screws (2) and on push pin fastener into the center of the belly pan.

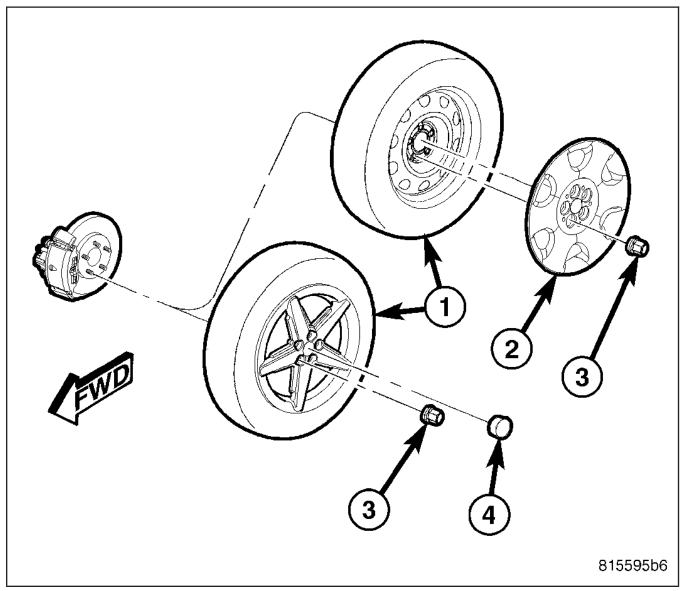


CROSSMEMBER-FRONT SUSPENSION

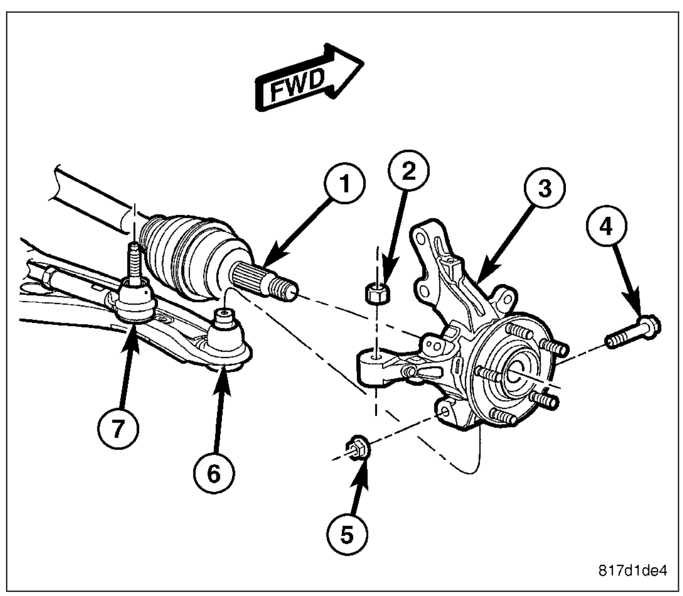
REMOVAL



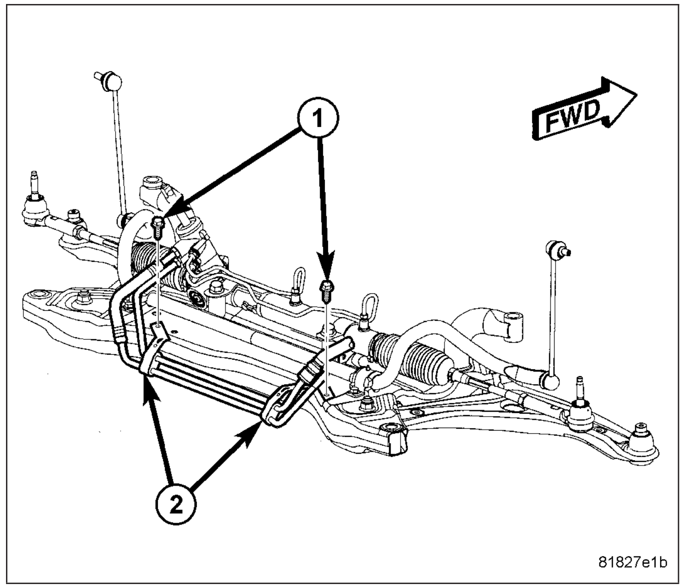
1. Raise and support the vehicle, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
2. Remove the four wheel well screws.
3. If equipped, remove the three front screws (4), the three rear screws (2) and one push pin fastener from the center of the belly pan.



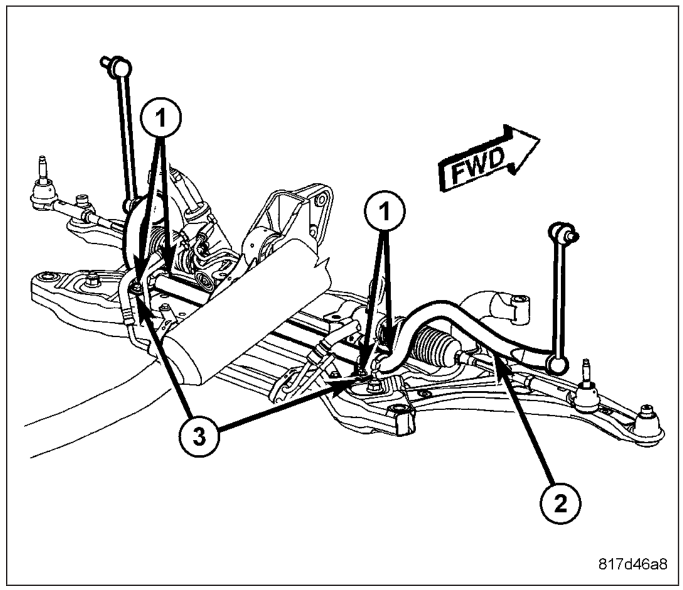
4. Remove the rear roll mount (4) through bolt (2).
5. Remove the three bolts (3) attaching the rear roll mount (5) to the crossmember and remove the mount.



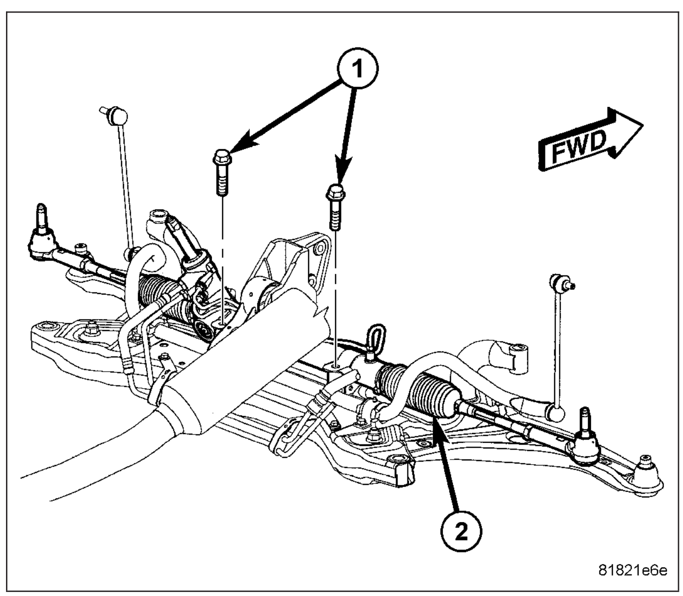
6. Remove the for/aft crossmember (4) (Refer to 13 - FRAME & BUMPERS/FRAME/CROSSMEMBER-FRONT FORE/AFT - REMOVAL).



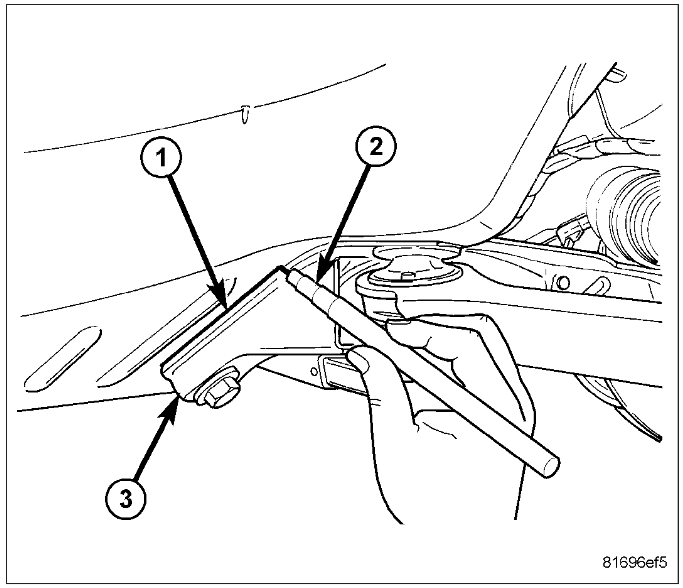
7. Remove the front wheels (1), (Refer to 22 - TIRES/WHEELS - SERVICE INFORMATION - REMOVAL).



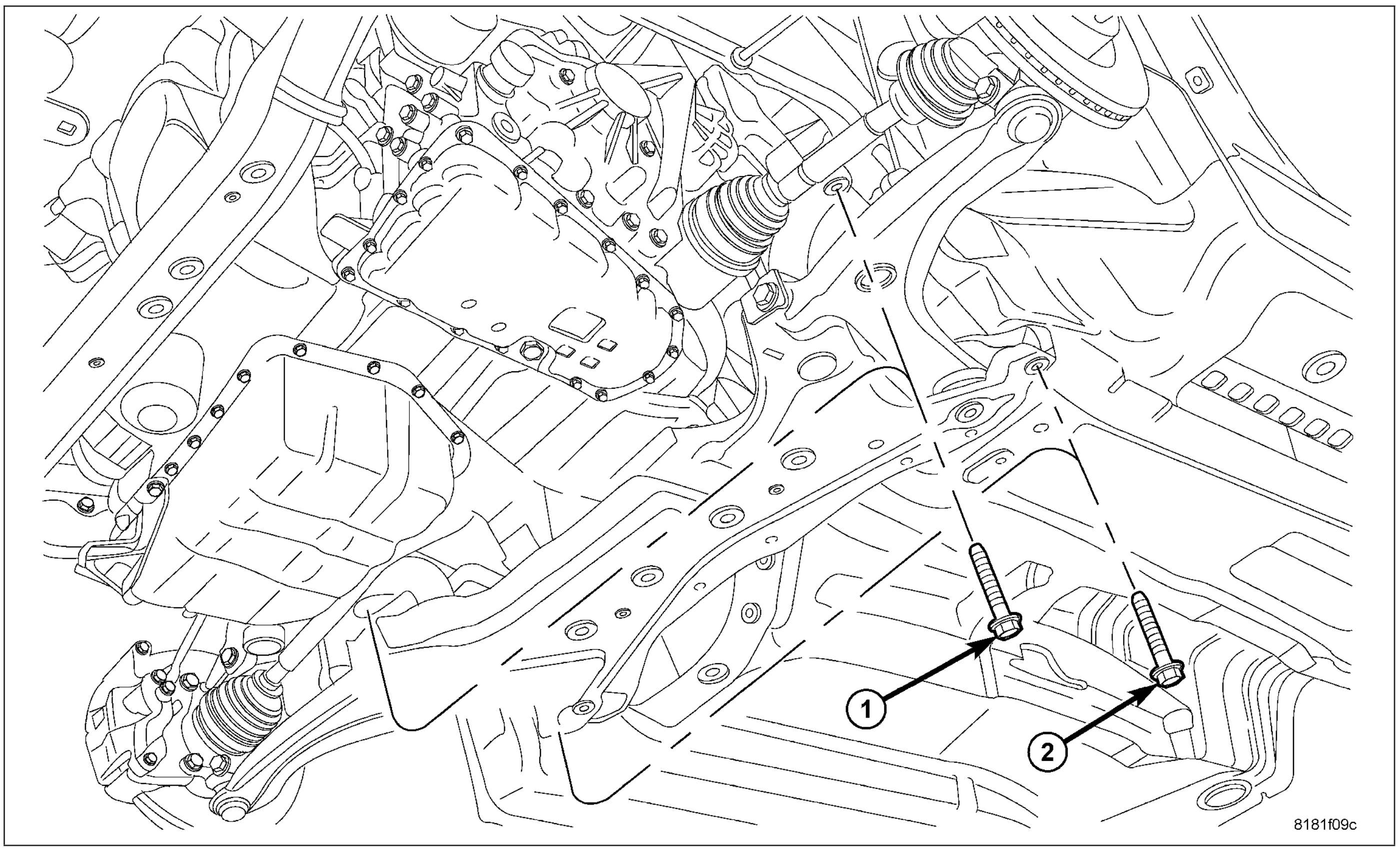
8. Remove the lower ball joint (6) pinch bolts (4) and nuts (5).



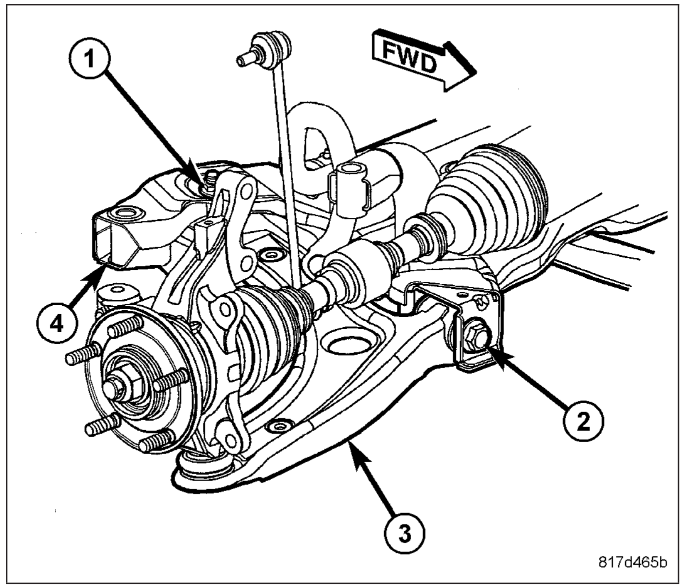
9. Remove the bolt attaching the pressure line routing bracket to the steering gear.
10. Remove the bolt attaching the return line to the crossmember.



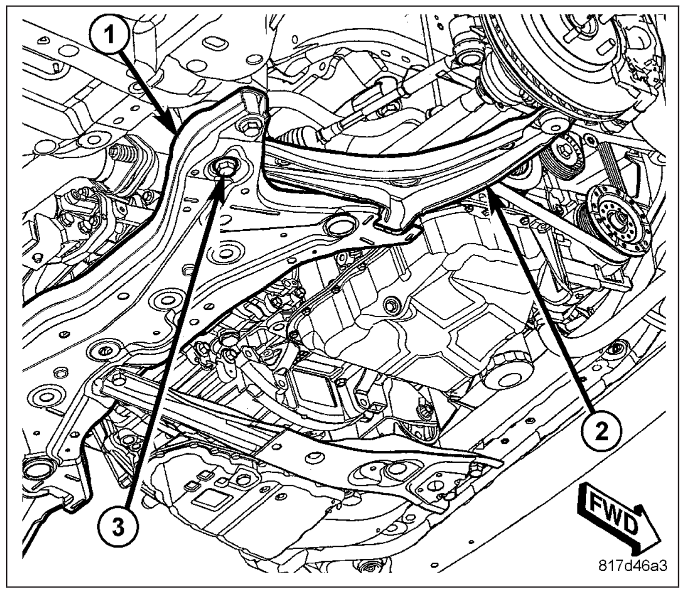
11. Remove the sway bar bushing bolts (1) and support the sway bar (2) up in the vehicle.



12. Remove the steering gear mounting bolts (1) and support the steering gear (2) up in the vehicle.

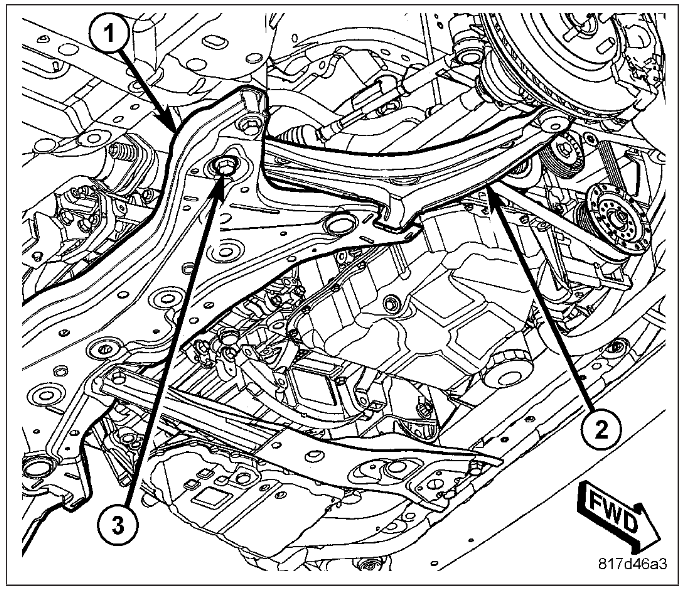


13. Mark the crossmember (3) to body location (1) using a grease pencil (2) or equivalent.

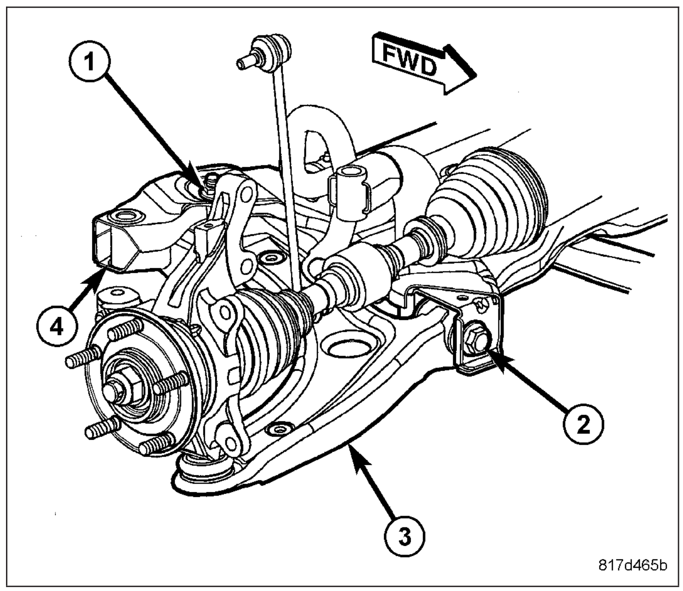


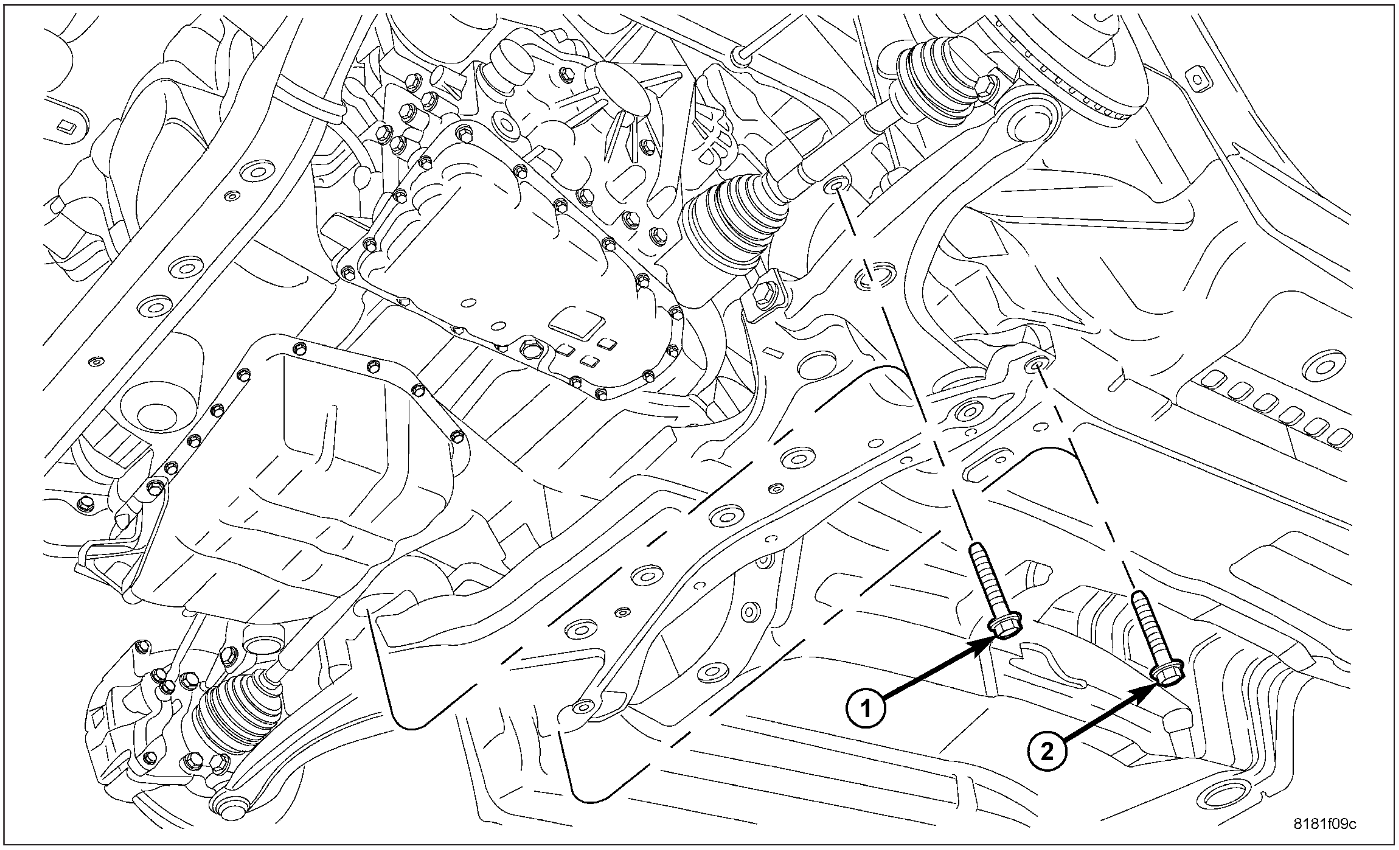
14. Support the crossmember with a suitable lifting device.
15. Remove the crossmember bolts (1 and 2) and lower the crossmember from the vehicle.

16. Remove the lower control arm (3) front pivot bolts (2).



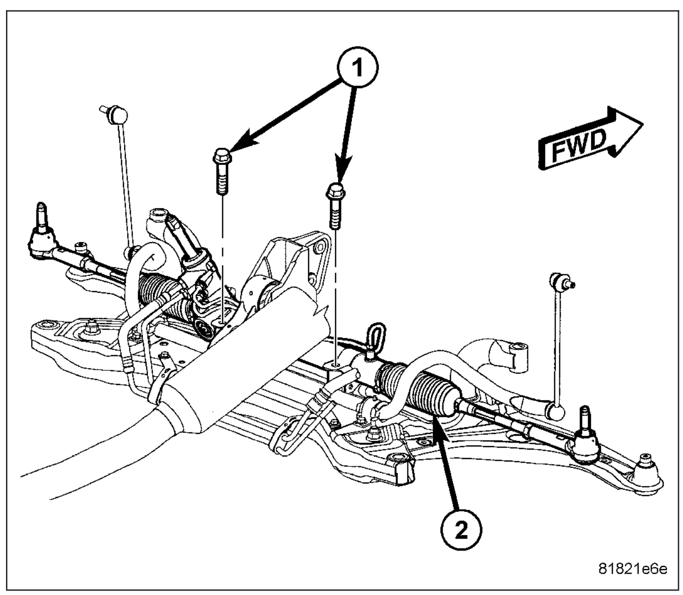
17. Remove the lower control arm rear pivot bolts (3) and separate the lower control arms from the crossmember (1).



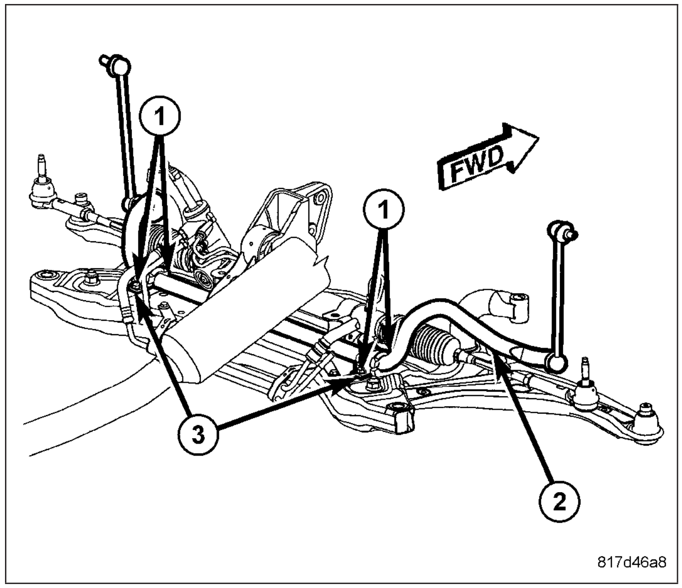


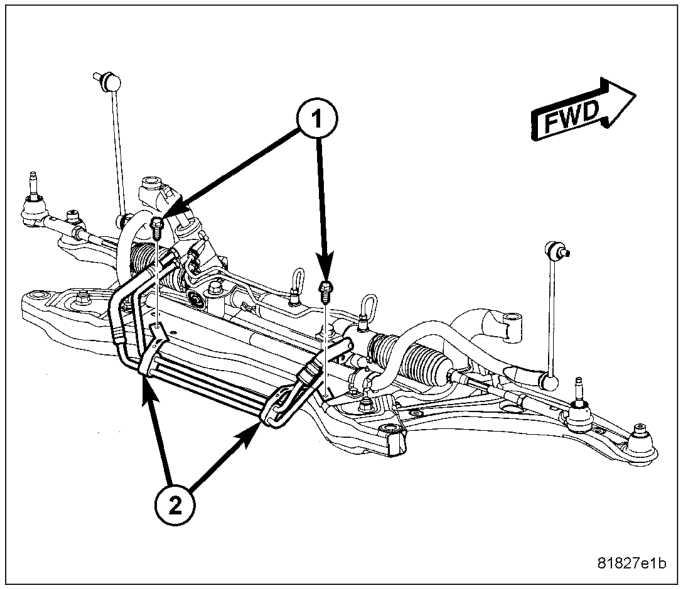
INSTALLATION

1. Install the lower control arms and install the rear pivot bolts (3).

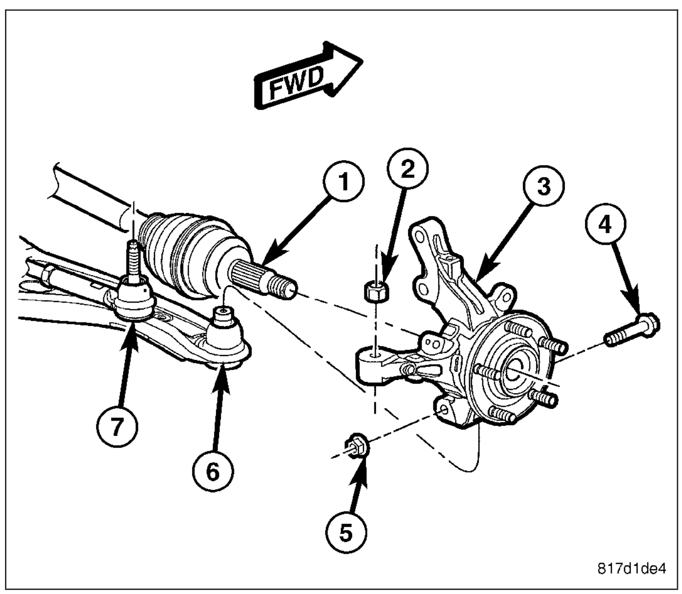


2. Install the front pivot bolts (2).

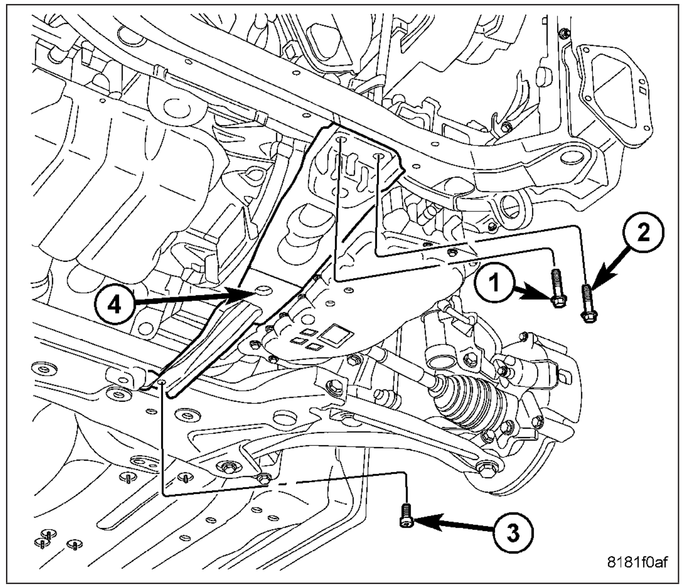




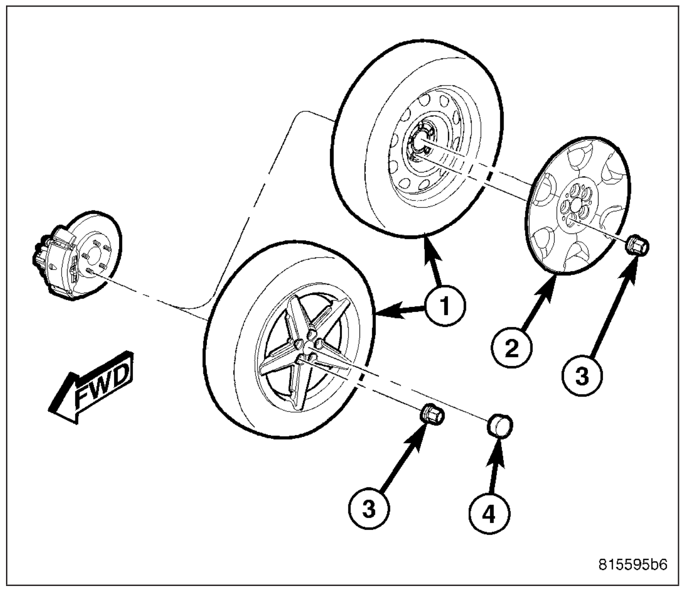
3. Support the crossmember on a suitable lifting device.
4. Raise the crossmember into position onto the vehicle.
5. Install the bolts (1 and 2) and align the engine cradle to the marks made during removal.
6. Tighten the bolts to 190 N·m (140 ft. lbs.).
7. Position the steering gear back into place and install the bolts (1).
8. Tighten the bolts to 61 N·m (45 ft. lbs.).



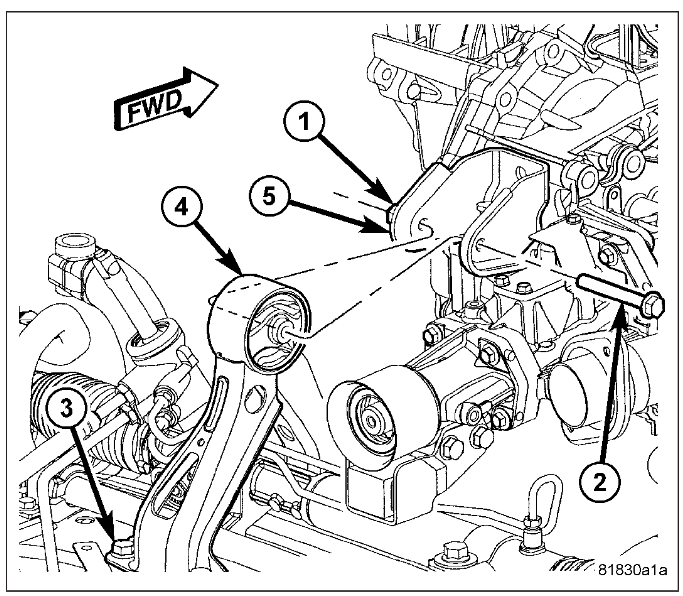
9. Position the stabilizer bar (2) back into place and install the bushing bolts (1).
10. Tighten the bolts to 61 N·m (45 ft. lbs.).



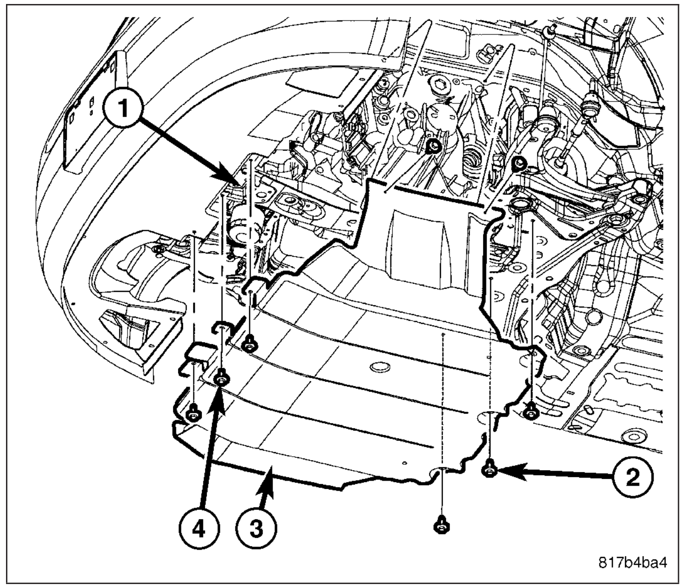
11. Position the power steering lines back into place and install the support bracket (2) bolts (1).
12. Tighten the bolts to 8 N·m (70 ft. lbs.).



13. Connect the lower ball joint stud (6) to the knuckle (3).
14. Install a NEW ball joint stud pinch bolt (4) and nut (5). Tighten the nut to 82 N·m (60 ft. lbs.).

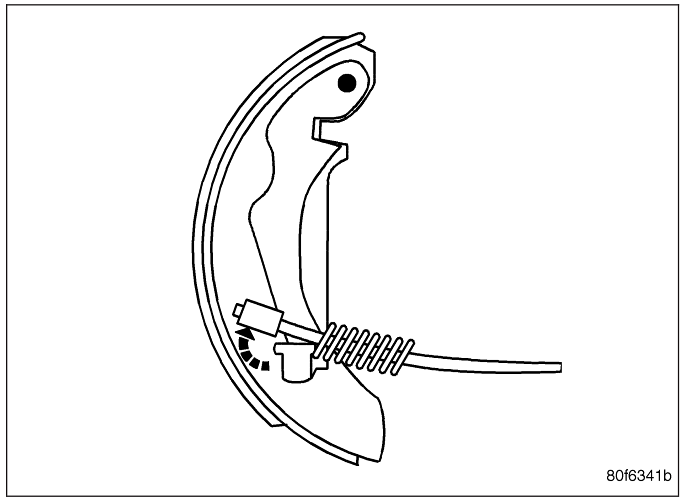


15. Install the fore/aft crossmember (4), (Refer to 13 - FRAME & BUMPERS/FRAME/CROSSMEMBER-FRONT FORE/AFT - INSTALLATION)

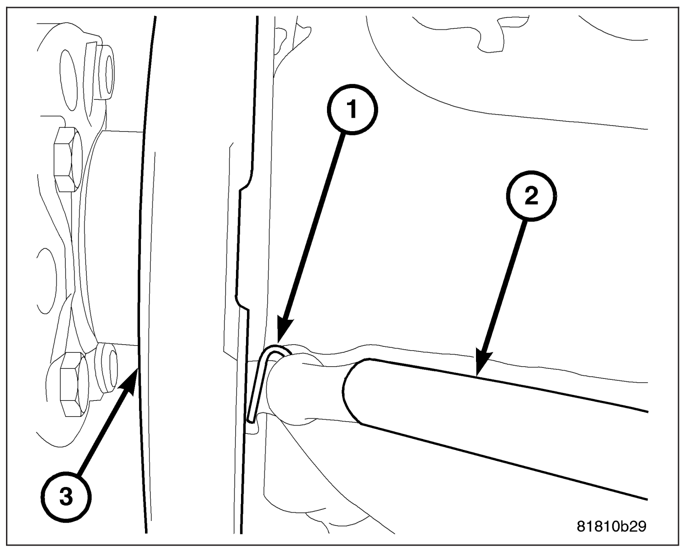


16. Install the front wheels (1), (Refer to 22 - TIRES/WHEELS - INSTALLATION)
17. With the full weight of the vehicle on the suspension tighten the front control arm bushing bolts to 123 N·m (91 ft. lbs.)
18. Perform wheel alignment as necessary. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

19. Install the rear roll mount (4) and install the three bolts (3) attaching it to the crossmember.
20. Tighten the bolts (3) to 153 N·m (112 ft. lbs.).
21. Install the through bolt (2) and tighten to 65 N·m (48 ft. lbs.).

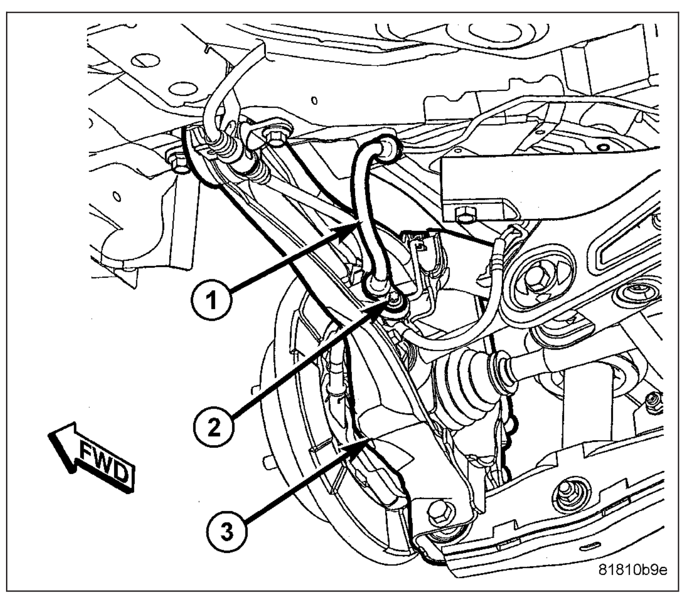


22. If equipped, install the belly pan.
23. Install the three front screws (4), the three rear screws (2) and push pin fasteners into the center of the belly pan.

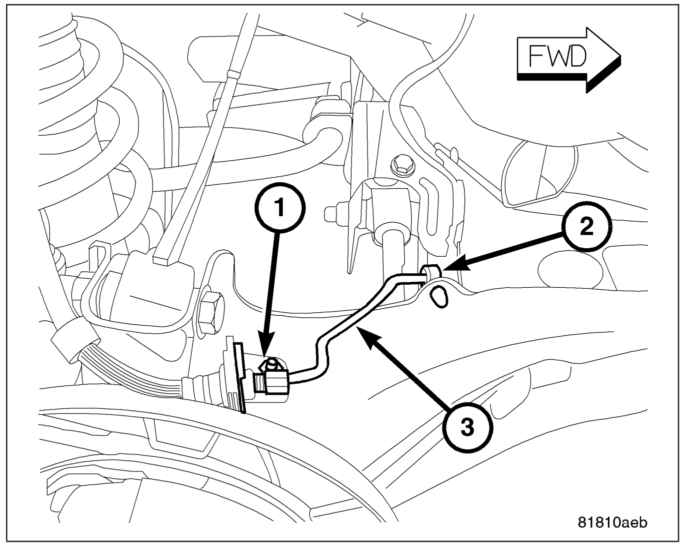


CROSSMEMBER-REAR SUSPENSION

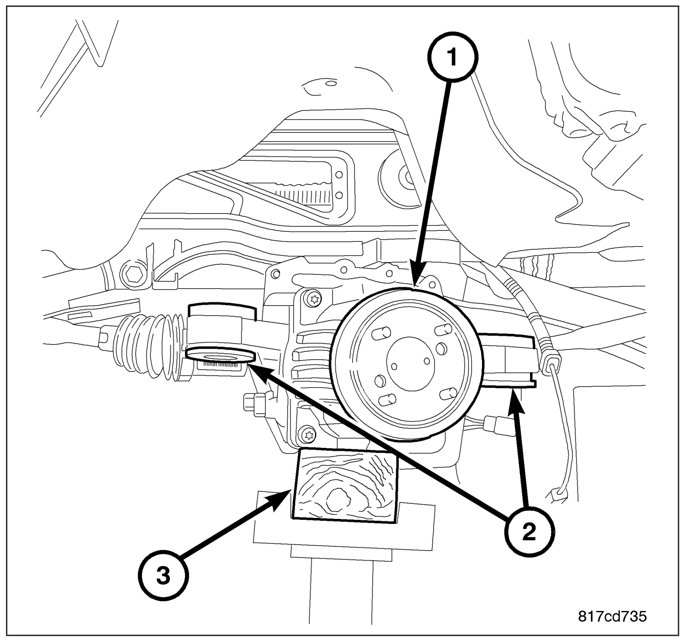
REMOVAL



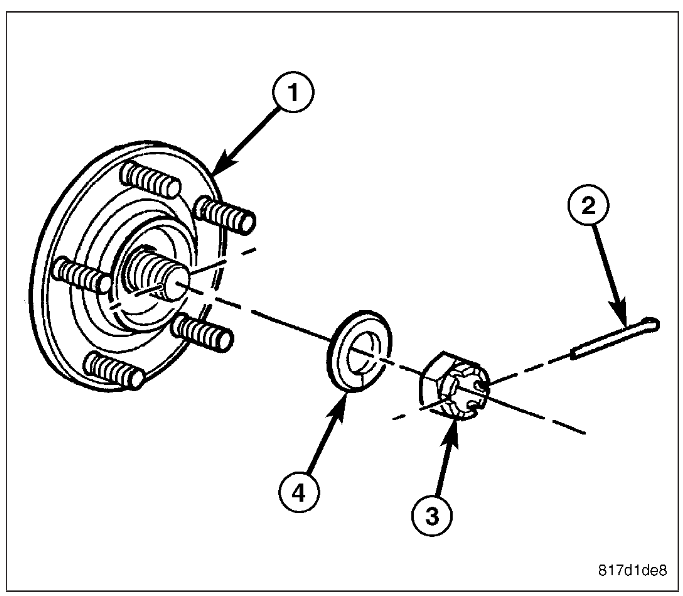
1. Remove the park brake shoes, (Refer to 5 - BRAKES/PARKING BRAKE/SHOE AND LININGS-PARKING BRAKE - REMOVAL).
2. Park brake cable from lever.



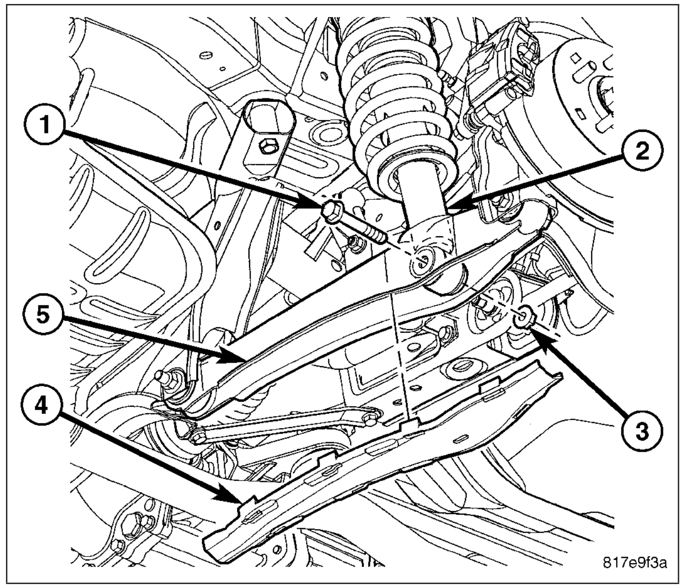
3. Remove the hair pin clip and separate the brake cable (2) from the backing plate (3).



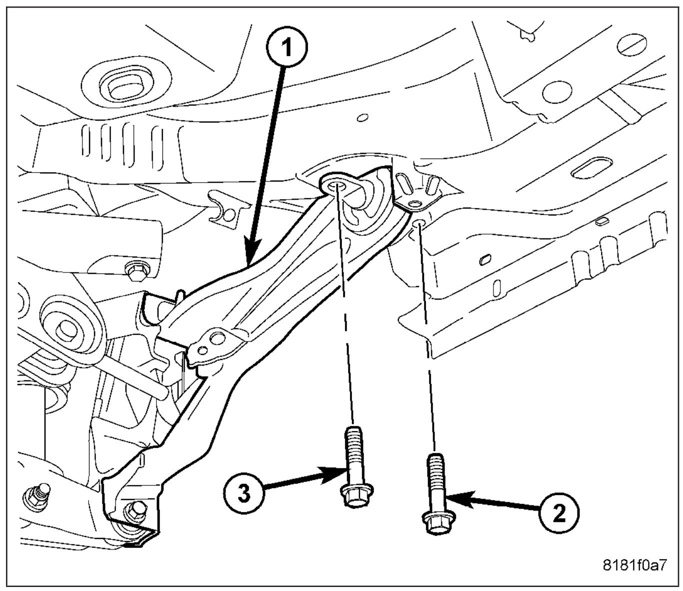
4. Remove the bolt (2) and separate the brake line (1) from the trailing arm (3).



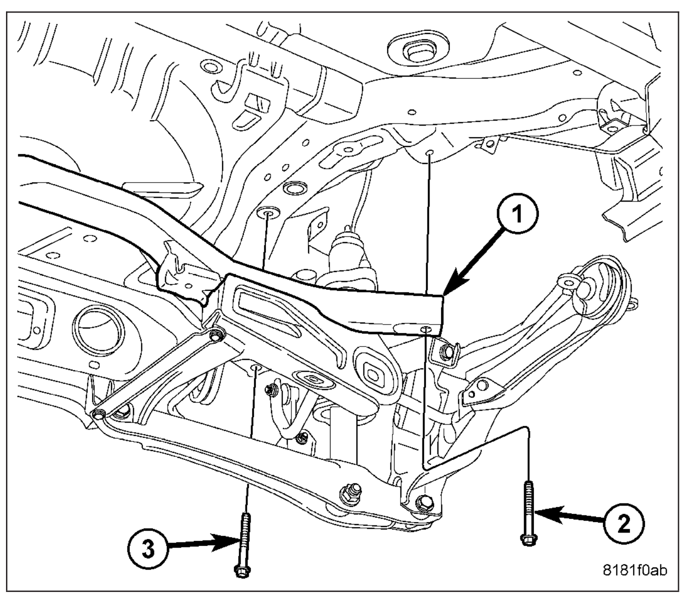
5. Remove the bolt (1), the clip (2) and separate the brake line (3) from the trailing arm.
6. Separate the wheel speed sensors and position aside as necessary to remove the crossmember, (Refer to 5 - BRAKES/ELECTRICAL/SENSOR-REAR WHEEL SPEED - REMOVAL)



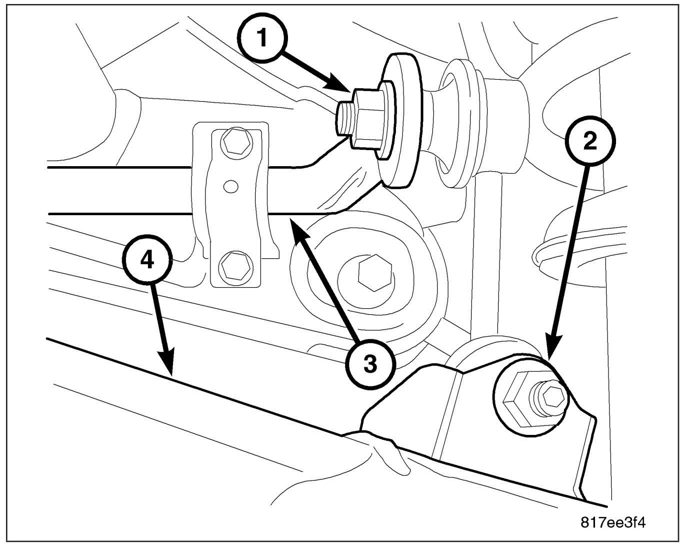
7. If equipped, remove the rear drive module, (Refer to 3 - DIFFERENTIAL & DRIVELINE/MODULE-REAR DRIVELINE - REMOVAL).



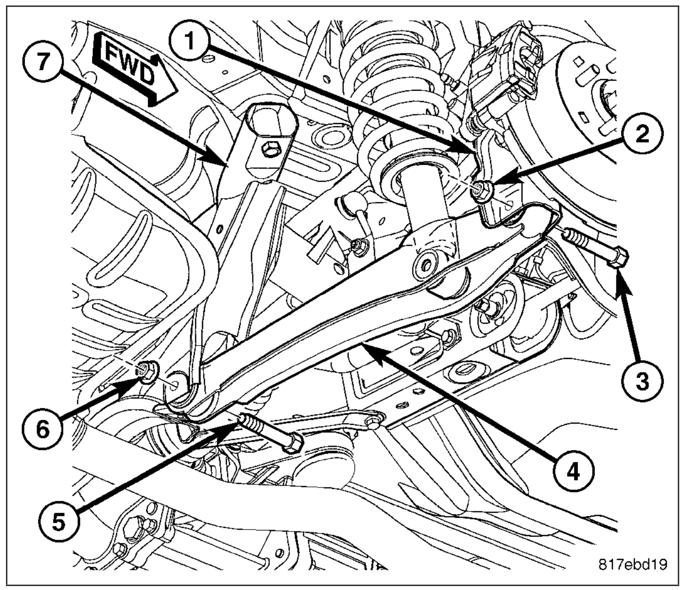
8. Remove the cotter pins (2), the nuts (3) and the washers (4).
9. Remove both half shafts.



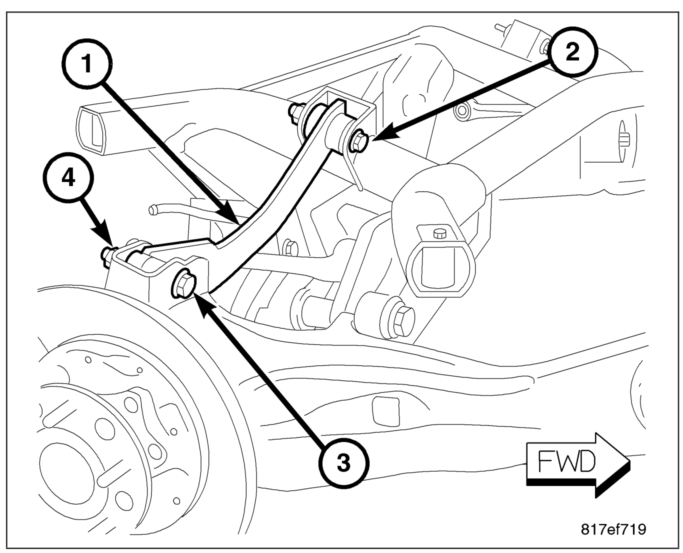
10. Remove the lower strut bolts.



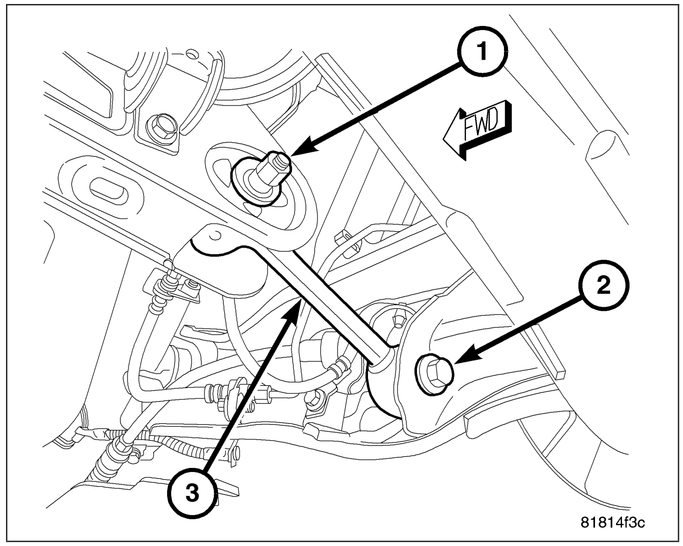
11. Remove the trailing link bushing bolts.



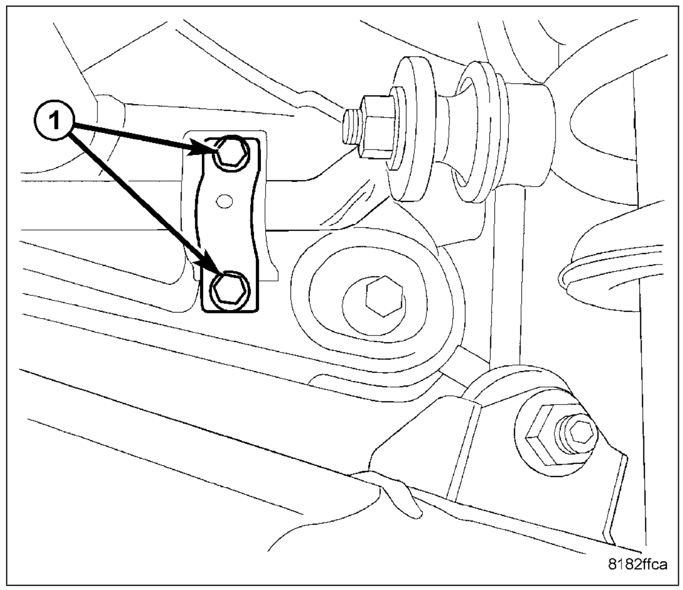
12. Support the rear cradle with a suitable lifting device.
13. Remove the rear cradle bolts and lower the cradle assembly from vehicle.



14. Remove the lower stabilizer link nuts (2).

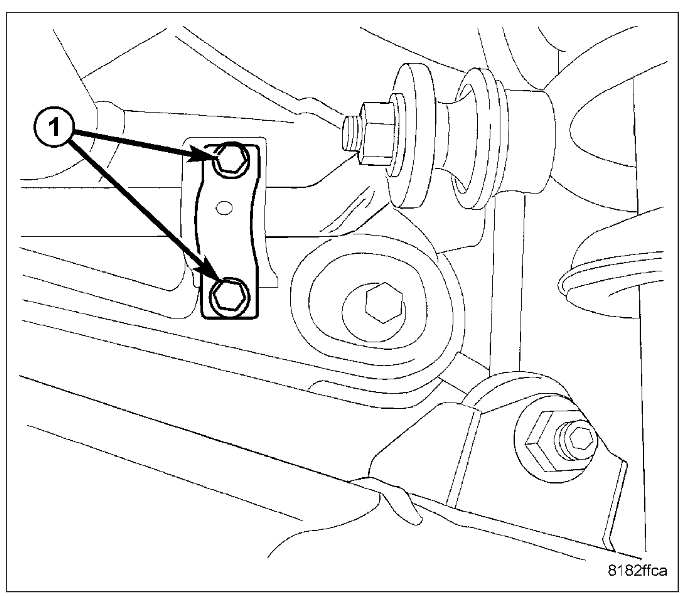


15. Remove the lower link bolts (5 and 6) at the cradle.

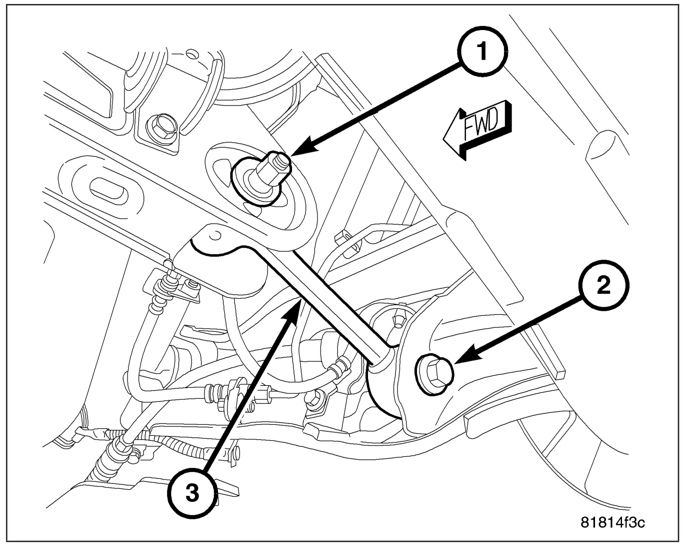


16. Remove the upper link bolts (2) at the cradle.

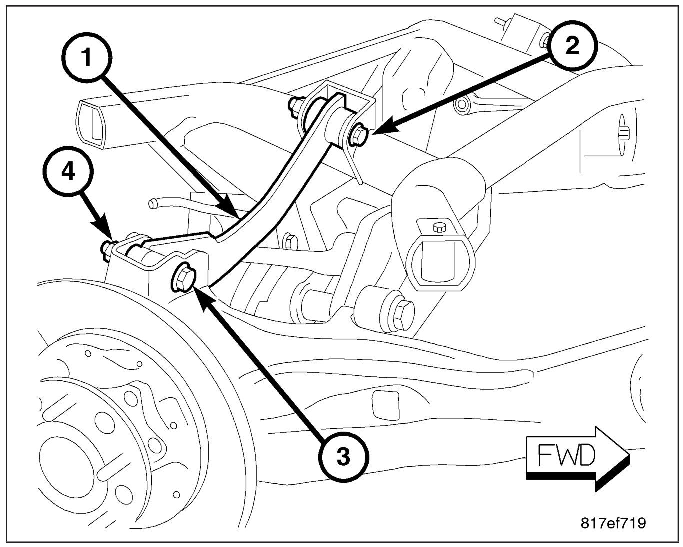
17. Remove the toe link cam bolts (1) at the cradle.



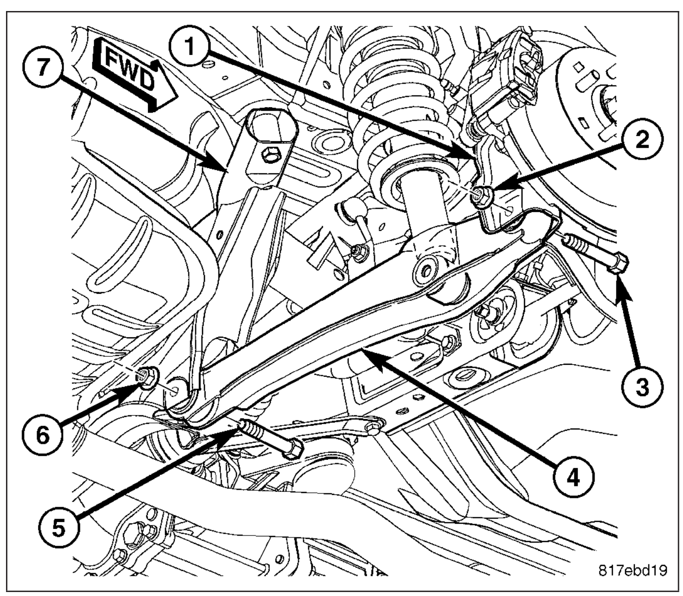
18. Remove the suspension knuckle assemblies.
19. Remove the stabilizer bushing bolts (1) and separate the stabilizer bar from the cradle.



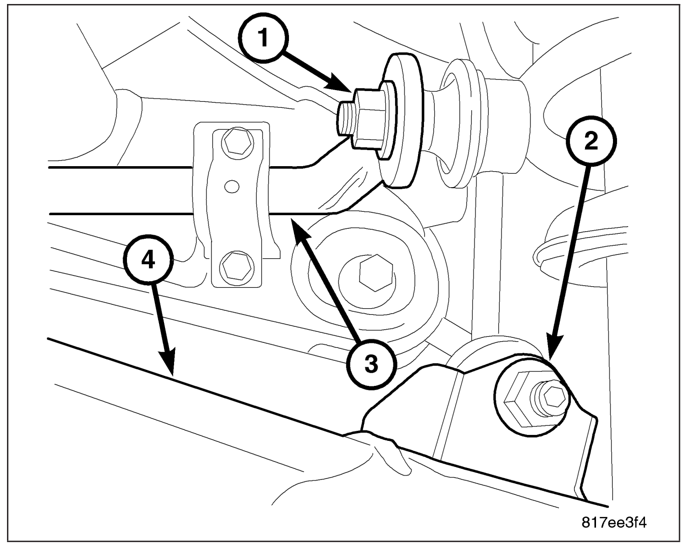
INSTALLATION



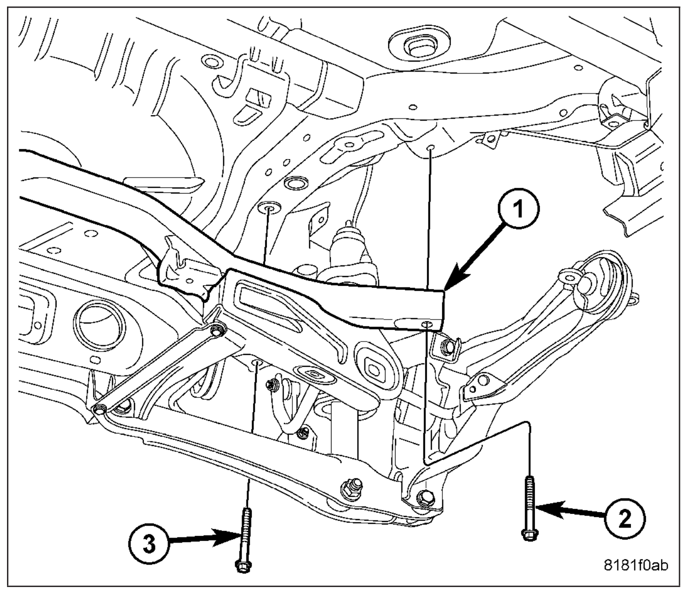
1. Install the stabilizer bar and install the bushings and bolts (1).
2. Tighten the bolts to 61 N·m (45 ft. lbs.).



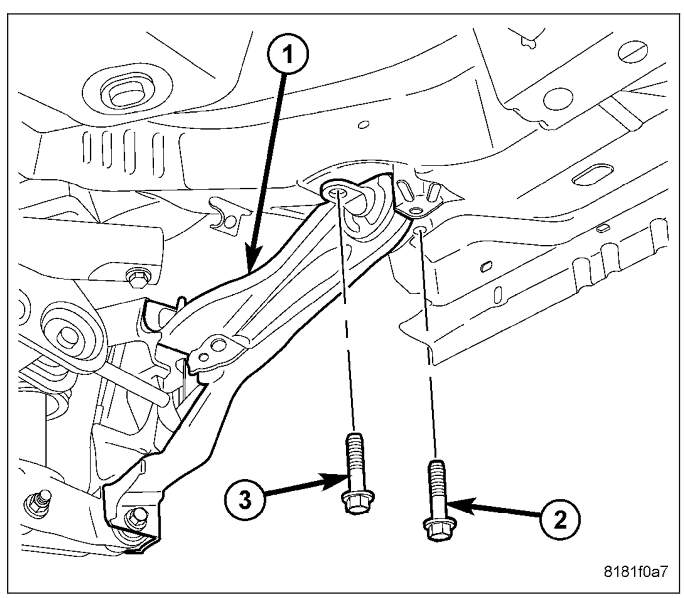
3. Position the suspension knuckle assemblies back into position onto the crossmember.
4. Install the toe link cam bolts (1) at the cradle.
5. Tighten the bolts to 35 N·m (26 ft. lbs.).



6. Install the upper link bolts (2) at the cradle.
7. Tighten the bolts to 90 N·m (70 ft. lbs.).



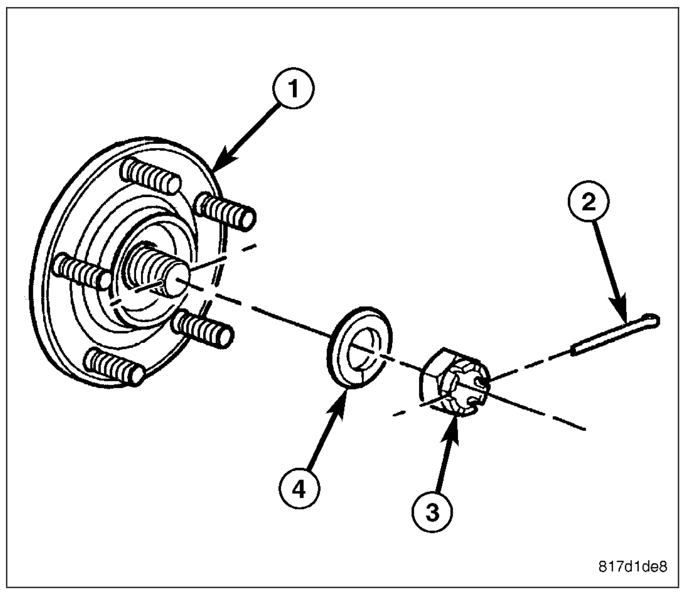
8. Install the lower link bolts (5 and 6) at the cradle.
9. Tighten the bolts to 90 N·m (70 ft. lbs.).



10. Install the stabilizer link nuts (2).
11. Tighten the nuts to 58 N·m (43 ft. lbs.).

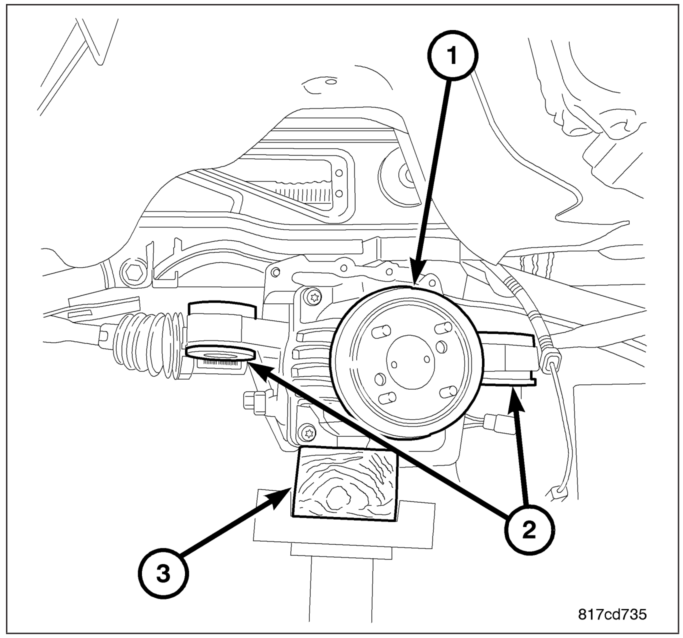
12. Support the rear cradle assembly (1) with a suitable lifting device and position back into the vehicle.
13. Install the cradle bolts (2 and 3):

   a. Tighten the front bolts (2) first to 110 N·m (81 ft. lbs.).
   b. Tighten the rear bolts (3) next to 110 N·m (81 ft. lbs.).
14. Install the trailing link (1) bushing bolts (2 and 3):

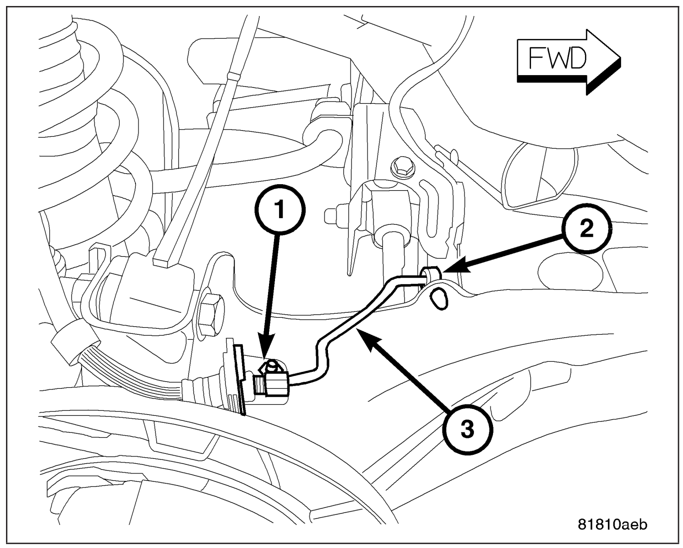


a. Tighten the inboard bolts (3) first to 110 N·m (81 ft. lbs.).

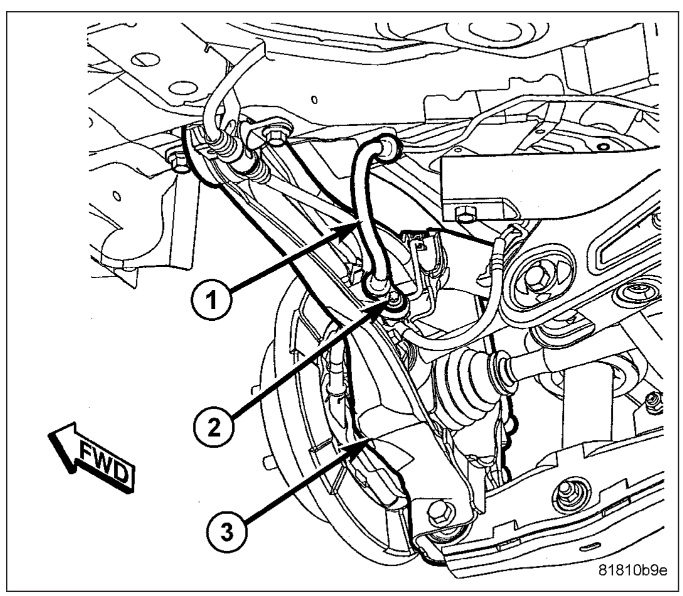
b. Tighten the outboard bolts (2) next to 110 N·m (81 ft. lbs.).



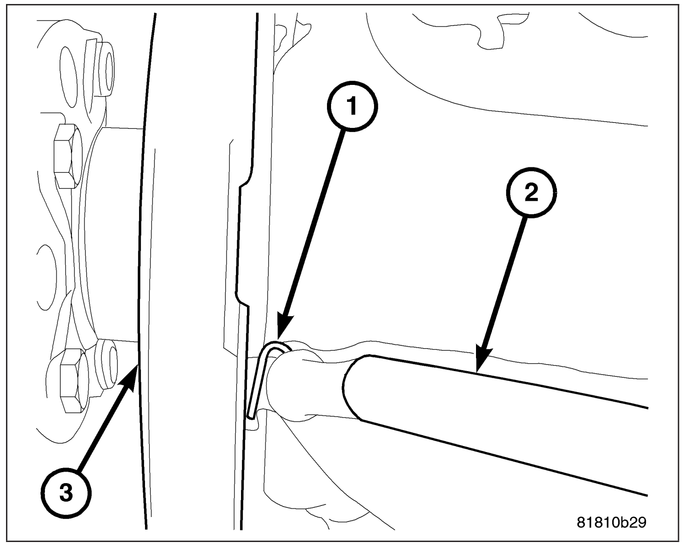
15. Install the lower strut bolts (1).
16. Tighten the bolts to 99 N·m 73 ft. lbs.).



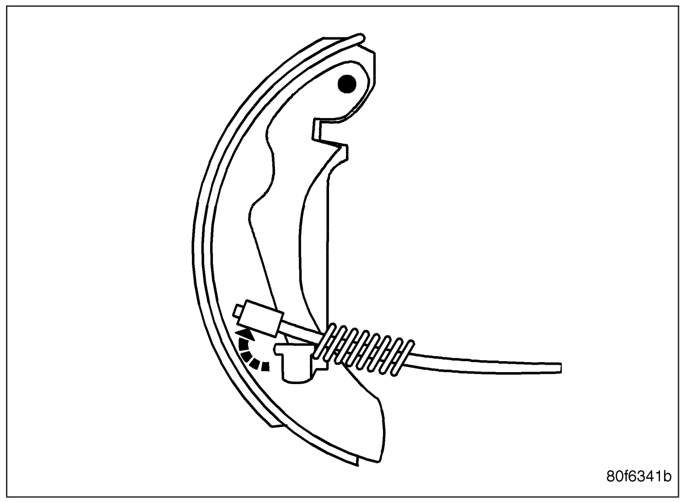
17. If equipped, install the rear half shafts.
18. Install the nuts (3) and washers (4).
19. Tighten the nuts to 244 N·m (180 ft. lbs.).
20. Install new cotter pins (2).



21. Install the rear drive module (1), (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR DRIVELINE MODULE - INSTALLATION).
22. Install the wheel speed sensor back, (Refer to 5 - BRAKES/ELECTRICAL/SENSOR-REAR WHEEL SPEED - INSTALLATION).



23. Position the brake lines (3) back into place, connect the clips (2) and install the bolts (1).
24. Tighten the bolts to 15 N·m (11 ft. lbs.).



25. Position the brake lines (1) back into place, and install the bolts (2).
26. Tighten the bolts to 23 N·m (17 ft. lbs.).

27. Install the brake cable (2) onto the backing plate (3) and install the hair pin clip (1).

28. Connect the brake cable to the park brake lever.
29. Install the park brake shoes, (Refer to 5 - BRAKES/PARKING BRAKE/SHOE AND LININGS-PARKING BRAKE - INSTALLATION).
30. Check and adjust wheel alignment as necessary, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

FUEL SYSTEM

TABLE OF CONTENTS

FUEL DELIVERY

TABLE OF CONTENTS

FUEL DELIVERY

DESCRIPTION

The fuel tank is made of plastic and is located near the rear center of the vehicle.

The Fuel Delivery System consists of: the following items:

- Electric fuel pump module
- Fuel filter
- Tubes/lines/hoses
- Fuel injectors

The in-tank fuel pump module contains the fuel pump. The pump is serviced as part of the fuel pump module. Refer to Fuel Pump Module.

The fuel filter is not serviceable, it is mounted on the inside of the fuel tank in the fuel pump module.

DIAGNOSIS AND TESTING - FUEL DELIVERY SYSTEM

(Refer to Group 9 Engine for all Powertrain Diagnostic Information)

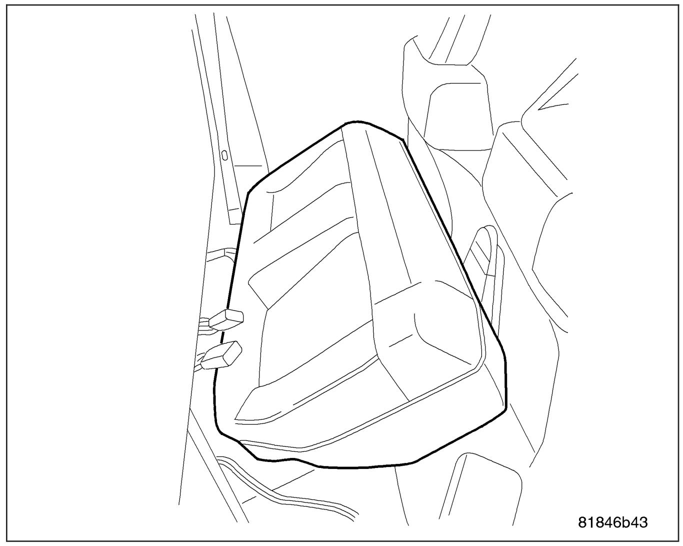
STANDARD PROCEDURE

FUEL CONTAMINATION

If a engine's fuel supply has been contaminated, the following procedure must be followed:

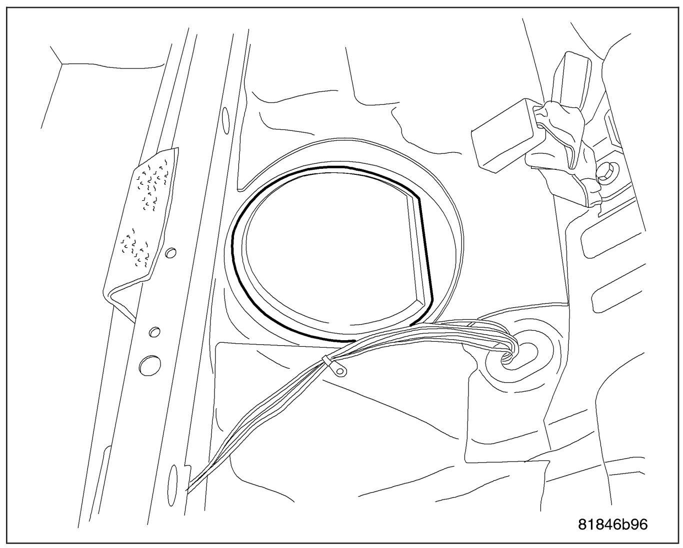
1. Remove all fuel from fuel tank. Use an appropriate fuel container. Dispose of contaminated fuel through the proper procedure of disposal. Clean fuel tank. This will require removal of the fuel tank to make sure all contaminated fuel is removed. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - REMOVAL).
2. Install fuel tank to vehicle, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK - INSTALLATION).
3. Fill fuel tank with fuel.
4. Check for DTC's and clear DTC's.
5. Start vehicle and run engine for 15 minutes and turn off vehicle.
6. Check for DTC's and clear DTC's.
7. Road test vehicle.
8. Check for DTC's.

NOTE: Dispose of Petroleum based products in a manner consistent with State, Federal, and Provincial Regulations.



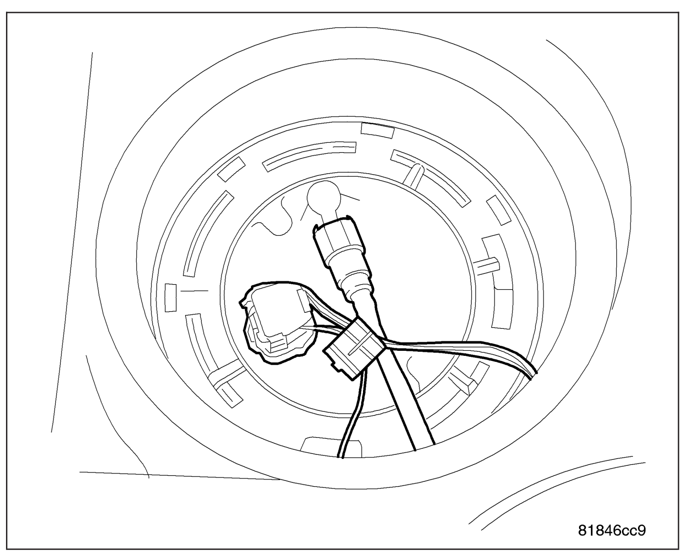
The engine should then be evaluated to determine if the contaminated fuel has caused any damage to the fuel system and or engine. Indicators that the fuel system and or engine has been damaged are the following:

- Unstable fuel rail pressure. This can manifest itself as instability at idle speeds, excessive undershoot/overshoot at engine start, or excessive undershoot/overshoot when the engine operating conditions change. A typical engine response to a large rail pressure undershoot would be a decrease in engine speed or engine stall.
- Excessive noise from the engine. This could indicate poor rail pressure control or the inability of the injection system to inject the proper amount of fuel.
- Excessive smoke (black or white). This could indicate inability of the fuel system to inject the proper amount of fuel.



NOTE: If any of these conditions are exhibited after cleaning the fuel system, proceed to the appropriate fuel system information. Repair fuel system and or engine as necessary.

STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE PROCEDURE



1. Remove lower rear seat cushion.

2. Remove the fuel pump module cover.

3. Disconnect the electrical connector for fuel pump module.
4. Start and run engine until it stalls.
5. Attempt restarting engine until it will no longer run.
6. Turn ignition key to OFF position.
7. Disconnect negative battery cable.
8. One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory. The scan tool must be used to erase a DTC.

FUEL FILTER

DESCRIPTION

The fuel filter mounts inside the fuel pump module and is a non-serviceable part.

FUEL LINES

DESCRIPTION - FUEL LINES/HOSES AND CLAMPS

Also refer to Quick-Connect Fittings.

WARNING: The fuel system is under a constant pressure (even with the engine off). Before servicing any fuel system hoses, fittings or lines, the fuel system pressure must be released. Refer to the fuel system pressure release procedure in this group. This may result in personal injury or death.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, use new original equipment lines/tubes/hoses.

If equipped: The hose clamps used to secure rubber hoses on vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause leaks.

Use new original equipment type hose clamps.

STANDARD PROCEDURE - HOSES AND CLAMP

Inspect all hose connections (clamps and quick connect fittings) for completeness and leaks. Replace cracked, scuffed, or swelled hoses. Replace hoses that rub against other vehicle components or show sign of wear.

Fuel injected vehicles use specially constructed hoses. When replacing hoses, only use hoses marked EFM/EFI.

When installing hoses, ensure that they are routed away from contact with other vehicle components that could rub against them and cause failure. Avoid contact with clamps or other components that cause abrasions or scuffing. Ensure that rubber hoses are properly routed and avoid heat sources.

The hose clamps have rolled edges to prevent the clamp from cutting into the hose. Only use clamps that are original equipment or equivalent. Other types of clamps may cut into the hoses and cause high pressure fuel leaks. Tighten hose clamps to 1 N·m (9 in. lbs.) torque.

Inspect all hose connections such as clamps, couplings and fittings to make sure they are secure and leaks are not present. The component should be replaced immediately if there is any evidence of degradation that could result in failure.

Never attempt to repair a plastic fuel line/tube. Replace as necessary.

Avoid contact of any fuel tubes/hoses with other vehicle components that could cause abrasions or scuffing. Be sure that the plastic fuel lines/tubes are properly routed to prevent pinching and to avoid heat sources.

FUEL PUMP

DESCRIPTION

The electric fuel pump is located in and is part of the fuel pump module. It is a positive displacement, gerotor type, immersible pump with a permanent magnet electric motor. The fuel pump module is suspended in fuel in the fuel tank.

OPERATION

The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains a check valve. The valve, in the pump outlet, maintains pump pressure during engine off conditions, for a short while. It is normal for fuel pressure to drop to zero after cooldown. The fuel pump relay provides voltage to the fuel pump. The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 kpa ±34 kpa (58 psi ± 5 psi).

FUEL PUMP MODULE

DESCRIPTION

The fuel pump module is installed in the top of the fuel tank.

The fuel pump module contains the following:

- Electric fuel pump
- Fuel pump reservoir
- Inlet strainer
- Fuel pressure regulator
- Fuel gauge sending unit
- Fuel supply line connection
- Fuel Filter

NOTE: The fuel level sensor and the pressure regulator are the only serviceable items. If the fuel pump or electrical wiring harness requires service, replace the fuel pump module.

OPERATION

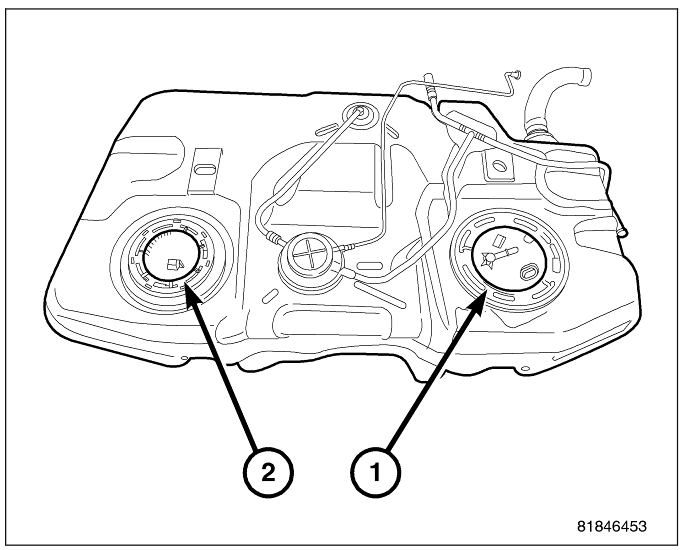
The pump draws fuel through a strainer and pushes it through the motor to the outlet. The pump contains one check valve. The check valve, in the pump outlet, maintains pump pressure during engine off conditions. The fuel pump relay provides voltage to the fuel pump.

The fuel pump has a maximum deadheaded pressure output of approximately 880 kPa (130 psi). The regulator adjusts fuel system pressure to approximately 400 ±34 kPa (58 ±5 psi).

FUEL PUMP ELECTRICAL CONTROL

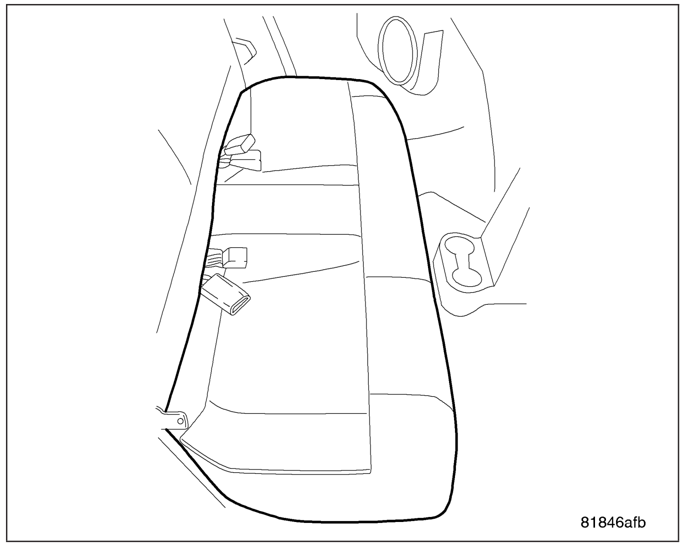
Voltage to operate the electric pump is supplied through the fuel pump relay. For an electrical operational description of the fuel pump refer to fuel Pump Relay—PCM Output.

ELECTRICAL PUMP REPLACEMENT



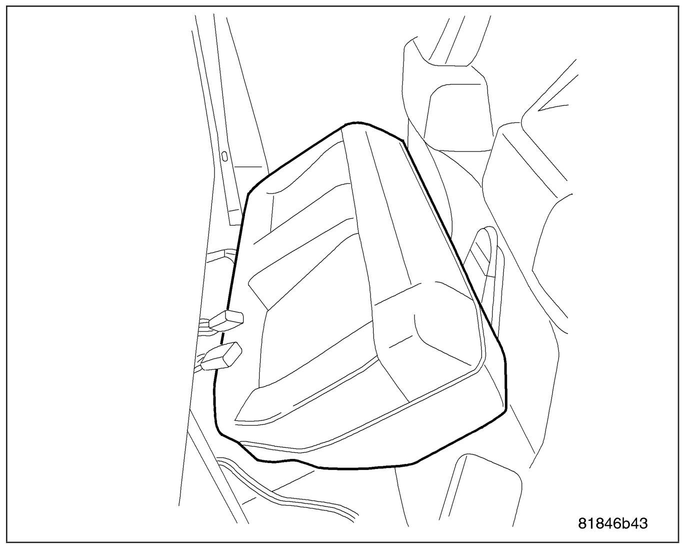
The electric fuel pump is not serviceable. If the fuel pump or electrical wiring harness needs replacement, the complete fuel pump module must be replaced. Perform the Fuel System Pressure Release procedure before servicing the fuel pump.

REMOVAL

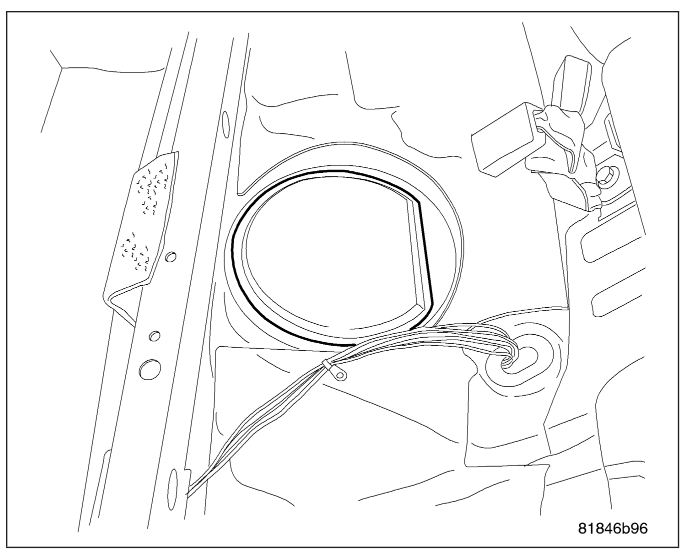


ALL WHEEL DRIVE

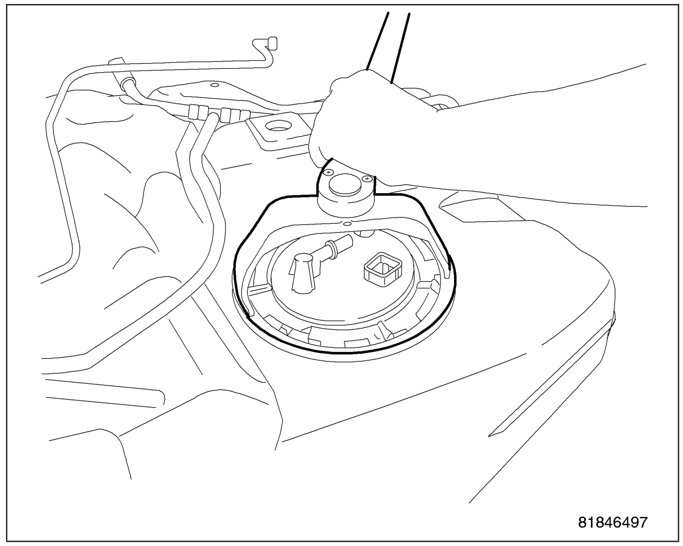
WARNING: Release fuel system pressure before servicing fuel system components. Service vehicles in well ventilated areas and avoid ignition sources. Never smoke while servicing the vehicle. This may result in personal injury or death.



1. Perform Fuel System Pressure Release procedure.
2. Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.
3. Remove the negative battery cable.

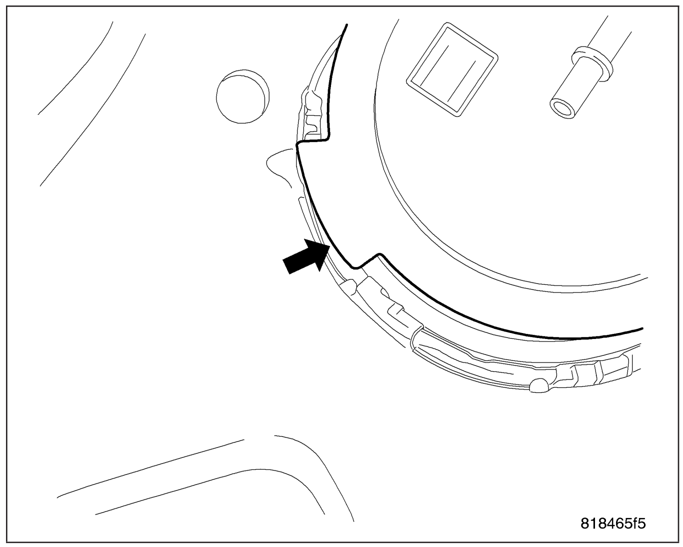


4. Remove the rear seat cushion.

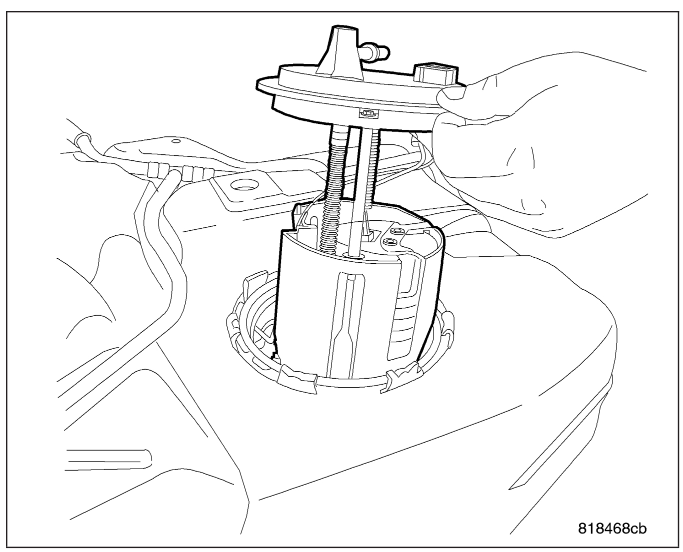


5. Rear seat cushion loose.

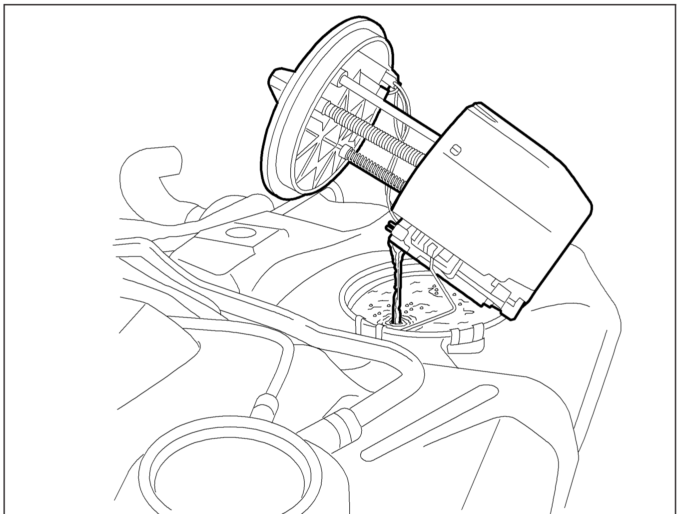
6. Remove plastic cover.



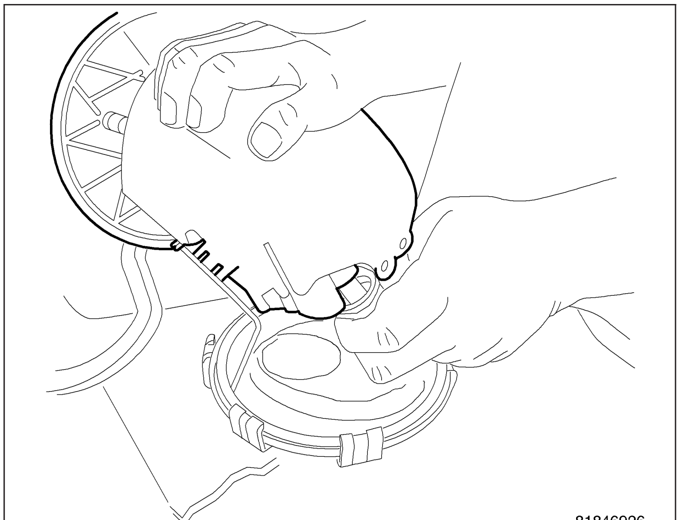
7. Clean top of tank to remove loose dirt and debris.
8. Use special tool #9340 to remove left side module lock ring.



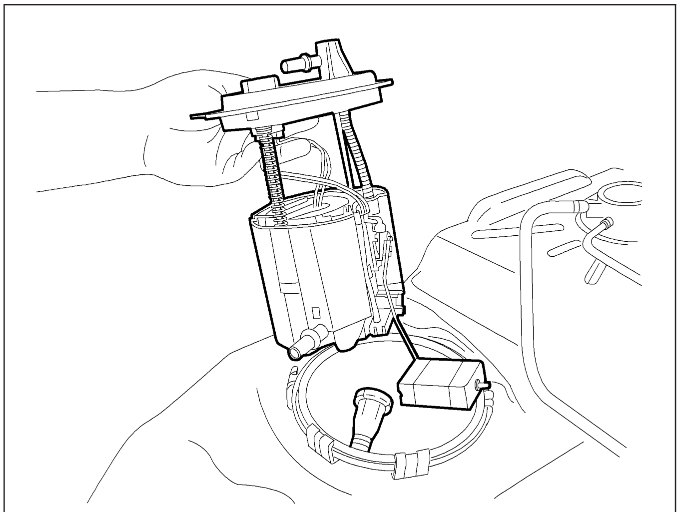
9. **Note the fuel pump location on the top of the fuel tank.**



NOTE: The pump has to be properly located to the tank for the fuel gauge to work properly.

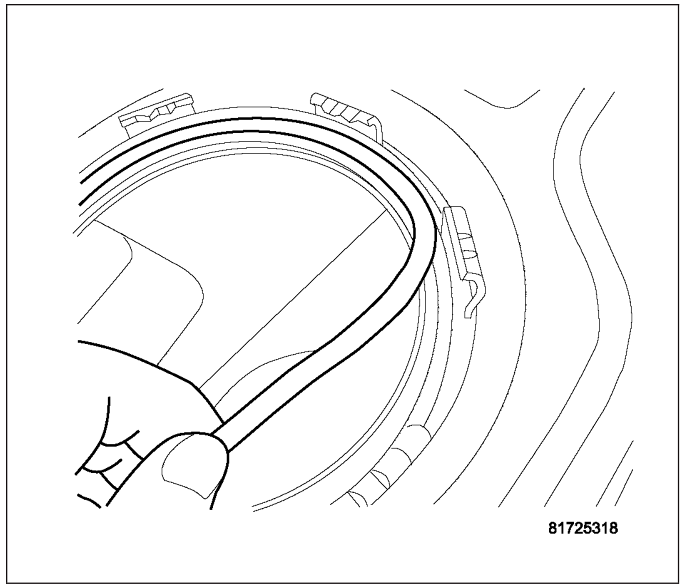


10. Pull module up out of fuel tank, make sure that you do not spill fuel inside of vehicle.



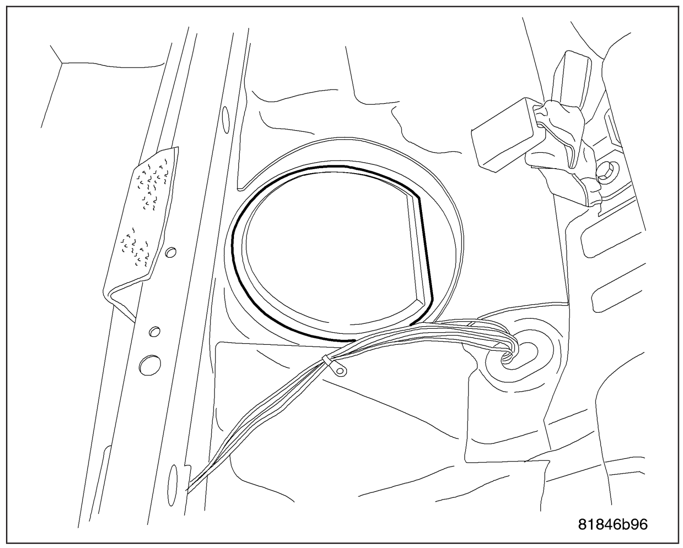
11. Drain fuel from fuel pump module. Do not spill fuel in interior of vehicle.

8184691b



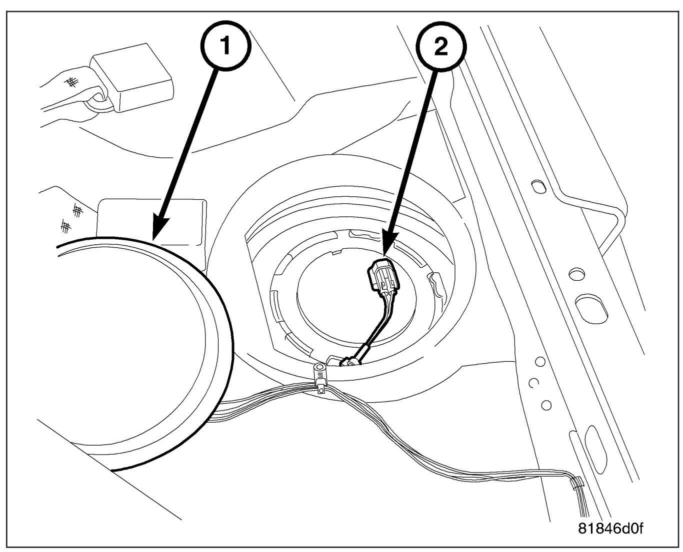
12. Disconnect internal line from fuel pump module.
13. Tip module on its side to drain remaining fuel from reservoir and remove module from vehicle.

81846926



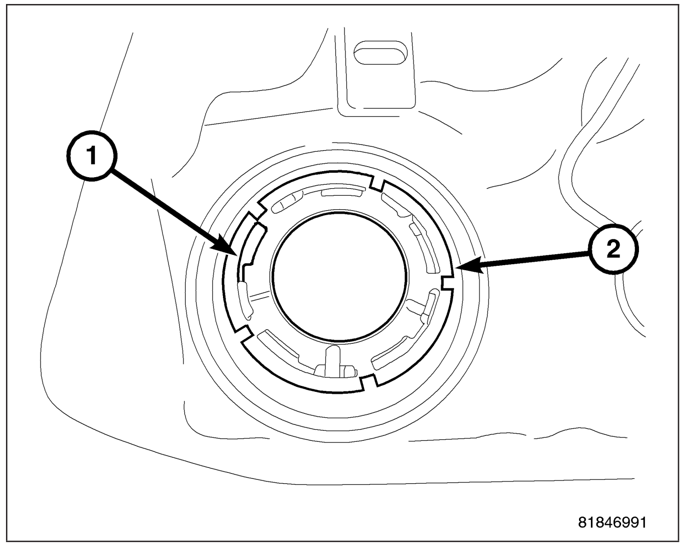
14. Remove module from vehicle.

81846930



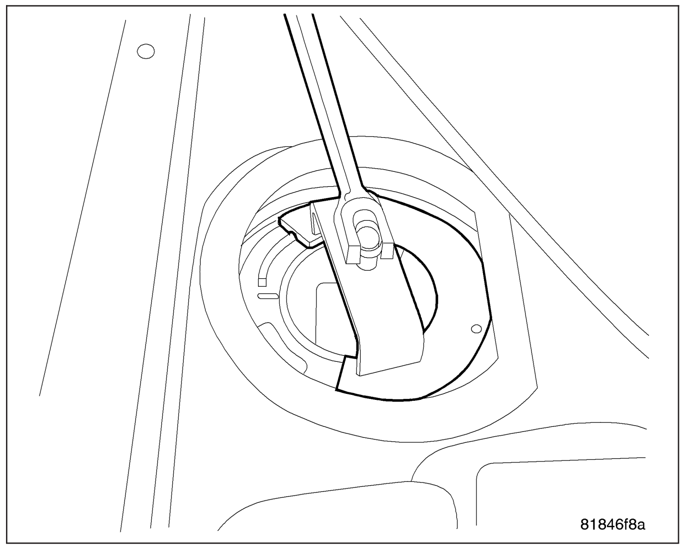
15. Remove seal from tank. Discard seal.

16. Remove plastic cover.

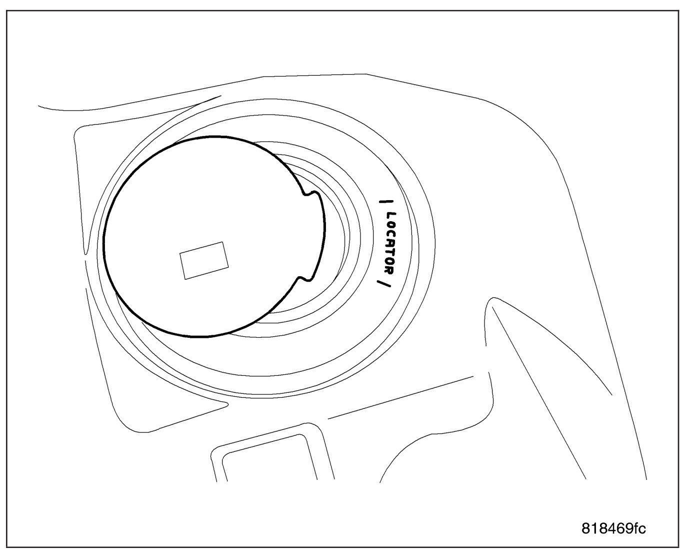


17. Clean top of tank to remove loose dirt and debris.
18. Disconnect electrical line from module.

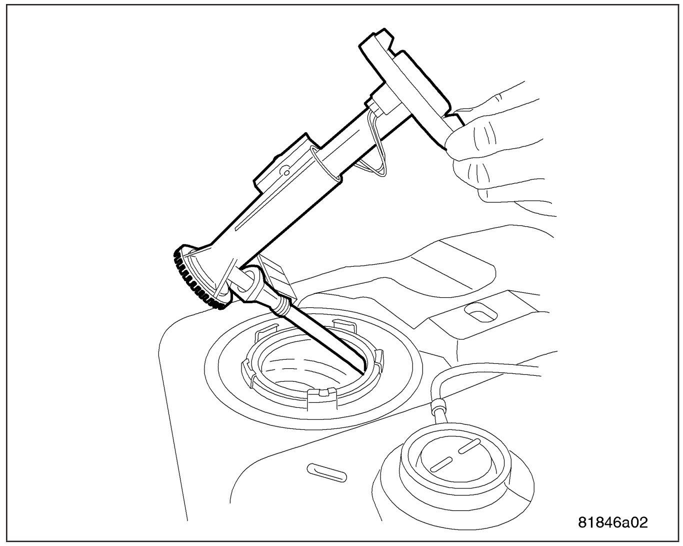
19. **Note the fuel level unit location on the top of the fuel tank (1).**



NOTE: The fuel level unit has to be properly located to the tank for the fuel gauge to work properly.

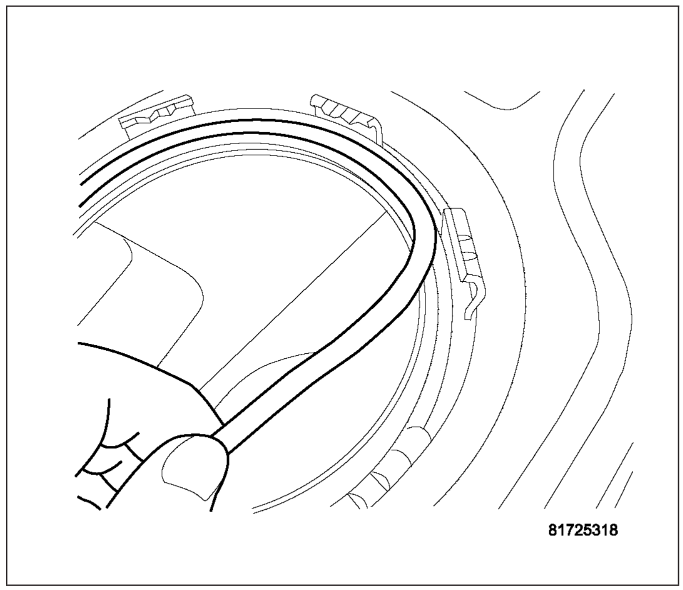


20. Using Special Tool #9318 remove lock ring (2) to release fuel level unit.



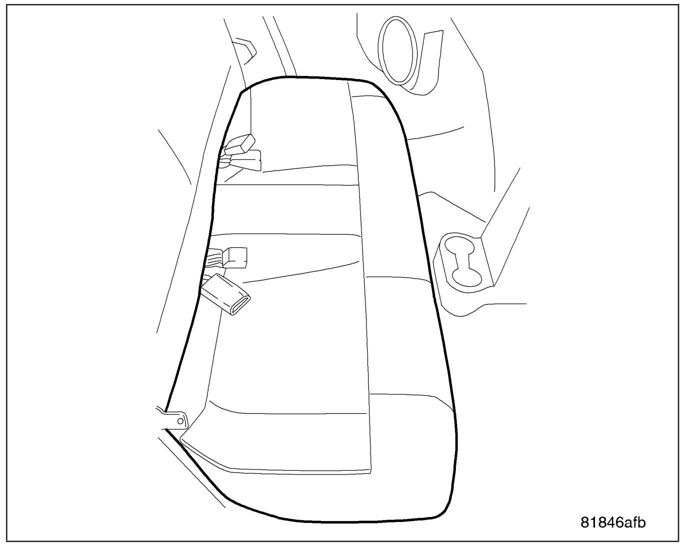
21. **Note the fuel level unit location on the top of the fuel tank.**

NOTE: The fuel level unit has to be properly located to the tank for the fuel gauge to work properly.

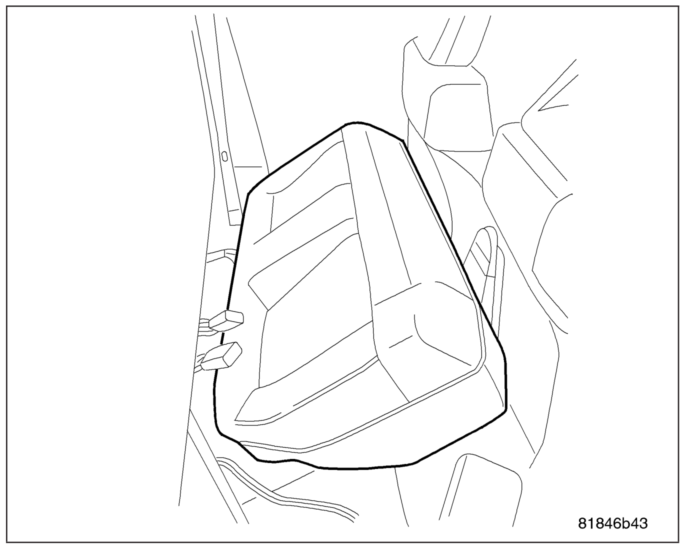


22. Remove fuel level unit module and disconnect line.

23. Remove module and seal from tank. Discard seal.

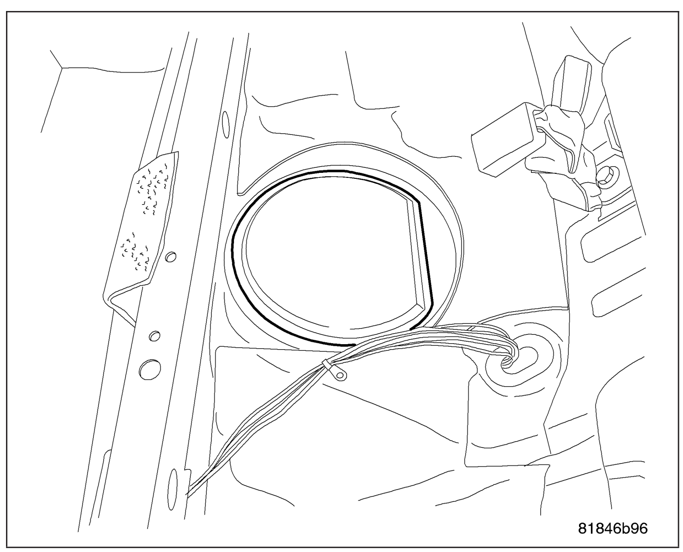


FRONT WHEEL DRIVE

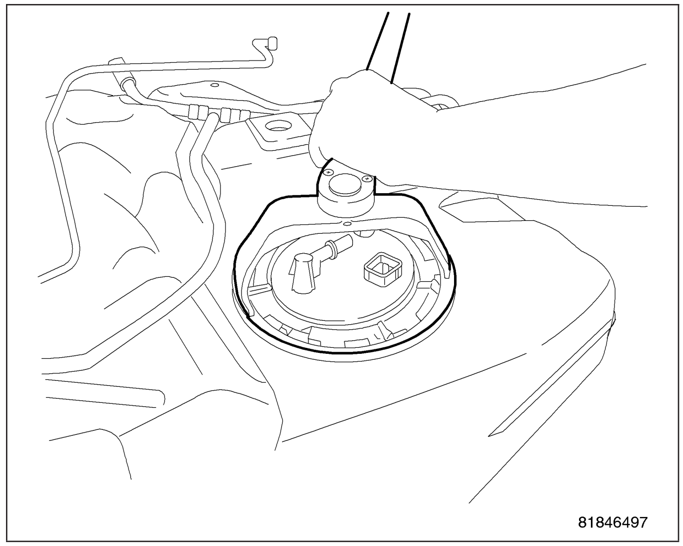


WARNING: Release fuel system pressure before servicing fuel system components. Service vehicles in well ventilated areas and avoid ignition sources. Never smoke while servicing the vehicle. This may result in personal injury or death.

1. Perform Fuel System Pressure Release procedure.
2. Remove the air cleaner lid, disconnect the inlet air temperature sensor and makeup air hose.
3. Remove the negative battery cable.

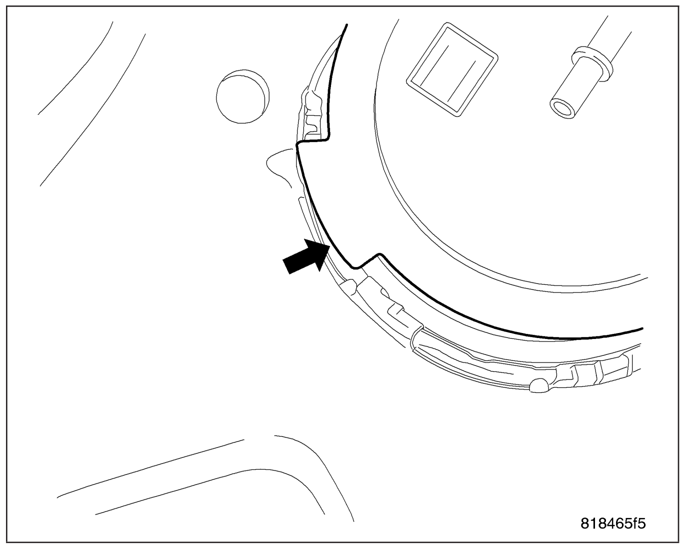


4. Remove the rear seat cushion.

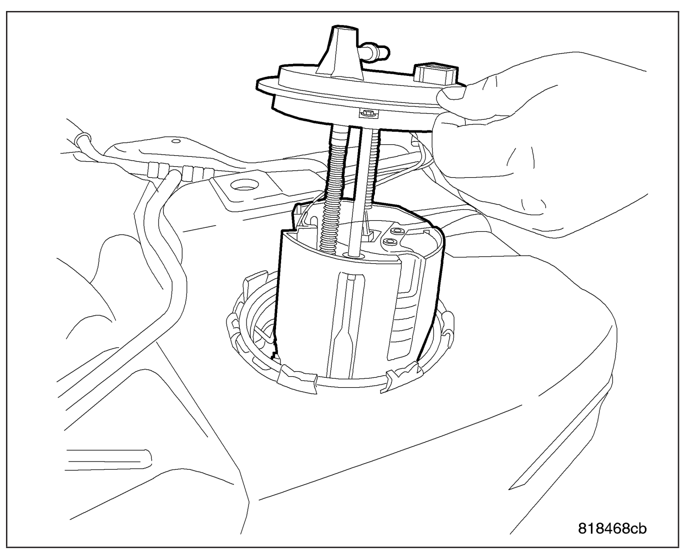


5. Rear seat cushion loose.

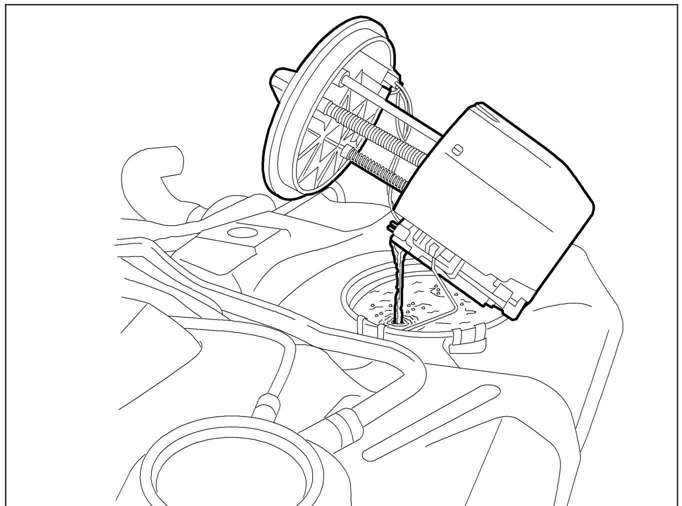
6. Remove plastic cover.



7. Clean top of tank to remove loose dirt and debris.
8. Use special tool #9340 to remove left side module lock ring.



9. **Note the fuel pump location on the top of the fuel tank.**



NOTE: The pump has to be properly located to the tank for the fuel gauge to work properly.

10. Pull module up out of fuel tank, make sure that you do not spill fuel inside of vehicle.
